*LOOMIS, ELIAS, LL.D., an American astronomer, was born at Willington, Connecticut, on the 7th of August, 1811. On completing his education at York College, Connecticut, he became professor of mathematics and physics at Western Reserve College, Ohio; and in 1844 was appointed to a similar professorship at New York University, which he still holds. His scientific publications are:—'On Certain Storms in Europe and America,' 4to, Washington, 1848; 'Historical Notes on the Discovery of the Planet Neptune,' 8vo, New York, 1848; 'Astronomical Observations,' published at intervals in connection with the Hudson Observatory; 'Elements of Algebra,' 12mo, New York; 'Elements of Geometry and Conic Sections,' 8vo, New York; 'Trigonometry and Tables of Logarithms,' 'Elements of Analytical Geometry and of the Differential and Integral Calculus,' 8vo, New York, 1851; 'Introduction to Practical Astronomy, with a Collection of Astronomical Tables,' 8vo, New York; 'Recent Progress of Astronomy, especially in the United States,' 12mo, New York, 1851; 'Treatise on Arithmetic, Theoretical and Practical,' 12mo, New York, 1856; 'Treatise on Meteorology,' 8vo, New York, 1868. Later editions of some of these books have appeared. Professor Loomis has also contributed a large number of scientific papers to 'Silliman's Journal,' the 'Transactions of the American Philosophical Society,' 'Sturgeon's Annals of Electricity,' the 'Proceedings of the American Association,' and 'Gould's Astronomical Journal.' The astronomical papers relate to shooting stars, comets, the possibility of a lunar atmosphere, planetary rotation, the satellites of Uranus, the August and November meteors, Professor Kirkwood's theory of planetary distances, comparison of star-catalogues, &c. On other branches of science his papers relate to the magnetic needle, terrestrial magnetism, the determination of longitudes by the electric telegraph, electrical phenomena in buildings, the measurement of latitudes and longitudes, the measurement of heights by the barometer, the resistance of the air to falling bodies, hurricanes and tornadoes, meteorological observations, rainfall and waterspouts, the moon's influence on the weather, &c.

LOOS, DANIEL FRIEDRICH, German medallist, was born at Altenburg, in Saxony, January 15th, 1735. He was a pupil of Stieler, and served an apprenticeship of seven years in the die department of the mint at Leipzig. In 1756 he was appointed engraver to the mint at Magdeburg; but, on the suppression of that establishment, was attached to the mint at Berlin, of which he became principal medallist. Loos improved the machinery, and greatly elevated the style of art of the Berlin mint. He executed numerous medals commemorative of passing events and in honour of distinguished personages. Several of them have been engraved in 'Médailles de la Révolution,' 'Trésor de Numismatique,' &c. Loos was a member of the Berlin Academy. He died October 18th, 1819.

LOOS, GOTTFRIED BERNHARD, son of D. F. Loos, born

at Berlin, August 6th, 1774, inherited a large share of his father's talent, which he improved by diligent culture. Gottfried Loos was appointed master of the Berlin mint in 1806, and, later, general warden. He executed numerous excellent medals, and fully sustained the high character of the establishment. He wrote several useful essays on general numismatics, which were published in a collected form: 'Sammlung einzelner Aufsätze über Gegenstände des Münzwesens und der Münzkunde,' in three parts, Berlin, 1822; a treatise on gold and silver coins for commercial use, 1821; and a guide to the detection of base coin, 1828. Gottfried Loos died at Berlin, July 29th, 1843.

LORCH, MELCHIOR, German engraver, was born at Flensburg, in Schleswig, about 1527. He engraved both on copper and on wood, and is one of the best of the many excellent engravers who at that time flourished in Germany. On copper he engraved portraits (among others of Martin Luther and Albert Dürer) and various figure pieces; on wood, a large cut of the Deluge, printed on two sheets, and a variety of other subjects, the most interesting being a series of prints illustrative of manners, costumes, &c., from sketches made by him during his long journeys in northern Germany, Denmark, Austria, &c. He also engraved a set of prints of the habits of the Turks, and a portrait of the Sultan from drawings made by him in Turkey. The date of Lorch's death is sometimes stated to be 1586, but he appears to have been alive in 1590.

LORENZINI, GIOVANNI ANTONIO, Italian engraver, was born in Bologna in 1665. He studied painting under L. Pasinelli, but turned his attention to engraving, in which he shortly acquired distinction. With a painter's feeling for general effect rather than elegance of line, Lorenzini trusted largely to etching and the dry point. Of a religious turn of mind, he entered the order of Franciscans, but continued to engrave till his death, in 1740. Among his early prints are a 'St. Anthony,' and a 'Martyrdom of St. Ursula,' after his master Pasinelli; but his later prints are chiefly after P. Veronese, Tintoretto, Guercino, Guido, and other more eminent painters. He engraved several of the plates in the Gallery of the Grand Duke of Tuscany. Bartsch and Nagler give full lists of his prints.

LOSCH, JOSEPH, German medallist, was born in 1770 at Amberg, in the Upper Palatinate. Trained as a die-cutter in the mint of his native town, he improved his taste by the study of ancient Greek gems; and on the death, in 1796, of the principal engraver to the Amberg mint, Losch was selected to succeed him. The Amberg mint was soon after given up; but in 1803 Losch was attached to the staff of the mint at Munich, and five years later was made principal medallist. This office he retained till his death in 1826. Under Losch the Bavarian coinage was much improved. The medals engraved by him include many struck in commemoration of passing events; the visits of distinguished personages; as rewards for military skill, or proficiency in literature, science, or art; portraits, &c.; and they are above the average of their class. His son, JOSEPH LOSCH, born at Munich in 1804, who succeeded his father as chief medal engraver in the Munich mint, has engraved several good occasional medals.

LOUDON, JANE WEBB [E. C. vol. iii. col. 932]. Mrs. Loudon, the popular authoress of various horticultural works, died July 13, 1858, aged fifty-eight years.

LOUVETURE, TOUSSAINT [TOUSSAINT LOUVETURE, E. C. vol. vi. col. 138].

LOUVILLE, JACQUES EUGÈNE D'ALLONVILLE, CHEVALIER DE, a French astronomer, was born at the Château of Louville, near Chartrain, July 14th, 1671. On the completion of his school studies he entered the Marine in 1690, and fought at the battle of La Hogue in 1692; then joined the army, and attained the rank of captain in 1700. He now served as a brigadier in the army of the King of Spain, who gave him the title of chevalier; but was recalled to the French army, fought, and was made prisoner at the battle of Oudenarde. Two years later he exchanged, and became colonel of the Queen's Dragoons. Quitting the army after the peace of Utrecht, he directed his energies to mathematics and astronomy. In 1713 he went to Marseille, to determine the latitude by measuring the height of the pole; in 1714 he was elected member of the Academy of Sciences; and in 1715 visited London, in order to observe a total eclipse of the sun. He established an observatory, and a workshop for making some of his instruments, in a small country house which he purchased in 1717, near Orleans. He measured very closely the angular diameter of the sun; and his solar tables were published by the Academy in 1720. He devised a new method of calculating eclipses; and put forth a

new theory concerning the secular decrease in the obliquity of the plane of the equator to that of the ecliptic. Among his scientific controversies was one against Leibnitz's view of the *Vis Vivæ*, and another against Bernoulli. His scientific papers appeared originally in the 'Mémoires' of the Academy and 'Le Mercure.' In September, 1732, he had a severe attack of lathargic fever, but during it studied his own symptoms as philosophically, says Fontenelle, as though he were observing external physical phenomena. A second attack, however, quickly supervening, carried him off in a few hours, at the age of 61.

LOVER, SAMUEL [E. C. vol. iii. col. 952]. Mr. Lover died on the 6th of July, 1868, aged 70.

* LOWE, RIGHT HONOURABLE ROBERT, M.P., P.C., &c., Chancellor of the Exchequer, was born at Bingham, Nottinghamshire, in 1811. His father, the Rev. Robert Lowe, rector of Bingham, was the object of a series of violent attacks in Cobbet's 'Register,' in consequence of his having originated in his own parish the principle of Poor Law administration which was afterwards adopted by the Poor Law Commissioners for the whole kingdom. Mr. Lowe was educated at Winchester and at University College, Oxford; and distinguished himself whilst an undergraduate for his energetic liberalism at the Union Debating Society. In 1833 he took his B.A. degree, standing first class in classics, and second class in mathematics; and proceeded M.A. in 1836, having been elected in 1835 to a fellowship of Magdalen College, which he vacated by his marriage in the following year. He attained a high reputation as a private tutor in the university; and in January, 1842, was called to the bar by the Society of Lincoln's Inn. Later in the same year he sailed for Australia, in the ship that carried out the Act of Parliament creating the Representative Assembly, or Legislative Council, of New South Wales, which, consisting of thirty-six members, of whom twenty-four were elected and twelve nominated by the Governor, superseded the despotic rule which had prevailed whilst New South Wales was a mere convict colony. Of this Assembly, Mr. Lowe, who had early attained a lucrative practice at the colonial bar as an advocate and as a chamber counsel, was nominated a member by the governor, the late Sir George Gipps, in October, 1843, in which year he was a member of the committee on the Land Question, to the drawing up of whose report he largely contributed. He also acted as chairman of the Committee on Education, in which capacity he drew up a report in strong antagonism to the evil results of the extreme denominationalism of the colonial system, and in favour of what was known as Lord Stanley's, or the Irish National, system, with well-trained masters under the control of an unpaid board, with a paid secretary. The mutual intolerance of ecclesiastical parties, who agreed alone in their opposition to the scheme, deferred its success, although it subsequently formed the basis of the educational system adopted generally throughout Australia. In the latter end of 1844, Mr. Lowe, for the sake of greater freedom of political action, vacated the seat which he held as nominee of the Government in the Legislative Council; but was returned to this body in April, 1845, as an elected member for the counties of St. Vincent and Auckland. He now became prominent by the ardour with which he resisted in the Legislative Council, in the press, and at public meetings, the arbitrary burdens which the governor sought to impose on the occupants of crown lands—an attempt which was abandoned by Sir Charles Fitzroy, who in 1846 succeeded Sir George Gipps as Governor-General. The next struggle between the Government and the squatters found Mr. Lowe in opposition to his late clients and allies; and as chairman of the Land Committee of 1847 he prepared a report which is regarded as a nearly exhaustive statement of the principle of free trade in land, in opposition to the monopoly desiderated by the squatters. In consequence of his attitude upon this question, Mr. Lowe, in 1848, lost his election for Auckland; but was returned, without canvass, to the Legislative Council as member for Sydney. During the rest of his stay in the colony, he was chiefly remarkable for the energy with which he advocated and carried various measures of law reform—the abolition of imprisonment for debt on first process; the expediting of legal proceedings, especially in Equity cases; and the institution of a Board of Examiners, appointed by the colonial judges, who were authorised to admit properly qualified gentlemen to the colonial bar, without the obligation of a legal education in England.

In 1850 Mr. Lowe returned to England, and in July, 1852, obtained a seat in the House of Commons as member for Kidderminster; and made his first short but successful speech

in Parliament on the 29th of November, on the Courts of Law (Ireland) Bill. His next effort was made on the 7th of December, on the subject of Limited Liability and the Law of Partnership; and on the occasion of his third speech, made on the 13th of December, in opposition to Mr. Disraeli's budget, he achieved a signal triumph. On the 27th of January, 1853, he was appointed one of the secretaries of the Board of Control, which office he held till February, 1855. From August, 1855—when he was made a Privy Councillor—to March, 1858, he acted as Vice-President of the Board of Trade and Paymaster-General; and in June, 1859, was appointed President of the Board of Health and Vice-President of the Education Board of the Privy Council, but resigned in April, 1864. He sat for Calne from 1859 to 1868, and in November of the latter year was returned as the first member for the University of London, of the Senate of which he had been a member since 1860. He opposed Lord Russell's Reform Bill in 1866, disapproving that measure as a dangerous step in the direction of democracy; and upon the accession to power of the Derby administration, opposed the Reform Bill introduced by Mr. Disraeli in 1867, during the debate upon which in committee he sought to introduce the principle known as cumulative voting, which was lost, however, by a majority of 314 against 173. His most important addresses on the extension of the franchise were collected in a volume entitled 'Speeches and Letters on Reform: with a Preface,' 8vo, London, 1867, in which he advocated the experimental method of treating political subjects, as opposed to the theological and the metaphysical. On the 9th of December, 1868, he assumed office in the Gladstone administration as Chancellor of the Exchequer, and his first budget, which was introduced on the 8th of April, 1869, was remarkable for the adroitness with which, by anticipating the taxes—"discounting a bill at nine months," as his critics said—he sought to meet the exceptional expenses of the Abyssinian expedition. In other respects it aimed at the equalization of taxation and the rectification of various anomalies. His most recent budget, April, 1871, was distinguished for an attempt to introduce a tax on lucifer matches, which met with almost unanimous condemnation, and was necessarily abandoned: the budget was considerably modified, without being rendered less unfair or onerous. As a member of the Liberal Government, Mr. Lowe has taken a prominent part in the various measures which have characterised its existence; and is in favour of the admission of Dissenters to the degree of M.A. at Oxford and Cambridge, and their consequent participation in the government of the universities. He is an ardent advocate for the promotion of education, whether in primary schools or at the university; and especially insists upon the importance of boys and young men having a knowledge of the institutions of their own country, in preference to the dead and gone institutions of the ancient classical countries. His principal speeches in this sense were delivered on the 1st of November, 1867, at the Philosophical Institution, Edinburgh, the University of which city conferred on him the degree of LL.D.; and on the 22nd of January, 1868, before the members of the Philomathic Society of Liverpool. Mr. Lowe was one of the foremost members of the Government to animadvert upon the position of England with reference to the belligerents in the war between France and Germany. Addressing an audience at Elgin in September, 1870, he repudiated mediation on the three-fold ground that belligerents knew their relative power better than bystanders; that giving advice to a belligerent must involve taking sides; and that this country could not mediate without becoming the object of the future resentment of both parties.

Many of Mr. Lowe's leading speeches, in and out of parliament, on political and miscellaneous subjects, have been separately published immediately after delivery; but in their present shape they are at once too slight and too numerous to admit of detailed mention. It may be added that Mr. Lowe, in addition to his other distinctions, is an elected trustee of the British Museum.

* LOWELL, JAMES RUSSELL, an American poet and man of letters, son of the Rev. Charles Lowell, D.D., pastor of the West Church, Boston, U.S., and a member of a family distinguished for culture and literary attainments, was born at Cambridge, Massachusetts, on the 22nd of February, 1819. He became a student of Harvard College, where he graduated in 1838, and recited a "class poem" which was published with the title of 'A Poem recited at Cambridge,' 8vo, Cambridge, 1839, and which contained many strokes of vigorous satire and pungent humour. Having gone through a course of legal study at Harvard University, he was admitted to the bar in 1840, and entered

upon practice at Boston. But he almost immediately abandoned this career, and devoted himself to literature. In 1841 he published a volume of poems, of much promise as indicating that they were the result of original feeling and observation, with the title of 'A Year's Life,' 8vo, Boston, 1841, which has never been reprinted, although many of the pieces have been incorporated with the subsequent collections of the author's writings. In January, 1843, he commenced, in association with Robert Carter, the publication of 'The Pioneer,' a literary and critical Magazine, Boston, which, notwithstanding that it numbered Poe and Hawthorne amongst its contributors, died with the issue of its third (March) number. The following year saw the issue of a second series of 'Poems,' 12mo, Cambridge, first three editions, 1844, another edition, 2 vols. 8vo, Boston, 1849, English edition, 8vo, London, 1844, which contained 'A Legend of Brittany,' 'Prometheus,' 'Miscellaneous Poems,' and 'Sonnets.' Mr. Lowell had contributed to the 'Pioneer' a short series of 'Essays on the English Song-Writers,' which exhibited a fine critical faculty, and the idea of which he now expanded into 'Conversations on some of the Old Poets,' 12mo, Cambridge, two editions, 1845, English edition, 8vo, London, 1845, which are in fact a series of essays, thrown into the form of dialogue, upon Chaucer, Chapman, Ford, and poets and poetry in general, interspersed with remarks on miscellaneous topics of a social or political character. Three years afterwards appeared his third collection of 'Poems,' 12mo, Cambridge, 1848, amongst which were 'The Present Crisis,' 'The Summer Storm,' 'Above and Below,' 'Extreme Unction,' 'On the Capture of certain fugitive Slaves near Washington,' and others which obtained great popularity as being levelled against the institution of slavery. The same year, he published a poem founded on the legend of the search for the Holy Graal, entitled 'The Vision of Sir Launfal,' 12mo, Boston, 1848, 16mo, 1855, sixth edition, 8vo, 1858; and also an ingenious review article on the American writers of the present day, done into rhyme as 'A Fable for Critics,' 12mo, New York, 1848, fifth edition, 12mo, Boston, 1856. Of nearly simultaneous publication with 'The Vision,' was a satire mainly directed against slavery and the invasion of Mexico by the United States in 1846—47, which had for the most part already appeared by instalments in the newspapers of the day. This satire, which consisted of various poems in the Yankee dialect; the droll characteristics of which they very happily portrayed, was ostensibly the production of Mr. Hosea Biglow, and from him entitled 'The Biglow Papers: Edited, with an Introduction, Notes, Glossary, and copious Index, by Homer Wilbur, A.M., pastor of the First Church in Jaalam, and (prospective) Member of many literary, learned, and scientific Societies,' 16mo, Cambridge, 1848, third edition, 1856, a work which has passed through several editions in the United States, and which has been frequently reproduced in England. In July, 1851, Mr. Lowell paid a visit to Europe, where he travelled in England, France, and Switzerland, and resided for a considerable period in Italy, returning to America in December, 1852. He visited Europe a second time in May, 1855, in order the more fully to qualify himself for the duties of the chair of Modern Languages and Belles-Lettres in Harvard College, to which he had been appointed in January of that year, in succession to Professor Longfellow, who had resigned. After spending more than twelve months in study, during which he made Dresden his chief place of residence, he went home in August, 1856.

Several editions of Mr. Lowell's collective poems have appeared in America, as, for instance, his 'Complete Poetical Works,' revised, and with additions, 2 vols. 16mo, Boston, 1850, &c., new edition, 2 vols. 8vo, Boston, English edition, with an Introduction by A. R. Scoble, 18mo, London, 1852 and 1853, and in 'Beeton's Companion Poets,' with a Preface by W. B. Stevens, 8vo, London, 1865, &c. His remaining works, in prose and verse, comprise 'Fireside Travels,' 8vo, Boston, 1864; 'Under the Willows and other Poems,' 8vo, Boston, 1869, English edition, 8vo, London, 1869; 'The Cathedral: A Poem,' 12mo, Boston, 1870; 'Among my Books,' 8vo, London, 1870; and a work in which he collectively reproduced several papers which have already had a fugitive publication, entitled 'My Study Windows,' 8vo, London, 1871, containing essays on 'My Garden Acquaintance,' 'On a certain Condescension in Foreigners,' on Chaucer, Pope, Carlyle, Swinburne, &c. He has likewise edited, for Brown and Co.'s Series of the British Poets, the Poetical Works of Marvell, Donne, Keats, Wordsworth, and Shelley; and has signalled his powers of prose composition in criticism, politics, and general literature, by a vast number of articles in various periodical publications. Thus he

has been connected, either editorially or as a contributor, with the 'National Anti-Slavery Standard,' folio, New York; the 'Atlantic Monthly: Devoted to Literature, Art, and Politics,' 8vo, Boston, 1857, &c., of which he was for some years the editor; the 'North American Review and Miscellaneous Journal,' 8vo, Boston, 1815, &c., of which he was also a sometime editor; 'Southern Literary Messenger: Devoted to every Department of Literature and the Fine Arts,' 8vo, Richmond, 1835, &c.; 'Graham's Magazine;' the New York 'Knickerbocker;' 'Putnam's Monthly Magazine of American Literature, Science, and Art,' 8vo, New York, 1853—1857, new series, 1868, &c.; and, not to attempt to exhaust the list, to Ripley and Dana's 'New American Cyclopædia,' 16 vols. 8vo, New York, 1858—1863, to which especially he contributed a noteworthy article on Dante.

LUBBOCK, SIR JOHN WILLIAM, BART. [E. C. vol. iii. col. 962]. During the latter few years of his life his pursuit of scientific investigation resulted in the publication of but few papers. His latest important inquiry was on the lunar theory. He died at High Elms, Farnborough, June 20, 1865.

* LUBBOCK, SIR JOHN, BART., naturalist and banker, is the son of Sir J. W. Lubbock, Bart., whom he succeeded in the baronetage in 1865. He was born April 30, 1834, and was educated at Eton and at Trinity College, Cambridge. He commenced writing scientific papers as early as 1853, when his attention was chiefly given to the crustacean family *Calanidæ*, and was afterwards extended to the *Entomostraca*. One of the most noticeable of this group of papers was 'An Account of the two Methods of Reproduction in *Daphnia* and of the Structure of the Ehippium,' in 'Philosophical Transactions' for 1857, pp. 79—100. This led to his writing another paper, 'On the Ova and Pseudova of Insects,' in the 'Philosophical Transactions' for 1859, pp. 341—369, and other papers on the ova of *Buccinum* and the *Annulosa*. From about 1861 he commenced publishing a series of papers on the antiquity of man, based partly upon his own observations and partly upon published data. These relate mainly to the kitchen-refuse heaps, or Kjökkenmøddings, of Western Europe, and the lake-dwellings of Switzerland. These and other papers of similar import were collected, and, together with an account of the habits, customs, and mental condition of the least civilized peoples of the present time (intended to throw light on the evidence existing respecting the oldest-known peoples), were published under the title of 'Prehistoric Times,' 8vo, London, 1865, second edition, 1869. The portion relating to savages has been largely expanded to form a later work bearing the title of 'The Origin of Civilization, and the Primitive Condition of Man,' 8vo, London, 1870. In 1862 he discovered two aquatic *Hymenoptera*, one of which, *Polynema natans*, is the first recorded instance of an insect which swims under water with its wings. Previous to this discovery, no British *Hymenoptera* had been known to be aquatic. In a paper on *Chloëon dimidiatum*, he indicates how the mature form is gradually acquired during a series of twenty or more moultings. He has written a few papers on banking matters, such as the clearing-house system, &c. He was one of the editors of the 'Natural History Review.' He is president of the Anthropological Institute, and member of Parliament for Maidstone.

LUCAS, SAMUEL, was born at Bristol in 1818. The son of a tradesman, he was educated with a view to succeeding to his father's business, but at his earnest request was allowed to proceed to Oxford, where he entered Queen's College; in 1841 won the Newdegate prize by a poem on the 'Sandwich Islands,' and in 1845 gained the Chancellor's prize for the English Essay on the 'National Revolutions of Ancient and Modern Times.' He proceeded B.A. in 1842, and M.A. in 1846, in which last year he was called to the bar of the Inner Temple. Mr. Lucas went the western circuit for some years, but did not acquire much practice. In 1853 he became editor of the newly established 'Press' newspaper; but quitted it in little more than a year to connect himself with the 'Times,' for which he wrote literary reviews, and of which successive series were collected and republished under the titles, 'Eminent Men and Popular Books,' 8vo, 1859; 'Biography and Criticism,' being a second series, &c., 1860; and 'Mornings of the Recess, 1861—1864, a series of biographical and literary papers. Reprinted from the "Times," and revised by the Author,' 2 vols. 8vo, 1864. His contributions to the larger reviews were embodied in 'Secularia, or Surveys on the Mainstream of History,' 8vo, 1862. From its commencement in 1859 to 1865, he edited 'Once a Week,' and on leaving it started the 'Shilling Magazine,' which, however, he discontinued at the end of the year. His health having failed, he retired to the country, but did not regain

strength, and died at Eastbourne, Sussex, on the 27th of November, 1868.

LÜCKE, GOTTFRIED CHRISTIAN FRIEDRICH, a German divine and commentator, was born on the 23rd of August, 1792, at Egeln, near Magdeburg, and was educated successively at the Universities of Halle and Göttingen, at the latter of which he became tutor (repetent) in theology, in 1813. In the year following he published his first work, which was a prize essay entitled 'Commentatio de Ecclesia Christianorum Apostolica,' 4to, Göttingen, 1814. In 1816 he repaired to the University of Berlin, where he acted for some time as a tutor (privatdocent); and where he gave a general but independent adhesion to the exegetical system of Schleiermacher. His chief literary works of this epoch were—on the New Testament Canon, &c., 'Ueber den neutestamentlichen Kanon des Eusebius von Cæsarea,' 8vo, Berlin, 1816; and an Outline of New Testament Hermeneutics, &c., 'Grundriss der neutestamentlichen Hermeneutik und ihre Geschichte,' 8vo, Göttingen, 1817. He likewise assisted De Wette in the preparation of his 'Synopsis Evangeliorum Matthæi, Marci, et Lucæ,' &c., 8vo, Berlin, 1818. In the spring of the last-named year he was appointed to be extraordinary professor at Berlin, and in the following autumn to be ordinary professor at the then recently founded University of Bonn. In 1827 he accepted the chair of Systematic Theology at the University of Göttingen; and, after having attained the rank of Consistorial Councillor, died in that city on the 14th of February, 1855.

The most important of the works of Professor Lücke was his Commentary on the Writings of St. John the Evangelist, 'Commentar über die Schriften der Evangelisten Johannes,' 4 vols. 8vo, Bonn, 1820—1832, which has gone through several editions, and of which an English translation was published in 4 vols. 12mo, Edinburgh, 1837. Besides this work, which still retains a high place amongst the most remarkable productions of German exegesis, Lücke published biographical essays on his teacher, Planck, 'Dr. Gottlieb Jacob Planck. Ein biographisches Versuch,' &c., 8vo, Göttingen, 1835; on De Wette, 'Dr. W. M. L. de Wette. Zur freundschaftlichen Erinnerung,' 8vo, Hamburg, 1850; and on Schleiermacher, with the last two of whom he was for some time associated in the conduct of the 'Theologische Zeitschrift' of Berlin. Lücke was further connected, either editorially or as a contributor, with various periodicals. His library was purchased, after his death, for the divinity schools of the University of Cambridge, Massachusetts.

LUDWIG I., KARL AUGUST, King of Bavaria [E. C. vol. iii. col. 970]. From his abdication in 1848 the old king lived a strictly private life. Accepting his position, he ceased to interfere in public affairs, and spent the greater part of his time in Rome, Paris, or Nice, quietly enjoying, after his fashion, art, literature, and society, and winning much personal esteem wherever he resided. After somewhat prolonged suffering, which he bore cheerfully, he died at Nice on the 29th of February, 1868, in his 82nd year, having survived his abdication very nearly twenty years.

* **LUTHER, ROBERT**, a German astronomer, remarkable for his success in discovering asteroids, was born in 1810. He fitted up an observatory at Bilk, near Düsseldorf, in Rhenish Prussia; and there, through the possession of good instruments, a keen sense of vision, and a competent knowledge of the zodiacal belt, he has been able to determine the planetary character of minute specks of light, formerly regarded as fixed stars of small magnitude. His first discovery of this kind was the asteroid or planetoid Thetis, and others followed in rapid succession till they numbered seventeen in all. Their names are Thetis, 1852; Proserpina, 1853; Bellona, 1854; Leukothea, 1855; Fides, 1855; Aglaia, 1857; Calypso, 1858; Mnemosyne, 1859; Concordia, 1860; Leto, 1861; Niobe, 1861; Diana, 1863; Alkmene, 1864; Clio, 1865; Antiope, 1866; Arethusa, 1867; Hecuba, 1869; and the most recent Amalthea, first seen by him March 12, 1871. A more particular account of the periods of discovery of these planetoids, with the elements of their orbits and other particulars, will be found under **ASTEROIDS**, E. C. S., Arts and Sciences Division, col. 174—178. A paper by Dr. Luther, giving the elements of his latest found asteroid, Amalthea, was read before the Royal Astronomical Society, London, April 14, 1871.

Dr. Luther has published nearly a hundred scientific memoirs and papers, mostly in the 'Astronomische Nachrichten.' They relate not only to the asteroids which he himself has discovered, but also to the appearance, position, elements, and ephemerides of many of the others. Some of his papers relate to comets; these and the asteroids have almost exclusively occupied his attention as an astronomical observer. He has written a few papers conjointly with Krüger and Vogel. In 1855 the Académie des Sciences at Paris awarded him a money prize, which he transferred to the town of Leyden, to aid in defraying the cost of establishing an observatory in that town. In 1861 the Lalande Medal was awarded to him for his discoveries.

LÜTKE, PETER LUDWIG, German landscape-painter, was born at Berlin in 1759. In 1785 he went to Italy, and studied for some time under Philip Hackert. He returned to Germany in 1788, and the following year was appointed professor of landscape painting in the Berlin Academy. Lütke was a diligent student of nature, had some acquaintance with the natural history sciences, and finished his pictures with great care. His landscapes are correct, though often cold and formal. Some of his largest and best works are in the palaces of Berlin and Potsdam. He died in 1831. His son, **LUDWIG EDUARD LÜTKE**, born at Berlin in 1801, is a much-esteemed painter and lithographer of landscapes, and architectural and marine subjects.

LYNDHURST, JOHN SINGLETON COPLEY, LORD [E. C. vol. iii. col. 988]. Lord Lyndhurst, notwithstanding his great age, continued to attend, at least occasionally, the sittings of the House of Lords; and if in his last years his voice was not often heard there, he retained his interest in its proceedings, and was regarded by all parties with profound respect. He died at his house, George Street, Hanover Square, on the morning of the 12th of October, 1868, in the 92nd year of his age. Lord Campbell's memoir of him in the 'Lives of Lord Lyndhurst and Lord Brougham,' 8vo, 1869, is a mendacious perversion of the circumstances of his personal as well as of his political career.

LYONS, EDMUND LORD [E. C. vol. iii. col. 990]. Lord Lyons lived but a few months after the memoir just cited was written. He died at Arundel Castle on the 23rd of November, 1858, two days after attaining his 68th birthday, and was succeeded by his eldest son,

* **RICHARD BICKERTON PEMELL**, second **LORD LYONS**, the distinguished diplomatist, born April 26th, 1817. He was educated at Winchester and Christ Church, Oxford, and, having adopted the diplomatic profession, served as attaché to the embassy at Athens 1839—1844, Dresden 1852, and as secretary of legation at Florence 1856—1858. In December, 1858, he was appointed British minister at Washington, which post he retained till February, 1865, when he returned home in consequence of ill-health. In November, 1867, he was nominated ambassador to the Emperor of the French, and retains his position, though now (1871) accredited to the Provisional Government. Lord Lyons was created G.C.B. in 1862, and in 1865 sworn in a member of the Privy Council. In June, 1865, the University of Oxford conferred on him the honorary degree of D.C.L.

* **LYTTON, EDWARD GEORGE EARLE LYTTON BULWER-LYTTON**, first **LORD** [E. C. vol. iii. col. 994]. In 1858 Sir Edward Bulwer-Lytton, under the Earl of Derby, was appointed Secretary of State for the Colonies, and, though he resigned with the rest of the ministry in 1859, he had the happiness, during his short tenure of office, of being the instrument of formally constituting two new British colonies, Queensland and British Columbia. When Lord Derby regained power in 1866, Sir Edward Bulwer-Lytton did not form part of the ministry; but he was almost immediately raised to the peerage as Baron Lytton of Knebworth, and he has not since taken a prominent part in political life. He has, however, continued to exhibit remarkable literary activity. In 1859 he published in a complete form his elaborate novel, 'What Will He Do with It?' which appeared originally in a periodical; and 'A Strange Story,' which also having first appeared as a serial, was issued as an independent publication in 1862. In 1865 appeared his 'Poems;' in 1866, 'Lost Tales of Miletus;' in 1868, 'Miscellaneous Prose Works;' in 1869, 'Translations from Horace;' and in 1870, 'King Arthur,' of which portions had been published some years previously.

M

MACARDELL, JAMES, an eminent engraver in mezzotint, was born in 1728 (Bryan erroneously says, "about 1710"). He was a native of Ireland, and learned his art in Dublin, but practised in London. Macardell was one of the ablest portrait-engravers in mezzotint of any period. He is best known by his prints after Reynolds, which are almost perfect in their rendering of the mind and manner of the great painter. Sir Joshua, as is well known, preferred mezzotint to the other methods of engraving on account of its painter-like breadth, fidelity, and force of general effect, and the softness of the flesh; and it was precisely in these qualities that Macardell excelled; hence, no doubt, he came through Sir Joshua's patronage to be so much employed on his portraits. But he also engraved several heads and figure-pieces after Rembrandt, Rubens, Vandyck, and Murillo, as well as Hogarth, Hudson, and Zoffany. He died June 2nd, 1765, when only in his 37th year.

MACARTHUR, JOHN, the chief founder of wool-farming and one of the earliest promoters of agriculture in Australia, was born at Plymouth, Devonshire, in 1766. He was an ensign in the army at an early age, but, retiring on half pay, studied farming for awhile. Re-entering the army with the rank of captain, he went out, in January, 1790, to New South Wales with a detachment of troops intended for the defence of the colony, then barely two years old. Captain Macarthur, noticing the capabilities of the soil and climate, obtained a grant of 200 acres of land at Paramatta, near the newly founded town of Sydney. He conceived the idea of rearing sheep, with a view to sending to England wool good enough in quality for use by the woollen manufacturers. He purchased rams and ewes of the small Bengal sheep, others of the larger Cape breed, and others from England; crossed the breeds, and gradually improved the fleece. After a few years of trial, he obtained a further cross with the Spanish or Merino breed, and in four successive crossings nearly equalled the real Merino wool. Specimens of cloth, spun and woven with this wool, were sent to England for inspection in 1798. In 1802 he started for England, to solicit from the Government encouragement for this new branch of industry, a grant of unoccupied tracts in the colony as grazing land, and the services of such convicts as might be useful as shepherds. The woollen manufacturers having supported his appeal, the Government granted him 10,000 acres, but required him to resign his army commission. He returned to New South Wales in 1804, taking with him five fine Spanish Merino sheep from the king's farm at Kew, and a number of trees, fruits, and plants of various kinds. He became a large grazier and stock-owner, with 4000 sheep, and also a planter or agriculturist. In 1809 he came again to England, where he remained several years, and then paid visits to France, Italy, and Switzerland, to make himself acquainted with the modes of culture best adapted for crops likely to be suitable for the climate of New South Wales. Returning to the colony with a large supply of seeds and plants in 1817, he greatly enlarged the sphere of his operations. In 1825 he became a member of the Legislative Council. In 1831, despondent at the loss of his eldest son, he retired to a secluded life on his estate at Camden, where he died on the 10th of April, 1834. Two of his sons, James and Sir William Macarthur, were instrumental in displaying the produce of the colony, and drawing attention to its capabilities, at the International Exhibitions of 1851, 1855, and 1862. Mr. Macarthur is justly regarded in New South Wales as the "Founder of the Colony," so far as concerns the most important of its products—wool. He was the beginner of the wool trade in Australia, which has grown to such an extent in eighty years that there are now 14,000,000 sheep in New South Wales, 10,000,000 in Victoria, 5,000,000 in South Australia, 2,000,000 in Tasmania, and 9,000,000 in New Zealand; whilst the wool brought to England from these colonies in a single year, 1870, was no less than 175,000,000 lbs.

MACAULAY, THE RIGHT HON. THOMAS BABINGTON, LORD [E. C. vol. iv. col. 5]. In September, 1857, Mr. Macaulay received the unexpected intimation that it was the desire of the Queen to raise him to the peerage. He took the title of Baron Macaulay, not caring to bury his own name under a territorial designation. Lord Macaulay had but brief enjoyment of his new dignity. His health was much broken, but

there was little apprehension of danger till the end, which "was sudden and singularly quiet. On December 28, 1859, he fell asleep and woke not again." He was buried on the 9th of January, 1860, in Poets' Corner, Westminster Abbey, at the foot of Addison's statue, and close by the grave of Samuel Johnson. He was never married, and his title died with him.

Lord Macaulay left his History a fragment. He continued working at it as long as he could hold a pen, but he carried it no farther than the death of his hero, William III. The two volumes, containing so much as was finished, were published in 1861, with a memoir of Lord Macaulay by his friend, Dean Milman. Two volumes of his miscellaneous works, including a few early pieces and some essays omitted by him from the original selection, have since appeared, and in 1866 'The Works of Lord Macaulay, complete. Edited by his sister, Lady Trevelyan.' 8 vols. 8vo.

***M'CLELLAN, GEORGE B.**, American general and military engineer, was born at Philadelphia, December 3rd, 1826. Receiving a military education at West Point Academy, he quitted that establishment in 1846 with the rank of second lieutenant of engineers. Soon after this he was engaged in the Mexican war, and having distinguished himself at Contreras, Churubusco, Molino del Rey, and Chapultepec, was promoted to be captain of a company of sappers and miners. He was engaged on engineering duty at West Point from 1848 to 1851; introduced the bayonet exercise into the army of the United States; and adapted a Military Manual for the service, which received official sanction. In 1851 he superintended the engineering construction of Fort Delaware; in 1852 assisted Major Marcy in exploring and surveying the Red River country; then acted under General Smith as chief engineer in the survey of Texas; and in 1853 surveyed the western division of one of the routes proposed for a railway across the whole breadth of the American continent. In 1855 he exchanged from the engineers into the cavalry, and accompanied General Robert Lee (at that time an officer of cavalry) to the Crimea, to witness the military operations at Sebastopol. On his return he wrote a work 'On the Organisation of European Armies, and the Operations of War.' Quitting the army in 1857, he became vice-president and engineer of the Illinois Central Railway; and in 1860 accepted similar positions on the Ohio and Mississippi line.

When the Civil War broke out in 1861 he was appointed major-general of the Volunteers of Ohio, Illinois, and Indiana; defeated the Confederates in small engagements at Philippi and Blue Mountains, and took 1000 prisoners at Beverley. When M'Dowell met with his disastrous defeat at Bull Run, M'Clellan was appointed in his stead to command the Army of the Potomac. He established strict discipline among the troops, and obtained from the journalists at Washington a promise that they would not print anything likely to give the enemy a clue to his plans. In November, when General Scott resigned the command-in-chief of the military forces of the United States on account of his advanced age, General M'Clellan was appointed to succeed him; but he surrendered this post in March, 1862, in order to resume the command of the Army of the Potomac, which he had thoroughly reorganised during the winter. The Confederates having retired from the Potomac towards Richmond, M'Clellan determined to attack them on another side; he landed on the peninsula included between the York and James rivers, and marched in the direction of Richmond, the Confederate seat of government. He reached the Chickahominy and York Town in April, turned the enemy's position at the last-named place, and had various alternations of success and failure during the month of May. In June he gained the battle of Fair Oaks, and advanced towards Richmond. But now disaster supervened; his plans became known to the enemy; a flank movement that was to have been made by M'Dowell came to nothing; and M'Clellan, in a series of seven days' sanguinary battles before Richmond, was so completely defeated by Lee that he had to retreat to his gunboats, and to abandon the peninsula with great loss. This abandonment, however, which was ordered by the new commander-in-chief, General Halleck, he executed under protest, as being against his own wishes. He took position at Alexandria, to defend Washington; and having strengthened and disciplined his army, resumed the offensive,

and (after fluctuating fortunes at the second battle of Bull Run, South Mountain, Harper's Ferry, and Antietam) forced Lee to retreat at Hagerstown, and drove him and Stonewall Jackson across the Rappahannock at Sharpsburg in September. President Lincoln, well pleased at this result, wished M'Clellan to push on and capture Richmond at once; but the general, who was one of the Peace Democrats of the North, rather desired some kind of compromise that might restore peace between North and South. This divergence of views led to the supersession of M'Clellan by Burnside in November; and the supersession was virtually the close of M'Clellan's services in the war. He engaged in politics for two years, became leader of the Peace Democrats, made an unsuccessful attempt to obtain the presidency in 1864, and resigned his commission in the United States army in November of that year. General M'Clellan has some of the old Presbyterian training in him, which he showed by a grave severity of discipline, and an encouragement to his soldiers to respect Sunday observance, so far as military necessities permitted. A Washington letter, in the time of the war, stated that the general "takes soldier's fare with the rest, asking no better food and no more luxurious bed than the newest recruited private under his command." Since the peace, he has resumed his connection with railway enterprise: he is president of the Atlantic and Great Western Railway, and in 1870 he accepted the appointment of chief engineer of the docks of New York.

* M'CLINTOCK, SIR FRANCIS LEOPOLD, Arctic voyager, was born at Dundalk in 1810. He entered the navy in 1831, and attained the rank of captain in 1854. From 1850 to 1854 he assisted in the exploration of the Arctic regions. In 1857 he undertook to conduct a search after Sir John Franklin. The voyages of Franklin and others in the Arctic regions form part of a series commencing with that of Cortereal in 1500, the object of which was to discover a north-west passage to China. McClintock's expedition, which started in the Fox from Aberdeen, on July 1, 1857, resulted in demonstrating the route followed by Franklin, which route was in all probability through Lancaster Sound, Franklin Channel, and to the entrance of Victoria Strait. This area comprises the portion of the northern end of the American continent, which had not been discovered prior to 1857. Immediately before Franklin's first voyage the undiscovered portion of the north-west passage was about 2060 miles, and of this Franklin himself navigated 1260, of which 560 miles were performed in his last voyage. Sir F. L. McClintock and his companions, of whom Messrs. Young, Hobson, and Petersen were his most important coadjutors, discovered and mapped 600 miles of new land, thus completing the discovery of a north-west passage and of the northern coast-line of the American continent. Lieutenant Hobson found some documentary evidence under two cairns relating to the death of Franklin, and to some of the events connected with the expedition under his charge. The Fox returned to London on September 23, 1859. In consequence of the success with which this expedition had been conducted, Sir F. L. McClintock had numerous honours conferred upon him, and amongst them were a knighthood, the freedom of the city of London, and the patron's medal of the Royal Geographical Society. In 1864, the Aurora, screw frigate, under his command, escorted the Prince and Princess of Wales to Copenhagen. He has written 'The Voyage of the Fox in the Arctic Seas,' 8vo, London, 1859, 3rd ed., 1869.

M'CULLOCH, HORATIO, R.S.A., was born in Glasgow in 1806; studied art in his native place, and about 1829 removed to Edinburgh, where, with brief intervals, he spent the rest of his life. A 'View on the Clyde,' exhibited by him at Edinburgh in 1829, attracted much notice; and thenceforward he was a constant exhibitor in Edinburgh, though his pictures were seldom seen in London. He painted almost exclusively Scottish scenery, and his landscapes, though usually topographical, were large in style and vigorously executed. 'Views in Cadzow and the Highlands,' 'Mist in the Mountains,' 'Loch Achray,' 'Loch Lomond,' 'Lord Macdonald's Deer Forest,' and the like, were his staple subjects. For many years he was the most popular landscape painter in Scotland, and he undoubtedly ranks among the ablest and most faithful delineators of the romantic scenery of the north. After suffering for several years from successive attacks of palsy, he died at his residence, St. Colm Villa, Trinity, near Edinburgh, on the 24th of June, 1867.

* M'CULLOCH, HUGH, an American statesman and financier, was born in the State of Maine in 1811, and received his education at Bowdoin College. In 1835 he settled in Indiana as a banker, and became president of the Indiana State Bank in 1855. In 1863 he was appointed by President Lincoln to the

newly-established office of comptroller of the currency, at Washington. His success in this office during the remaining period of the Civil War, when the financial requirements of the Federal Government were so unprecedentedly heavy, led to the selection of Mr. M'Culloch as successor to Mr. Fessenden in the office of Secretary to the Treasury, when Mr. Lincoln entered upon his second term of Presidency in 1865.

MACCULLOCH, JOHN RAMSAY [E. C. vol. iv. col. 12]. In 1859 Mr. Macculloch published a second edition of his 'Treatises and Essays on Subjects connected with Economical Policy.' He died on the 11th of November, 1864. A new edition of his 'Dictionary, Geographical, Statistical, and Historical, of the various Countries, Places, and principal Natural Objects in the World,' was issued in 1867, under the editorship of Mr. F. Martin.

* M'DOUGALL, HON. WILLIAM, a Canadian statesman and journalist, was born at Toronto, January 25th, 1822. After finishing his education at Victoria College, he studied law, and was called to the bar. During a portion of his career, from 1848 to 1858, he conducted the 'Toronto Monthly Journal of Agriculture,' a periodical which had an extensive circulation; and during nearly the same period he edited the 'North American,' which was incorporated with the 'Toronto Globe' in 1857. In 1858 Mr. M'Dougall was elected member of the Canadian Parliament; and in 1862 received the appointment of commissioner of crown lands and member of the Executive Council. He resigned with his colleagues in 1864, but later in the same year joined a new coalition Government as provincial secretary. In 1866, as Minister of Marine, he assisted Admiral Hope in organising a flotilla of gunboats to act against the Fenians, if necessary. Mr. M'Dougall assisted in bringing about the union of the British North American colonies of Canada, New Brunswick, and Nova Scotia into a confederation in 1867.

MACDOWELL, PATRICK, R.A. [E. C. vol. iv. col. 15]. Subsequently to the date of the memoir just cited Mr. Macdowell executed two or three poetic figures, such as the 'Day-Dream,' 1858, and 'Eve,' 1865, and some memorial statues, including that of the Earl of Chatham for St. Stephen's Hall, in the New Palace of Westminster; but his chisel was mostly engaged on portrait busts. He died December 9th, 1870.

* MACFARREN, GEORGE ALEXANDER, composer and musical writer, was born in London, March 2nd, 1813. His father, George Macfarren (author of several dramatic compositions, and director of the Queen's Theatre, Tottenham Court-road, and afterwards of the Strand Theatre, died 1843) placed him first under Mr. C. Lucas, and then at the Royal Academy of Music, where he completed his musical training under Mr. C. Potter. Mr. Macfarren has been connected more or less with the Academy ever since, as professor, director, &c. In his numerous compositions, produced during a period of thirty-five years, he has frequently aimed at the establishment of something like a national style of music, based upon old English forms of construction, and avoiding mere imitation of Italian, German, and French music: this has given to Mr. Macfarren a special place among our living composers. His works of an operatic kind are—'The Devil's Opera,' 1838; 'Don Quixote,' 1846; 'King Charles the Second,' 1849; 'Robin Hood,' 1860; 'Jenny Lea' (an 'Opera di Camera'), 1863; 'She Stoops to Conquer,' 1864. Of these, 'Robin Hood' is regarded as the most characteristic and successful. Among his compositions of the cantata and serenata class are 'The Sleeper Awakened,' 1850; 'Leonora,' 1852; 'May Day,' 1856; 'Christmas,' 1859; 'Helvellyn,' 1864. Five of his overtures bear the titles of 'The Merchant of Venice,' 'Romeo and Juliet,' 'Chevy Chase,' 'Don Carlos,' and 'Hamlet.' In 1840 he produced a cantata called an 'Emblematical Tribute,' on the occasion of the marriage of her Majesty; and in 1864 another, 'Freya's Gift,' on that of the Prince of Wales. A 'Cathedral Service,' a Series of Old English Ditties, Songs from Shakspeare, Songs from Tennyson, Songs from Kinglake, Songs from the 'Arabian Nights,' a Harmonised Arrangement of Chappell's 'Popular Music of the Olden Times,' Symphonies, various instrumental compositions, and some hundreds of songs, duets, and glees, bear testimony to Mr. Macfarren's activity as a composer. His 'Rudiments of Harmony' stands high in estimation. He has written critical analyses of the music in Handel's 'Messiah' and other oratorios, Haydn's 'Creation,' Beethoven's Mass in D, and the same composer's 'Fidelio.' Mr. Macfarren took part in the inquiry instituted by the Society of Arts in 1860 concerning concert pitch. In 1867 he delivered six 'Lectures on Harmony,' which were afterwards published.

*MACILVAINE, RIGHT REV. CHARLES PETIT, D.D., Bishop of Ohio, U.S., was born January 18, 1798, at Burlington, New Jersey, a state which his father, the Hon. Joseph Macilvaine, subsequently represented in the Senate of the United States. He was educated at Princeton, where he graduated in 1816; and on the 4th of July, 1820, was ordained deacon by Bishop White. In 1823, after having laboured about two years in Christ Church, Georgetown, he was admitted to priest's orders by Bishop Kemp, of Maryland. In 1825 he became chaplain and professor of history and ethics in the Military Academy at West Point, which he quitted in 1827, on his appointment to the rectory of St. Ann's Church, Brooklyn, New York. He was appointed in 1831 to the professorship of the evidences of revealed religion and sacred antiquities in the University of New York; and in performance of the duties of his office delivered a course of lectures which were afterwards extremely popular and influential in their collected form, as 'The Evidences of Christianity in their external Division, exhibited in a Course of Lectures delivered in Clinton Hall, in the Winter of 1831—32, under the Appointment of the University of New York,' 12mo, New York, 1832, and which has been adopted as a text-book by several American colleges, and has gone through more than thirty editions, having been reprinted in Philadelphia, London, and Edinburgh. On the 31st of October, 1832, Dr. Macilvaine was consecrated "Bishop of the Protestant Episcopal Church in the State of Ohio," the duties of which diocese were lightened in 1859 by the consecration of Dr. Bedell as assistant-bishop. In 1853 the University of Oxford conferred the degree of D.C.L. on Bishop Macilvaine, and in 1858 he received that of LL.D. from the University of Cambridge. He visited this country in 1862 for the purpose of explaining the position and policy of the Federal Government; and on the 22nd of February presided at a public breakfast which was held in Freemasons' Hall, London, on the anniversary of the birth of Washington.

Dr. Macilvaine, who is "distinguished for the soundness and clearness of his evangelical views, and for the expository character of his preaching," has published various 'Episcopal Charges,' and 'Sermons' preached at consecrations, ordinations, and in behalf of missions and of education; and he has been a diligent contributor to periodical religious literature in New York, Philadelphia, and, to a less extent, in London. The most remarkable of his works, which include several 'Memoirs,' are his 'Oxford Divinity compared with that of the Roman and Anglican Churches: with a special View of the Doctrine of Justification by Faith,' 8vo, Philadelphia, 1841, 8vo, London and Thames Ditton, 1841; 'Reasons for Refusing to Consecrate a Church having an Altar instead of a Communion Table,' &c., 12mo, New York, 1846; a series of Twenty-two Discourses, "published at the request of the Convention of the Diocese of Ohio," entitled 'The Truth and the Life,' 8vo, New York, 1855, English edition, 8vo, London, &c., 1855; 'The True Temple: or, the Holy Catholic Church and Communion of Saints, in its Nature, Structure, and Unity. With an Introductory Preface by the Honourable S. Waldegrave, Lord Bishop of Carlisle,' 8vo, London and Philadelphia, 1861; and an article, reprinted from the 'Christian Observer' for May, 1867, with the title of 'A Letter to "Clerical Brethren in Norfolk," on Ritualism and Rationalism in the American and English Churches,' 8vo, London, 1867.

MACLEAY, WILLIAM SHARP, entomologist, was born in London, July 30, 1792. He was educated at Westminster and at Trinity College, Cambridge. Soon after leaving the university he became secretary to the Board for liquidating British claims in France. In 1828 he went to Cuba as commissioner of arbitration to the Mixed British and Spanish Court of Commission, and in 1836 he was appointed judge of the Mixed British and Spanish Court of Justice. In 1856 he returned to England, and in 1857 he retired from the public service. In 1859 he went to New South Wales for the benefit of his health, and settled at Elizabeth Bay, Sydney, where he occupied himself in cultivating rare plants, in prosecuting his studies, and in entertaining his friends. He died at his residence in Elizabeth Bay on the 25th of January, 1865. Although his attention was mainly given to insects, he had an extensive acquaintance with most of the other classes of organic forms. His first important work was 'Horæ Entomologicae,' 2 parts, 8vo, 1819—1821, which has become very scarce, owing to the greater portion of the copies of the first part having been destroyed by fire, and to the second edition having been damaged by water during a high rise of the Thames. He also wrote 'Annulosa Javanica,' 4to,

London, 1825, a work which was never completed. He contributed the 'Illustrations of the Annulosa of South Africa,' in A. Smith's 'Illustrations of the Zoology of South Africa,' 4to, 1849; and wrote numerous papers for various scientific journals. He gave great attention to the systematic classification of organic beings, and was one of the first to clearly point out the necessity of distinguishing between affinity and analogy in the formation of groups. He opposed the prevailing method of arranging the relationships of animals in linear series and dichotomously, and proposed a circular mode of arrangement. Every natural group, he considered, returned into itself, and consisted of ten types, five of which were primary and five subordinate or osculant. In his 'Horæ Entomologicae' he developed his system with remarkable skill. His views were adopted by several eminent zoologists. Thus Vigors applied them to birds, Horsfield to the butterflies, and Swainson to various groups. In Macleay's later writings he considered each group to consist of five types only. This method of circular grouping finds little favour now, as most of the classifications based upon it are necessarily more or less constrained and arbitrary. After 1849 he published little, but he left a large mass of papers ready for publication.

*MACLEOD, NORMAN, D.D., a Scottish divine and author, son of the late Rev. Dr. Norman Macleod, who was a distinguished Gaelic scholar, one of the deans of the Chapel Royal of Holyrood, and a sometime Moderator of the General Assembly of the Church of Scotland, was born on the 3rd of June, 1812, at Campbeltown, Argyshire, and was educated at the Universities of Glasgow and Edinburgh. He further pursued his studies in Germany; and, in 1838, became minister of the parish of Loudoun, Argyshire, a charge which he exchanged in 1843 for that of Dalkeith. In 1851 he was called to the Barony parish, in Glasgow, and received the degree of D.D. in 1858. He is widely known for his breadth and liberality of sentiment, and the zeal with which he has devoted himself to the advancement of the working classes, in whose behalf he has instituted and conducted special services in his church, and connected himself with several associations in Glasgow for their benefit.

Dr. Macleod, who is one of her Majesty's chaplains for Scotland, in which capacity he frequently officiates before the Court in the Highlands, is most popularly reputed as the editor of 'Good Words,' a monthly periodical, which, commenced in 1860, speedily attained a circulation unprecedented amongst works of its character. To this magazine he has been a constant contributor, passing the principal of his later works through its pages before giving them an independent publication. He is the author, *inter alia*, of the 'Earnest Student: being Memorials of J. Macintosh,' 8vo, Edinburgh, 1847, &c., popular edition, 8vo, London, 1863; 'The Home School: or, Hints on Home Education,' 8vo, Edinburgh, 1856, &c.; an 'Introduction' to 'Prevailing Prayer,' 8vo, Edinburgh and London, 1859; 'Parish Papers,' 8vo, London and Edinburgh, 1862; 'The Recognition of Friends in Heaven,' 16mo, London, 1863; 'The Lord's Day: Substance of a Speech delivered at a Meeting of the Presbytery of Glasgow, on Thursday, 16th November, 1865,' 8vo, Glasgow, London, and Edinburgh, 11th thousand, 1865, which gave rise to much animadversion on account of an announcement by the author that he did not believe in the continued obligation of the fourth commandment, and that he based his opinion in reference to the Lord's Day, "not on the Sabbath law of the Decalogue, as to the origin, but on the necessities of Christian worship, and the authority of Christ and his Apostles;" 'Eastward,' 8vo, London and New York, 1866, being a record of travel in Palestine, in company with Mr. Strahan, his publisher; 'Simple Truth spoken to Working People,' 8vo, London, 1867; 'The Old Lieutenant and his Son,' 8vo, London, 1867, which was reproduced in vols. 643 and 644 of the 'Tauchnitz Collection of British Authors,' 16mo, Leipzig, 1841, &c.; 'Reminiscences of a Highland Parish,' 8vo, London, 1867; 'The Starling: a Scotch Story,' 2 vols. 8vo, London, 1867, &c.; 'Address on Christian Missions to India: with general Reference to the Educational Missions of the Church of Scotland,' 8vo, Edinburgh and London, 1868, which was delivered on the 28th of May of the last-named year, as the result of his observations on a tour of missionary inspection throughout the various Presidencies of India, to which he was commissioned by the General Assembly of 1867; 'The Concluding Address to the General Assembly of the Church of Scotland, May, 1869,' 8vo, London, 1869; and various 'Sermons,' 'Lectures,' and 'Addresses.'

MACLISE, DANIEL [E. C. vol. iv. col. 30]. For some years after the publication of the memoir in the E. C., Mr. MacLise was almost exclusively occupied on his great paintings of Waterloo and Trafalgar in the Royal Gallery of the House of Lords. His performance of this commission illustrates remarkably MacLise's conscientious mode of procedure. The original intention of the authorities was to have the pictures executed in fresco; but, dissatisfied with the appearance of the frescoes already painted on the walls of the Houses of Parliament and elsewhere, Mr. MacLise went to Italy to examine the early frescoes and the recent mural paintings and processes, and thence to Germany, in order to study the new method of painting in water-glass, or stereo-chromy, adopted by Kaulbach. Having, after patient comparison, convinced himself of the superiority of the new process, he determined to adopt it, and stayed at Munich till he had thoroughly mastered its technical difficulties. The process as modified by MacLise is explained under WATER-GLASS PAINTING, E. C., Arts and Sciences, Div., vol. viii. col. 743. The pictures are each 45 feet long and 12 feet high, and are painted in water-colours on an intonaco of lime, the water-glass (a soluble silicate of potash) being applied in a diluted state as a varnish. The first of the two pictures, 'The Meeting of Wellington and Blucher on the Evening of the Battle of Waterloo,' was completed in the spring of 1862; 'The Death of Nelson at Trafalgar' occupied two or three years longer. Beyond comparison, they are the finest mural paintings yet executed in England, and far superior to any works of a similar class that have in our time been produced on the Continent. With minute accuracy in circumstance and details—and for everything represented MacLise could produce authority of a kind to satisfy the most exacting historical critic—both pictures combine general truth, breadth of treatment, poetic feeling, and the most powerful and refined sentiment, and exhibit a mastery over technicalities such as is rarely equalled. On the completion of these pictures MacLise returned, somewhat disturbed by the treatment he experienced at the hands of the Government, and depressed by the little sympathy expressed for his ten years' labour, to his easel-painting, but he never worked again at oil-painting with his old vigour. The only pictures of consequence exhibited by him subsequently to the completion of the Waterloo and Trafalgar were—'Othello, Desdemona, and Ophelia,' and 'A Winter Night's Tale,' 1867; 'The Sleep of Duncan,' and 'Madeline after Prayer,' 1868; 'King Cophetua and the Beggar Maid,' 1869, a work executed quite in his old manner; and 'The Earls of Desmond and Ormond,' exhibited posthumously, 1870. Daniel MacLise, after having been for some time out of health, though not seemingly seriously ill, died, at his residence, Cheyne Walk, Chelsea, on the 25th of April, 1870, having just completed the first quarter of his 60th year. MacLise was a member of the Royal Academy, Stockholm. On the death of Sir Charles L. Eastlake, December 1865, the presidency of the Royal Academy was offered him, but declined, and he also declined the honour of knighthood. A marble bust of Daniel MacLise has been placed in the council-room of the Royal Academy, 1871. 'A Memoir of Daniel MacLise, R.A., by W. J. O'Driscoll,' 8vo, 1871, is chiefly concerned with his personal character and private life.

* MACMAHON, MARIE EDMOND PATRICE MAURICE DE, DUC DE MAGENTA, a Marshal of France, was born July 13, 1808, at Sully (Saône et Loire). The MacMahons, an Irish family who had risked and lost much in defence of the Stuarts, settled in France, and intermarried with some of the noble families of that country. The father of Marshal MacMahon was a peer of France, and a personal friend of Charles X. Young MacMahon entered the Military School of St. Cyr in 1825, and on quitting it joined the corps of the *État Major*. He went to Algiers in 1830, and in 1832 accompanied the French expedition to Antwerp as aide-de-camp to General Achard. Returning to Algiers in 1833 with the rank of captain, he served as aide-de-camp, was wounded at the siege of Constantine in 1837, and received the decoration of the Legion of Honour. He was promoted to the rank of major of *Chasseurs à pied* in 1840; lieutenant-colonel of the Foreign Legion in 1842; colonel of the 41st regiment of the line in 1845; general of brigade in 1848; commander of the Legion of Honour in 1849; general of division in 1852; and grand officer of the Legion of Honour in 1853. When Marshal Canrobert quitted the French army in the Crimea in 1855, and returned invalided to France, MacMahon took the command of a division under Bosquet; and upon him fell the onerous duty of leading the assault against the formidable Malakoff fort, which was the key to the Russian position at Sebastopol. The success of this achievement, on the 8th of September, won further honours for MacMahon; he was

made grand cross of the Legion of Honour, and in 1856 a senator; while Queen Victoria bestowed upon him the decoration of the Grand Cross of the Bath. He fought the Italian campaign in 1859; his services there were rewarded by admission among the roll of Marshals of France, and by a peerage title as Duc de Magenta. He took part in a costly and brilliant embassy to Berlin in 1861, as representative of France at the coronation of the King of Prussia; but returned to military duties in 1862, as commander of the Third Corps d'Armée; and in 1864 resumed duty in Algiers. The Government of that colony, for the next five years, brought more harass than honour, through epidemic sickness, the departure of some of the industrious non-military colonists, and hostile incursions by the Kabyles and other tribes; and as late as 1869 Marshal MacMahon had to repel an inroad of natives from the Sahara.

When France declared war against Prussia in July, 1870, Marshal MacMahon was placed in command of the First Corps d'Armée, stationed in the Vosges Mountains and Northern Alsace, to conduct operations on the Rhine frontier. In this important and arduous post he had to pass through a brief but terrible campaign without one gleam of success. During the last week in July his troops held various positions near the Rhine and on the frontier of Rhenish Bavaria. On the 4th of August the Prussians, under the Crown Prince, suddenly appeared on the French side of the frontier, and defeated a portion of the Marshal's army at Weissenbourg. Two days afterwards a more serious defeat was inflicted at Wörth, when the French lost 6000 men, 30 pieces of artillery, 6 mitrailleuses, and 2 eagles. So impetuous was the attack made by the Crown Prince of Prussia, and in such overwhelming force, that the Marshal had to retreat hastily towards the west; the Prussians gained possession of the passes over the Vosges Mountains on the 12th; pushed him towards Toul on the 13th; and he was only enabled by rapid marches to reach the camp at Châlons. Under such hurried councils as could at the time be agreed upon, MacMahon started from Châlons on the 20th, entered Rheims on the 21st, reached Reims on the 24th, and then encountered another Prussian army, under Prince Charles. He was defeated near Montmédy on the 29th, with a loss of 4000 prisoners; at Beaumont on the 30th, with a loss of 10,000 prisoners and 25 pieces of artillery; and at Douzy and Bazeilles on the 31st. His object had been to effect a junction with Marshal Bazaine at Metz; but his plans are believed to have been overruled, and he was obliged to retreat to Sedan, which place was closely invested and besieged by the enemy in enormous force on the 1st of September. MacMahon was wounded; and the Emperor of the French decided to surrender himself and 90,000 trained troops prisoners of war. The time has hardly arrived for tracing the true cause or causes of this terrible series of disasters; but few attribute them to the Duc de Magenta. MacMahon remained at large on parole during the winter of 1870–71, slowly recovering from his wound. In April, 1871, the Government of the National Assembly summoned him to Versailles to take command of the troops engaged against the Government of the Commune at Paris; and he has almost to the moment of writing been engaged in the saddest duty that can occupy a soldier—that of fighting against a portion of his countrymen. Paris being reconquered (June 1871), he has undertaken the next most urgent and onerous task of reorganising the army.

MACNAB, SIR ALAN [E. C. vol. iv. col. 31]. Sir Alan MacNab died on the 8th of August, 1862.

MADERNO, CARLO, celebrated Italian architect, was born, in 1556, at Bissone in Como. Employed as assistant by his uncle, Domenico Fontana, in erecting some obelisks at Rome, his attention was directed to architecture, and he engaged in the study of its principles and practice. One of his first works was the completion of the church of S. Giacomo degl' Incurabili, commenced by F. da Volterra; and this was followed by the façade of S. Susanna and the cupola of S. Giovanni dei Fiorentini, and the Aldobrandini, Rusticucci, and Strozzi palaces. In 1605 he received from the new Pope, Paul V., the appointment of architect to the Vatican, and directions to complete the cathedral of St. Peter. Maderno's design, which was approved by the Pope, was to extend the nave, and so alter the plan of the church from a Greek cross, as designed by Michelangelo, to a Latin cross. The entrance façade and portico were also added by Maderno: their propriety has been a subject of contest ever since their erection, but it is now generally admitted that Maderno's alterations and additions detract materially from the unity and majesty of Michelangelo's design. Maderno's other works include the erection or alteration of the Pontifical Palace

on the Quirinal, and the Olgiate, Lancellotti, and Mattei palaces, and the churches of SS. Chiara and Andrea della Valle. He also acted as military engineer and surveyor of the papal harbours. He died in 1629.

* MÄDLER, JOHANN HEINRICH, Prussian astronomer, was born at Berlin, May 29th, 1794. After serving as director of the Normal School in that city, he joined Beer (brother of Meyerbeer, the composer) in a series of accurate observations and measurements of the moon. In 1836 they completed the publication, in four sheets, of a Map of the Moon, three feet in diameter—the best produced up to that time, and ever since regarded as of the highest authority. A work was afterwards published descriptive of it, 'Allgemeine Vergleichende Selenographie,' 2 vols. Berlin, 1837. His success in these labours led to the appointment of Mädler to the Berlin Observatory in 1836; and in 1840 he was appointed director of the Russian Observatory at Dorpat. He took up with great earnestness the study of the fixed stars, and put forth a theory much discussed since, viz., that all, or nearly all, the visible stars revolve, as if they were planets, round a central sun, the centre of the universe—the direction of which, in reference to the earth, he attempted to indicate. He published annual reports of the observations made at Dorpat, 'Beobachtungen der Kaiserlichen Universitäts Sternwarte zu Dorpat.' The fine instruments at that observatory enabled him to make accurate measurements and tabulations of the stars, some of which he embodied in 'Untersuchungen über das Fixsternsystem.' In 1841 he published, with Beer, a treatise on the Physical Characteristics of the Solar System, 'Beiträge zur physischen Kenntniss der himmelischen Körper in Sonnensystem;' in 1844, an Introduction to the Study of Mathematical and Physical Geography, 'Leitfaden zur mathematischen und allgemeinen physischen Geographie;' in 1845, 'Ueber das Fixsternsystem;' in 1846, a popular treatise on astronomy, and 'Die Centralsonne,' of which a second edition appeared in 1847; in 1851, 'Der Gestirnte Himmel;' in 1851, another work on the same subject, 'Der Fixsternhimmel;' in 1861, the second edition of 'Die Fixsternwelt,' and in the same year, an Account of the Solar total Eclipse, 'Ueber totale Sonnenfinsternisse.' Besides these distinct works, Mädler has contributed nearly one hundred papers to the scientific journals, almost all on astronomical subjects. Among the more important are 'Ueber die Sternsysteme;' 'Uebersicht der neuesten Erweiterungen und des gegenwärtigen Standes unserer Kenntniss der Sonnensystem,' 1846; and 'Ueber den Bau des Weltalls,' 1856. He has also written papers in conjunction with Beer, Gersdorff, and Nohus. Having overtaxed his powers by long-continued observations on the stars, he contracted a malady of the eyes, which rendered necessary his retirement from his office at Dorpat Observatory in 1865; he then returned to Germany.

MADRAZO Y AGUADO, DON JOSÉ DE, an eminent Spanish painter, was born at Santander, April 22nd, 1781. He studied in the Madrid Academy; at Paris, under David; and in Italy. In 1818 he returned to Madrid, on being appointed court-painter by Ferdinand VII.; in 1819 he was made director of the Madrid Academy of the Fine Arts. Madrazo painted religious, historical, and mythological subjects, and some portraits; of these a 'Christ Scourged,' the 'Triumph of Divine over Profane Love,' and an 'Equestrian Portrait of Ferdinand VII.,' which are in the Museum, Madrid, are characteristic examples. His paintings are greatly admired by his countrymen, but they are weak imitations of the style of David. As director of the Academy, Madrazo exerted a powerful influence over recent Spanish art, and Spain owes to him the foundation of the Royal Lithographic Establishment of Madrid, of which he had the entire control. From it he issued the series of lithographs of paintings in the Royal Galleries of Spain, 'Coleccion lithographica de cuadros del Rey de España,' Madrid, 1826—1842, in three folio volumes, a work which is not an unworthy rival of the famous Dresden Gallery, though the lithographs are of very unequal merit. Madrazo also established, in conjunction with De Schoa, the periodical, 'El Artista.' He died in 1859.

* MADRAZO Y KUNT, DON FEDERICO, son of Don José de Madrazo, was born at Rome, February 12, 1815. He was taken by his father to Madrid in 1818, and learned painting under his father and D. A. Lista. He painted a 'Resurrection' when only fourteen years of age, and when nineteen a huge picture of the Deathbed of Ferdinand VII., which, under the title of 'El Amor conugal o Maria Christina,' was lithographed and inserted in the great 'Coleccion' of royal pictures by express command of the Queen. Federico de Madrazo afterwards visited France and Germany, where he became a convert to the theories

of Overbeck, as was shown in his large painting of 'Angels at the Sepulchre announcing the Resurrection of Christ.' His 'Godefrey proclaimed King of Jerusalem' obtained a place in the Museum of Versailles. Madrazo's portraits are, however, more esteemed than his compositions. He was court portrait-painter, and one of his state portraits of Queen Isabel forms the frontispiece to the third volume of the 'Coleccion' above referred to. A long and very eulogistic biography of F. de Madrazo is given in volume vi. of Pastor Daiz's 'Galeria de Españolas Celebres Contemporáneas.' A brother, LUIS MADRAZO, is also a painter of historical and religious subjects.

* MADVIG, JOHAN NICOLAI, a Danish critic, philologist, and statesman, was born on the 7th of August, 1804, at Svaneke, in the island of Bornholm; and was educated successively at the school of Frederiksborg and the University of Copenhagen, in the latter of which he became a docent in 1826, a lector in 1828, and in 1829 professor of the Latin language and literature. As a member of the National Diet, to which he was elected in 1839, he laboured earnestly to promote the interests of his university and the advancement of classical education; whilst as a politician he advocated the principle of Scandinavian unity. In November, 1848, the advanced liberalism of his opinions, and the prominent position he had assumed in promoting the war against the Duchies, procured him the appointment of minister of Public Worship; from which office he retired on his appointment, January 28th, 1852, to the directorship-general of Public Instruction.

His critical and philological works comprise, 'Emendationes in Ciceronis Libros philosophicos,' 8vo, Copenhagen, 1826; 'De Q. Asconii Pediani et aliorum veterum Interpretum in Ciceronis Oraciones Commentariis Disputatio critica,' 8vo, Copenhagen, 1828; 'Ad Virum celeberrimum Joh. Casp. Orellium Epistola critica de Oratorum Verrinarum Libris II. extremis emendandis,' 8vo, Copenhagen, 1830; 'De Coloniarum Populi Romani Jure et Conditione Quæstiones historice,' 2 parts, 4to, Copenhagen, 1832; 'Opuscula academica, ab ipso collecta, emendata, aucta,' 2 vols. 8vo, Copenhagen, 1834—1842; a Latin Grammar for the use of Schools, 'Latinsk Sproglaere til Skolebrug,' 8vo, Copenhagen, 1841, and since republished in several editions, German translation, by L. H. F. Oppermann, 'Lateinische Sprachlehre für Schulen,' 8vo, Brunswick, 1844, third edition, 1857, and others, English translation, by G. Woods, from the German of Oppermann, 8vo, Oxford, second edition, 1851; 'Graesk Ord-føiningslaere, issaer for den attiske Sprogform,' 8vo, Copenhagen, 1846, German translation, 'Syntax der griechischen Sprache, besonders der attischen Sprachform,' 8vo, Brunswick, 1847, English version, translated from the German by H. Browne, and edited by T. K. Arnold, 'Syntax of the Greek Language, especially of the Attic Dialect,' &c., 8vo, London, 1853; 'Emendationes Livianæ,' 8vo, Copenhagen, 1860; and political brochures on the Bill on the Constitution of the Estates of Holstein, &c., 'De holstenske Stænders Forfatningsforslag og Grev Sponneck,' 8vo, Copenhagen, 1859, German translation, 'Der Verfassungsvorschlag der holsteinischen Stände und Graf Sponneck,' 8vo, Copenhagen, 1859; and the National Policy and the Danish Monarchy, 'Den nationale Politik og det danske Monarchie,' 8vo, Copenhagen, 1864. Professor Madvig has likewise edited selections from the Latin poets, and select orations and philosophical treatises of Cicero; and, jointly with J. L. Ussingius, the works of Livy, 'Titii Livii Historiarum Romanarum Libri qui supersunt,' 8vo, Copenhagen, 1861, &c.

MAGINN, WILLIAM, LL.D., a journalist and scholar, was the son of a schoolmaster at Cork, where he was born in the year 1794. Thanks to his own precocity and the skilful training of his father, he was able at ten years of age to enter Trinity College, Dublin; after going through the curriculum of which, he returned to Cork to undertake the management of his father's school. He conducted this establishment for some years, varying his duties with fugitive writing for periodicals, especially for 'Blackwood's Edinburgh Magazine,' to which he was a contributor from the year 1819, and in which his 'Maxims of Sir Morgan O'Doherty,' 16mo, Edinburgh, 1849, made their original appearance. In 1823 he married, gave up his school, and repaired to London, where his varied gifts of scholarship and satire speedily procured him sufficient literary employment. In 1825 he acted as Paris correspondent to a short-lived and unfortunate daily paper called 'The Representative.' Afterwards he became joint-editor of the 'Standard;' and in 1830, in conjunction with Hugh Fraser, projected and established 'Fraser's Magazine,' to which he was for several years the most remarkable contributor. A caustic review of a novel entitled 'Berkeley

Castle' so irritated the author that the latter committed a violent assault upon Mr. Fraser. Maginn adopted the quarrel, and a duel, fortunately a bloodless one, was the result. A Tory in politics, he directed against the members of the Liberal party the gaiety and recklessness of his satire; but the original irregularity of his habits rapidly increased during his latter years, and his circumstances became so much embarrassed that in the beginning of 1842 he found himself lodged as a debtor in the Fleet prison. He recovered his liberty by passing through the Insolvent Debtors' Court; but the shock to his spirits and constitution was so great that he died a short time after, August, 1842, of consumption, at Walton-on-Thames. He was interred in the churchyard there; but his grave is unmarked by a stone. At the period of his death he was in extreme destitution, from which the munificence of Sir Robert Peel, whose party he had served without owing anything to their patronage, came too late to relieve him. Dr. Maginn died in ignorance of the kindness of the benevolent statesman, having not long before dictated for 'Blackwood's Magazine' the close of the last of a series of poems, which were afterwards published as 'Homeric Ballads,' &c., 16mo, London, 1850. Several biographical sketches have appeared of Dr. Maginn; but his works, which have several times been called for in a collected form, have not yet been issued in this country. Many of them have, however, been collected and republished in America, by Dr. R. Shelton Mackenzie, who has enriched them with notes and a biographical notice. They are entitled 'Maginn's Miscellanies,' 5 vols., 12mo, New York, 1855—1857, of which the first and second volumes contain 'O'Doherty's Papers;' the third volume, the 'Shakspeare Papers,' which were afterwards published in London, 8vo, 1859, new edition, 1860; and the fourth and fifth volumes, respectively, the 'Homeric Ballads' and the 'Fraserian Papers.' Some of his stories have been issued as parts of volumes, and have especially figured in 'Tales from Blackwood;' whilst one of his larger works of fiction had a substantive publication as 'John Manesty, the Liverpool Merchant,' 2 vols., 8vo, London, 1844.

* MAGNE, PIERRE, a French senator and financier, was born on the 3rd of December, 1806, at Périgueux, where, after having studied law at Toulouse, he commenced practice as an advocate in 1831. He represented Périgueux in the Chamber of Deputies from 1843 to 1848, during which interval he sustained confidential relations with Marshal Bugeaud, and attracted attention by the ability of a report which, as a member of the committee on the budget in 1845, he drew up on the finances of Algeria. He was appointed successively "directeur du contentieux" to the Ministry of War, July 11th, 1846, and under-secretary of state to the same department, 24th November, 1847. On the triumph of the Revolution of February, 1848, he retired to his practice at Périgueux; from which he emerged in November, 1849, to fill the office of under-secretary for finance. On the 10th of April, 1851, he was appointed to the ministry of Public Works, an office which he filled, with two short intervals—between the 26th of October and the 1st of December, 1851, and the 22nd of January and the 28th of July, 1852—until 1854, when he was called to succeed M. Bineau as finance minister, being in turn succeeded, in November, 1860, by M. de Forcade Laroquette. He now became one of the first two ministers without a portfolio, M. Billault being the other; and in this capacity took part in the deliberations of the Senate, of which he had been named a member on the 31st of December, 1852. He resigned office at the end of March, 1863, in consequence of a difference of opinion with M. Fould; and was appointed by the Emperor—who had, in August, 1854, promoted him to be Grand Cross of the Legion of Honour—to be a member of the Privy Council, April 1st, 1863. On the 13th of November, 1867, M. Magne was recalled by imperial decree to the ministry of Finance, which he resigned on the 27th of December, 1869, with all his colleagues, in order to make way for the cabinet of M. Emile Ollivier.

MAGNOL, PIERRE, botanist, was born at Montpellier, June 8, 1638. He evinced from his earliest years a strong inclination for botanical studies. In 1659 he took his degree of doctor of medicine; in 1663, on the recommendation of Tournefort, he was appointed one of the king's physicians; in 1667 he offered himself for the professorship of botany at Montpellier, but was rejected on account of his having embraced the Protestant religion. He then occupied himself in exploring various parts of France, the Alps, and the Pyrenees. When the Edict of Nantes was issued Magnol renounced Protestantism, and in 1694 was appointed professor of medicine at Montpellier.

In 1697 he became director of the Botanical Gardens of Montpellier, and in 1707 was elected to succeed Tournefort as a member of the Academy of Sciences, the rule requiring that every member be a resident in Paris being set aside in his favour. He died in his native town, May 21, 1715. His writings comprise—'Botanicum Monspelienae,' 8vo, Lyon, 1676, of which subsequent editions appeared at Montpellier in 1686 and 1688; 'Prodromus Historiæ generalis Plantarum in quo familiæ plantarum per tabulas disponuntur,' 8vo, Montpellier, 1689; 'Hortus Regius Monspelienensis,' 8vo, Montpellier, 1697; 'Novus character Plantarum in duos tractatus: primus de herbis et subfructibus, secundus de fructibus et arboribus,' 4to, Montpellier, 1720; and several scientific articles. His most important work is the 'Prodromus,' in which he contributed towards the establishment of the natural method of classification by recognising the existence of natural groups, for which he proposed the word family, and which he defined by the characters presented not only by the fruit, but by every other portion which affords distinctive characters. He himself did not make much advance in classifying, owing to his not being acquainted with the principle which was established by Bernard de Jussieu, viz., the subordination of characters. His name and fame are commemorated in the beautiful genus, *Magnolia*.

* MAGNUS, EDUARD, German painter, born at Berlin, January 7, 1799; studied in the first instance medicine and philosophy, and then architecture, but eventually turned to painting, and became a pupil of Schlesinger. His first picture was exhibited in 1826. He then went to Rome, where he remained several years. In 1835 he returned to Berlin; in 1837 he was elected a member of the Berlin Academy, in 1844 professor, and in 1866 member of the Senate. Magnus's reputation rests chiefly on his genre pictures and portraits. Of the former many are of Italian peasants, fishermen, &c. His portraits include the royal family of Prussia, Thorwaldsen, Mendelssohn, Jenny Lind, Sonntag, and other eminent persons, and are considered to be faithful and characteristic likenesses.

MAGNUS, HEINRICH GUSTAV, was born at Berlin, 2nd May, 1802. He was a student at Berlin University, and studied chemistry at Stockholm and at Paris. In 1831 he returned to Berlin, and, as privat-docent, delivered lectures on Technology and also on Physics, of which subjects he became professor at the university in 1845. He died at Berlin on the 4th of April, 1870. From the year 1825 to the time of his death he published a very large number of papers, chiefly in Poggendorff's 'Annalen,' on subjects connected with chemistry, physics, and physico-chemistry. Some of his later investigations referred to the conduction, absorption and polarisation of heat by different gaseous and liquid media. His well-known work, 'Hydraulische Untersuchungen,' 8vo, Leipzig, 1855—1859, is a revised reprint of papers that had already appeared in the 'Annalen.'

MAGNUSSON, FINN or FINNUR, a celebrated Scandinavian archaeologist, was born on the 27th of August, 1781, at Skalholt, in Iceland; and after receiving his earlier education from his maternal uncle, Bishop Hans Finnson, repaired in 1797 to the University of Copenhagen. Having completed his studies in arts and in law, he returned to Iceland in 1803, and practised as an advocate at Reykjavik. In 1815 he was appointed to a professorship at Copenhagen; and delivered lectures in the University and the Academy of the Fine Arts, on ancient northern literature and mythology. Throughout a series of years he devoted himself to the exposition and illustration of the mythology and Saga-history of the north of Europe, on the former of which themes especially his writings are extremely valuable and important. He died at Copenhagen on the 24th of December, 1847.

His works comprise a treatise on the Most ancient Abode and the Migrations of the Caucasian Race, 'Udsigt over den kaukasiske Mennekestammes ældste Hjemsted og Udvandringer,' 8vo, Copenhagen, 1818; Contributions to Northern Archaeology, 'Bidrag til nordisk Archaeologie,' 8vo, Copenhagen, 1820, Swedish translation, Stockholm, 1825, in which he maintained the adaptability of the northern legends for the purposes of artistic representation, by which he provoked considerable discussion; a Translation and Exposition of the elder Edda, &c., 'Den ældre Edda. En Samling af de nordiske Folks ældste Sagn og Sange ved S. Sigfusson. Oversat og forklaret,' &c., 4 parts, 8vo, Copenhagen, 1821—1823; an Exposition of the Doctrines of the Eddas in relation to the Origin and Nature of the Universe, the Gods, &c., 'Eddalaeren og dens Oprindelse,' &c., 4 vols. Copenhagen, 1824—1826, a work of vast research and great ingenuity, in which the author regards the Eddas chiefly, if not exclusively, as poetic

pictures and interpretations of the phenomena of external nature; *Review of the Life and Career of Snorre Sturlesön*, 'Udsigt over Snorre Sturlesön's Liv og Levnet,' 8vo, Copenhagen, 1823; '*Priscæ veterum Borealiæ Mythologiæ Lexicon: cuncta illius Cosmologica, Theosophica, et Dæmonica Numina Entia et Loco Ordine alphabetico indicans, illustrans et a magna Parte cum Exteris ista contingentibus comparans. Accedit septentrionalium Gothorum, Scandinavorum, aut Danorum gentile Calendarium, ex Asia oriundum, jam primum expositum et cum variis cognitarum Gentium, Fastis, Festis, et solemnibus Ritibus vel Superstitionibus collatum*,' 4to, Copenhagen, 1828; a large work on Runes, '*Runamo og Runerne*,' Copenhagen, 1841. Besides a considerable number of fugitive and less important contributions to poetical, monumental, and mythological antiquity, Magnusson produced, in conjunction with Rafn, an important work on the *Historical Monuments of Greenland*, '*Grönlands historiske Mindeaaerker*,' 3 vols. Copenhagen, 1838—1845.

MAHONEY, FRANCIS SYLVESTER, a scholar and journalist, better known by his *nom de plume* of FATHER PROUT, and a member of a younger branch of the ancient family of Mahoney, of Dromore Castle, county Kerry, was born at Cork, about the year 1805. He was educated from an early age at a Jesuit college in France, and was afterwards a student at the University of Rome; and returning from Italy in clerical orders, performed for a short time the duties of a Roman Catholic priest in Ireland. His connection with the Society of the Jesuits having been severed, he devoted himself to literature as a profession, and his ripe scholarship, combined with his powers of wit and pathos, ensured his welcome reception as a contributor to '*Fraser's Magazine*,' then under the direction of Dr. Maginn, for which he wrote a series of pseudonymous papers, which were afterwards published as '*The Reliques of Father Prout*,' 2 vols., 12mo., London, 1836, and since re-issued as one of the volumes of '*Bohn's Illustrated Library*.' He subsequently spent some years in travelling through Hungary, Asia Minor, Greece, and Egypt; and in January, 1846, accepted the invitation of the late Charles Dickens to undertake the post of Roman correspondent of the '*Daily News*,' to which he contributed a series of articles, which were republished as '*Facts and Figures from Italy*,' by Don Jeremy Savonarola, Benedictine Monk, addressed during the last two Winters to Charles Dickens, Esq., being an Appendix to his "*Pictures*," 8vo, London, 1847. For the last eight years of his life Mahoney was Paris correspondent of the '*Globe*,' of which journal his letters were one of the chief attractions; and, in spite of a long and complicated illness, he continued to fill the duties of his post until a few weeks before his death, when he was obliged to delegate them to another hand. He died at Paris on the evening of the 18th of May, 1866.

MAIRAN, JEAN JACQUES DORTOUS DE, was born at Béziers, 26th November, 1678, of a family belonging to the lower nobility. When only four years of age, he lost his father, but was carefully educated by his mother. He studied in the College of Toulouse, and, becoming master of his own actions at the age of 16, he preferred to lead a retired studious life. In 1698 he went to Paris, and passed four years in studying mathematics and physics. Returning to his native town, he resumed his quiet life, and was a little alarmed at the acclamation with which some Memoirs of his were received by the Academy of Bordeaux between 1715 and 1717. For the better cultivation of science he determined to settle in Paris, where he became an Associate of the Academy in 1719. His '*Dissertation sur la Glace*' appeared first in 1715 and 1717, and again in 1749. His '*Traité Physique et Historique de l'Aurore Boréale*' also went through several editions. He likewise wrote on subjects connected with heat, light, astronomy, and mechanics. He was also employed by Government in certain scientific inquiries, and in 1740 succeeded Fontenelle as Perpetual Secretary of the Academy; but he accepted the post for three years only, and in 1743 became full member. He was also a Fellow of the Royal Society of London and other societies, and was for some time editor of the '*Journal des Savants*.' In addition to his numerous publications, we may notice a volume of '*Éloges*' of the academicians who died while he was secretary. He is not so happy in this branch of literature as Fontenelle, but nevertheless sustains the high character of this peculiarly French mode of writing. Voltaire frequently consulted Mairan on subjects connected with science. Mairan died on the 20th of February, 1771, from the effects of a cold, caught in going to a dinner-party at the Prince de Conti's, and wishing to spare the men who carried his chair in consequence of the rigorous weather.

MAISTRE, JOSEPH, COMTE DE, an Italian statesman and man of letters, member of an ancient family which was originally of Languedoc, and son of Count François Xavier de Maistre, president of the Senate of Savoy, was born at Chambéry on the 1st of April, 1753, being the eldest of a family of ten children. He received his earlier education from the Jesuits, a respect for whose order he inherited from his mother; and having completed his course of legal studies at the University of Turin, entered the magistracy on the 6th of December, 1774, and became, on the 29th of January, 1788, a member of the Senate of Savoy, at that time under the presidency of his father. After the incorporation of Savoy with France, as the *Département du Mont-Blanc*, in December, 1792, he retired first to Aosta, and next, after his return from a few days' visit to Turin in January, 1793, to Chambéry, which, on his refusing to take any kind of oath to the new Government, he was compelled to quit and to seek refuge at Lausanne. Here he lightened the troubles of exile by the production of several works, especially of '*Lettres d'un Royaliste savoisien à ses Compatriotes*,' 8vo, Lausanne, 1793, and '*Considérations sur la France*,' 8vo, London (which should probably be read as Neuchâtel), 1796, and frequently reprinted in Paris and elsewhere, new edition, 8vo, Lyon, 1861, the circulation of which was jealously though unsuccessfully forbidden by the French authorities, and which procured for the author a complimentary letter from Louis XVIII. In 1797, M. de Maistre, accompanied by his wife and family, repaired to Turin on the invitation of Charles Emmanuel IV.; and when in December, 1798, the king was obliged to give up his continental possessions, he retired to Venice, which he left, after passing about a year in a state scarcely removed from destitution, to occupy the post of grand chancellor of the Island of Sardinia. In this office, the duties of which were made very arduous by the arrears and lawlessness of a long period of war and disaster, he exhibited great tact and powers of conciliation. In September, 1802, he accepted the post of envoy-extraordinary and minister-plenipotentiary to the Court of St. Petersburg, in which city he arrived on the 13th of May, 1803. He distinguished himself for the ability with which, during a period of fourteen years, he conducted negotiations in the interest of his country; and he won the confidence of the Emperor Alexander, from whom he received many tokens of esteem. He devoted his leisure to studies in philosophy and religion; the result of which appeared in a number of treatises, some of which were of posthumous publication. The works written at this epoch comprise his '*Essai sur le Principe générateur des Constitutions politiques et des autres Institutions humaines*,' 8vo, St. Petersburg, 1810, 8vo, Paris, 1814, &c. &c., new edition, 8vo, Lyon, 1864, a résumé of his political doctrines, in which he maintains that God is the one source of authority on earth, where he is represented by kings and aristocracies. Any attack on religion is thus a prelude to the destruction of social and political order. The rights of the people, he holds, repose on the will and the benevolence of the monarch, and it is both useless and dangerous to build them on a written and unelastic contract, like a constitution, which, to be serviceable, should be free of innovations, and confined exclusively to a declaration of antecedent rights; an annotated Translation from Plutarch, entitled '*Sur les Délais de la Justice divine dans la Punition des Coupables*,' 8vo, Paris, 1816, 8vo, Lyon, 1829, &c.; '*Du Pape*,' 2 vols. 8vo, Lyon, 1819, second edition, enlarged and corrected, 2 vols. 8vo, Lyon, 1821, third edition, 1830, new edition, 12mo, Paris, 1860, and 8vo, Lyon, 1862, Spanish translation, '*Del Papa y de la Iglesia galicana*,' 12mo, Paris, 1847, English translation, by Æ. McD. Dawson, '*The Pope: considered in his Relations with the Church, temporal Sovereignties, separated Churches, and the Cause of Civilization*,' 8vo, London, 1850, a work still regarded as one of the standard Catholic defences of the doctrine of papal infallibility, which claims for the Pope, as the representative of God on earth, the right to be heard as God; '*De l'Eglise gallicane dans son Rapport avec le souverain Pontife, pour servir de suite à l'Ouvrage intitulé, "Du Pape,"*' 8vo, Paris, 1821, and often reprinted, new edition, 8vo, Lyon, 1862, in which the author attacks the champions of Gallican liberty, Bossuet, Fleury, and others; '*Les Soirées de Saint-Pétersbourg: ou, Entretiens sur le Gouvernement temporel de la Providence. Suivies d'un Traité sur les Sacrifices*,' 2 vols. 8vo, Paris, 1821, seventh edition, 2 vols. 8vo, Lyon, 1854, a work consisting of eleven conversations between three persons, whose opinions differ very slightly from each other, and who treat of the justice of war and of capital punishment, and the difficulties and the justice of the divine government of the world; '*Examen de la Philosophie de Bacon*,

où l'on traite différentes Questions de Philosophie rationnelle,' 2 vols. 8vo, Paris and Lyon, 1836, new editions, 2 vols. 8vo, Lyon, 1845 and 1864, in which the author depreciates Lord Bacon, and disparages critical philosophy in general. M. de Maistre left St. Petersburg in May, 1817, on his return to Turin, where he was received with much favour and distinction by the king, who conferred upon him several honours; so that at the time of his death he was a minister of state, regent of the Grand Chancellery of Sardinia, and chevalier grand cross of the orders of St. Maurice and St. Lazare. He died of paralysis on the 26th of February, 1817, and was buried in the church of the Jesuits at Turin.

The works of Count Joseph de Maistre, besides those already mentioned, comprise, 'Eloge de Victor Anédée III., Duc de Savoie, Roi de Sardaigne,' &c., 8vo, Lyon, 1775, the earliest production of the author; 'Lettres à un Gentilhomme russe sur l'Inquisition espagnole,' 8vo, Paris, 1822, 8vo, Lyon, 1864, English translation, by A. McD. Dawson, 'Letters to a Russian Gentleman on the Spanish Inquisition,' 18mo, London, 1851, in which the Inquisition is advocated and defended; 'Lettres inédites,' 8vo, St. Petersburg, 1858; 'Lettres et Opuscules inédits du Comte Joseph de Maistre, précédés d'une Notice biographique par son Fils, le Comte Rodolphe de Maistre,' 2 vols. 8vo, Paris, 1851, "nouvelle édition, revue, corrigée, et augmentée," 2 vols. 8vo, and 12mo, Paris, 1861; 'Mémoires politiques et Correspondance diplomatique de J. de Maistre, avec Explications et Commentaires historiques, par Albert Blanc,' 8vo, Paris, 1858, second edition, 8vo, 1859, which, if it exhibited a few discrepancies as compared with the antecedently expressed opinions of the author, showed him as full of the expectation of an entirely new political and social order, in which all the states of the world should be closely united, under the Pope as president—an idea which has since become almost the formula of a school of Roman Catholic writers; 'Pensées du Comte Joseph de Maistre sur la Religion, la Philosophie, la Politique, l'Histoire et la Littérature, recueillies et annotées par un Père de la Compagnie de Jésus,' 2 vols. 12mo, Toulouse, 1864; 'Œuvres de Joseph de Maistre,' 7 vols. 8vo, Brussels, 1838; 'Œuvres du Comte J. de Maistre,' 4to, Paris, 1841; 'Œuvres,' &c., "nouvelle édition," 4 vols. 8vo, Lyon, 1864; and 'Œuvres posthumes,' &c., "nouvelle édition," 4 vols. 8vo, Lyon, 1864.

MAISTRE, XAVIER DE, a writer of much delicacy, wit, and ingenuity, and a younger brother of the subject of the preceding notice, was born at Chambéry, in October, 1763, and early in life entered the military service of Sardinia. His talent for writing was manifested by an accident. When he was about twenty-six or twenty-seven years of age, and whilst in the performance of garrison duty at Alexandria, he was placed under arrest for having been concerned in a duel; and, in order to divert himself during the monotony of his detention, wrote a little work, which he afterwards, in 1793, submitted to his brother, Count Joseph de Maistre, at Lausanne. The latter, struck with the uncommon life, grace, and delicacy of the style, caused it to be published, and it appeared with the title of 'Voyage autour de ma Chambre,' 8vo, Turin, 1794, and often reprinted, English translation, 'A Journey round my Room,' 12mo, London, 1840. Despairing of the affairs of his native country, Xavier de Maistre, after having taken part in the Italian campaign of the Austrians and Russians in 1799, repaired to Russia, in the military service of which country he hoped for advancement through the influence of Marshal Suvarov. When the latter, however, was disgraced, De Maistre supported himself for some time by his pencil; and, upon the arrival of his brother as envoy-extraordinary to the Court of St. Petersburg, he was placed, by his influence, first in an office in the department of the Marine, and afterwards, in April, 1805, was nominated by the Emperor Alexander to the directorship of the library and the museum of the Admiralty at St. Petersburg, with the rank of lieutenant-colonel. Subsequently he was appointed to a staff colonelcy; and in the campaign of the Caucasus obtained the rank of major-general. In 1825 he revisited his native country, and spent some years at Naples. But being recalled to St. Petersburg in 1839, he repaired thither, and devoted the rest of his life to literary and scientific pursuits, especially chemistry, to which he made some respectable contributions. He died in St. Petersburg, on the 12th of June, 1852.

The remaining works of Xavier de Maistre include 'Le Lépreux d'Aoste,' 1811, frequently reprinted in Paris and elsewhere, English translation, 'The Leper of Aosta,' Philadelphia (U. S.), 1825, and 24mo, Aberdeen, 1856; 'Les Prisonniers du Caucase. La Jeune Sibérienne,' 18mo, Paris, 1815, &c., English

translation of the latter story, which is one of real life, and the basis of Madame Cottin's 'Élisabeth'; 'Prasca Loupouloff: a Russian Narrative,' 12mo, London, 1838; 'Expédition nocturne autour de ma Chambre,' 8vo, Paris, 1825, &c., a kind of sequel to the 'Voyage,' &c., with which it was conjoined in an English translation, 8vo, London, 1843; 'Œuvres,' &c., 3 vols., 18mo, Paris, 1825; 'Œuvres Complètes,' &c., 2 vols., 8vo, and 4 vols., 32mo, Paris, 1828, 12mo, 1838, 8vo, Brussels, 1838, new editions, 12mo, Paris, 1854, 8vo, 1862 and 1868, &c.; 'Œuvres Choiesies,' 12mo, Paris, 1864.

MAITLAND, REV. SAMUEL ROFFY, D.D. [E. C. vol. iv., col. 59.] Dr. Maitland died at his residence, Gloucester, on the 19th of January, 1866, aged 64.

MAJOR, THOMAS, line-engraver, was born about 1719. He studied under Le Bas, in Paris, where several of his early plates were executed. Major engraved figure-pieces and portraits, but he excelled as a landscape-engraver. His best plates are those after Berghem, Teniers (two 'Flemish Festivals'), Rubens ('Landscape with a man driving sheep'), Claude Lorraine, and G. Poussin. 'The Ruins of Pæstum,' after drawings by J. B. Borra, is a well-known series of twenty-four plates published by him in 1768. Mr. Major was engraver to the king, George III., and for forty years held the more lucrative post of engraver to the Stamp-office. He died December 30, 1799.

MALAN, CÉSAR HENRI ABRAHAM, a Swiss divine, was born at Geneva, on the 7th or 8th of July, 1787, and educated at Geneva, in the Grand Collège, of which he became a regent; and was consecrated to the ministry in 1810, after which he officiated for many years as a pastor of the State Church. He lost his academical position as regent in 1818, the circumstances of his deposition being explained in 'Pièces relatives à la Destitution du Ministre Malan de sa Place de Régent de la cinquième Classe du Collège de Genève,' 8vo, Geneva, 1819, English translation, 1820; and in 1825 was deprived of his pastoral office, having rendered himself obnoxious by the theological views he had adopted under the influence of Dr. Mason, of New York, and Robert Haldane, of Scotland. He now became a member of a mystic association of Methodists, which had been founded about 1818 by Pasteur L. Empaytaz, and the members of which were derisively known by the sobriquet of Mômiers. Of this communion he presently became the principal leader and apologist, and gave it the name of l'Eglise du Témoignage. In 1826 he was created D.D. by the University of Glasgow; and he died at Vandœuvres on the 8th of May, 1864.

Dr. Malan was a voluminous author, producing many works of a pious and devotional character, and especially being prominent as the sacred poet and the apologist of his church. His writings include, besides sermons and addresses, 'Venez et Voyez,' 12mo, Geneva, 1817; 'Le petit Garçon chrétien' and 'La petite Fille chrétienne,' Geneva, 1818; 'Les Chants de Sion: ou, Recueil de Cantiques de Louanges, de Prières, et d'Actions de Grâces à la Gloire de l'Eternel,' 12mo, Geneva, 1826, fifth edition, 12mo, Paris, 1841, and several others. With the later editions of the 'Chants de Sion,' tunes, which were also the composition of Dr. Malan, were incorporated, and a 'Supplement' of sixty-six new 'Chants,' forming a second volume; 'Theogenes; or, a plain and scriptural Answer to the solemn Question: Am I, or am I not, a Child of God?' 12mo, London, 1828, which was reprinted in the first year of its issue, and of which a French edition was afterwards published; 'Jésus-Christ est l'Eternel Dieu manifesté en Chair: Première Réponse à l'Ecrit de M. le Professeur Chenevière, contre le Dieu des Chrétiens,' Geneva, 1830, second edition, 8vo, 1831; 'Le Méthodisme Genevois,' 8vo, Geneva, 1831; 'Six Discours prononcés dans la Chapelle du Témoignage, près Genève,' 8vo, Geneva, 1833; 'Le Procès du Méthodisme de Genève, mis devant ses Juges compétents, par C. Malan, Docteur en Théologie, Ministre déclaré déchu de l'Eglise de Genève, et Régent déposé du Collège de cette Ville,' 8vo, Geneva, 1835; 'Le Témoignage de Dieu, annoncé dans des Sermons, des Homélie, et des Instructions familières,' 8vo, Paris, 1838; 'Les Grains de Sénevé: ou, Recueil de Traités religieux, d'Entretiens et d'Anecdotes évangéliques,' 4 vols. 12mo, Paris, 1844; 'Pourrai-je entrer jamais dans l'Eglise romaine, aussi longtemps que je croirai toute la Bible?' &c.; third edition, 12mo, Paris, 1844, English translation, 'The Church of Rome examined: or, Can I ever enter?' &c., 8vo, London, 1840; 'Le Véritable Ami des Enfants et des jeunes Gens,' 1830, fourth edition, 4 vols. 12mo, Paris, 1845. The American Tract Society and the publishing department of the Dutch Reformed Church

have printed many of the tracts, &c., of Dr. Malan; and his 'Church of Rome,' &c., translated by Dr. Robert Baird, New York, 1844, his 'Stories for Children,' 1852, and his 'Pictures from Switzerland,' 1854, have been issued in English translations in America. Of translations of his works published in England may be mentioned 'The True Cross: a Narrative as profitable to Protestants as to Roman Catholics,' 8vo, London, 1834; 'The Rechabites: a solemn Warning to sincere Disciples of Jesus,' 8vo, London, 1844; 'Sketches for Youth,' 8vo, London, 1845; 'Sermons translated from the French: to which is prefixed a Sketch of the late religious Discussions at Geneva,' 8vo, London, 1819; 'Missions at Home,' 8vo, London, 1826; 'Recollections of the Rev. C. Malan: being Notes of Sermons preached by him in Edinburgh,' 8vo, London, 1827; 'The Weathercock: or, the Difference between Faith and Sight. With a Preface on Personal Assurance, by the Translator,' 8vo, London, 1830; and 'Gospel Seeds: a Collection of unpublished Pieces on the revealed Truths in the Word of God. Part 1,' 8vo, London, 1833.

* MALAN, SOLOMON CÆSAR, a philologist and Anglican divine, son of the late Dr. C. H. A. Malan, of Geneva, was born in that city in 1812, and was educated there and at Edmund Hall, Oxford. Here he distinguished himself for his oriental learning, carrying off the Boden Sanscrit scholarship and the Pusey and Ellerton Hebrew scholarships. In 1837 he graduated B.A. in the second class of Literæ Humaniores; and in the following year, 1838, was appointed classical professor at Bishop's College, Calcutta, where he received ordination from the bishop of the diocese. On account of impaired health, he returned to England after a few years' absence; and, having been admitted to Balliol College, Oxford, he proceeded M.A. in 1843, in which year he was made a priest by the Bishop of Winchester. In 1845 he was presented to the vicarage of Broadwindsor, Dorsetshire, after having been curate successively at Alverstoke (1843—44) and Crowcombe (1844—45); and was subsequently appointed rural dean and Diocesan Inspector of Schools. During a sojourn which he made in Arabia, Palestine, and various parts of Europe, he completed his familiarity with various oriental dialects; and he stands amongst the foremost of living philologists for the range and versatility of his acquirements. Besides translating and editing various devotional treatises from oriental Christian writers, Mr. Malan has published an 'Outline of Bishop's College, and of its Missions in the Neighbourhood of Calcutta,' 8vo, London, 1843; 'Who is God in China—Shin or Shang-Te? Remarks on the Etymology of Elohim and of Theos, and on the Renderings of those Terms into Chinese,' 8vo, London, 1855; 'A Letter to the Right Hon. the Earl of Shaftesbury, on the Buddhistic and Pantheistic Tendency of the Chinese and Mongolian Versions of the Bible published by the British and Foreign Bible Society,' 8vo, London, 1856; a Translation, with critical Notes, of 'The Threefold San-tse-king: or, Trilateral Classic of China,' 8vo, London, 1858; 'Magdala and Bethany,' 8vo, London, 1857; 'The Coasts of Tyre and Sidon,' 8vo, London, 1858; 'Letters to a Young Missionary,' 8vo, London, 1858; 'On Ritualism,' 8vo, London, 1867; and 'An Outline of the Early Jewish Church from a Christian Point of View,' 8vo, London, 1867.

MALLET DU PAN, JACQUES FRANÇOIS, a Swiss publicist, son of a Protestant clergyman, and member of an "ancient family, which had for many years given magistrates to the Republic of Geneva, and scholars to the Republic of Letters," was born at or near Geneva, in the year 1749. After going through the ordinary curriculum of the Académie, or University, he devoted some time to the study of law, from which he was attracted by the superior charms of literature. In 1772 he made the acquaintance of Voltaire, through whose influence he was appointed by the Landgrave of Hesse-Cassel to a professorship of history and belles-lettres. The inaugural lecture which marked his assumption of this office was published with the title of 'Discours de l'Influence de la Philosophie sur les Lettres,' 8vo, Cassel, 1772. After some months, however, he resigned, and repaired, first to London and afterwards to Brussels, and was received as a collaborateur by M. S. N. H. Linguet, whom he had known at Geneva, in the production of his 'Annales politiques et littéraires.' After M. Linguet had been committed to the Bastille, in consequence of a visit which he had imprudently paid to Paris in 1779, Mallet continued the 'Annales' with the modified title of 'Mémoires historiques, politiques et littéraires sur l'Etat présent de l'Europe,' 5 vols., 8vo, Geneva (Paris), 1779—1782. A paper which appeared in it in the last year of its issue, and which was substantively published as

'Tableau historique et politique de la dernière Révolution de Genève,' 8vo, Geneva, 1782, spoke the truth with such severity as to offend all parties, and to make it expedient for the writer to leave his native city, where he had for some time resided. He accordingly repaired to Paris, where he published the 'Journal historique et politique de Genève,' of which the first number appeared early in 1783, and which was merged, in 1788, into the 'Mercure de France,' &c., the amalgamated publication being continued under the editorship of M. Mallet, who had been a contributor to the 'Mercure' for some years previously. In the face of the advancing revolutionary spirit he won great credit by his publication, during the three years' sitting of the first French Assembly, of an analysis of its debates, which was read throughout all Europe, and considered a model of discussion no less luminous than impartial. His moderation, and the favour with which he regarded the royal family of France, exposed him to many losses, annoyances, and interruptions; but at the same time they procured him the confidence of the king, who entrusted him, in May, 1792, with a secret mission to the Emperor of Austria and the King of Prussia, which, with whatever zeal it was conducted, was attended with little success. The confiscation of his property, including his library and papers, some of the latter of which were unfinished works of his own, followed soon after his departure from Paris; and, finding himself unable to return to France, he sojourned for some time at Geneva, whence he corresponded with the ministers of England, Austria, and Prussia. In 1793, whilst resident at Brussels with the Archduke Charles, he published a work on the French Revolution, which so aptly expressed the opinions of Burke, that the latter was accustomed to say that, when he read it, he thought he had written it himself, so exactly consonant was it with his sentiments. This work was entitled, 'Considérations sur la Nature de la Révolution de France, et sur les Causes qui en prolongent la Durée,' 8vo, Brussels, 1793, English translation, 'Considerations on the Nature of the French Revolution, and on the Causes which prolong its Duration,' 8vo, London, 1793. In the following year he published a treatise, 'Sur les Dangers qui menacent l'Europe,' 8vo, Hamburg and Leipzig, 1794, English translations, 'Dangers which threaten Europe: Principal Causes of the Want of Success in the late Campaign,' 8vo, London, 1794, and 'The Dangers, &c. To which is added the Eras of Events subsequent to the Revolution of France,' &c., 8vo, New York, 1795. In 1794 M. Mallet returned to Switzerland, which, after varying his residence in different towns and cantons, he was finally obliged to quit in 1798, in consequence of the action of the French Directory, to which he had made himself obnoxious by several of his writings. He now took refuge in England, having, it was said, been invited thither to silence the political reformers of the day; and where, under the patronage of the Government, he established a fortnightly periodical, entitled 'Mercure Britannique: ou, Notices historiques et critiques sur les Affaires du Temps,' 5 vols., 8vo, London, 1798—1800, the last issue of which, No. xxxvi., bore the date of the 25th of March, 1800. The first three numbers of the 'Mercure,' &c., contained a descriptive and patriotically indignant history of the invasion of Switzerland by the French, which was substantively published as 'Essai historique sur la Destruction de la Ligue et de la Liberté helvétiques. Extrait du "Mercure Britannique," Octobre, 1798,' 12mo, London, 1798, English translation, 'History of the Destruction of the Helvetic Union and Liberty,' 12mo, Boston (U. S.), 1799. M. Mallet died at the house of his friend, the Comte Lally-Tollendal, at Richmond, Surrey, on the 10th of May, 1800, and four days after was buried in the new churchyard of that parish. He died of a consumption, which was accelerated by his antecedent hardships and his unremitting labours, facing his end with a serenity which was only disturbed by the uncertainty of the future fortunes of his wife and family of five children, for whom a provision, however, was promptly made by public and private subscriptions.

The works of M. Mallet, in addition to those which have been already mentioned, include, 'Du Pêril de la Balance Politique de l'Europe: ou, Exposé des Motifs qui l'ont altérée dans le Nord, depuis l'Avènement de Cathérine II. au Trône de Russie,' 8vo, London (Paris), 1789, and an annotated edition, 8vo, London (Warsaw), 1789, English translation, "with a preliminary Discourse, and additional Notes by Lord Mountmorres," who refers the original to Gustavus III., King of Sweden, 'The Danger of the Political Balance of Europe,' &c., 8vo, London, second edition, corrected, 1791; 'Lettre à M. de B., sur les Evénements de Paris, au 10 Août, 1792,' 8vo; 'Lettre à un

Membre du Corps Législatif sur la Déclaration de Guerre à la République de Venise, 8vo, 1797; 'Lettre à un Membre du Corps Législatif sur la Révolution actuelle de Gènes,' 8vo, 1797; 'Correspondance Politique pour servir à l'Histoire du Republicanisme français,' 8vo, London (Hamburg), 1796, English (partial) translation, 'A Translation of a Passage in a Pamphlet of M. du P., intitled "Correspondance Politique:" containing a Vindication of King Lewis the XVI. from a false Charge brought against him,' &c., 8vo, London, 1796; 'Lettre à un Ministre d'Etat sur les Rapports entre le Système Politique de la République française, et celui de sa Révolution,' 8vo, London, 1797; 'A short Account of the Invasion of Switzerland by France, in a Letter from M. M. du P. to M. de M * * * *'. Translated from the French,' 8vo, London, 1798; and 'Mémoires et Correspondance de Mallet du Pan, pour servir à l'Histoire de la Révolution française. Recueillis et mis en Ordre par A. Sayous,' 2 vols. 8vo, Paris, 1851, English translation, 'Memoirs and Correspondence of M. du P., illustrative of the History of the French Revolution. Collected and arranged by A. Sayous,' 2 vols. 8vo, London, 1852.

MALTE-BRUN, a well-known geographer and poet, whose real name is Malte Conrad Bruun, was born at Thisted, in Jutland, August 12, 1775. He was educated for the ecclesiastical profession, but had no taste for theological studies. When the French Revolution broke out, he enthusiastically adopted the ideas which it developed, and determined upon devoting himself to the law. He wrote several political pamphlets, which brought upon him the censure of the Danish Government. He took refuge in the island of Hven, which once belonged to Tycho Brahe, and lived for a time in the large observatory built at the expense of that astronomer. Here he wrote some poems which were published when he went to Copenhagen after the termination of his short exile. The poems acquired considerable popularity. He then started a periodical, entitled 'Tria Juncta in Uno,' which was published during 1797 and 1798, but was then stopped owing to the danger which he incurred of being proceeded against by the Government. He left the country, took refuge in Sweden, but afterwards went to Hamburg, where he was occupied in teaching the children of a merchant. He then selected France as his adopted country, and, after engaging in politics and incurring Bonaparte's displeasure, he determined to occupy himself exclusively in writing geographical descriptions of various countries. These at once found favour, and led to his writing the series of geographical works on which his reputation is founded. In 1821 he assisted in establishing the Geographical Society of Paris. He died of apoplexy, December 14, 1826. His publications are very voluminous; some of the more important are mentioned below. In conjunction with Mentelle and Herbin, he compiled the 'Géographie mathématique, physique, et politique de toutes les parties du monde,' 16 vols. fol. Paris, 1803—1807; 'Tableau historique et physique de la Pologne ancienne et moderne,' 8vo, Paris, 1807, 2nd edition, 1830; and 'Précis de la Géographie Universelle, ou Description de toutes les Parties du Monde, sur un plan nouveau d'après les grandes divisions naturelles du Globe; précédé d'un Histoire de la Géographie chez les Peuples anciens et modernes, et d'une Théorie générale de la Géographie mathématique, physique, et politique,' 8 vols. 8vo, Paris, 1810—1829, with a folio atlas, 2nd edition, 12 vols. 1831—1837, by J. J. N. Huot. The work has been reproduced, either in an abridged or in a more or less modified form, in the French and English languages. Malte-Brun also edited 'Annales des Voyages, etc.,' 24 vols. 8vo, 1808—1815, which was continued as the 'Nouvelles Annales des Voyages' from 1819 onwards. He himself was one of the editors of the first and second series, which form 60 vols. 8vo. The third series commenced in 1834. A selection from his minor works was made by J. Nachez, under the title of 'Mélanges scientifiques et littéraires de Malte-Brun,' 3 vols. 8vo, 1828.

* MALTE-BRUN, VICTOR ADOLPH, geographer, son of Conrad Malte-Brun, was born at Paris in 1816. He was educated at the College of Versailles, and in 1838 commenced his career as professor of history, which post he held successively at Pamiers (1838), at Ste. Barbe (1840), and at the Stanislas College (1846). In 1847 he began to devote himself to geography. He joined the Geographical Society, and in 1855 was elected its secretary-general. He has constructed maps for numerous works, such as Barbie du Bocage's 'Madagascar,' 8vo, 1859; Duval's 'Les Colonies,' 1864; and others. He has edited new editions of his father's 'Géographie complète et universelle,' and is the principal

editor of the 'Nouvelles Annales des Voyages.' In addition to these, he has issued several small works and a few of a more extensive character, such as 'Les États-Unis et le Mexique: Histoire et Géographie,' 4to, Paris, 1862; 'La France Illustrée,' 8vo, Paris, 1855; 'Géographie complète de la France et de ses Colonies,' 8vo, Paris, 1857; 'Histoire Géographique et Statistique d'Allemagne,' 4to, 1866—1868; and 'Pays-Bas Belgique,' 8vo, Paris, 1867.

MALTON, THOMAS, designer and engraver, was born about 1748. Malton made "washed" or coloured drawings of buildings, which were in considerable request, when the newly introduced art of aquatint engraving suggested to him the means of multiplying copies of them for publication. He mastered the method, and applied it with much success. He published a 'Picturesque Tour through the Cities of London and Westminster,' 2 vols. fol., 1792, which has already become of special value to the antiquary; 'Picturesque Views of the University of Oxford,' fol., 1802—3; and he engraved some views of St. Petersburg. He died March 7th, 1804. In nearly all the biographical notices of the engraver, Malton, he is confounded with a namesake, THOMAS MALTON, SENIOR, the author of a 'Royal Road to Geometry,' 8vo., 1775; and 'A Complete Treatise on Perspective,' 2 vols. fol., 1775. Thomas Malton, senior, died at Dublin, February 18th, 1801. The 'Descriptive View of Dublin,' with many illustrations in aquatinta, which some of the biographies place among the works of Thomas Malton, the engraver, was by JAMES MALTON, a designer and engraver of some ability, who died in July, 1803.

* MAMIANI, TERENCE DELLA ROVERE, CONTE, an Italian poet, statesman, and philosopher, was born in 1800, at Pesaro, a coast town in central Italy; and early began to exhibit his talent for poetry, and his addiction to liberalism. In 1831 he took a prominent part in the revolutionary movement which followed the accession of Cardinal Mauro Capellari, as Gregory XVI., to the papal throne, and acted as a member of the Provisional Government of Bologna. After the prompt suppression of this movement through the assistance of Austria, Mamiani fled to Paris, where he devoted himself to literary, philosophic, and patriotic activity, some of the results of which appeared in his 'Inni Sacri,' 8vo, Paris, 1832; 'Nuove Poesie,' 8vo, Paris, 1835; 'Del Rinnovamento della Filosofia antica Italiana. Libro uno,' 8vo, Paris, 1835, third edition, 8vo, Florence, 1836, which provoked some controversy; 'Nostro Parere sulle Cose Italiane,' 8vo, Paris, 1839, &c.; 'Dell' Ontologia e del Metodo,' 8vo, Paris, 1841, Florence, 1848; 'Ausonio: Idillio eroico,' 8vo, Paris, 1842; 'Poesie,' &c., 12mo, Paris, 1843, new edition, 8vo, Florence, 1857; 'Mario Pagano: ovvero, della Immortalità, Dialogo,' 8vo, Paris, 1845; 'Dialoghi di Scienza prima,' 8vo, Paris, 1846, &c. Mamiani returned to Italy in the beginning of 1848; and, on the 4th of May of the same year, accepted from the Pope the post of minister of the interior and of president of the cabinet, which he found it expedient to resign in the latter end of July following. In the month of August he quitted Rome for Turin, where, with Gioberti and other advocates of the principle of Italian unity and independence, he founded the Società della Confederazione Italiana, of which he was one of the three presidents. Returning to Rome, he became minister for foreign affairs in the Galletti cabinet, formed after the assassination of Pellegrino Rossi (November 15, 1848), and the flight of the Pope to Gaeta (November 24th). He laboured zealously, whether in his capacity of minister or as a member of the Costituente Romana, in the attempt to reconcile the pontifical authority with the necessities and demands of the time; and when he found all his efforts futile to withstand the installation of republican government, he withdrew on the same day from public affairs. Although thus acting in the Pope's interest, and anxiously preserving the papal prerogatives where the circumscription of these was not necessary to the unification of Italy, he was banished from Rome by a papal decree issued from Gaeta on the 26th of July, 1849. He retired to Genoa, which, having been naturalised as a Sardinian subject in July, 1855, he was elected, February, 1856, to represent in the national parliament, where he became a zealous champion of the policy of Victor Emmanuel and of Count Cavour, in whose administration he accepted, in 1860, the post of minister of public instruction. In March of the following year he was sent on a mission, the purpose of which was probably scientific, to Athens; and in 1865 was accredited to Berne as the ambassador of the Italian Government.

Count Mamiani has devoted much time and energy to the development of existing institutions for the encouragement of

literature, art, and science, and to the founding of new ones, especially of the Accademia di Filosofia Italiana, which was inaugurated at Genoa in 1850. The *Memorie*, or papers, contributed by Mamiani occupy a considerable proportion of the first two volumes of the 'Atti,' or Transactions of this Society; the principal of them being entitled respectively, 'Dell' Impossibilità d'una Scienza assoluta;' 'Del Bello in Ordine alla Teorica del Progresso;' 'Dell' Uso della Metafisica nelle Scienze fisiche;' 'Sulla Origine, la Natura, e la Costituzione della Sovranità;' and 'Del Diritto di Proprietà.'

Besides the works already mentioned, we owe to Count Mamiani a treatise on the Papacy, 'Sul Papato,' 8vo, Genoa, 1850, Paris, 1851, &c.; 'Scritti politici. Edizione ordinata dall' Autore,' 8vo, Florence, 1851, forming vol. i. of a projected issue of his works; 'D' un Nuovo Diritto Europeo,' 8vo, Turin, 1859, &c., English translation, by R. Acton, "with the author's additions and corrections," 'Rights of Nations: or, the new Law of European States applied to the Affairs of Italy,' 8vo, London, 1860, French translation, by Léonce Lehmann, from the fourth Italian edition, 'Des Traités de 1815 et d'un Nouveau Droit Européen,' 12mo, Paris, 1862; 'Confessioni di un Metafisico,' 2 vols. 8vo, Florence, 1865; 'Prose Letterarie,' 8vo, Florence, 1867; and 'Teorica della Religione e dello Stato e sue speciali attinenze con Roma e le Nazioni Cattoliche,' 8vo, Florence, 1868.

* MANBY, CHARLES, civil and mechanical engineer, was born in Staffordshire in 1804. His father, Mr. Aaron Manby, was proprietor of the Horseley Iron Works; and several other members of the family have been connected with mechanical and engineering pursuits. Before he was of age, and while apprentice to his father as a mechanical engineer, he superintended the construction of a new marine steam-engine with oscillating cylinders, which his father had invented and patented; and he designed and constructed the first iron steamer that went to sea, called the "Aaron Manby," acting as chief engineer when the vessel made her first voyage from London to Paris. He was successively engaged in many engineering works in France—erecting gasworks at Paris; managing the iron works at Charente, which had been established by his father; filling the post of chief engineer at the government tobacco manufactories; constructing marine steam-engines; and remodelling the celebrated Creusot Iron Works, which have since grown to such magnitude. Mr. Manby returned to England in 1829, and was employed as manager of the Beaufort Iron Works, on the confines of Brecknockshire and Monmouthshire, from that year till 1836. He then settled in London as a civil engineer. His professional work has since been chiefly that of a consulting engineer for large undertakings, such as that of the Suez Ship Canal, of which he was a member of the scientific international committee before the enterprise had attained such a form as to be taken up by a commercial company. He has also been engaged on scientific commissions. Mr. Manby has been one of the most prominent members of the Institution of Civil Engineers; he was its secretary from 1839 to 1856; and then, on resigning, was presented with a testimonial, a purse of two thousand guineas, and the title of honorary secretary. He has edited many of the professional papers printed in or reprinted from the Journal of the Institution; and, with Mr. Eaton, prepared the Catalogue of the Institution Library, a second edition of which was published in 1866. He is a Fellow of the Royal and Statistical Societies; and his services to foreign governments, in connection with various engineering undertakings, have obtained for him the insignia of the Legion of Honour, the order of St. Maurice and St. Lazarus of Italy, and the Swedish and Norwegian order of Vasa. Mr. Manby (who since 1856 has been the representative in London of the firm of Robert Stephenson & Co., of Newcastle-on-Tyne) is one of the leading officers of the Engineer and Railway Volunteer Staff Corps, the special character of which has been noticed under BIDDER, GEORGE PARKER, E. C. S. col. 235.

* MANDEL, EDUARD, German engraver, was born at Berlin, February 15th, 1810. His talent for art having been brought under the notice of the king, Frederick William III., he obtained admission to the Academy, and became a pupil of Buchhorn. His first engraving, 'The Warrior and his Son,' after Hildebrandt, 1835, was greatly admired, and he received a commission to engrave Begas's 'Lorelei' for the Prussian Kunstverein. In 1837 he was elected a member of the Academy, and the same year obtained a medal at the Salon, Paris. He has since executed many fine plates, including the portraits of Vandyck and Raffaele, from the originals in the Louvre; the por-

trait of Titian, from the Berlin Museum; Charles I., from the Dresden Gallery; Raffaele's Colonna Madonna, a very beautiful plate; the 'Ecce Homo' of Guido; Carlo Dolce's 'Mater Dolorosa,' and other works from the great masters: his masterpiece in this class being the famous Dresden 'Madonna della Sedia.' Mandel has also engraved several contemporary works, including Kaulbach's 'Gretchen' and Ary Sheffer's 'Christ Weeping over Jerusalem.'

MANGLES, CAPTAIN JAMES, R.N. [E. C. vol. iv. col. 82]. Besides his 'Travels,' Captain Mangles wrote a few geographical treatises, amongst which may be mentioned 'Geography, Descriptive, Delineative, and in Detail: and Hydrography in Detail, combined and universally applied,' 8vo, London, 1849; and 'Guide to the Navigation of the Thames Mouth,' 4to, London, 1853. He died November 18, 1867.

MANIN, DANIELE [E. C. vol. iv. col. 83]. Manin lived not to see even the dawn of that bright day of Italian promise for which he had so long yearned and struggled. He died, an exile, at Paris, September 22, 1857. In the spring of 1861 his statue was erected at Turin, amidst great manifestations of respect for his memory. In 1862 appeared 'Daniel Manin and Venice in 1848—49,' by Henri Martin, with a Preface by I. Butt, Q. C., M.P., 2 vols. 8vo.

* MANNING, HENRY EDWARD, D.D., a Roman Catholic divine and author, son of the late William Manning, M.P., a merchant of London, was born at Totteridge, in Hertfordshire, on the 15th of July, 1808, and was educated successively at Harrow and Balliol College, Oxford, the latter of which he entered in 1827. In 1830 he took his B.A. degree in first-class honours; and was elected to a fellowship at Merton College. He received ordination in due course, and in 1833 was presented to the conjoint rectories of Woollavington and Graffham, in the county of Sussex, and the diocese of Chichester; to the archdeaconry of which he was collated on the 30th of December, 1840. Whilst fulfilling the duties of his ecclesiastical offices in the Church of England, he was for some time one of the select preachers to the university, and in this capacity delivered and published 'Sermons preached before the University of Oxford,' 8vo, Oxford, 1844. To this epoch also belong a great number of occasional sermons—'The English Church: its Succession and Witness for Christ,' 8vo, London, 1835; 'National Education,' 8vo, London, 1838; 'The Rule of Faith,' 8vo, London, 1838, which was followed by an 'Appendix, containing an Examination of certain popular Objections,' 8vo, London, 1838; 'The Mind of Christ, the Perfection and Bond of the Church,' 8vo, Chichester, 1841; 'Penitents and Saints: a Sermon in behalf of the Magdalen Hospital,' 8vo, London, 1844; 'Sermons,' 3 vols. 8vo, 1844—1847. He likewise published his visitation 'Charges,' severally, for a number of years, as well as 'The Principle of the Ecclesiastical Commission examined,' 8vo, London, 1838; 'The Preservation of unendowed Canonries,' &c., 8vo, London, 1840; and 'The Unity of the Church,' 8vo, London, 1842. After many years of preparation for the step, commenced in the influence which he experienced from the "Oxford movement," he was received on Sunday, April 6, 1851, into communion with the Church of Rome, at the Jesuits' Church, Farm-street; and having been admitted to the priesthood by Cardinal Wiseman, and having, whilst at Rome in 1852, received the degree of D.D., he became very zealous for the spread of his new faith in his native country. After filling several minor dignities, he was appointed in May, 1865, to be the second Roman Catholic Archbishop of Westminster and Metropolitan, in succession to Cardinal Wiseman, whose funeral sermon he had preached in the previous February, of which a Spanish translation was published with the title of 'Omnia pro Christo. Oracion funebre pronunciada en las solemnes Exequias de su Eminencia el Cardenal N. Wiseman,' &c., 8vo, Madrid, 1865. Dr. Manning was consecrated at Moorfields, by Bishop Ullathorne, on the 8th of June, 1865; and received the pallium from the hands of the Pope on the 29th of September following. As a prelate of the Romish Church, the Archbishop of Westminster has signalled himself by the devotion with which he has advocated the temporal independence and sovereignty of the Holy See, the dogmas of the immaculate conception and papal infallibility, and generally for the Ultramontanist attitude of his principles and opinions. He is favourably known for his philanthropy, and for the paternal strictness with which he watches over the morals of his flock; whilst beyond his own communion he exhibits a readiness for common action with every denomination of Christians who are zealous to contend, in public

meetings or by parliamentary action, against the prevalence of drunkenness.

His later works include various 'Sermons,' 'Charges,' 'Lectures,' &c.; editions of the lives of several of the saints of the Romish Church, and prefaces and introductions to a considerable number of doctrinal treatises. Amongst his polemical or apologetic productions may be mentioned, 'The present Crisis of the Holy See tested by Prophecy. Four Lectures,' 8vo, London, 1861; 'The last Glories of the Holy See greater than the first. Three Lectures, with a Preface,' 16mo, London, 1861; 'Temporal Sovereignty of the Popes. Three Lectures,' &c., 8vo, London, 1860; 'The Temporal Power of the Vicar of Jesus Christ,' &c., second edition, 8vo, London, 1862, French translation, 'Conférences prêchées à Londres sur le Pouvoir,' &c., 12mo, Paris and Corbeil, 1863; 'The Temporal Power of the Pope in its present Aspect,' 8vo, London, 1866; 'The Temporal Mission of the Holy Ghost: or, Reason and Revelation,' 8vo, London, 1865; 'The Reunion of Christendom: a Pastoral Letter,' &c., 8vo, London, first and second editions, 1866; 'The Centenary of St. Peter and the General Council: a Pastoral Letter,' &c., 8vo, London, 1867; 'England and Christendom,' 8vo, London, 1867; 'The Œcumenical Council and the Infallibility of the Roman Pontiff: a Pastoral Letter to the Clergy,' &c., 8vo, London, 1869.

MANNLICH, JOHANN CHRISTIAN VON, German painter, was born at Strasburg in 1740. He studied painting in his native place; in 1763 went to Paris, and in 1767 to Italy. In 1772 he returned to Germany, and eventually settled at Munich, where, in 1799, he was appointed director of the Bavarian Gallery. Mannlich's oil-paintings are much praised for their correct drawing, perspicuous arrangement, and lively colouring; several of them are in the churches of Bavaria. But he is better known out of Germany by having published, in his capacity of director of the Bavarian Gallery, the extensive series of lithographs (432 in number) from the original drawings in the royal cabinets. For this work, which was commenced in 1810, Mannlich himself supplied some of the plates; but the greater part were executed by his pupils, Piloty and Strixner. In 1817 he commenced the companion series of lithographs by Piloty, Strixner, the Quaglios, Heideck, &c., from the royal pictures. Herr Mannlich also published (with plates) treatises on the Costumes and Habits of the Ancients (4to, 1802); on Beauty; and on Anatomy, for the use of students and amateurs of the fine arts. He died at Munich in 1822.

MANSEL, HENRY LONGUEVILLE, an English divine and metaphysician, eldest son of the Rev. H. L. Mansel, rector of Cosgrove, Northamptonshire, was born in that parish on the 6th of October, 1820, and received his early education at Merchant Taylors' School, London. He was elected scholar of St. John's College, Oxford, in 1839, of which he afterwards became a fellow; graduated B.A. in double first-class honours in 1843; proceeded M.A. in 1847; and B.D. and D.D. respectively in 1852 and 1867. He became a deacon in 1844, and was admitted to priests' orders in 1845, by the Bishop of Oxford. He was appointed reader in moral and metaphysical philosophy in Magdalen College in 1855; and in 1858 delivered the Bampton Lectures, which were published with the title of 'The Limits of Religious Thought, examined in Eight Lectures preached before the University of Oxford in the year 1858, on the Foundation of the late Rev. J. Bampton,' 8vo, Oxford and London, 1858, fifth edition, 8vo, London, 1867, which gave rise to considerable discussion and controversy, into which the Rev. F. D. Maurice especially entered. In 1859 he was appointed Waynflete professor of philosophy; and from 1866 to 1868 filled the office of regius professor of ecclesiastical history, to which was attached a canonry of Christ Church. He was preferred also to be an honorary canon of Peterborough, and chaplain to the bishop of the diocese. In 1868 he became Dean of St. Paul's, London.

The various publications of Dr. Mansel include 'The Demons of the Wind, and other Poems,' 12mo, London, 1838; 'Prolegomena Logica: an Inquiry into the Psychological Character of Logical Processes,' 8vo, Oxford, 1851, second edition, corrected and enlarged, 8vo, Oxford, 1860; an edition, with notes, of Aldrich's 'Artis Logice Rudimenta,' 8vo, 1849, 1852, 1856, 1862, &c.; 'Psychology the Test of Moral and Metaphysical Philosophy: an inaugural Lecture,' 8vo, Oxford, 1855; 'A Lecture on the Philosophy of Kant,' 8vo, Oxford, 1856; 'Metaphysics: or, the Philosophy of Consciousness, phenomenal and real,' 8vo, Edinburgh, 1860, second edition, 1866; and 'The Philosophy of the Conditioned: comprising some Remarks on Sir William Hamilton's Philosophy, and on Mr. J. S. Mill's Examination

of that Philosophy. Reprinted, with additions, from the "Contemporary Review," 8vo, London and Edinburgh, 1866. Dr. Mansel was a contributor to the volume entitled 'Aids to Faith;' and, as an adherent of the philosophy of Sir William Hamilton, took part with Professor Veitch in editing his 'Lectures on Metaphysics,' 8vo, 1859, &c.

MANT, RICHARD, a poet and divine, eldest son of the Rev. Richard Mant, D.D., rector of All Saints' Southampton, and of Fonthill-Bishops, Wiltshire, and author of several theological works, was born at Southampton on the 12th of February, 1776. He received from his father the first rudiments of education, which he continued as a foundation scholar at Winchester, where he was admitted in 1789. Having been somewhat arbitrarily deprived of his scholarship in April, 1793, he entered Trinity College, Oxford, where, in 1794, he obtained a scholarship. He graduated B.A. in 1797, and in the spring of the following year was elected to a fellowship of Oriel College. In the summer of 1799 he carried off the Chancellor's prize for an English essay 'On Commerce,' which was published in the second volume of 'The Oxford English Prize Essays,' 8vo, Oxford, 1830; proceeded M.A. in 1800; and in 1802 was ordained deacon by Dr. Brownlow North, Bishop of Winchester, as curate to his father. After having passed a few months on the Continent, he returned in 1803 to Oriel College, and was soon afterwards ordained priest by Dr. Randolph, Bishop of Oxford. In 1804 he became curate in sole charge of Buriton, a village in Hampshire, where he produced several works calculated for the spiritual benefit and guidance of his parishioners, and where he vacated his fellowship by his marriage on the 22nd of December, 1804. Some time after, he published, with a dedication in verse to Bishop Barrington, a volume of 'Poems,' 8vo, Oxford, 1806, which he followed up, in 1807, with 'The Slave, and other poetical Pieces: being an Appendix to "Poems."' Early in 1808, Mr. Mant left Buriton for the curacy of Crawley, in the same county, which he vacated in December, 1809, in order to assist his father in the oversight of his parish in Southampton. He was preferred, in the spring of 1810, to the vicarage of Coggeshall, in Essex; and in 1812 delivered the Bampton Lectures at St. Mary's, Oxford, which were published with the title of 'An Appeal to the Gospel: or, an Inquiry into the Justice of the Charge alleged by Methodists and other Objectors, that the Gospel is not preached by the National Clergy,' 8vo, Oxford, 1812, sixth edition, 8vo, London, 1816; the favourable reception of which encouraged the publication of 'Sermons for Parochial and Domestic Use,' &c., 3 vols. 8vo, Oxford, 1813-14, fifth edition, 1823. In 1813 he was appointed domestic chaplain to Archbishop Manners Sutton, at Lambeth, and soon after resigned his vicarage of Coggeshall; and, being about this time appointed one of the select preachers in the University of Oxford, delivered a series of sermons against Socinianism, which were published with the title of 'Sermons preached before the University of Oxford, in the Years 1814-16,' 8vo, Oxford, 1816. In March, 1813, he undertook, jointly with Dr. D'Oyly, afterwards rector of Lambeth, the preparation—with explanatory and practical notes, selected from various authors, who, however, in matters of doctrine and discipline, were to be members of the Church of England—of the 'Family Bible,' which, after occupying its editors for nearly four years, was issued in 1817, under the auspices of the Society for Promoting Christian Knowledge, by whom the work was commissioned, and who were the patrons of a supplementary work, carried out after the same method, entitled 'The Book of Common Prayer. With Notes,' &c., 4to, 1820, fifth edition, 1840. In 1815, the same year in which he took his degree of D.D., he was collated to the rectory of St. Botolph's, Bishopsgate, to which he was presented by Dr. Howley, Bishop of London. In 1818 he was presented by the Archbishop of Canterbury to the rectory of East Horsley, in Surrey; and on the 30th of April, 1820, was consecrated by Archbishop Brodrick, in the cathedral of Cashel, to the Bishopric of Killaloe and Kilfenora. In the spring of 1823 he was translated to the see of Down and Connor, over which he presided for nearly twenty-six years; and, in 1842, the charge of the diocese of Dromore also devolved upon him, under the provisions of the Irish Church Temporalities Act, on the decease of Dr. James Saurin. He died on the 2nd of November, 1848, at the rectory-house of Ballymoney, county Antrim.

Bishop Mant was very frequent in his pulpit ministrations; and his publications, whether as 'Charges,' 'Sermons,' or polemical works, were voluminous. They include, 'Biographical Notices of the Apostles, Evangelists, and other Saints: with Reflexions and Collects, adapted to the minor Festivals,' &c., 8vo, Oxford, 1828; 'The Gospel Miracles,' &c., 12mo, London, 1832; 'The Happi-

ness of the Blessed, considered as to the Particulars of their State, their Recognition of each other in that State, and its Difference of Degrees. To which is added, Musings on the Church and her Services,' 12mo, London, 1833, new edition, 8vo, London and Edinburgh, 1870; 'The British Months: a Poem, in twelve Parts,' 2 vols. 8vo, London, 1835; 'The Church and her Ministries: in a Series of Discourses,' 8vo, London, 1838; 'Romanism and Holy Scripture compared,' new edition, 12mo, London, 1839, another edition, 16mo, London, 1868; 'History of the Church of Ireland, from the Reformation (to the Union of the Churches of England and Ireland, January 1st, 1801). With a preliminary Survey, from the Papal Usurpation in the twelfth Century, to its abolition in the sixteenth,' 2 vols. 8vo, London, 1840; 'Primitive Christianity, exemplified and illustrated by the Acts of Primitive Christians,' 8vo, London, 1842; 'Horæ Ecclesiasticæ,' &c., 16mo, London, 1845; 'Horæ Liturgicæ,' &c., 16mo, London, 1845; 'Feriæ Anniversariæ: Observance of the Church's Holy-days no Symptom of Popery,' &c., 2 vols. 16mo, London, 1847; 'The Sundial of Armoy: a Poem. Gnomon Armoyensis,' 16mo, Dublin, 1847; and 'The Matin Bell: or, the Church's Call to Daily Prayer. A Poem,' 16mo, Oxford, 1848.

MANTEGNA, FRANCESCO, son, scholar, and assistant of ANDREA MANTEGNA [E. C. vol. iv. col. 88], was born at Mantua about 1470. His works are probably often cited as the productions of his father; pictures attributed to F. Mantegna are not common. He does not appear to have possessed much original power. The date of his death is uncertain; he was alive in 1517. In the National Gallery is a 'Noli me Tangere' (No. 639), by Francesco Mantegna.

*MANTEUFFEL, OTTO THEODOR, FREIHERR VON, a Prussian statesman, was born at Lübben, in Brandenburg, on the 3rd of February, 1805; and, having received his early education at the Landesschule of Schulpforte, proceeded to the University of Halle, for the study of jurisprudence and political economy. In 1827, he went to Berlin, where, in 1829, he was appointed to a subordinate post (referendarius) in the magistracy, and was shortly afterwards promoted to be councillor at Lückau, where he gave sufficient evidence of ability to procure his election, in 1837, as representative of the Sternberg district, at the Brandenburg Diet. In 1841, he was appointed to a councillorship at Königsberg, the internal affairs of whose government he managed with considerable success and popularity until 1843, when he was nominated to the vice-presidency of the Government of Stettin. In 1844, he was attached as reporting councillor to the Prince of Prussia, with the rank of a privy councillor; and, in the following year, became under-secretary to the Minister of the Interior. In the first General United Diet of Prussia, which was opened on Sunday, April 11th, 1847, in virtue of a royal ordinance which accompanied the decree granting the Constitution, on the 3rd of February previous, and in which the members of the eight provincial Diets assembled for common deliberation, Manteuffel was one of the foremost of those who came soon afterwards to be recognised as conservative members, and strenuously resisted the liberalism of the opposite party. In November, 1848, he became minister of the interior, in the administration of Count Brandenburg, upon whose death, November 6th, 1850, and the accession of Count Ladenberg to the presidency of the Council of Ministers, he was entrusted *ad interim* with the portfolio of foreign affairs. It thus fell to him to represent Prussia at the Conference of Olmütz, November 28th and 29th, in which the interests of Austria were upheld by Prince Schwarzenberg, and the object of which was to prevent by negotiation the rupture which at that time threatened to involve Germany and indeed Europe, in war. He sacrificed much popularity by what was thought to have been his too great deference to the views and the position of Austria, and the concessions which he made in behalf of peace; but his policy was defended, especially by Bismarck, in a speech of the 3rd of December following, on the general ground of the community of interests between Prussia and Austria with reference to revolutions, and the community of action of both States in German affairs. Both Bismarck and Manteuffel had to wait until 1866 for the full justification of the Olmütz Conference, and the supplementary one of Dresden, which opened on the 23rd of December, 1850. On the 19th of the last-named month, Manteuffel was appointed chief of the cabinet, in succession to Count Ladenberg, with which he retained the position of minister for foreign affairs; and on the 13th of January, 1852, was appointed president of the Council of State. For a series of years Manteuffel took the initiative in nearly all the conservative measures of the Prussian Government, and dictated

the forms of diplomatic correspondence with foreign nations. He was long unfavourably known in England for the pro-Russian policy of the Court of Berlin during the war in the East, a policy which first became notorious by his declaration in the Prussian Chamber that Prussia adhered to the Vienna Note, but that she would preserve an independent attitude, and would resist every attempt that might be made to influence her conduct, come from what quarter it might—the strength and the sword of Germany would only be employed to defend German interests. The neutrality thus assumed was rather a passivity which told disastrously upon the Allies; for it enabled Russia to withdraw her troops from the Polish-Prussian frontier, to employ them in the Crimea. The Government of Prussia had, therefore, little claim to be represented at the Peace Congress, which sat at Paris in the last days of March, 1856; but it accepted the invitation which, at the eleventh hour, was given it, "not to negotiate the treaty of peace"—as was stated by Lord Palmerston in the House of Commons, March 14, 1856—"but to accede to the result of the negotiations of those who were more directly interested in the matter." The Prussian representatives were Count Hatzfeldt, then ambassador at Paris, and Baron Manteuffel; and the latter was on this occasion described as "le sombre et austère Manteuffel, un Ministre d'avant le Déluge." Baron Manteuffel finally retired from office on the 6th of November, 1858, on which date he was succeeded by the Prince of Hohenzollern-Sigmaringen, as president of the Ministry and the Council of State, having on the 11th of the previous month—a few days after the appointment of the Prince of Prussia, at present the Emperor William of Germany, to the Regency—been replaced by Baron Schleinitz.

MARCEY, ALEXANDER, was born at Geneva in 1770, the son of a rich merchant, and was destined for commercial pursuits, but after two years' trial, finding them not to his taste, he obtained his father's permission to devote himself to the study of science. The political troubles of Geneva led to his being suspected, and he was condemned by the democratic party, in 1794, to five years of banishment. He now decided on adopting the medical profession, and, having obtained a doctor's degree at Edinburgh in 1797, he established himself in London, and was naturalised in 1800. He became connected with the medical staff of Guy's Hospital, and lectured on chemistry. He also became inspector of the Military Hospital at Portsmouth. On the death of his father-in-law he inherited a considerable fortune, resigned his appointments, and devoted himself to experimental chemistry. In 1815 he returned to Geneva, and was elected a member of the Representative Council, and, in conjunction with De la Rive, lectured on chemistry at the university. In 1821 he returned to London, and died on the 22nd of October, 1822. Between 1792 and 1822, he published various papers in the 'Transactions of the Royal Society' and in the medical journals. His most important work was on the 'Treatment of Calcareous Disorders,' published in London in 1817, which was inferior only to the work of Prout. His wife,

JANE MARCEY, the daughter of a merchant named Haldimund, was well known for her 'Conversations on Chemistry,' Faraday's first book on that science; and we have Faraday's own account of the delight experienced by him in being introduced to the author. She also published 'Conversations on Natural Philosophy,' on 'Vegetable Physiology,' on 'Political Economy,' 'Land and Water,' and a Spelling-book, all of which were at one time very popular. She died in London, June 28, 1853. Their son,

* FRANÇOIS MARCEY, was born in London, 25th May, 1803. He received a scientific education, and became professor of physics in the Academy at Geneva. He was elected a fellow of the Royal Society in 1836. He has published a number of papers on experimental science on his own account, or in conjunction with De la Rive and others.

MARCHESI, POMPEO, celebrated Italian sculptor, was born at Milan, in 1790. The favourite pupil of Canova, he was employed by the great sculptor to complete his later works. Having acquired celebrity by figures from the heathen mythology, Venus, Terpsichore, and the like, he was much employed in the production of religious sculpture and portrait statues. To the former class belong a colossal 'Pieta,' for Milan Cathedral; to the latter, twelve statues of eminent Italians, for the palace at Milan; the Emperor Francis I.; a colossal statue of Charles Emmanuel III., for Novara; Philibert Emmanuel, for the present King of Italy; Goethe, for Frankfurt Library; and numerous busts. He was professor of sculpture in Milan Academy, and died in that city on the 6th of February, 1858.

* MARCOU, JULES, geologist, was born at Salins, April 20, 1824. He was educated at Salins, Besançon, and at Paris. Owing to ill health, he was obliged to return home, and his leisure was spent in exploring the Jura mountains, in the neighbourhood of his native town. In this work he was encouraged by Germain, Thurmann, and Agassiz, with whom he had formed a friendship. The results of his researches were given in 'Recherches géologiques sur le Jura Salinois,' which appeared in the 'Mémoires' of the Geological Society of France, iii. pp. 1—151 (1848). In 1846 he became an assistant in the museum of the Sorbonne. In 1847 he arranged the greater portion of the invertebrate fossils in the museum. In 1848 he was appointed travelling geologist, and, as such, accompanied Agassiz to Lake Superior, and then proceeded alone to Keewenau Point, Lake Huron, and the Niagara. In 1849, he made extensive explorations in the United States, along the line of the Alleghany mountains; in Nova Scotia, New Brunswick, and through Canada, along the valley of the St. Lawrence and the great lakes. His exertions and fatigue brought on typhoid fever. Soon after his recovery, he married, and returned to France. He then resigned his appointment in connection with the Sorbonne museum, and, after staying a few months in the Jura mountains, he again set out for America. In 1853 he published 'A Geological Map of the United States,' with a memoir, 4to; and this was followed by a 'Résumé explicatif d'une Carte géologique des États-Unis et des Provinces anglaises de l'Amérique du Nord,' in 'Bulletins' of the Geological Society of France, xii. pp. 813—935 (1854—55). In 1853 and 1854, he accompanied the scientific expedition, supported by the United States Government, which examined the region between the Mississippi and the Pacific at San Francisco. This journey furnished the materials for several geological papers on the Rocky Mountains. In 1855, having returned to Europe, he was appointed professor of palæontology at Zurich. In 1860 he again visited America, and made researches on the fossils of the older Silurian rocks of that country. In 1862 he issued his 'Carte géologique de la Terre.' Besides the papers and books above mentioned, he has written others relating to the carboniferous, triassic, and cretaceous rocks of America and Europe, to the changes undergone by the Falls of Niagara in the course of fifteen years, and to the old glaciers of Auvergne.

MARCOY, WILLIAM LARNED, American statesman, was born at Sturbridge, Massachusetts, December 12th, 1786. On completing his studies at Brown University, Providence (Rhode Island), he for some time held a post as teacher at Newport, and then studied law at New York. He early acquired influence at New York as a politician, and from 1816 filled various judicial and administrative offices in the State, but resigned them in contemplation of his election in 1832 to the governorship of New York, to which he was re-elected in 1834 and 1836. He continued to take an active share in State and federal politics, and in 1845 was appointed commissioner for the Mexican claims, his conduct of which obtained much applause, and he was nominated by President Polk Minister of War. In 1851 he was put forward as a candidate for the presidency, but gave way in favour of Mr. Franklin Pierce, who, on his election in 1852, appointed Mr. Marcy Secretary of State. In this post it fell to his lot to conduct several affairs of delicacy and importance, especially the questions arising out of Walker's filibustering expeditions, the Canadian and Newfoundland fisheries, the laws regulating maritime relations with foreign countries, and others of equal or nearly equal consequence, and his despatches and memoirs are regarded by American jurists as among their ablest papers on these branches of international law. Mr. Marcy quitted office on Mr. Buchanan's installation in the presidency, 1856. A few months later he had an apoplectic attack, and died suddenly, July 4th, 1857, at Ballston Spa, Saratoga, where he had gone in the vain hope of benefiting his health.

* MARECHAL, CHARLES LAURENT, an eminent French painter on glass, was born at Metz about 1800. Brought up as a workman, he was at length able to enter the atelier of the painter Regnault at Paris, where he remained some years. In 1825 he returned to Metz, and for several years practised as a painter in oil and crayons, with a steadily increasing reputation. About 1840 he was led to direct his attention to painting on glass, in which he met with remarkable success. Windows painted by him have been placed in the churches of Vincent-de-Paul, Ste. Clotilde, St. Valère, and St. Augustin, at Paris; and in various cathedrals and churches at Metz, Limoges, Cambrai, Troyes, &c. He was made officer of the Legion of Honour in 1855. He gained first-class medals at the Great Exhibition of 1851, at the Exposition Universelle of 1855, and the International Exhibition of

1862, "for the highest artistic and executive merit." His son, CHARLES RAPHAEL MARECHAL, gained a similar medal at the Exhibition of 1862, "for his stained glass windows, in which he employed a new process of ornamentation."

MARGRAAF, ANDREW SIGISMUND, was born in Berlin, March 9, 1709, and died there August 7, 1782. His father was an apothecary, and taught him a little chemistry. He also studied under Neumann, and then, after the manner of German apprentices, set out on his wanderings in pursuit of chemical knowledge. On his return to Berlin, he began to publish new facts and processes, which laid the foundation of chemical analysis. His experiments on phosphorus gave the first accurate notions as to this body, and also as to phosphoric acid. He first determined the properties of the earthy basis of alum—alumina—and showed that it existed in clay, and gave to that substance its peculiar properties. He pointed out the nature of soda, and gave an easy method for obtaining pure silver from its chloride. He also wrote on the salts of tartar, on fluor spar, and other subjects, which led to important results. In 1760 he became director of the physical class of the Berlin Academy of Sciences. In 1762 twenty-six of Margraaf's papers were collected, translated into French, and published at Paris. Other papers by him appeared in the 'Memoirs of the Berlin Academy.'

* MARIETTE, AUGUSTE ÉDOUARD, French archæologist, was born at Boulogne-sur-Mer, on the 11th of February, 1821, and educated at the college of his native place. Whilst a teacher of language and design in the college, he gained some notice by a dissertation upon the antiquity of Boulogne; but he devoted all his spare time to the study of the hieroglyphics and antiquities of Egypt, and, after the revolution of 1848, he obtained a post in the department of Egyptian antiquities at the Louvre. In 1850 he was sent by the minister on a scientific visit to Egypt, and, in excavating in the Necropolis of Memphis, had the good fortune to discover the foundations of the Temple of Serapis, and bring to light many objects of interest. The success of his labours led the government to extend the time and scope of his mission, and, being amply supplied with funds, he was enabled to carry out an important series of excavations and investigations. On his return to France, in 1854, M. Mariette was created knight of the Legion of Honour, and appointed adjunct-keeper of the Egyptian Museum. The following year, he spent some months in studying the Egyptian remains in the Berlin Museum, and received the decoration of the Red Eagle. In 1858 he again visited Egypt, and under the auspices of the pasha, who appropriated him a body of 500 labourers, he conducted an important series of investigations in the valley of the Nile, in the course of which he removed the sand accumulated during ages from the bases of the principal temples and monuments, from Memphis to the island of Elephantine. His archæological discoveries were important, and he formed a remarkable collection of antiquities, a selection from which, when shown at the London International Exhibition of 1862, excited great interest, and formed the subject of valuable papers by Mr. Birch and other eminent Egyptologists. Whilst engaged in these researches, M. Mariette assisted in the foundation of the Egyptian Institute, and received the appointment of inspector-general of the monuments of Egypt. M. Mariette has written several papers on Egyptian archæology; but the most important of his writings, as embodying the results of his personal investigations, are the costly but unfinished work entitled 'Le Sérapium de Memphis,' folio, with plates, 1857—64, published under the auspices of the minister of state; 'Lettres à M. le Vicomte de Rongé sur les Résultats des Fouilles entreprises par ordre du Vice-roi d'Égypte,' 8vo, with plates, 1860; 'Nouvelles Tableaux d'Abydos,' 8vo, 1865; 'Fouilles exécutées en Égypte, en Nubie et en Soudan d'après les Ordres du Viceroi d'Égypte,' folio, with plates, &c., 1867; and 'Exposition Universelle de 1867. Aperçu de l'Histoire ancienne d'Égypte pour l'intelligence des Monuments exposés dans le Temple du parc Égyptien,' 8vo, 1867.

* MARKHAM, CLEMENTS ROBERT, geographer and botanist, was born in July, 1830, at Stillingfleet, in Yorkshire. He was educated at Westminster. In 1844 he entered the navy, and served for several years, partly in the Pacific Ocean and partly in the Arctic Regions, as a midshipman, in the expedition sent to search for Sir John Franklin, in 1850 and 1851. In 1852 he left the navy, and then spent some time in travelling in Peru and Brazil. In 1858 he became the honorary secretary to the Hakluyt Society. In 1859—1861 he superintended the collection of cinchona plants in South America, and their transport to India. In 1863 he was elected an honorary secretary of the

Royal Geographical Society, and has retained the office since. In 1867—68 he accompanied the Abyssinian expedition as geographer. His books include 'Franklin's Footstep: a Sketch of Greenland,' 8vo, London, 1853; 'Cuzco: a Journey to the Ancient Capital of Peru . . . and Lima, a Visit to the Ancient Capital and Provinces of Modern Peru,' 8vo, London, 1856; 'Travels in Peru and India, while superintending the collection of Cinchona Plants and Seeds in South America, and their Introduction into India,' 8vo, London, 1862; 'Contributions towards a Grammar and Dictionary of Quichua, the language of the Incas of Peru,' 8vo, London, 1864; 'Report on the Irrigation of Eastern Spain,' 8vo, London, 1866; 'A History of the Abyssinian Expedition,' 8vo, London, 1869; 'The Life of the Great Lord Fairfax,' 8vo, London, 1870; and a summary of the work done by the Geological Survey of India, published in 1871. He has also translated or edited several volumes for the Hakluyt Society, mainly the accounts of ancient travellers in South America. His papers also relate principally to the geography and botany of South America and Abyssinia.

MARMORA, ALBERTO, CONTE DELLA [E. C. vol. iv. col. 113]. From 1819 to 1860 he was engaged upon his scientific description of the island of Sardinia. The completed work consists of three parts, 8vo, 1839—1860, with two parts of a folio atlas. He has written an 'Itinéraire de l'île de Sardaigne,' 2 vols. 8vo, Paris, 1860, which forms a supplement to the foregoing; and several papers relating to the geology of Sardinia and of the Balearic Islands. He died May 18, 1863.

* **MARMORA, ALFONSO, CONTE DELLA** [E. C. vol. iv. col. 112; **VICTOR EMMANUEL**, E. C. S.]

MAROCCHETTI, CARLO, BARON, R.A. [E. C. vol. iv. col. 113.] During the last years of his life Baron Marochetti was constantly receiving important commissions; but none of his later works were decidedly successful, and his popularity gradually declined under the persistent attacks of hostile critics. Among the statues executed by him subsequent to the notice in the E. C., the best perhaps was one of colossal size of the Duke of Wellington for the Strathfieldsaye Memorial, which, as well as the statue, was designed by Marochetti. His other works, mostly in bronze, include a statue of Lord Clive for Shrewsbury, and another of more pretentious character, but not of superior merit, erected near the Duke of York's statue, Waterloo Place; Lord Herbert of Lea, erected in the Market-place, Salisbury; an equestrian statue of Viscount Combermere, erected opposite the principal entrance to Chester Castle; and the recumbent statue of the Prince Consort, for the Albert Memorial, was summarily rejected, and on his death the commission was transferred to Mr. Foley. Baron Marochetti, in the course of a journey to Brussels, was taken suddenly ill, and died at the house of his sister-in-law, the Countess de Sade, Passy, Paris, on the 29th of December, 1867. He was born at Turin in 1805, and was consequently in his 63rd year at the time of his decease.

* **MARSTON, WESTLAND, LL.D.**, dramatist and novelist, was the son of a dissenting minister at Boston, in Lincolnshire, where he was born January 30th, 1820. He was articled to a solicitor in London, and went through the usual course of study; but on the termination of his articles he followed the bent of his own inclination, by adopting literature as a profession. In a career of about thirty years he has produced many works, mostly in one or other of two forms, serious dramas and short tales. In 1841 appeared 'The Patrician's Daughter,' a tragedy in five acts; in 1842, 'Gerald,' a dramatic poem, with other poems; in 1847, 'The Heart and the World,' a play in five acts; in 1849, 'Strathmore; or, Love and Duty,' a tragedy in five acts; in 1850, 'Philip of France and Marie de Méranie,' also a tragedy in five acts; in the same year, 'A Life's Ransom,' a three-act play; and in 1852, 'Anne Blake,' a play in five acts. Among other works by him are 'Borough Politics,' a comic drama in two acts; 'The Hard Struggle,' a short domestic drama; 'Trevanion; or, the False Position,' a play in three acts; 'Pure Gold,' a play in four acts; 'The Wife's Portrait,' a drama in two acts; and two comedies, 'Donna Diana,' and 'Lamed for Life,' 1871. In 1855 appeared his 'Death-ride at Balaklava: a Tale of the Light Brigade.' In 1856 he cooperated with Mr. John Saunders in conducting the 'National Magazine.' Among his more recent works are a novel, 'A Lady in her Own Right,' 1860; a collection of tales, including 'Family Credit,' 1861; and a comedy, 'The Favourite of Fortune,' 1866. In 1870 another collection of his tales appeared, including a new edition of 'The Wife's Portrait.' Dr. Marston

has written the more important of his plays in verse, with a care that raises them above the ordinary level of contemporary dramas. Some of them, acted at the London theatres, are included either in Webster's or Lacy's 'Editions of Acting Plays.'

* **MARTIN, THEODORE**, a scholar and poet, remarkable especially for the vigour and elegance of his verse-translations, was born at Edinburgh in the year 1816, and was educated successively at the high school and the university of his native city. He adopted law as a profession, and for some years practised as a solicitor in Edinburgh; which he quitted in 1846, in order to establish himself in London as a solicitor and parliamentary agent. Devoted to literature from an early period of life, he attracted attention by his fugitive contributions to magazines, which he subscribed with the pseudonym of "Bon Gaultier." It was under this name that he edited the 'Book of Ballads,' 16mo, London, 1845, fifth edition, "illustrated by Doyle, Leech, and Crowquill," 8vo, London and Edinburgh, 1857, which, the joint production of himself and the late Professor W. E. Aytoun, were variously distributed as "Spanish," "American," and "Miscellaneous." A few years after the first issue of the 'Bon Gaultier Ballads,' Mr. Martin published an English translation of 'Kong Rene's Datter: lyrisk Drama,' 12mo, Copenhagen, 1847, the author of which was Henrik Hertz, with the title of 'King Rene's Daughter: a Danish lyrical Drama,' 8vo, London, 1850, second edition, 12mo, Edinburgh and London, 1864. This play was produced on the stage with great effect, its principal character having the advantage of being personated by Miss Helen Faucit, who, on the 25th of August, 1851, became the wife of Mr. Martin at Brighton. Mr. Martin, who was at this time known as one of the writers in the 'Edinburgh Review,' followed up his 'King Rene's Daughter' by translations from another Danish dramatist, Adam Gottlob Oehlenschläger, two of whose plays he published in an English form, and with notes, as 'Correggio. A Tragedy,' &c., 8vo, London, 1854, and 'Aladdin: or the Wonderful Lamp. A dramatic Poem in two Parts,' &c., 8vo, London, 1857. Other translations followed:—Goethe's 'Poems and Ballads,' 8vo, Edinburgh, 1859, second edition, 8vo, Edinburgh and London, 1860, in the production of which he had Professor Aytoun for a collaborateur; Goethe's 'Faust. A dramatic Poem,' &c., 8vo, London, 1865, second edition, 1866, third, 1870; 'The Odes of Horace translated into English Verse [with the Epodes and the Secular Hymn], with a Life and Notes,' &c., 8vo, London, 1860, third edition, 8vo, London and Edinburgh, 1870; 'The Poems of Catullus. Translated into English Verse, with an Introduction and Notes,' &c., 8vo, London, 1861; 'The "Vita Nuova" of Dante. Translated, with an Introduction and Notes,' &c., 8vo, London, 1862; and 'Poems: original and translated [from the German of Goethe, Schiller, and Uhland], "printed for private circulation," 8vo, London, 1863. In 1867 he published a 'Memoir of William Edmondstone Aytoun, D.C.L.;' and he is understood to be occupied in preparing for publication the continuation of the Life of the Prince Consort.

* **MARTIN DE MOUSSY, JEAN ANTOINE VICTOR**, geographer, was born at Moussy le Vieux, June 26, 1810. After studying at Paris, he entered the Military Hospital, obtained his degree of doctor of medicine, and in 1841 went to South America, where he settled down to medical practice at Monte Video. For twelve years he kept a constant register of meteorological phenomena; and he took a prominent part in the defence of Monte Video during the nine years it was besieged. In 1852 he commenced his exploration of the Argentine Confederation. From 1855 to 1858 he was entirely occupied in travelling about the country, and making short excursions into the neighbouring parts of Chili and Bolivia. He made a large collection of facts relating to the geography, ethnography, geology, and statistics of the districts visited by him. From these materials he has drawn up a 'Description Géographique et Statistique de la Confédération Argentine,' 3 vols. 8vo, Paris, 1860—1864. He has also written short accounts of the same country in the reports on the Universal Exhibition of 1867, and contributed articles to the 'Encyclopédie des Connaissances utiles,' the 'Dictionnaire Politique,' and to the 'National' newspaper.

MARTINEZ DE LA ROSA, FRANCISCO [E. C. vol. iv. col. 125.] On the formation of the short-lived Armero-Mon ministry, October 1857, Martinez de la Rosa returned to office as first secretary of state for foreign affairs. In July 1858 he was appointed president of the Council of State in the ministry of O'Donnell. In May, 1860, he was elected president of the Cortes, and re-elected in November, 1861. He died at Madrid on the 7th of February, 1862.

MARTIUS, CARL FRIEDRICH PHILIP VON [E. C. vol. iv. col. 128]. This eminent observer held, in addition to the posts previously mentioned, the perpetual secretaryship of the Academy of Munich, in which capacity he composed numerous *éloges* on deceased scientific men. His great work on palms, '*Historia Naturalis Palmarum*,' fol. 1823—1850, consists of three volumes, and contains 245 plates. His '*Flora Brasiliensis*,' which was commenced in 1829, reached its 48th fasciculus in 1869, and still remains incomplete. He was assisted by many of the most eminent botanists of the day. He also wrote another important work, viz., '*Beiträge zur Ethnographie und Sprachenkunde Amerikas zumal Brasiliens*,' 2 vols. 8vo, Leipzig, 1867, which is an admirable account of the nations of South America, while the section relating to the Brazilians is remarkably full and exhaustive. He died December 13, 1868.

MASSARD, JEAN, an eminent French engraver, was born at Bellême, August 22nd, 1740. In the main self-taught, he formed his style on that of J. C. Wille, of whom he may be considered one of the most successful followers. In 1814 he was appointed engraver to the king. He engraved several plates in the '*Musée Royal*' and the '*Florence Gallery*.' Among his best prints are '*Hagar and Ishmael*,' '*Virgin and Child*,' and '*The Family of Charles I.*,' after Vandyck; '*The Death of Socrates*,' after David; and the '*Broken Pitcher*,' after Greuze. There are also some good prints by him after Raffaele, Domenichino, Rembrandt, &c. He died at Paris, March 16th, 1822.

MASSARD, JEAN-BAPTISTE RAPHAEL-URBAIN, son of the preceding, was born at Paris in 1775. He studied design in the atelier of David, and engraving under his father. His prints are clean in line, and neatly finished, like those of his father, but hardly so vigorous. Among the best are '*St. Cecilia*,' after Raffaele; '*Apollo and the Muses*,' after Giulio Romano; and the '*Rape of the Sabines*,' after David. He died September 27th, 1849.

MATTEI, STANISLAUS, ABBÉ, an Italian musical composer and conductor, was born at Bologna, February 10th, 1750. As a poor boy, he loved to listen to the sacred music at the church of a neighbouring Franciscan monastery, and his eager attention attracted the notice of the celebrated Padre Martini, who was the maestro di capella. Young Mattei entered as a choir-pupil, took the Franciscan vows at the age of sixteen, and became a priest at twenty-one. As a relaxation from severer discipline, he studied the theory and composition of music. He was first the dutiful pupil, then the affectionate friend, then the confessor, of Martini; and when the latter died, in 1784, Mattei succeeded him as maestro di capella. In 1791, and again in 1794, he was president of the Philosophical Society of Bologna. The tenour of his life was changed in 1798, when the French entered Bologna, and suppressed the monastery. He supported himself for some years as a teacher of music, as a maestro di capella at St. Petronia, and as one of the professors at a lyceum maintained by the French for a short time at Bologna. Among his pupils were Morlacchi, Pilotti, Palmerini, Perotti, Mancini, Tadolini, and two who afterwards rose to great eminence, Rossini and Donizetti. In 1808 he was elected member of the musical section in the Italian Institute of Science, Literature, and the Arts. In 1824 he was admitted as one of the associates of the Académie des Beaux Arts, in the French Institute. He continued to fill the office of maestro di capella at St. Petronia till his death, which took place on the 12th of May, 1825. He was held in such general esteem that his funeral was conducted with musical honours. The Abbé Mattei is said to have composed as many as eight hundred pieces of music. Almost every kind of church music is included among them—masses for three, four, six, and eight voices, some with organ and some with orchestral accompaniments; kyries, credos, dies iræ, stabat maters, misereres, funeral masses, motetts, hymns, psalms, graduals; a '*Passione*,' for four voices and chorus; and several offertory symphonies. Of a more secular kind are numerous cantatas, rondos, choruses, trios, recitatives, airs, exercises for figured basses for violins and violas, fugues for the organ and orchestra, &c. In early life he composed an opera buffa for four voices, '*La Bottega del Libraio*,' performed at the Seminario di Bologna, before the Cardinal-Archbishop Gioanetti; and, for the same place, two choruses for an oratorio, '*Sedecias*.' His music generally is characterised by rich harmony and a scientific development of fugue and counterpoint; the solo compositions have less merit. As a teacher of music, he published '*Contrappunti*,' for two to eight voices, 1788; '*Pratica d'Accompagnamento e Contrappunti*,' and '*Principj di Musica*,' 1804.

MATTEIS, PAOLO DE', a celebrated painter of the Neapo-

litan school, was born at Cilento in 1662. He was the best of the scholars of Luca Giordano, whom he equalled in celerity, though not in ability. He was also a pupil of Morandi. He spent three years in France, where he obtained considerable celebrity. At Rome, where he was invited by Pope Benedict XIII., he painted the Minerva and the Church of Ara Coeli. At Genoa he painted a S. Saverio, and an Immaculate Conception for the Church of S. Girolamo. But his chief works were executed at Naples; that on which he most prided himself being the decoration, in ten days, of the large cupola of the Gesù Nuovo (since destroyed) with frescoes in the manner of Lanfranco. His paintings in the Matalona gallery and in the church of the Pii Operai are in a better style. Matteis, Lanzi thinks, may vie with any painter of his age. He is, however, one of the able men who are chiefly memorable as prominent amongst those who helped forward the decline of art in Italy. He died in 1729. Matteis etched some plates, and wrote a folio volume of instructions in design, '*Il Libro d'Insegnamento del Disegno*.'

MATTER, JACQUES, a French philosopher and ecclesiastical historian, was born on the 31st of May, 1791, at Altkendorf, in the Bas-Rhin, and, being destined by his father for the profession of law, was educated successively at the Gymnasium of Strasburg and the University of Göttingen. Afterwards, with the idea of preparing himself for a diplomatic career, he repaired to Paris, where he attended the lectures of Boissonade, Lécrotelle, and others, in the faculty of letters. In 1816, he carried off the prize of the Académie des Inscriptions et Belles-Lettres, for his '*Essai historique sur l'Ecole d'Alexandrie*.' Coup d'Œil comparatif sur la Littérature grecque, depuis le Temps d'Alexandre le Grand jusqu'à celui d'Alexandre Sévère,' 2 vols. 8vo, Paris and Strasburg, 1820, second edition, "entièrement refondue," with the modified title of '*Histoire de l'Ecole d'Alexandrie, comparée aux principales Ecoles contemporaines*,' &c., 3 vols. 8vo, Paris, 1840—44. In 1819, having taken his degree of docteur-ès-lettres, he received, through the influence of MM. Royer-Collard and Guizot, the post of professor of history at the College of Strasburg, and, two years after, was appointed to the chair of ecclesiastical history at the Academy, and to the direction of the Gymnasium of that city. Devoting himself to the studies and the duties of his position, he produced a work with which he a second time obtained the prize of l'Institut, and which was entitled, '*Histoire critique de Gnosticisme, et de son Influence sur les Sectes religieuses et philosophiques des six premiers Siècles de l'Ere chrétienne*,' 2 vols. 8vo, Strasburg and Paris, 1828, second edition, 3 vols. 8vo, Strasburg, 1843—44; and also published his '*Histoire universelle de l'Eglise chrétienne*,' 4 vols. 8vo, Strasburg and Paris, 1829—35, second edition, with the modified title of '*Histoire générale de Christianisme, de ses Institutions et de ses Doctrines*,' 4 vols. 8vo, Paris, 1843. As a tribute to the erudition and ability of the '*Histoire de Gnosticisme*,' Dr. Matter was appointed in 1828, the year of its first publication, to be inspector of the Academy of Strasburg; and, in 1831, became a corresponding member of the Académie des Inscriptions, whose prize he received, for the third time, for his '*Histoire des Sciences mathématiques et cosmographiques à l'Ecole d'Alexandrie*,' which was incorporated with the second edition of the '*Histoire de l'Ecole d'Alexandrie*.' His next important publication was a treatise, '*De l'Influence des Mœurs sur les Lois, et de l'Influence des Lois sur les Mœurs*,' 8vo, Paris, 1832, second edition, 1843, to which the Académie Française awarded an extraordinary prize of ten thousand francs, and the first publication of which was almost synchronous with the author's removal to Paris, to undertake the office of inspector-general of studies. In 1845, he became inspector-general of the libraries of France, officer of the Legion of Honour, and ordinary counsellor of the University. He received the membership of various learned and philosophical societies; and, having contributed much by his writings, which circulated in several European languages, to the interests of education, he died, June 23, 1864.

The works of Dr. Matter, in addition to those which have been already mentioned, include '*De l'Affaiblissement des Idées et des Etudes morales*,' 8vo, Paris, 1841; '*Schelling: ou, la Philosophie de la Nature et la Philosophie de la Révélation*,' 8vo, 1842, new edition, 8vo, Paris, 1845; '*Lettres et Pièces rares ou inédites, publiées et accompagnées d'Instructions et de Notes*,' 8vo, Paris, 1846; '*De l'Etat moral, politique et littéraire de l'Allemagne*,' 2 vols. 8vo, Paris, 1847; '*Une Excursion gnostique en Italie*,' 8vo, Strasburg, 1852; '*Du Ministère ecclésiastique et de sa Mission spéciale dans ce Siècle*,' 8vo, Paris, 1852;

'Histoire de la Philosophie dans ses Rapports avec la Religion depuis l'Ère chrétienne,' 12mo, Paris, 1854; 'Du Vrai Type de l'Eloquence Sacrée: Discours,' &c., 8vo, Paris, 1854; 'La Philosophie de la Religion,' 2 vols. 12mo, Paris, 1857; vol. i., 'La Science de Dieu. La Science du Monde matériel,' vol. ii., 'La Science du Monde spirituel,' 'La Morale: ou, la Philosophie des Mœurs,' 12mo, Paris, 1860; 'Saint Martin, le Philosophe inconnu: sa Vie et ses Écrits,' &c., 8vo, Paris, 1862; 'Emmanuel de Swedenborg: sa Vie, ses Écrits, et sa Doctrine,' 8vo, Paris, first two editions, 1863; and 'Le Mysticisme en France au Temps de Fénelon,' 8vo, Paris, 1864.

MATTEUCCI, CARLO, eminent for his researches in electricity and electro-physiology, was born at Forlì, June 21, 1811. His earlier education was received at Bologna, and his later at the Polytechnic School at Paris. In 1831 he returned to Italy, and resolved to devote himself to the study of physics. Before this, however, the future tendency of his thoughts had manifested itself in a few short papers which he had written on the influence of the electricity on the earth's surface on climate, on the electric power of the sun's rays, and on the action of the voltaic pile. In 1837 he was invited to assume the directorship of the chemical laboratory connected with the Surgical Hospital at Ravenna, and the professorship of physics in the college of the same town. In 1840 he was transferred to the chair of physics at Pisa. In 1846 he was appointed director of the telegraphic line of Tuscany; in 1848 was made a senator; and in 1860 was elected a member of the Italian Parliament. He took a part in reorganising the Italian kingdom, and was named inspector-general of all the Italian telegraphic lines. In 1862 he succeeded Mamiani as minister of Public Instruction. He was a member of numerous scientific societies, and many honours were conferred upon him by his country. The Copley medal of the Royal Society of London was given him in recognition of his merits. He died June 25, 1868. His papers and books are very numerous, but mostly relate to electricity. Amongst the latter the more important are 'Essai sur les Phénomènes Électriques des Animaux,' 8vo, Paris, 1840; 'Lezioni di Fisica,' of which four editions have appeared at Pisa, and three at Naples; 'Lezioni sui Fenomeni fisico-chimici dei corpi viventi,' 2nd ed. 8vo, Pisa, 1846; 'Lezioni di elettricità applicate agli arti industriali, all'economia domestica e alla terapeutica,' 8vo, Torino, 1852; 'Manuale di Telegrafia Elettrica,' 8vo, Pisa, 1851; 'Cours d'Électro-physiologie,' 8vo, Paris, 1858. As minister of Public Instruction, he endeavoured to advance the progress of education in scientific subjects, and wrote some works on the subject, of which the following may be mentioned: 'La Réorganisation Universitaire en Italie,' 8vo, Paris, 1863; 'Sull'indirizzo degli Studi e sul riordinamento dei locali del Museo di fisica e di storia naturale di Firenze,' 8vo, Florence, 1866; and 'Raccolta di Scritti varii intorno all'Istruzione Pubblica,' 2 vols. 8vo, 1867. His papers are upwards of 250 in number. They mostly relate to the electricity of animals, such as the electrical condition of the muscles, the influence of electrical currents in physiological phenomena, and the electrical functions of the torpedo; to the electricity of the air; to diamagnetism; to the electro-chemical decomposition of compounds; and to various questions more or less connected with electricity. He assisted in establishing the law that the amount of electricity which will separate a certain quantity of an element from the substance with which it is combined will also release a quantity of any other element which is chemically equivalent thereto. He ascertained that the electric state of a muscle is modified when in the act of contracting; but this subject was afterwards more fully developed by Raymond. He found that the electro-motive power of a muscle depended not upon the area of the cross section, but upon the length, and that it was greater in proportion to the degree of organisation of the animal, being greatest in mammals and birds. He proved that the processes of nutrition and secretion give rise to electric disturbance. His researches on the torpedo were continued at intervals over many years, and formed the subject of many papers. He demonstrated that the electric organ of the fish is always charged with electricity, that currents are always circulating in the water surrounding its body, and that the organ retains its functions independent of nervous influence. The discharge of the organ is dependent on the will of the animal, or on mechanical irritation of the nerves; but the accumulation of electricity is quite independent of its will. By these and other researches he materially advanced the sciences which he cultivated.

MATTHAI, JOHANN FRIEDRICH, German painter, was born at Meissen, March 4th, 1777. His father, Johann Gotlob

Matthäi (born at Meissen, 1753, died at Dresden, 1832), a sculptor of some ability, and keeper of the Mengs Gallery of Casts at Dresden, was his earliest instructor in art. After leaving the Dresden Academy, Friedrich Matthäi studied in Paris under Casanova; in Vienna, under Füger; then proceeded to Italy, and in 1809 won the prize for painting at Florence. The pictures sent by him from Italy to the Dresden Exhibition excited much interest. He was, in 1809, nominated professor of painting in the Dresden Academy. For a long series of years Matthäi was one of the leaders of the Dresden school of painting, and many eminent living painters of Germany were his pupils. His works are admired for correct drawing, careful finish, and a warm tone of colour, which reminds the observer of that of the Florentine school. He died at Vienna, whilst on a journey, October 23rd, 1845.

MATTHIÆ, AUGUST HEINRICH, a distinguished German philologist, was born on the 25th of December, 1769, at Göttingen, and was educated successively at the Gymnasium and the University of his native town. In 1789, he repaired to Amsterdam, where, while fulfilling the duties of a private tutor, he further developed those studies in philosophy and classical antiquities which had especially occupied his attention at Göttingen. In 1798, he was appointed professor at an educational institution at Weimar; and, in 1801, became director of the Gymnasium of Altenburg, the duties of which office he performed until his death, on the 6th of January, 1835.

The works of Matthiæ, many of which have been especially valuable to the interests of classical education, include, 'Commentatio de Rationibus ac Momentis quibus Virtus nullo Religionis Præsidio munita sese commendare ac tueri possit,' 4to, Göttingen, 1789; 'Animadversiones in Hymnos Homericos cum Prolegomenis de cujusque Consiliis, Partibus, Ætate,' 8vo, Leipzig, 1800; on the Difference of National Character, 'Versuch über die Ursachen der Verschiedenheit in den Nationalcharakteren. Eine Preisschrift,' 8vo, Leipzig, 1802; 'Homeri Hymni et Batrachomyomachia,' &c., 8vo, Leipzig, 1805; 'Miscellanea Philologica,' 2 vols. 8vo, 1803—4, second edition, Leipzig and Altenburg, 1809; a complete Greek Grammar, 'Ausführliche griechische Grammatik,' &c., 8vo, Leipzig, 1808, third edition, 3 vols. 8vo, Leipzig, 1835, &c., French translation, by Longueville and Gail fils, 3 vols. 8vo, Paris, 1831—36, English translation, by E. V. Blomfield, and edited by C. J. Blomfield (afterwards Bishop of London), 'A copious Greek Grammar,' &c., 2 vols. 8vo, Cambridge, 1818, fifth edition, "thoroughly revised and greatly enlarged from the last edition of the original, by J. Kenrick," 2 vols. 8vo, London, 1852, an epitome of which, by C. J. Blomfield, appeared as 'A Greek Grammar, abridged,' &c., 12mo, London, 1822, fourth edition, "revised by the Rev. J. Edwards," 12mo, London, 1834, sixth edition, 1839, new and enlarged edition, by E. S. Crooke, &c., 8vo, London, 1870; Elements of Greek and Latin Literature, 'Grundriss der Geschichte der griechischen und römischen Literatur,' Jena, 1815, &c., third edition, 8vo, Jena, 1834, English translation, 'A Manual of the History,' &c., 4to, Oxford, 1841; Project of a Theory of Latin Style, 'Entwurf einer Theorie des lateinischen Stils,' 8vo, Leipzig, 1826; Handbook of Philosophy, the original German edition of which appeared at Leipzig, 1823, &c., French translation, by M. H. Poret, 'Manuel de Philosophie. Traduit de l'Allemand sur la troisième édition,' &c., 8vo, Paris, 1837; Miscellaneous Writings, &c., 'Vermischte Schriften in lateinischer und deutscher Sprache,' 8vo, Altenburg, 1833. Matthiæ is also known for several valuable editions of the whole, or of portions, of the works of several classical authors, as Homer, Alcæus, Herodotus, Cicero, &c., and especially for his edition of Euripides, 'Euripidis Tragediæ,' 9 vols. 8vo, Leipzig, 1813, and following years; to which a tenth volume of 'Indices' was added by Kamppmann, 8vo, Leipzig, 1837.

MATTHIESSEN, AUGUSTUS, the son of a London merchant, was born the 2nd January, 1831. When between two and three years of age, he was seized with paralysis, from which he never quite recovered. While still very young, he lost both his parents, and his guardians did not agree to his strong desire to devote himself to science, or even to follow his father's pursuit, deeming the paralytic affection from which he suffered sufficient to incapacitate him for either. In order to strengthen his constitution, they selected a business which would require him to be much in the open air of the country, and accordingly apprenticed him to a farmer in Dorsetshire. During the three years which he passed at the farm he devoted much of the time and money that were at his disposal to experiments in chemistry. As soon as he became of age, he went to Giessen, and studied

chemistry and physics under Professors Will and Buff, and also took his degree of doctor of philosophy. He next went to Heidelberg, where under Bünsen's direction he commenced the preparation of the metals, of the alkalies and the alkaline earths, and the study of their physical properties. He further worked on this subject in the laboratory of Kirchhoff, and in 1857 published an account of his experiments on the electrical conductivity of many of the metals, metalloids, and some alloys. In 1857 he returned to England, and worked for a short time under Dr. Hofmann at the College of Chemistry. He afterwards had a laboratory of his own at his house in Torrington Place, and worked there during about four years, on the nature of alloys and the properties of the metals. [See ALLOYS, E. C. S., ARTS AND SCIENCES DIV., col. 99.] He also gave attention to the organic alkaloids, and his latest papers relate to the organic bases, narcotine, morphine, and codeia. In 1861 he became a fellow of the Royal Society, and in 1862 lecturer on chemistry at St. Mary's Hospital Medical School, a post which he exchanged after six years for a similar one at St. Bartholomew's Hospital, where a new laboratory was built under his supervision. Here he continued for some time interested in his work, planning new researches, completing old ones, instructing a large class of students, carrying on an extensive consulting practice, managing everything with precision and regularity, when he was made the subject of a brutal charge, apparently for the purpose of extorting money, the effect of which was so to disturb the functions of an overworked brain, that he died by his own hand on the 6th October, 1870, at the age of 39. His loss to science just as he had attained the foremost position is much to be lamented. He obtained the Royal Medal of the Royal Society in 1869, and in 1870 was chosen one of the examiners in chemistry of the University of London. He presented a remarkable instance of a man overcoming great natural defects, so as to be able to lecture to large audiences.

MATTIOLI, LUIGI, Italian engraver, was born at Crevalcore in 1662. He studied painting under C. Cignani; but his pictures not succeeding, whilst his pen-drawings of landscapes found a ready sale, his thoughts were turned towards engraving, and he took lessons of G. Crespi. As an engraver he was industrious and successful. Nearly two hundred of his plates have been catalogued, but many are very slight. Perhaps the most esteemed is an Annunciation after L. Carracci. Several others of his prints are after the same master, A. Carracci, Guido, &c., and many are from his own designs. He died at Bologna in 1747.

MATTIOLI, PIETRO ANDREA, botanist, was born at Sienna, March 23, 1500. His youth was passed in Venice, where he learned Greek and Latin, and he then went to the University of Padua to study law, but preferred medicine. Having obtained his degree of doctor of medicine, he practised at Sienna, and soon realized a fortune. For some years he lived at Rome, but owing to war he withdrew to a place near Trent, and remained there from 1527 to 1540. From 1540 to 1552 he lived at Göriz, and was soon after appointed the principal physician to the Emperor Maximilian II. He resigned this post in 1562, and retired to Trent, where he died in 1577.

Mattioli is best known for his 'Commentarii in libros sex P. Dioscoridis de Materia Medica, &c.' folio, Venice, 1544, which was repeatedly reprinted, re-edited, and translated into various languages. For a long time it was the great text-book on materia medica. The most valued edition is that of 1565, which contains upwards of 1000 excellent wood-engravings. J. Bauhin brought out a new edition of it in 1598, and raised the number of woodcuts to 1400. Mattioli also wrote a 'Compendium de Plantis omnibus,' 4to, Venice, 1571. This work has also been translated into various languages. Most of his other works have been collected in 'Opera quæ extant omnia: hoc est, Commentarii in vi. libros P. Dioscoridis; De ratione distillandi aquis ex omnibus plantis; Apologia in Amatium Lusitanum; Epistolarum Medicinalium; Dialogus de Morbo Gallico,' folio, Frankfurt, 1598.

MATURIN, CHARLES ROBERT, a poet, novelist, and divine, the descendant of a French Huguenot family, who had been driven from their country by the revocation of the Edict of Nantes, was born at Dublin, in the year 1782, and received his education at Trinity College in that city. Immediately after the completion, with considerable distinction, of his academical course, he married; and, having taken orders, was admitted to the curacy of St. Peter's, Dublin. In order to increase his income, which had been seriously curtailed by the misfortunes of his father, he set up a boarding-school; and, when he was obliged to sell this to meet the demands of the creditors of a

BIOG. DIV.—SUP.

friend for whom he had become security, he sought to compensate himself by the proceeds of his literary activity. His works, which, in common with his general character and demeanour, exhibited abundant marks of genius, wildness, and eccentricity, achieved various degrees of popularity, but his pulpit eloquence is said to have been of an extremely high order. His controversial sermons, 'Five Sermons on the Errors of the Roman Catholic Church,' 8vo, Dublin, 1824, second edition, 12mo, Dublin, 1826, attracted greater crowds to the parish church during their delivery, which was in Lent, 1824, than had been seen there from the time of Dean Kirwan; and they alone constitute a sufficient monument on which to rest his reputation. Some years before the delivery of these polemical discourses, he had published a volume of 'Sermons,' 8vo, London, 1819, second edition, 1821; but all his talent and eloquence did not avail against the extravagances of an ill-balanced mind to procure him further professional advancement than that with which he entered upon clerical duty. After a protracted illness, he died, curate of St. Peter's, at his house in York Street, Dublin, on the 30th of October, 1824.

His principal dramatic work is 'Bertram: or, the Castle of St. Aldobrand. A Tragedy in Five Acts [and in verse],' 8vo, London, first five editions, 1816, and published in vol. iii., 8vo, London, 1844, of 'The British Drama,' French translation, by MM. Taylor and C. Nodier, 'Bertram: ou, le Château de St. Aldobrand. Tragédie en cinq Actes, traduite librement,' &c., 8vo, Paris, 1821, and with the English text, in No. V. of 'Glashin and Robertson's English Theatre,' 12mo, Paris, 1830 (7). 'Bertram,' which was highly commended by Sir Walter Scott, and which had been rejected by the Dublin managers, was brought out, through the influence of Lord Byron, at Drury Lane, with complete success, to which the acting of Edmund Kean greatly contributed. To 'Bertram' succeeded an unsuccessful tragedy, entitled, 'Manuel,' 8vo, London, first two editions, 1817, which Lord Byron characterised as the "absurd work of a clever man;" and 'Fredolfo. A Tragedy in five Acts [and in verse],' 8vo, London, 1819, the extravagances and want of decorum of which confounded the critics who considered it as the production of a clergyman. Mr. Maturin's other works include 'Fatal Revenge: or, the Family of Montorio. A Romance,' 3 vols., 12mo, London, 1807; 'The Wild Irish Boy. A Novel,' 3 vols., 12mo, 1808; and 'The Milesian Chief. A Romance,' 4 vols., 12mo, 1811, all of which works, apparently devoted to the task of outdoing Mrs. Radcliffe or Monk Lewis in horror and grotesquerie, were published under the pseudonym of Dennis Jasper Murphy; 'Woman: or, Pour et Contre. A Novel,' 3 vols., 12mo, Edinburgh, 1818; 'Melmoth, the Wanderer. A Novel,' 4 vols., 12mo, 1820; and 'The Universe. A Poem,' 8vo, London, 1821. His son,

* EDWARD MATURIN, has been for a number of years a resident in New York. He is the author of 'Montezuma, the Last of the Aztecs. A Romance,' 2 vols., 12mo, New York; 'Benjamin, the Jew of Granada. A Romance,' 12mo; 'Eva: or, the Isles of Life and Death,' 2 vols., 12mo, 1848; 'Lyrics of Spain and Erin,' 12mo, Boston (U.S.), 1850; and 'Bianca. A Tale of Erin and Italy,' 12mo, New York, 1852.

MAUREPAS, JEAN FREDÉRIC PHÉLYPEAUX, COMTE DE, a French minister, was born at Versailles, July 9th, 1701. His father was secretary of the Maison du Roi to Louis XIV., and at the same time secretary of state for the Marine; and young Maurepas succeeded him nominally in the first of these two posts when in his fifteenth year, and formally in 1718, when he was declared of age for that purpose. In 1723 he became secretary of the marine also. As a minister of state he sat at Cabinet Councils, where his characteristics came into full play. Marmontel pictured him as being superficial, indolent, ill-instructed, gay, frivolous, selfish; nevertheless, he retained his influence by quickness of perception, suppleness, an insinuating manner, fertility in devising means and expedients, and persuasive powers of conversation. It was to his credit that he worked well at the Marine or Admiralty. He attached geometers and astronomers to that department of the government; employed Maupertius, Clairaut, Bouguer, Godin, &c., in scientific investigations; sent out two geodetical expeditions to measure an arc of the meridian; made himself personally familiar with the chief ports and arsenals; encouraged improvements in naval construction; established a naval school at Paris; sent surveying expeditions along the coast of France; and caused new and improved charts to be drawn and engraved. Maurepas's fall was sudden and complete. In 1740 a witty but licentious lampoon on Madame de Pompadour, the reigning favourite at

court, was traced to the pen of Maurepas. Louis XV. at once disgraced him, and never again gave him honour or office during the remaining twenty-five years of his reign. Maurepas was exiled first to Bourges, then to Pontchartrain. He had become a sort of oracle, a model to be copied, a brilliant courtier to be imitated; and he seems to have borne his banishment from court with a light heart. When Louis XV. died, and Louis XVI. ascended the throne, in 1774, Maurepas was again summoned to court. The young king intended to have given him a secondary post in the ministry; but the count, by a mixture of address and audacity, obtained the offices of minister of state and president of the council of finance—becoming, in fact, chief minister. The young king was not without good or, at any rate, honest well-intentioned advisers; Turgot, Malesherbes, and Necker being among his financial ministers. The first two, in conjunction, drew up many schemes of reform, especially in concerns of national income and expenditure; but Maurepas, frivolous and selfish, and jealous of the influence they had acquired or might acquire, thwarted their intentions; and he found the clergy and the nobility only too ready to aid him in discouraging the reform schemes. He re-established the ancient parliaments of France, but too late, and with too little power, to avert the Revolution which was gradually approaching. But Maurepas had no real desire for popular institutions: his one purpose was by any means to maintain himself in power; and as he had acted towards Turgot and Malesherbes, so at a later date he acted towards Necker in embarrassing his proceedings and discouraging his plans of financial improvement. His weak, trifling, and selfish conduct rather hastened than arrested the catastrophe of the French monarchy; but Maurepas escaped from experiencing in his own person the effect of the Revolution he had done much to render inevitable. He died in the palace of Versailles on the 21st of November, 1781.

MAURER, CHRISTOPH, sometimes written MURER, Swiss painter and engraver, was born at Zurich in 1558. The son of Josias Maurer, a favourite painter on glass and poet (born 1530, died 1580), he was early instructed in the principles of design by his father, but later studied under Tobias Stimmer, of Schaffhausen, whose manner he adopted. He painted in fresco, in distemper, and on glass, etched on copper, and engraved on wood. His best prints are a set of Hunting Scenes from the drawings of Stimmer, published in 1605; a series of woodcuts of scriptural designs, which, however, though designed, were certainly not all engraved by him; a set of 20 plates and 20 etchings of Miscellaneous Emblems, published posthumously, in 1622, by J. H. Bordorf, and several portraits. Maurer's prints are now very rare, and much prized. He seems to have been a prosperous man, and held in esteem by his fellow-citizens, as he was member of the great council of Bern, and charged with the administration of the state expenditure at Winterthur, where he died in 1614.

MAURO, FRA, a celebrated Italian geographer, who died October 20, 1459, but about whom little is known, beyond his being a monk resident in the monastery of San Michele de Murano, near Venice, and a great authority upon geographical matters amongst his contemporaries. He executed a map of the world, which still exists in manuscript in the library of his monastery. Its date is supposed to be about 1457. It is a little over six feet each way, and is in itself a fine specimen of penmanship. Although, judged by the present state of science, it abounds in errors, and is faulty as regards the proportions and forms of the continents, still it was far superior to any map previously drawn in its approach to accuracy and the range of countries delineated; and indeed surpassed many of the maps of posterior date. In other and older maps the northern portions of Europe and Asia and the south of Africa were unknown regions, but in his they are drawn in something like their true form and position. This map has been copied and published by numerous persons, as by Fraser in 1804, Zurla in 1806, and MacCarthy in 1846.

* MAURY, LOUIS FERDINAND ALFRED, French archaeologist, was born at Meaux (Seine-et-Marne), on the 23rd of March, 1817. He was educated with a view to the profession of an engineer, but, displaying a marked preference for literature, he obtained an appointment in 1836 in the Bibliothèque Royale, where, however, he only remained two years. He then studied the ancient languages and literature, medicine, and law, and was admitted as avocat; but was recalled to the Bibliothèque in 1838. In 1842 he translated Boissier's 'Monuments d'Architecture des Bords du Rhin,' large folio, Munich; and was shortly after elected sub-librarian of the Institute. In 1843

he published an 'Essai sur les Légendes pieuses du Moyen Âge,' a work of great learning and acumen; and 'Les Fées du Moyen Âge,' 12mo, Paris, 1843, 2nd edition, 1855. The subjects treated in these works have been further developed by him in memoirs in various archaeological journals, and in the article 'Fée' in the 'Encyclopédie Moderne,' whilst correlative matters were treated in 'De l'Hallucination envisagée au point de vue philosophique et historique,' 8vo, Paris, 1845; 'Considérations pathologico-historiques sur les Hallucinations,' 8vo, 1846; 'La Magie et Astrologie dans l'Antiquité et au Moyen Âge,' 8vo, Paris, 1860; 'Le Sommeil et les Rêves: Études psychologiques,' 1861; and 'Croyance et Légendes de l'Antiquité,' 1863. Meanwhile his attention had been directed to a very different subject, which he illustrated in a work of great research, entitled 'Histoire des Forêts de la Gaule et de l'ancienne France, procédée de Recherches sur l'Histoire des Forêts de l'Angleterre, de l'Allemagne et de l'Italie, et de considérations sur les caractères des Forêts des diverses parties du Globe,' 8vo, Paris, 1850; and in an elaborate memoir in the 'Recueil' of the Académie des Inscriptions, 1854, for which he was awarded a gold medal at the Concours des Antiquités nationales in the same year. In 1856 he was nominated knight of the Legion of Honour; in 1857 elected member of the Institute; in 1860 appointed librarian of the Tuileries, and in 1862 professor of history at the Collège de France. Besides the works already mentioned, M. Maury has written a résumé of recent additions to geographical knowledge, under the title of 'La Terre et l'Homme,' 12mo, Paris, 1856; and 'Les Académies d'Autrefois,' 1864; numerous memoirs in archaeological and literary journals; assisted M. Guignaut in the last two volumes of 'Religions de l'Antiquité,' M. É. Pelletan in his 'Histoire du Brahmanisme,' and M. de Clarac in the 'Manuel de l'Histoire de l'Art chez les Anciens,' besides completing, with the assistance of M. de Clarac's MSS., the 'Musée de Sculpture Antique et Moderne,' and editing, as Secretary-General, the 'Bulletin' of the Geographical Society of Paris. M. Maury's most important independent work, however, remains to be mentioned—his 'Histoire des Religions de la Grèce Antique,' 3 vols. 8vo, 1857—60, a work almost exhaustive in its learning, and equally valuable for its general soundness of judgment.

MAURY, MATTHEW FONTAINE, LL.D. [E. C. vol. vi. col. 1012.]

MAXIMILIAN, FERDINAND JOSEPH, Emperor of Mexico, known in his earlier life as the Archduke Ferdinand, brother of the Emperor Francis Joseph of Austria, and second son of the Archduke Francis Charles, was born at Vienna, on the 6th of July, 1832. After careful preparatory study, he entered the Austrian navy, and having made several cruises, and held various subordinate commands, was made rear-admiral, and placed at the head of the Austrian marine. In 1855, he visited Greece, Syria, and Egypt; and in the following year, having visited Paris and the principal naval stations of France, he met, at Brussels, the Princess Charlotte, daughter of Leopold, late King of the Belgians, to whom he was married, on the 27th of July, 1857, whilst holding the position of governor-general of the Lombardo-Venetian territory. He ruled judiciously within the limits of his prerogative, devoting much care and attention to the development of various industrial pursuits and enterprises, and quitted his government in 1859, in the winter of which year he visited Madeira, in the company of his wife, and subsequently made a voyage, for scientific purposes, to Brazil. On his return, he fixed his residence at Miramar, near Trieste, where, on the 3rd of October, 1863, he received a deputation of Mexican notables, who had been commissioned, in virtue of a decree made on the 10th of July previous, to offer him the crown of their country. The ardour and romance of his disposition incited him to a prompt acceptance, contingent only on the will of his imperial brother, and the ratification of the choice by a national vote of the people of Mexico. At length, all obstacles having been overcome, and having especially renounced any possible future claim to the throne of Austria, he solemnly accepted the title offered to him, on the 10th of April, 1864, and, four days after, embarked at Civita Vecchia, in an Austrian frigate, for the scene of his dominion. He arrived at Vera Cruz on the 28th of May, and having landed on the following day, proceeded to make a tour, in the course of which he was well received, especially by the Indian population, entering the city of Mexico on the 12th of June. The popularity of which he and the empress were at this time the objects was testified by various manifestations of joy, both civic and literary, and recorded in various publications, as, for instance, 'Advenimiento de SS. MM. II. Maximiliano y

Carlota al Trono de Mexico. Documentos relativos y Narracion del Viaje de nuestros Soberanos de Miramar á Veracruz, y del Recibimiento que se les Hizo en este ultimo Puerto y en las Ciudades de Cordova, Orizava, Puebla, y Mexico,' 8vo, Mexico, 1864; 'Breve Noticia del Recibimiento y Permanencia de SS. MM. II. en la Ciudad de Puebla,' 4to, Puebla, 1864; 'Coleccion de las Composiciones poeticas inscritas en los Arcos y Arrojadadas al Paso de SS. MM. en su solemne Entrada á la Capital del Imperio,' 8vo, Mexico, 1864; and 'Inscripciones, Poesias y otras Piezas literarias, colocadas, en el Instituto Literario de Toluca, el 28 de Octubre de 1864, en que se dignó visitarlo S. M. I. Maximiliano I,' 12mo, Toluca, 1864. The new emperor devoted himself with great energy to the consolidation and development of his dominions, through a great proportion of which he made a successful progress. He granted an amnesty to political offenders, and instituted the plan of public audiences, where every Sunday he considered the grievances of complainants, and the projects of persons who submitted novel plans for the improvement of the country. In 1865, he proclaimed the Roman Catholic religion to be that of the state, whilst granting toleration to every other kind of faith and worship; and took large measures to ensure the prevalence and excellence of primary education. All the liberalism and paternal solicitude of his legislation was, however, insufficient to conciliate the Republican party, or to compel a general acquiescence in the form and personality of a government which was forced upon Mexico by the French; and the clergy became alienated by the refusal of the emperor to restore to them the enjoyment of the secularised property of the Church. Disappointed with the results of a policy under which the empire was the scene of incessant conflicts between the partisans of President Juarez and the combined French and Imperial troops, and yielding to the advice of the French commander, Maximilian at length adopted measures of mingled feebleness and severity, placing in a state of siege all those provinces in which national resistance had either continued or had been renewed, and issuing a decree, October 3rd, 1865, for the shooting of the members of the Juarist bands, and of those who assisted them. These measures for a time appeared to be effective; but again opposition and conspiracies spread throughout the country, and spies and traitors penetrated the imperial court, and infected even the imperial cabinet. Complications and misfortunes now thickened around Maximilian; jealousies and misunderstandings with Bazaine, and the impending withdrawal of the French troops, which was demanded at once by French opinion at home, and by the representations of the government at Washington, which had from the first resented the Napoleonic idea of giving predominance to the Latin race by the establishment of a monarchy on the continent of North America. A mission, undertaken by the Empress Charlotte to the Emperor Napoleon and to the Pope, was without any more exhilarating effect than loss of reason on the part of the imperial suppliant; and upon the final withdrawal of the French troops, in 1866, Maximilian, who had retired to Orizaba, having put the question of his stay in Mexico to the national vote, complied with the prayer of a convention of notables, who invited him to endeavour to maintain the empire. He was, notwithstanding, driven by the misfortunes of his arms, and the pressure of an almost universal rising amongst his subjects, to shut himself up in Queretaro, which for some time he defended with courage and success. Being at length taken prisoner, he was tried by a military council, on the order of Juarez, and condemned to be shot—a sentence which, in spite of the efforts of the representatives of the various European powers, was carried out on the 18th of June, 1867, when Miranon and another faithful follower shared his execution. The body of the emperor was finally surrendered to Austria, and his funeral was celebrated with great pomp in the Cathedral of Vienna, on the 18th of January, 1868.

A man of refined tastes and cultivated intellect, Maximilian was himself an author in various departments of literature; and his talent and activity in this respect are represented by a volume of Travels in Greece, entitled, *My First Excursion*, &c., 'Mein erster Ausflug. Wanderungen in Griechenland von Maximilian I., Ferdinand Maximilian, Erzherzog von Oesterreich,' 8vo, Leipzig, 1868; and by a book, also of posthumous publication, containing Sketches of Travel, Aphorisms, and Poems, entitled, 'Aus meinem Leben. Reisekizzen, Aphorismen, Gedichte,' 4 vols., 8vo, Leipzig, 1867, English translation, 'Recollections of my Life,' &c., 3 vols., 8vo, London, 1868.

The picturesque and pathetic tragedy of his fate, and that of the empress, has naturally called forth a voluminous literature

in most of the languages of Europe, almost approaching the dimensions of a library. From the works conversant about his career, may be selected for mention, 'Mejico y el Archiduque Ferdinand Maximiliano. Por Don J. M. Gutierrez de Estrada,' 8vo, Paris, 1862; *An Attempt at an Historical Sketch of Mexico*, by M. J. Gaijinans, 'Maximilian en Juarez. Proeve eener geschiedkundige Schets van Mexico,' 8vo, Arnhem, 1867; 'Maximilien et la Monarchie du Mexique,' 8vo, Paris, 1867; 'Maximilien, &c. Détails biographiques,' 8vo, Paris and Lille, 1867, by M. A. de la Poste; 'Révélations sur la Vie intime de Maximilien,' 12mo, Paris, 1867, by Adrien Marx; 'Kaiser Maximilian von Mexiko,' 8vo, Brünn, 1867, by Dr. St., who on his title-page speaks of Maximilian as the last knight of the 19th century, 'der letzte Ritter des 19 Jahrhunderts,' 'Maximilien, Empereur du Mexique: sa Vie, sa Mort, son Procès, Détails intimes et inédits,' 24mo, Paris, 1867; 'With Maximilian in Mexico: from the Note-book of a Mexican Officer. By Max, Baron von Alvensleben, late Lieutenant of the Imperial Mexican Army,' 8vo, London, 1867; 'My Diary in Mexico in 1867. Including the last Days of the Emperor Maximilian, with Leaves from the Diary of the Prince Salm Salm, &c. By Felix Salm Salm, General, first Aide-de-camp, and Chief of the Household to his late Majesty,' &c., 2 vols., 8vo, London, 1868, which called forth a protest entitled, 'Maximiliano y los últimos Sucesos del Imperio en Queretaro y Mexico. Opúsculo en que se refutan las Memorias redactadas por F. de Salm Salm. Escrito por Ignacio de la Peza y Agustin Pradillo,' &c., 12mo, Mexico, 1870; 'Mexico under Maximilian,' 8vo, Philadelphia, Boston, Richmond, &c., 1867; 'Life, &c., with a Sketch of the Empress Carlota,' 12mo, New York, 1868, by Frederic Hall, "one of his Majesty's legal advisers;" 'Kaiser Maximilian,' &c., 8vo, Dresden and Leipzig, 1868, by Adolf Stern; 'Mexiko und Kaiser Maximilian,' &c., 12mo, Reutlingen, 1868; an illustrated volume of memorial verses, entitled, 'Immortellen aus einer Kaisergruft. Dichtungen des hochseligen Kaisers Maximilian von Mexico. Mit Illustrationen von Hermine Stilke,' 4to, Leipzig, 1868; 'Maximilian. A Tragedy [in three Acts and in verse], 8vo, Dublin, 1868; 'Maximilian von Habsburg, Kaiser von Mexiko. Ballade,' 4to, Trieste, 1868; 'Maximilien et le Mexique. Histoire des derniers Mois de l'Empire Mexicain,' 12mo, Paris, 1869, by Charles D. d'Héricault; and a comprehensive sketch of his career and works, together with an Epitome of the History of Mexico, by Friedrich von Hellewald, entitled, 'Maximilian I., Kaiser von Mexico. Sein Leben, Wirken, und sein Tod, nebst einem Abriss der Geschichte Mexico's,' 2 vols., 8vo, Vienna, 1869.

* MAY, SIR THOMAS ERSKINE, K.C.B., was born in 1815, and educated at Bedford Grammar School. At the age of sixteen he was appointed assistant librarian of the House of Commons. The hours unoccupied by his official duties he gave to the study of the law, and he was called to the bar of the Inner Temple in 1838. In 1846 he was made examiner of petitions for private bills in the House of Commons. The following year he was made taxing-master; in 1856 he was called to the table of the House as clerk-assistant, which office he held till the retirement of Sir Denis Le Marchant in 1870, when he was made chief clerk. As assistant clerk he has long been regarded as the highest authority in all questions referring to the constitution of the House, parliamentary law, and the like; and his advice and assistance have been found of the greatest value by members. The importance of his public services has been recognised by his nomination, in 1860, to the companionship of the Bath, and his promotion, in 1866 to be knight-commander. Sir Thomas Erskine May has published several works of standard value: 'A Treatise on the Law, Privileges, Proceedings, and Usages of Parliament,' 8vo, 1844, is the accepted text-book on all parliamentary questions; whilst the 'Constitutional History of England since the Accession of George III., 1760—1860,' taking up the history where it was left by Hallam, is admittedly of equal authority with that classic work, and much more agreeable in style, without being less profound: it has been translated into German and French, and reprinted in the United States. Sir T. E. May is also the author of 'Remarks and Suggestions with a view to facilitate the Despatch of Public Business in Parliament,' 1849, and of a pamphlet 'On the Consolidation of the Election Laws,' 1850. He has contributed to the Edinburgh and other reviews; and for the 'Penny Cyclopædia' he wrote many valuable articles on Parliament and parliamentary law, political economy, and biography, which have been embodied in the 'English Cyclopædia.'

MAYER, JOHANN ERNST, German sculptor, was born at

Ludwigsburg in 1776. He studied in the Munich Academy, and afterwards at Rome under Thorwaldsen. On his return to Munich he was elected into the Academy, and afterwards nominated professor of sculpture. He was greatly esteemed in Munich, and found constant employment in executing the sculptural decorations of the royal palace, the Glyptothek, the Library, and other of the many new churches and public buildings in that city. He died January 22, 1844.

MAYER, JULIUS ROBERT, was born at Heilbronn, 25th November, 1814. He was educated for the medical profession, and went on a voyage to Java as surgeon in a Dutch ship. He noticed that the venous blood of a feverish patient in the tropics was redder than in more northern latitudes. Professor Tyndall remarks in his 'Treatise on Heat considered as a Mode of Motion,' London, 1863:—"Starting from this fact, while engaged in the duties of a laborious profession, and apparently without a single kindred spirit to support and animate him, Mayer raised his mind to the level indicated by the references made to his works throughout this book. In 1842 he published his first memoir, 'On the Forces of Inorganic Nature,' in 1845 his 'Organic Motion' was published; and in 1848 his 'Celestial Dynamics' appeared. After this, his overtasked brain gave way, and a cloud settled on the intellect which had accomplished so much." It is stated in Poggendorff's 'Biog. Liter. Handwörterbuch,' that Mayer died in an asylum before 1858; but in the Appendix to that work the correction is made that in 1862 he was still alive. The claims of Mayer to be considered as the discoverer of the mechanical equivalent of heat, in opposition to Joule, are stated with elaborate emphasis in the above work by Professor Tyndall.

MAYERNE, THEODORE TURQUET DE, born near Geneva, September 28th, 1573, was the son of Louis Turquet de Mayerne (born 1550, died 1618), author of the 'Histoire générale d'Espagne,' folio, 1587, and 'La Monarchie aristodémocratique,' and godson of Theodore Beza. Theodore de Mayerne studied successively at Geneva, Heidelberg, and Montpellier, at which last he took his doctorate in medicine, February, 1597. He settled in Paris, and practised with so much success as to receive an appointment at the court, and be invited to accompany the Duc de Rohan in 1600 on his mission in Germany and Italy. On his return, he gave lectures on anatomy and pharmacy to students in medicine; but this procedure, coupled with the innovation of practising chemistry and prescribing various chemical preparations instead of the simple substances then in use, gave great offence to the older practitioners, who published, December, 1603, a decree condemning his practice, and forbidding orthodox members of the faculty from consulting with him. Mayerne defended himself in a tract, 'Apologia in qua videre est, involutis Hippocratis et Galeni legibus, remedia chimice preparata tuto usurari posse,' which met, of course, with an orthodox response. His quarrel with the faculty did not interfere with his popularity. His practice increased, and he was nominated physician to the king; but the ratification of the appointment was prevented by the queen, Marie de' Medici, at the instigation of the Jesuits, who feared his Huguenot opinions. These professional and ecclesiastical intrigues, however, at length decided him to accept, in 1611, an invitation from James I. to settle in London, with the appointment of first physician to the king. He remained in favour till the death of James, when he was continued in office and favour by Charles I. The civil war interfered little with his good fortune; but he retired about 1637 to a house he had built for himself at Chelsea, where he died, March 15, 1655, in the 82nd year of his age, leaving a large fortune to his only daughter, who married the Marquis de Montpoullan, and died at the Hague in 1661. De Mayerne was perhaps the most accomplished physician of his time, and holds a high place in the history of chemistry (Brande, 'Manual of Chemistry,' p. 23). His medical and chemical writings, which were highly valued by his contemporaries and immediate successors, were collected and published by Dr. Joseph Browne in 1700, in a thick folio volume—'Operum Mayernii,' in two books: (i.) 'Consilia, Epistolae, et Observationes;' (ii.) 'Pharmacopœam, variasque Medicamentorum formulas.' But of more permanent value, perhaps, is a work of a very different kind. De Mayerne was fond of painting, and he made many experiments on the preparation of colours, freely communicating the results to his friends, Rubens, Vandyck, Petitot, and other artists, who, in return, explained their respective technical methods. From De Mayerne's processes Petitot is said to have obtained the principal colours he employed in his enamels and the means of vitrifying them. De Mayerne

made a careful record of his investigations and of what he learned from painters, and the original manuscript, entitled 'Pictoria, Sculptoria, Tinctoria, et quæ subalternarum Artium spectantia in Lingua Latina, Gallica, Italica, Germanica conscripta, a Petro Paulo Rubens, Van Dyke, Somers, Greenberry, Jansen, &c., A.D. 1620,' is now in the British Museum. (Sloane MSS., No. 2052). It is of exceeding interest for the light it throws on the methods of Flemish painting at the most brilliant period of its history. (Eastlake, 'Materials for a Hist. of Oil Painting,' p. 545, &c.) A fine portrait of De Mayerne, from the painting by Rubens, forms the frontispiece to his works. De Mayerne was created Baron D'Aulbonne in 1621.

MAYOW, JOHN, was born in Cornwall in 1645, and died in September, 1679, at the early age of thirty-four, at the house of an apothecary in York Street, Covent Garden. His powers as an experimental inquirer were of the highest order, but the scientific mind was not prepared for the bold statements made by him, which, if accepted, would have overthrown some existing theories. He is the first chemist who published anything of value on the subject of combustion and respiration; while his remarks on affinity are characterized by great shrewdness. In fact, Dr. Beddoes, and more recently Dr. Yeats ('Observations on the Claims of the Moderns to some Discoveries in Chemistry, &c.,' London, 1798), have, we think successfully, made out his title to several of the discoveries claimed by later chemists. He showed, for example, that one part only of the atmosphere is capable of supporting life and combustion, and that the part which maintained combustion by absorption into the blood was in some way connected with animal heat; he showed that there was more air in arterial than in venous blood, and that there was an analogy between the respiration of animals and plants. Mayow also produced hydrogen gas and nitrous gas, and had some clear notions respecting "the mutual action of salts of contrary kinds." His views of affinity were admirable, considering the absurd mass of error in which the subject was invested at the time. Newton recognised their value, and adopted them in his sketch of a theory of chemical attraction attached to the third book of his Opticks. Mayow was a student of Wadham College, Oxford, and afterwards a probationer Fellow of All Souls. Before applying himself to the study of medicine, he obtained a degree in Civil Law. After leaving college, his chief place of residence was Bath. His celebrated treatise, 'De Sale Nitro et Spiritu Nitro aëreo,' was published at Oxford in 1674, and at the Hague in 1681: in this there is clear proof that Mayow was aware of the existence of what was afterwards called oxygen, and that metals gain in weight by calcination. His early death is to be deplored: had he lived longer, his very remarkable discoveries would doubtless have been pushed farther, and by dint of repeated demonstration have made an impression on the scientific men of the time which it required at least another century to effect.

MAZOIS, CHARLES FRANÇOIS, French architect and archæologist, was born at Lorient, October 12th, 1783. He was a pupil of Percier; then went to Rome, where he distinguished himself; and was invited to Naples by Murat, for whom, amongst other things, he restored the Palace of Portici. He was thus led to examine the ruins of Pompeii, to which he eventually devoted himself with untiring assiduity during the years 1809-11, carefully drawing and measuring every building and object of interest. He published the first two volumes of 'Les Ruines de Pompéi,' folio, in 1812-15; but political and other changes prevented the immediate continuance of this magnificent work—the standard authority on the buried city, and the architectural and archæological subjects associated with it. M. Mazois did not, however, discontinue his labours; and before his death he had prepared most of the remaining plates and much of the text. The two concluding volumes were published under the care of M. Gau, in 1838. M. Mazois also wrote a popular description of a Roman house—'Le Palais de Scæurus,' 4to, with twelve plates, 1819, a second edition, 1822, third, 1861. He wrote likewise some lives of architects in the 'Galerie Française,' and a few professional memoirs. His architectural labours are not very important: he built several houses, and restored the church of St. Remi at Rheims. In 1819 he was appointed one of the four inspectors of civil buildings. He was created a knight of the Legion of Honour in 1823; and died at Paris, December 31st, 1826.

* MEADE, GEORGE GORDON, an American general, was born in 1816, at Cadiz (or at Barcelona, according to some authorities), in Spain, where his father was American consul. His father belonged to a Pennsylvania family; but his mother

was a Catalonian lady. He received his education in the United States, where he entered the West Point Military Academy in 1831; and quitted it in 1835, with the grade of second lieutenant of the second regiment of artillery. He withdrew from military service in 1836, but re-entered it in 1842 with the rank of second lieutenant of Topographical Engineers. He served with his corps in the Mexican war in 1846; distinguished himself at Palo Alto; was promoted to be first lieutenant for his bravery at Monterey; was made captain in 1856; and major in 1860. When the civil war broke out in 1861 he was appointed brigadier general of volunteers, in the Pennsylvania reserve corps, under General M'Call. Very shortly he was transferred to the army of the Potomac, under General M'Dowell, and served in the first corps of that army in Virginia. He fought in the battles of Mechanicsville and Gaines Mill towards the close of June, 1862, and in the "Seven Days" battle before Richmond; was wounded at Newmarket Road, and received the rank of lieutenant-colonel in the regular army. In the severe battle of Antietam between Lee and M'Clennan, in September, Meade succeeded Hooker (who was wounded) in command of the ninth corps. When General Burnside, who had superseded M'Clennan, headed another advance on Richmond, he was ably seconded by Meade; but the attack was disastrously defeated by Lee at the battle of Fredericksburg on the 13th. On the 15th Meade was made major-general, and superseded Butterfield in command of the fifth corps. During the winter he assisted in re-organising the Federal forces. In May, 1863, Hooker, who had succeeded Burnside in command of the army of the Potomac, crossed the Rappahannock, and, with Meade as commander of his right wing, fought the battle of Chancellorsville, May 2-4. This sanguinary action was won by Lee and Stonewall Jackson; and the Federals were again forced to withdraw from Virginia. When Lee carried the war into Maryland in June, Meade succeeded Hooker in command of the army of the Potomac; he justified the promotion by defeating Longstreet at the battle of Gettysburg, July 1-3. This so far frustrated Lee's plan as to induce the Confederates to withdraw from Maryland to Virginia; Meade was unable, nevertheless, to effect much against the Confederates on their own side of the Potomac. In April, 1864, another change was made: General Grant was appointed commander-in-chief of the United States forces, and he organised a series of operations covering a vast area. Meade still commanded the army of the Potomac, but under the personal supervision of Grant. While covering Washington, he advanced upon Richmond; began his Virginia campaign in May, and fought the severe battles of the Wilderness, Spottsylvania Court House, Jericho's Ford, North Anna, and Cold Harbour. In most of these actions Meade was outmanoeuvred by Lee, with terrible losses on both sides. Throughout the remainder of the war General Meade witnessed a good deal of hard service; but the operations by which the Federals gradually gained a complete advantage over the Confederates, such as those under Sherman and Sheridan, were mostly headed by armies with which he was not personally connected. He was more closely concerned with the persistent and at length successful investment and capture of Richmond.

MECHEL, CHRISTIAN VON, Swiss engraver, was born at Basel in 1737; studied under Heumann and Preissler at Nürnberg, and J. G. Wille at Paris, and settled at Basel as an engraver and printseller. He used the graver with facility and neatness; engraved and published several good contemporary portraits and subject-pieces; the works of Holbein, 4to, 1780, with descriptions; the medals of Hedlinger, with illustrative text, folio, 1776; the Düsseldorf Gallery, 2 vols. folio, 1778; views on the Rhine, &c. He died at Basel in 1817.

MECKEL JOHANN FRIEDRICH, anatomist, was born at Wetzlar, July 31, 1714. At first he was intended for the legal profession, but by the advice of his grandfather, Dr. Möller, he was induced to study medicine. For this purpose he proceeded to Göttingen and Berlin, and received his doctorate from the Göttingen University in 1748. After serving as a demonstrator in one of the schools at Berlin, he was appointed, in 1751, professor of anatomy in the university of that city. In 1773 he resigned this post on being nominated surgeon to the King of Prussia. He died at Berlin, September 8, 1774. He made numerous discoveries in the structure of the human body, and wrote many papers on the nerves, the brain, and on disease of the heart. His son, PHILIP FRIEDRICH THEODOR MECKEL, born April 30, 1756, died March 28, 1803, was also an anatomist and professor. His grandson, having the same name as himself, is noticed in the following article.

MECKEL, JOHANN FRIEDRICH, anatomist, was born at Halle, October 17, 1781. His education was received at Halle, Göttingen, Würzburg, and Vienna. In 1806 he was elected the professor of surgery at Halle, but was afterwards transferred to the chair of anatomy and physiology. His grandfather, who was one of the most eminent anatomists of his day, established a museum, which was added to by his father and by himself, and which became the richest and best arranged of its kind in Germany. His own taste for comparative anatomy was mainly fostered by his familiarity with this museum in childhood, and by his desire to improve and enrich it. After his death, on October 31, 1833, it was sold to the University of Halle. His works indicate much laborious research, and abound in general views on subjects of comparative anatomy and physiology beyond those of almost any contemporary or precedent writer. His work on human monsters—'De duplicitate monstrosa commentarius,' fol., Halle and Berlin, 1815, is one of the best on the subject. His most philosophical production is the 'System der vergleichende Anatomie,' 8vo, Halle, 1821—1833, which remained unfinished when he died. He also wrote a translation of Cuvier's lectures on comparative anatomy, 'Anatomisch-physiologische Beobachtungen und Untersuchungen,' 8vo, Halle, 1822; 'Beiträge zur vergleichende Anatomie,' 8vo, Leipzig, 1808—1812; 'Handbuch der pathologischen Anatomie,' 2 vols., 8vo, Leipzig, 1812—1816; 'Tabula anatomico-pathologica,' fol., Leipzig, 1817—1826, and a few others. He devoted a large portion of his time to editing the 'Archiv für Anatomie und Physiologie,' 1826—1833, and the periodical of which it was virtually the continuation, 'Deutsches Archiv für die Physiologie,' 1815—1823, in one or other of which most of his fifty-five scientific papers appeared.

MEDINA, SIR JOHN BAPTIST, portrait-painter, was born in 1660, at Brussels, where his father, Don Medina de l'Asturias, was resident. He learned painting of Du Chalet; but formed his style by the study of Rubens. He married young, and came to England in 1686. He found a warm patron in the Earl of Leven, who invited him to settle in Scotland, and insured him commissions to the extent of 500*l*. Medina settled in Edinburgh, where, with the exception of a brief removal to London, he continued to reside till his death, in 1711. He painted the portraits of most of the nobility and principal gentry of Scotland, executed a few historical pieces and one or two landscapes; but he had twenty children, says Walpole, and he did not grow rich. His portrait, painted by himself, is in the gallery of painters' portraits, Florence; another is in the hall of the College of Surgeons, Edinburgh, where are also several portraits of professors by him. Half-a-dozen of his portraits (his own amongst them) were in the Second Special Exhibition of National Portraits, 1867. Walpole says, that when he went to Scotland he carried with him "a large number of bodies and postures, to which he painted heads;" but the portraits we have seen do not sustain the imputation. The positions are varied and characteristic, and the heads evidently belong to the bodies, and are not adroitly managed additions. His works have a certain largeness of style, and the countenances are intelligent and expressive; but his coarse facility of handling often degenerates into carelessness. Medina was knighted by the Duke of Queensberry, the lord high commissioner, and was the last knight made in Scotland before the Union.

MÉHUL, ÉTIENNE HENRI, a French musical composer, was born at Givet, in the Ardennes, June 24th, 1763. He received his first music-lessons from a poor blind organist, and then became a pupil of Hauser, organist at the convent of Laval Dieu—a player of much celebrity at that time. Young Méhul went to Paris in 1778, and, although only in his sixteenth year, began to teach music as a means of support, whilst studying composition under Edelmann. Paris was at that time engrossed by the violent feud between the Gluckists and the Piccinists. Méhul obtained the aid and advice of Gluck, and this was a step towards his advancement in life. In 1782 appeared Méhul's first composition, a sacred ode, to words by Rousseau. Turning his attention to opera, he composed three operas before he was twenty years of age, 'Psyche,' 'Anacréon,' and 'Lydie;' but these, under the advice of Gluck, were rather for practice than for public presentation. His 'Euphrosyne et Coradin' in 1790, and his 'Alfonzo et Cora' in 1791, contained a sufficient amount of good music to draw attention favourably towards him. A few of the airs which he composed in 1792 for a one-act historical drama, called 'Stratonice,' lived long after the drama itself had been forgotten. His compositions then appeared in rapid succession: 'La Jeune Sage et le Vieux Fou,' in 1793; 'Horatius Cocles,' and 'Phrosine et Mélidor,' in 1794; the overture

and chorus to a tragedy called 'Timoléon,' and a series of national songs, the 'Chant du Départ,' 'Chant du Victoire,' and 'Chant du Retour.' These songs were written and composed to celebrate the fourth anniversary of the taking of the Bastille; and the first of them, the 'Chant du Départ,' was the only companion to the celebrated 'Marseillaise' in maintaining a permanent hold as a national song. In 1795 he produced his opera, 'La Caverne,' in the same year he was elected a member of the Académie des Beaux-Arts, and appointed one of the five professors at the newly established Conservatoire de Musique. In 1797 his 'Jeune Henri' experienced a fate somewhat similar to that of Kreutzer's 'Lodoiska': nothing lives of it except the overture. 'Adrien,' and a successful comic opera called 'Ariodant,' appeared in 1799; 'Bion,' and (in conjunction with Cherubini) 'Épicure,' in 1800. Various minor works were produced by him during the later years of the century, including 'Le Jugement de Paris,' a ballet; 'Doria,' 'Le Pont de Lodi,' 'La Toupie et la Papillon,' and 'La Dansomanie,' a ballet. In 1801 he was incited to adopt, or to imitate, the graceful melodies which had rendered the Italian music of Cimarosa and Paisiello popular in Paris; he composed 'L'Irato' with this intent, but, though successful, the opera was felt to be wanting in the lightness of the Italian style. Three new operas and musical dramas in 1802, 'Le Trésor Supposé,' 'Joanna,' and 'L'Heureux Malgré Lui,' and two in 1803, 'Une Folie' and 'Hélène,' testified to the activity of his pen. In the last-named year he also participated with Kreutzer, Boieldieu, and Nicolo in composing the music to 'Le Bauer et la Quitance.' Méhul showed a generous appreciation of the merits of Cherubini when the office of maître de chapelle was vacant: Napoleon offered it to Méhul, who suggested Cherubini as a more worthy recipient; but Napoleon, having a prejudice against Cherubini, refused, and a less accomplished musician than either was chosen. Méhul's next productions were 'Les Hussites,' a melodrama, in 1804; 'Gabrielle d'Estrée,' in 1805; 'Les Deux Aveugles de Tolède,' and 'Uthal,' founded on an Ossianic subject, in 1806; and 'Joseph,' a religious opera, in 1807. This last contains some of Méhul's finest music. In 1811 appeared 'Les Amazones,' in the same year, 'Persée et Andromède,' in 1813, 'Le Prince Troubadour,' in 1814 (in conjunction with Bertin, Kreutzer, and Paër), 'L'Oriflamme,' a cantata to celebrate the restoration of the Bourbons; and in 1816, 'La Journée aux Aventures.' Several other operas by him still remain in MS. Méhul also composed numerous hymns, cantatas, symphonies, pianoforte sonatas, and solfeggio lessons. He contributed two papers to the Institute—'Sur l'État futur de la Musique en France,' and 'Sur les Travaux des Éléves du Conservatoire à Rome.' He died at Paris, October 18, 1817.

MELBOURNE, WILLIAM LAMB, VISCOUNT, an English statesman, second son of Sir Peniston Lamb, first Viscount Melbourne, was born in London, on the 15th of March, 1779, and was educated successively at Eton and at Trinity College, Cambridge. Afterwards he studied politics and jurisprudence under Professor Millar, at the University of Glasgow; and in November, 1804, was called to the bar by the Society of Lincoln's Inn, of which he had become a member in July, 1797. His practice as a barrister was limited to a single attendance at the Lancashire sessions, where, through the influence of Mr. Scarlett, afterwards Lord Abinger, he received his first and only brief. By the death of his elder brother, in 1805, he became heir to the family honours, and was returned to Parliament as member for Leominster. In the same year he married Lady Caroline Ponsonby, daughter of the Earl of Besborough, and afterwards celebrated as Lady Caroline Lamb, as the correspondent of Lord Byron, as an active politician, and as the author of various novels and fugitive poetical pieces. She died in 1828. Immediately upon his entry into the House of Commons, Mr. Lamb attached himself to the Whig party, under the leadership of Charles James Fox; and was chosen, under the Grenville administration, to move the address to the crown in answer to the royal speech on the opening of the new Parliament in December, 1806, in which he had obtained a seat for the Scottish royal burgh of Lauder, in Berwickshire. In the general election in the summer of 1807 he was returned for Portarlington, which he continued to represent until 1816, when he was elected for Peterborough, for which he was again returned in 1818. In the following year he became one of the representatives for the county of Hertford, and was re-elected in 1820. During the administration of Mr. Perceval and Lord Liverpool, Mr. Lamb continued in a course of moderate opposition, not unfrequently giving them his support; and from the retirement of the Whigs, in 1807, on their

refusal to compromise the Catholic question, till 1829, he supported on every occasion the measure of Catholic emancipation. In April, 1827, he assumed office under the composite administration of Mr. Canning, as Chief Secretary for Ireland, and retained it under the government of Lord Goderich, afterwards Earl of Ripon, retiring only on the appointment of Lord Francis Leveson Gower, under the administration formed by the Duke of Wellington on the 25th of January, 1828. By the death of his father, on the 22nd of July following, Mr. Lamb was called to the House of Peers, where, as Viscount Melbourne, he gave his cordial support to the Catholic Relief Bill of 1829, and distinguished himself as an advocate of parliamentary reform. He became Secretary of State for the Home Department in November, 1830, in the cabinet of Earl Grey; and upon the retirement of the latter, on the 9th of July, 1834, was called upon to succeed him as First Lord of the Treasury. His first tenure of the premiership was of short duration; and in November following he was dismissed by the king, who, choosing to consider the removal of Lord Althorp, the Chancellor of the Exchequer, to the Upper House as the breaking up of the administration, dismissed Lord Melbourne, and summoned Sir Robert Peel to undertake the duties of prime minister. The new cabinet, which, in the absence of Sir Robert Peel in Italy, was, for a short time, conducted provisionally by the Duke of Wellington, fell, in April, 1835, speedily before the adverse attitude of the House of Commons, and Lord Melbourne became once more First Lord of the Treasury. The accession of Queen Victoria, in 1837, increased the influence of Melbourne and the strength of his government; and it devolved upon him to instruct the youthful sovereign in the exercise of her duties and position, a task which he fulfilled in a manner calculated to attract the gratitude of the queen and the confidence of her subjects. On the 9th of April, 1839, Mr. Labouchere introduced a bill for suspending the constitution of the Island of Jamaica, the second reading of which was allowed to pass *pro forma*; but on the motion that the Speaker do leave the chair, a long and warm debate arose, which terminated, on the 6th of May, in a division of 294 to 289 in favour of the motion, giving the ministers a majority of five. Next day they announced their resignation; and Sir Robert Peel attempted to form a cabinet, but failed in consequence of a difference with the queen on the subject of the appointments of the ladies of the household. Lord Melbourne immediately returned to office, in which he continued until the 30th of August, 1841; when a vote of want of confidence having been carried by Sir Robert Peel in the House of Commons, on the 4th of June, by a majority of one, and ratified by a majority of ninety-one in a new Parliament, which assembled on the 19th of August, he and his colleagues tendered their resignation. He was succeeded by Sir Robert Peel, and soon afterwards, sinking into confirmed ill-health, he ceased to take a prominent part in public affairs. The disease, which was at length fatal to him, was of about six weeks' duration; and he died on the evening of Friday, October 24th, 1848, at his seat, Brocket Hall, Hertfordshire.

In public life Viscount Melbourne exhibited no considerable degree of oratorical power; but he secured the reputation of being honest and well-intentioned. He was courageous, dispassionate, and unprejudiced; skilled in the arts of accommodation, and knowing how to conceal seriousness of purpose under a gay and sometimes flippant exterior. His social qualities were remarkable for their charm and attractiveness.

MELDOLA, or MELDOLA, ANDREA, Italian engraver. A large number of engravings, chiefly after the designs of Parmigiano, and executed about 1540—1570, bear the signature of A. M., or Andrea Meldola. Formerly they were attributed to Andrea Schiavone, whose family name was Medola; but Zani, who investigated the subject very carefully, believed that he had proved the engraver, A. Meldola, to be a different person from the painter, A. Medola. Bartsch, Nagler, and other authorities adopted his view, and the point was pretty generally conceded. More recently, however, Harzen ('Kunstblatt,' 1853, p. 327) and Passavant ('Peintre-Gravure,' 1860—1864, i. 366, iv. 175) have sought to rehabilitate the old opinion, chiefly on the authority of a document dated 1563, discovered at Venice, and printed in the Florentine edition of Vasari, 1856, but which, in fact, merely proves, what was not denied, that Schiavone was called Medola ("Andreas Sclabonus dictus Medola") [SCHIAVONE, ANDREA, E. C. vol. v. col. 316]. Passavant himself points out the curious fact that the prints known to be by Schiavone are all etchings, whilst those which have the signature of Meldola, or the monogram "A. M.," are executed with the graver and dry

point. As nothing is known of the engraver apart from the prints, it is difficult to arrive at a definite conclusion. But the difference in the character of the prints, and the improbability that a painter like Schiavone would have engraved so many plates with the burin after another painter, seem to support the opinion that the painter and the engraver were two different persons. The most celebrated of Meldola's prints is the *Heliodorus of Raffaele* from a drawing by Parmigiano. Meldola is by some thought to have engraved on pewter. There are full lists of Meldola's prints in Bartsch (tom. xvi.), and by Messrs. Smith in Stanley's edition of Bryan (pp. 458-464), the latter increasing the entire number to 110.

MELONE, ALTOBELLO, Italian painter, seems to have painted between the years 1497 and 1518. Nothing is known of his life. According to Vasari, he painted in fresco a series of scenes from the life of Christ, in the Cathedral of Cremona, in competition with Boccacino Boccacci: they were very beautiful, he adds, and worthy of all commendation. But Melone's oil-paintings were considered more successful than his frescoes. One of these is in the National Gallery (No. 753), 'Christ and the Disciples going to Emmaus.' The figures, nearly life-size, are in a well-painted landscape. It was formerly in the Carmelite church of San Bartolommè, at Cremona.

MELLONI, MACEDOINE, was born at Parma in 1801. We have no particulars respecting the education of this remarkable man; but we know that his affections were divided between love of country and scientific research, and that the stupid despotism which so long oppressed Italy entailed on him much suffering, both as a patriot and a philosopher. He occupied the chair of physics in his native town, when in 1831 he was compelled to seek refuge in a foreign land from his political persecutors. He resided nearly a year in Geneva, where he conducted some of those experiments on radiant heat which served to lay the foundation of an entirely new branch of science. He then fixed his residence at Paris, where his discoveries excited the admiration and respect of the civilised world. He had already assisted his friend and countryman, Nobili, in perfecting the idea of a highly sensitive thermometric instrument, based on the thermo-electric pile, and recording its indications by means of a galvanometer. By means of this instrument and his own marvellous experimental skill, it was proved that rays of heat present phenomena as complex as those of light. We must refer to another division of this work for an account of these researches, which led De la Rive to apply to their author the complimentary title of "the Newton of heat."

Although his residence in Paris was made gratifying to Melloni by the love and respect of numerous scientific men, yet he pined for his native land; so much so, that Arago and Humboldt made a strong appeal to Prince Metternich to allow him to return. In March, 1839, he obtained the post of director of the Conservatory of Arts and Manufactures at Naples, and professor of physics at the Bureau of Meteorology. Here, in the autumn of 1846, he conducted his researches on the nocturnal cooling of bodies. His memoirs on this subject were read before the Royal Academy of Naples, in February and March, 1847. Mr. Tomlinson, in giving an account of these experiments, says:—"The most curious point connected with this inquiry is its origin. It will hardly be believed that the Austrian and Bourbon governments, in their dread of novelty, would not allow the true theory of dew to be taught. Melloni, in order to show that the laws of terrestrial radiation are the same in Italy as in countries where there is more political liberty, undertook these researches."

The events of 1848 led to the loss of Melloni's appointments. He retired to Portici, and hoped that, by leading a retired life, he might escape the suspicions of the government. He was, however, watched and sometimes visited by the police. "You are a man of European reputation," they would remark. "Anything you say has weight and influence; it is necessary, therefore, that we should watch your conduct." It was in this way that they justified their persecutions. But Melloni busied himself only in the kingdom of science, where despotism cannot exist. He examined some deep water in a grotto near Naples, by which he explained the colour of limpid and deep waters. He also demonstrated the existence of a calorific power in lunar light; and a month before his death, which took place from a sudden attack of cholera, 11th of August, 1853, he communicated to his friend De la Rive some interesting researches on electrical induction. Melloni was a corresponding member of the Academy of Sciences at Paris, and a chevalier of the Legion of Honour.

MELVILLE, HERMAN, an American author, descended

from an ancient Scottish family, and grandson of one of the "Boston Tea Party," was born at New York, on the 1st of August, 1819. At the close of a boyhood passed chiefly in Albany and Lansingburg, New York, and Berkshire county, Massachusetts, he was seized with a passion for the sea; and, in his eighteenth year, made a voyage before the mast from New York to Liverpool, after his return from which he embarked, on the 1st of January, 1841, on a whaling voyage to the Pacific. After a cruise of about eighteen months, he took an opportunity, whilst his ship was at Nukahiva, one of the Marquesas Islands, to escape, with a comrade, from the tyranny of the captain. Falling by mishap into the hands of a warlike race who inhabited the Typee Valley, he was detained amongst them as a prisoner, but without unkindness, for four months, when he was unexpectedly rescued by the crew of a Sidney whaler, in which he proceeded to Tahiti. After some time spent in the Society and the Sandwich Islands, he embarked, in 1843, on board of an American frigate, at Honolulu, and landed at Boston (U.S.) in October, 1844, after an absence of nearly four years. As the literary first-fruits of his observation of the peculiar phases of nature and of society which he had encountered during his wanderings, he published 'Typee, Narrative of a Four Months' Residence among the Natives of a Valley of the Marquesas Islands: or, a Peep at Polynesian Life,' 12mo, New York, 1846, &c., which passed through several editions, and was translated into various European languages, and of which an English edition appeared as No. xxx. of 'Murray's Home and Colonial Library,' 8vo, London, 1843, &c. 'Typee' was valued for its remarkable freshness, as having been the first account published of a residence among the natives of the Polynesian Islands, by a person who had lived with them in their own manner, and, so far as was possible, on terms of social equality. It was followed by 'Omoo: a Narrative of Adventures in the South Seas,' 8vo, New York, first three editions, 1847, and others, 16mo, London, 1847, and in Nos. xliii. and xlv. of 'Murray's Home and Colonial Library,' a work which, without being so popular as its predecessor, brought down upon the author the attacks of certain critics for the presumed unfairness of his animadversions on the Protestant mission in Tahiti. In 1847, Mr. Melville married a daughter of Chief Justice Shaw, of Massachusetts, and resided for a few years in New York; after which, in 1850, he removed to Pittsfield, Massachusetts, where he divided his time between the pursuits of agriculture and literature, varying both by a circumnavigatory episode in a whaling-vessel, about ten years after his removal to Massachusetts.

Mr. Melville, whose gifts of graphic delineation entitle him to a high place amongst the contemporary authors of America, from which only his own wilful eccentricities can bar him, has been a frequent contributor to periodical literature; and some of the works which are still to be mentioned have had their original publication in the pages of magazines, &c. They include 'Mardi: and a Voyage thither,' 2 vols., 12mo, New York, 1849, English edition, 3 vols., 12mo, London, 1849; 'Redburn: his First Voyage. Being the Sailor-Boy Confessions and Reminiscences of the Son of a Gentleman in the Merchant-service,' 12mo, New York, 1849, 2 vols., 12mo, London, 1849, a work partially autobiographical, in which many of the faults of 'Mardi' were corrected or modified; 'White Jacket: or, the World in a Man-of-War,' 12mo, New York, 1850, English edition, 2 vols., 12mo, London, 1850; 'Moby Dick: or, the Whale,' 12mo, New York, 1851, English edition, 3 vols., 12mo, London, 1851; 'Pierre: or, the Ambiguities,' 12mo, New York, 1852, the mystical transcendentalism of which has not been attractive enough to secure its publication in England; 'Israel Potter: his Fifty Years of Exile,' 12mo, New York, 1855, English edition, 12mo, London, 1855, which is a reproduction, with alterations, of a true story, entitled, 'The Life and Adventures of Israel R. Potter,' published in 1824, and written by Henry Trumbull, from Potter's dictation; 'The Piazza Tales,' 8vo, New York, 1856, a volume of stories which had originally appeared in 'Putnam's Monthly Magazine,' and consisting of 'The Piazza,' 'Bartleby,' 'Benito Cereno,' 'The Lightning-rod Man,' 'The Encantadas or Enchanted Islands,' and 'The Bell-Tower'; 'The Confidence-Man: his Masquerade,' 8vo, New York, 1857, English edition, 8vo, London, 1857; 'The Refugee,' 8vo, Philadelphia, 1865 (?); and a volume of poems, entitled, 'Battle Pieces and Aspects of War,' 8vo, New York, 1866.

MENDIZABEL, JUAN ALVAREZ Y, a Spanish financier and statesman, was born in 1790, at Cadiz, where his father, a Jew, named Mendez, carried on trade in humble life. When the French commenced hostilities in Spain in 1808, young

Mendizabel obtained a situation in the Spanish commissariat, which he held for several years. After the war, he was for a time with a banker at Madrid. When the Liberal party was formed in Spain, in 1819, to enforce a restoration of the constitution of 1812, he joined Galiano, Mina, and Isturitz, and aided in raising money for the revolutionary army. They succeeded in 1820; when Spain witnessed the restoration of the constitution, a general amnesty, the assembly of the Cortes, the formation of a Liberal ministry, the abolition of the monastic orders, and the abrogation of the laws of entail. But the king and the clergy, aided by the French under Louis XVIII., gradually overcame the Constitutionalists; and Mendizabel was, in 1823, forced to take refuge in England. Here he was for a time imprisoned for debt, arising out of the loan raised for the Constitutionalists. On his liberation, he engaged in commerce in London with considerable success. During business visits which he paid to Portugal, he formed a connection with the agents of Don Pedro, for whom he negotiated a loan. In 1833, when Isabella, a child of three years old, succeeded her father, Ferdinand, on the Spanish throne, Mendizabel acted as financial agent in England for the regent Christina, and this led to his appointment as Finance Minister of Spain in 1835, under the government of Count de Toreno. He soon supplanted the count, and became president of the Council of Ministers. The Cortes gave him willing assistance, and it was expected that he would crush the Carlist insurrection in a few months; but failing in this, and surrounded by enemies, he resigned in May, 1836. Five months later he was appointed Minister of Finance by the new premier, Calatrava; but this was against the wish of Christina, and, as many of his supporters fell away, he resigned in August, 1837. After sitting three years as a somewhat violent member of the opposition party in the Cortes, representing the province of Madrid, he was once more appointed Minister of Finance, under the regency of Espartero, in 1841. When Espartero yielded to the rising influence of Narvaez, Mendizabel went again into exile to England, and remained away from his native country for many years. He returned to Spain after the events of 1848, and aided with the Liberal party till his death, which took place at Madrid, November 3, 1853.

MERCADANTE, SAVERIO, Italian musical composer, was born at Altamura, in the kingdom of Naples, in 1798. In his twelfth year he entered the Royal College of Music of St. Sebastian, Naples, where he studied composition under Zingarelli, learned the flute and violin, and composed pieces for those instruments. During some years he was chief violinist at the Conservatorio. When quite a young man he began composing operas, and continued his compositions for nearly forty years. A cantata, for the Fondo at Naples, appeared in 1818; and in the same year his first opera, 'L'Apoteosi d'Ercolo,' at the Theatre of San Carlos. Six other operas appeared in rapid succession within the next four years; but one only, 'Elisa e Claudio,' produced at Milan, was received with much favour. For a time there was a belief among his countrymen that he would be the leading Italian composer of the age; but Rossini, Bellini, and Donizetti attained a European reputation which Mercadante never reached. His next operas varied much in popularity; they were 'Andronico Didone,' 'La Nitocri,' 'La Donna Caritea,' 'Rappresaglia,' and 'Zaira,' some of them were brought out in Madrid and Cadiz, where he resided in 1827 and 1828. His 'I Briganti,' which had great success when produced in Naples, failed to please the Parisians when presented at the Théâtre Italien in 1836, although supported by the four most renowned singers of that time—Grisi, Rubini, Tamburini, and Lablache. In 1833 he was appointed maestro di capello at Novara Cathedral. In 1837 he produced his best opera, 'Il Giuramento,' founded on Victor Hugo's 'Angelo, the Tyrant of Padua.' In 1839 he produced an opera which remained long in favour with the Italians, 'Due Illustri Rivali'; and in the following year was appointed director of the Conservatorio at Naples. 'La Vestale,' produced in 1842, fell flat among the Italians, but has had more success in Germany and France. Since then have appeared, at various intervals, 'Statira,' 'La Violetta,' 'Il Bravo,' 'Il Vascello di Gama,' 'Leonora,' 'Il Pelagio,' 'Gli Orazi ed i Curazi,' 'Il Proscritto,' 'Il Regente,' 'Il Signore in Viaggio,' 'La Solitaria delle Asturie,' and other operas. His 'Giuramento' was performed in London in 1858, and two or three of his operas have occasionally been heard here. He also composed ecclesiastical music, such as motetts, masses, &c. In truth, Mercadante composed too rapidly and too much. His music comprises many graceful and melodious pieces, while there are materials in 'Il Giuramento' and a few others of his operas for grand orchestral

and choral stage effects; but he was wanting in originality, depth, and science. In 1856 he was elected foreign member of the French Institute; and in 1868 King Victor Emmanuel decorated him with the Civil Order of Merit. Mercadante died at Naples, December 17th, 1870.

MERCK, JOHANN HEINRICH, a German scholar and author, was born on the 11th of April, 1741, at Darmstadt; and having completed his university studies, and subsequently accompanied a certain Herr von Bibra on his travels, settled at his native town, where, in 1767, he became secretary of the Privy Chancery. He was afterwards appointed paymaster-general of the army and a war-councillor. About the year 1770, he accompanied the Landgrave of Hesse-Darmstadt upon a journey to St. Petersburg; and, in 1790, was despatched to Paris on a state-mission. The latter part of his life was clouded by domestic and pecuniary misfortunes, which led him to commit suicide by shooting himself on the 27th of June, 1791.

Merck was a man of wide sympathy and of great cultivation, so that whether at home at Darmstadt, or sojourning at Giessen, Frankfurt, and other centres of intellectual activity, he found himself an important and influential member of literary and æsthetic circles. He is chiefly remembered at present, however, for his friendship with Goethe, Herder, Wieland, and others, whose letters to him were published, under the editorship of Dr. Karl Wagner, as 'Briefe an Merck, von Goethe, Herder, Wieland, &c.,' 8vo, Darmstadt, 1835; whilst another edition of his correspondence, including both letters received and written by him, appeared under the care of the same editor, with the title of 'Briefe an und von Johann Heinrich Merck. Eine selbständige Folge der im Jahre 1835 erschienenen Briefe an J. H. M. Aus den Handschriften herausgegeben, &c. Mit Facsimilien der Handschrift von Goethe, Herder, Wieland, Karl August und Amalia von Weimar,' &c., 8vo, Darmstadt, 1838; which was further supplemented by a third volume, also edited by Dr. Karl Wagner, entitled, 'Briefe aus dem Freundeskreise von Goethe, Herder, Hopfner, und Merck. Eine selbständige Folge der beiden in den Jahren 1835 und 1838 erschienenen Merckischen Briefsammlungen. Aus den Handschriften herausgegeben,' &c., 8vo, Leipzig, 1847. Besides translating several English works into his own language, especially Addison's 'Cato,' and co-operating with Lavater in his work on Physiognomy, Merck was intimately concerned in various periodical and other literary enterprises. He wrote a 'Lettre à M. de Cruse, sur les Os fossils d'Éléphants et de Rhinocéros qui se trouvent dans le Pays de Hesse-Darmstadt,' 4to, Darmstadt, 1782; and a selection from his writings on Art and Belles-Lettres was published, under the editorship of A. Stahr, as 'Ausgewählte Schriften zur schönen Literatur und Kunst. Ein Denkmal, herausgegeben,' &c., 8vo, Oldenburg, 1840.

MÉRIMÉE, PROSPER, a French senator and man of letters, son of Jean François Léonore MÉRIMÉE, a painter and chemist, was born at Paris on the 28th of September, 1803; and, after having received his earlier education at the Collège Charlemagne, and gone through a course of legal study, was admitted as an advocate. His attachment to literature diverted him from the serious practice of his profession; and in his twenty-second year he contributed, under the pseudonym of Joseph Lestrangé, to the dramatic and romantic literature of France a work, which, although really original, was professedly a translation from the Spanish, entitled, 'Théâtre de Clara Gazul, Comédienne espagnole. Avec une Notice sur l'Auteur,' &c., 8vo, Paris, 1825, new edition, 12mo, Paris, 1842, which contains eight comedies in prose, with annotations, and which was followed by another pseudonymous work, ostensibly collected and translated, but really original, entitled, 'La Guzla: ou, Choix de Poésies illyriques, recueillies dans la Dalmatie, la Bosnie, la Croatie, et l'Herzégowine,' 18mo, Strasburg and Paris, 1827; a drama, "par l'Auteur du Théâtre de Clara Gazul," entitled, 'La Jacquerie. Scènes féodales: suivies de la Famille de Carvajal,' 8vo, Paris, 1828, new edition, incorporated with the 'Théâtre,' &c., 8vo, Paris and Corbeil, 1857, and 12mo, Paris, 1865; and a collection of Tales and Romances, entitled, 'Mosaïque,' &c., 8vo, Paris, 1833. After the Revolution of July, 1830, MÉRIMÉE was appointed secretary to the Count d'Argout, and afterwards to the Ministers of Commerce and Marine. In 1831, he became inspector of the historical and archaeological monuments of France; and, during his long tenure of this office, he travelled much in various parts of the country, extending his investigations, in 1840, as far as Spain, where he became acquainted with the family of the lady who was afterwards the Empress Eugénie. By the provisional government of 1848, he was selected to act on the com-

mission which was constituted to decide upon the extent and value of the property of the Orleans family; and some time after was condemned to fifteen days' imprisonment for the boldness with which, in two letters contributed to the *'Revue des Deux Mondes,'* he called in question the justice of the condemnation which had been passed upon his friend, M. Libri. He was raised to the rank of senator in 1853, and on the 12th of April, 1860, and the 14th of August, 1866, respectively, was promoted to be commander and grand officer of the Legion of Honour. His other appointments comprised the perpetual secretaryship of the *École royale des Beaux-Arts*; an assistant-membership of the *Société d'Encouragement*; a membership of the *Académie Française*, in which he succeeded M. Ch. Nodier, in 1844; and a free membership of the *Académie des Inscriptions et Belles-Lettres*.

The works of M. Mérimée, which vary as dramatic, romantic, historical, and antiquarian, include, *'Notes d'un Voyage dans l'Ouest de la France: Extrait d'un Rapport adressé à M. le Ministre de l'Intérieur,'* 8vo, Paris, 1836; *'Notes d'un Voyage en Corse,'* &c., 8vo, Paris, 1840; *'Essai sur la Guerre sociale,'* 8vo, Paris, 1841; *'Colomba,'* 8vo, Paris, 1841, originally published in the *'Revue des Deux Mondes,'* and several times reissued with other works of the author, especially as *'Colomba: suivi de la Mosaïque et autres Contes et Nouvelles. Nouvelles éditions corrigées,'* 12mo, Paris, 1858 and 1865, English translations, *'Colomba: a Corsican Story. Translated by A. R. Scoble,'* 8vo, London, 1853, and *'Colomba. A Novel. With a Preface, by E. Brette, C. Cassal, and T. Karcher,'* 16mo, London, 1867; *'Études sur l'Histoire romaine,'* 2 vols., 8vo, Paris, 1844, and 12mo, 1853: vol. i., *'Guerre sociale,'* ii., *'Conjuration de Catilina,'* *'Histoire de Don Pedro 1^{er}, Roi de Castille,'* new editions, 8vo, Paris, 1848, and 12mo, Paris, 1865, English translation, *'The History of Peter the Cruel,'* 2 vols., 8vo, London, 1844, German translation, *'Geschichte Peter's des Grausamen,'* 8vo, Leipzig, 1852, forming vol. xxv. of the *'Hausbibliothek historische,'* *'Chronique du Règne de Charles IX. Suivre de la Double Méprise, et de la Guzla,'* second edition, 8vo, Paris, 1832, the first edition of the *'Chronique'* having been published in 1820, with the title of *'1572. Chronique du Temps,'* &c., "nouvelles éditions, revues et corrigées," 12mo, Paris, 1847, and 12mo, Paris, 1865, English translation, by A. R. Scoble, *'A Chronicle of the Reign of Charles IX.,'* 8vo, London, 1853; *'Carmen,'* 8vo, Paris, 1846; *'Nouvelles,'* 12mo, Paris, 1852; *'Épisode de l'Histoire de Russie. Les faux Démétrius,'* 12mo, Paris, 1853; English translation, by A. R. Scoble, *'Demetrius the Impostor,'* &c., 12mo, London, 1853, German translation, by W. E. Drugulin, *'Der falsche Demetrius. Episode aus der Geschichte Russlands,'* 8vo, Leipzig, 1853, forming vol. iv. of the *'Geschichtschreiber moderne,'* *'Mélanges historiques et littéraires,'* 12mo, Paris, 1855; *'Monte Vreto: Contes et Poèmes de la Grèce moderne, précédés d'une Introduction,'* 16mo, Paris, 1855; and *'Les Cosaques d'Autrefois,'* 12mo, Paris and Saint-Germain, 1865, forming part of the *'Bibliothèque Contemporaine.'*

MERLE D'AUBIGNE, J. H. [D'AUBIGNE, J. H. MERLE, E. C. vol. ii. col. 516.]

METCALFE, CHARLES THEOPHILUS, BARON, a distinguished Anglo-Indian statesman and colonial governor, was born at Fern Hill, Berkshire, January 30, 1786. His father, who was a baronet, and a director of the East India Company, trained him for the civil service of the Company; and the youth was sent out to India as a writer in 1800. His natural abilities, and the family influence used in his behalf, opened to young Metcalfe a rapid succession of official appointments. In 1801 he commenced as assistant to Lord Cowley, at that time British Resident with the Marhatta prince, Dowlut Rao Scindia, at Gwalior. In 1802 he was appointed assistant in the Chief-Secretary's office; in 1803, assistant in the Governor-General's office; in 1806, after a brief service in the commander-in-chief's office, assistant to the British Resident at the Mogul's court, Delhi. His first assumption of responsibility, as the chief of a mission or enterprise, was in 1808; when, at the early age of twenty-three, he was appointed by Lord Minto British Resident at Lahore, supported by a column of troops under Colonel Ochterlony. It was at a time when Runjeet Singh threatened the independence of all the minor Sikh states. Mr. Metcalfe's duty was difficult and delicate; but he succeeded in making a treaty whereby the river Sutlej was declared the boundary between the two powers; and so well were the terms of this treaty observed on both sides, that during the remaining thirty years of the reign of that remarkable man, Runjeet Singh was never once at war with the British. After occupying many other official posts, Mr. Metcalfe

BIOG. DIV.—SUP.

was in 1819 appointed secretary of the Secret and Political Department at Calcutta, specially concerned in the relations between the East India Company and the native princes; and at the same time private secretary to the Governor-General. In 1820 he went to Hyderabad, as British Resident at the court of the Nizam. In 1825, as Sir Charles Metcalfe (he having succeeded to the baronetcy in 1822), he filled a similar post at Delhi. During seven years his duties next kept him at Calcutta—as member of the Supreme Council in 1827, president of the Board of Revenue in 1828, and vice-president and deputy-governor of Fort William (Calcutta) from 1830 to 1834. In the last-named year he went to Agra as president of the North-west Provinces. In 1835, when Lord William Bentinck resigned, Sir Charles exercised the functions of Governor-General of India until the arrival of Lord Auckland from England. During thirteen months' occupancy of this post, he made improvements in some of the laws or regulations affecting the natives, established a uniformity of coinage, and sanctioned increased liberty to the press. This last proceeding gave great dissatisfaction to the directors in London. When, in 1836, the governorship of the Madras Presidency became vacant, the general voice of opinion in India, both English and native, was in favour of Sir Charles Metcalfe as the new occupant of the post; but the directors showed their resentment by ignoring his claim. Sir Charles, who had returned to his office at Agra, would not consent to remain in the service of the Company under a ban of disfavour; he announced the fact publicly in 1837, and quitted India in 1838, after thirty-eight years of uninterrupted service. His conduct was approved by the English government as well as by public opinion: he had given offence only to the Board of Directors. In 1839 the Colonial Office appointed him successor to Sir Lionel Smith as Governor of Jamaica, at a time when negro emancipation required both firmness and conciliation in the management of the island. Injured in health by the climate, he resigned in 1842; but was speedily selected by Sir Robert Peel as Governor-General of Canada. The troubles between Upper and Lower Canada, and the discontent of large numbers of the colonists, rendered this office a difficult one; but he filled it to the satisfaction of the home government. Returning to England with shattered health in 1845, he was rewarded with a peerage and other honours; but did not live long to enjoy them. Lord Metcalfe died at Fern Hill, September 12, 1846. He was childless, and the peerage title died with him; but the baronetcy descended to his brother. The general relation which Lord Metcalfe's Indian official life bore to that of others in the Company's service has been treated by Mr. J. W. Kaye, in *'The Administration of the East India Company, a History of Indian Progress,'* 8vo, London, 1853; and more fully in *'The Life and Correspondence of Charles Lord Metcalfe, from Unpublished Letters and Journals,'* 8vo, London, 1854, second edition, 1858; as also in the same author's *'Selections from the Papers of Lord Metcalfe,'* 8vo, London, 1855.

METTERNICH, CLEMENT WENCESLAS, PRINCE [E. C. vol. iv. col. 212.] This celebrated diplomatist died at Vienna, on the 11th of June, 1859, at the age of 86.

* METZGER, EDUARD, German architect and writer on architecture, was born at Pappenheim in 1807. He studied architecture in Munich art-academy under Von Gaertner and Von Klenze, and then (1831) repaired to Greece to examine the remains of Grecian art. On his return he was nominated professor in the Munich polytechnic school. Herr Metzger has erected several buildings in Munich and other towns of Bavaria; completed the Siegesthor, &c., commenced by Von Gaertner; made the designs for a monument to Francis I. of Austria; laid out a new street in Prague, &c. He has written a treatise on the *'Influence of the Principles of Construction on the Forms of Buildings,'* 1837, illustrating his views chiefly by an examination of the Greek temple; an elaborate work on Greek elevations (1839), and several professional memoirs.

MEULEMEESTER, JOSEPH CHARLES DE, Belgian engraver, was born 28th of April, 1771, at Bruges, and learned engraving of Bervic. In 1806 he went to Rome, and made an elaborate copy in water-colours of Raffaele's fresco of the *'Finding of Moses,'* which was so much admired that he was induced to copy the series of fifty-two Bible-pictures by Raffaele, on the ceilings of the Loggia of the Vatican. On this undertaking he was engaged twelve years, almost every day being spent on the lofty ladders, by which alone he could gain proper access to the pictures. In 1819 he returned to Antwerp, was nominated engraver to the king, and entered zealously upon the other part of his great task, the engraving of the pictures he had spent so

many years in copying. The first part of 'Les Loges de Raphaël,' containing four coloured plates, appeared in 1825. After the Belgian revolution he removed to Paris, hoping to carry on his work there with less interruption. He died, during a visit to Antwerp, November 5th, 1836. Meulemeester's Loggie prints are remarkably faithful renderings of the originals: unfortunately he only lived long enough to complete nine parts (thirty-six plates) in colours; of the uncoloured series much fewer were issued. The completion was undertaken by a Brussels publisher. Meulemeester finished comparatively few other plates; the chief are a 'St. Cecilia,' by Raffaele, and a portrait of Rubens.

MEUNG, MEUN, or MEHUN, JEAN DE, a French poet and scholar, who, on account of his lameness, was also known by the sobriquet of CLOPINEL, was born about 1279 or 1280, at Meun, a small town on the Loire, in the neighbourhood of Orleans. He was carefully educated, and became skilled in all the studies and accomplishments of the age—theology, rhetoric, philosophy, chemistry, and mathematics; but devoted himself to the cultivation of poetry. Little is known of his personal history, and the question of his condition, whether ecclesiastic or layman, has not been determined. It has been held, on the one hand, that he was a doctor in law; and on the other, that he was a doctor in theology, and a member of the Dominican order—a theory against which the freedom of his satirical attacks upon the various orders of the regular clergy is pertinently arraigned. A member of a considerable if not of a noble family, he early entered into the service of the greatest personages in France, and by his poetical talents and the vivacity of his parts rendered himself a favourite at the court of Philippe le Bel, to whom he dedicated his French translation of the 'De Consolatione Philosophiæ' of Boethius. Before the translation of this treatise, he had translated or compiled, as he himself announces in the dedication just alluded to, the work of Vegetius Rhenanus on Chivalry, 'L'Art de Chevalerie selon Vegece,' &c., folio, Paris, 1488, new edition, with the modified title of 'L'Arbre des Batailles et Fleur de Chevalerie selon Vegece,' &c., 8vo, Paris, 1527; the 'Livre des Merveilles de Hirlande'; the 'Livre des Épitres de Pierre Abeillard et Héloïse sa Femme'; and the 'Livre de Aelred de spirituelle Amitié.' He appears to have freely exercised his talent for satire upon the ladies of the court; and on one occasion the latter became so irritated against him, that a party of them seized him, and resolved to give him a severe flogging. His ready wit, however, came to the rescue, and he eluded the threatened punishment by desiring the most unchaste amongst his fair enemies to commence the castigation. He is supposed to have died about the year 1320.

Besides the translations already mentioned, Meung is the author of 'Le Miroir d'Alquimie de Jehan de Meun, Philosophe très-excellent, avec la Table d'Émeraude d'Hermès Trismegiste, et le Commentaire de l'Ortolain sur la dite Table,' &c., 8vo, Paris, 1612; a poetical paraphrase of the Creed, entitled 'Les sept Articles de la Foy: et Proverbes dorés, selon Maître Jhean de Meung,' 8vo, Paris, 1503, a beautifully illuminated volume, printed on vellum, of which an edition was incorporated with some of the later issues of the 'Roman de la Rose'; 'La Destruction de Troye la Grande: le Ravissement d'Heleine fait par Paris Alexandre, composée en Rithme Françoisse, par Maître Jehan de Meun, premier Inventeur de Réthorique Françoisse. Avec les Prouesses, Noblesses, et Vertus du preux Hector, la damnable Trahison commise par les Grecs, la Description de Fortune mutable et instable. A la Vérité nouvellement revue et corrigée, et très-diligemment reduite en la vraye Langue Françoisse, Historiée d'Histoires nouvelles contenantent entièrement les Faits des Troyans et Gregeois,' folio, Lyons, 1544, the authorship of which has sometimes been claimed for J. Millet; 'Le Dodechedron de Fortune. Livre non moins plaisant et récréatif que subtil et ingénieux entre tous les Jeux et Passetemps de Fortune. Autresfois composé par feu M. Jan de Meun, pour le Roy Charles le Quint, et nouvellement mis en Lumière. Par F. G. L. [François Gruget], 4to, Paris, 1556, reprinted as 'Le Plaisant Jeu du Dodechedron de Fortune,' &c., 4to, Paris, 1560, 8vo, Lyons, 1576, 1581, &c., English translation, by Sir W. B. Knight, 'The Dodechedron of Fortune: or, the Exercise of a quick Wit. A Book so rarely and strangely composed that it giveth (after the most admirable manner) a pleasant and ingenious Answer to every Demand,' &c., 4to, London, 1613. But the principal work of Jean de Meung was his continuation of the 'Roman de la Rose,' commenced by Guillaume de Lorris, whose passion for a certain fair lady incited

him to outlive Ovid in his exposition of the Art of Love. Forty years after the death of Lorris, Meung undertook the completion of his work, and the additions which he made to it constitute more than three-fourths of the whole. The popularity of this celebrated 'Roman' has been immense, and edition after edition has ever and anon been issuing from the press since its first publication in the later years of the 15th century. Of these may be selected for mention, 'Le Roman de la Rose (commencé par Guillaume de Lorris et achevé par Jean de Meung,' folio, without date or place, but probably printed at Lyons, about 1485, and in other years between 1480 and 1490; 'Le Romant de la Rose (Jean du Pré), folio, Paris, about 1496; 'Le Rommant de la Rose, nouvellement imprimé à Paris, pour Jehan Petit,' folio, Paris, without date; 'Le Rommant,' &c., 4to, Paris, 1509, another edition, 1519; 'Sensuyt de Rommant de la Rose,' &c., 4to, Paris, 1526, which contains the genuine text, not Marot's recension; 'Cy est le Romât de la Roze,' &c., folio, Paris, 1526, an edition generally known as that of Galliot du Pré, whose name appears in the privilege and in most of the copies at the foot of the title-page, instead of that of Jehan Petit, the publisher of a later edition, 'Cy est le Rommant de la Roze,' &c., folio, Paris, 1531; 'Le Rommant de la Rose, nouvellement revu et corrigé outre les précédentes Impressions,' 2 vols. 8vo, Paris, 1529, other editions, 3 vols. 12mo, 1735, and 3 vols. 12mo, Amsterdam, 1735, 5 vols. 8vo, Paris, 1799, &c., &c.; 'Le Roman,' &c., "nouvelle édition, corrigée par M. Méon," 4 vols. 8vo, Paris, 1814; and 'Le Roman de la Rose, par Guillaume de Lorris et Jean de Meung. Nouvelle édition, revue et corrigée par Francisque Michel, Correspondant de l'Institut de France, &c., &c., 2 vols. 12mo, Paris, 1864. Modernised editions have also been issued, as well as a German translation, 'Das Gedichte von der Rose. Aus dem Altfranzösischen, &c., übersetzt von H. Fahrman. Mit einem Vorwort eingeführt von F. H. von der Hagen,' 8vo, Berlin, 1839.

MEYEN, FRANZ JULIUS FERDINAND, botanist, was born at Tilsit, East Prussia, June 28, 1804. He was sent to the gymnasium of his native town, and early manifested the future tendency of his thoughts. In 1819 he was articulated to an apothecary at Munich, with the intention of his being educated for the medical profession. In 1821 his elder brother took him to Berlin, and in 1822 he commenced a course of scientific study at the Royal Military Medical Institute. In October, 1826, he received his degree of M.D., on which occasion he wrote a thesis in which he noticed the spontaneous movements of the pollen-granules of plants. It was published under the title of 'De primis vitæ phenomenis in fluidis formationis et de circulatione sanguinis in parenchymate,' 4to, Berlin, 1826. This was followed by a series of papers on the *Alga*, the circulation of the sap in plants, and the freshwater *Hydra*; by 'Untersuchungen über die Natur parasitischer Geschwülste in menschlichen Körper insbesondere über den Mark- und Blut-schwamm,' 8vo, Berlin, 1828; and by a work on phytotomy in 1830. In September, 1830, he sailed from Hamburg on a journey round the world, which occupied him till far on in the year 1832. On his return he wrote his description of the expedition, under the title of 'Reise um die Erde,' 4to, Berlin, 1834-5, a description which manifested the variety and depth of his knowledge and his extraordinary powers of observation. His merit was soon recognised. The King of Prussia presented him with a gold medal, and numerous European societies hastened to elect him a member of their respective bodies. His journey supplied him with materials for various books and papers, which relate chiefly to botany; but zoology occupied a considerable share of his attention. Thus, his 'Beiträge zur Zoologie,' collected during this journey, occupy 245 pages of the 16th volume of the 'Nova Acta physico-medica Academiæ Caes. Leopoldino-Carolinæ Naturæ Curiosorum,' (1832), and relate to the *Salpa*, the *Mammalia*, the Birds, the natives of Peru and the Philippine Islands, and the phosphorescence of the sea; while in subsequent volumes he contributed to the reports on the Lichens and Amphibia. The other more important works written by him are, 'Grundriss der Pflanzengeographie,' etc., 8vo, Berlin, 1836; 'Neues System der Pflanzenphysiologie,' 3 vols. 8vo, Berlin, 1837-39; 'Ueber die Secretions Organe der Pflanzen,' 4to, 1837; and 'Noch einige Worte über die Befruchtungsakt und die Polyembryonie bei den höheren Pflanzen,' 8vo, Berlin, 1840. While, amongst the papers, his 'Jahresberichte über die Resultate der Arbeiten im Felde der physiologischen Botanik,' for the years 1834-39, may be mentioned. They are published in Wiegmann's 'Archiv für Naturgeschichte,' for the years 1835-1840, and comprise in the aggregate nearly 900 pages. In 1840 he became the general

secretary of the Royal Horticultural Society; but died soon afterwards. He was the first to discover (in 1827) the remarkable concretions of cellulose and carbonate of lime, known as *cystoliths*, which are so prevalent in the nettle group; but he erroneously considered them to be formed of gum. His works on the physiology of plants are held in high esteem by his countrymen.

MEYER, CONRAD, Swiss painter and engraver, was born at Zurich, in 1618. He was the son and scholar of Dietrich Meyer (born at Eglisau, in 1572, died in 1658,—a painter and engraver of some repute), and studied also under Matthew Merian the younger. Conrad Meyer painted historical subjects and portraits; but is best known by his engravings, which number in all about a thousand. They include a set of 122 subjects from the New Testament; 24 of the Precepts of Christ; 60 of the Dance of Death, and 16 of the Christian Mirror (both from designs by his elder brother, Rudolf Meyer); 69 Portraits of the Burgomasters and Pastors, and 64 of the illustrious Preachers of Zurich; besides various series and separate plates of sports of children, landscapes, religious pieces, &c. He died at Zurich, in 1689.

MEYER, HERMANN ERICH CHRISTIAN VON, palæontologist, was born at Frankfurt-am-Main, September 3, 1801. In 1822 he went to Heidelberg for the purpose of studying governmental law and chemistry. In 1834 he enjoyed a high position in the municipal administration of his native town, and in 1837 he became one of the directors of the treasury of the Germanic Confederation. His official life was, however, of comparatively little importance as compared with his scientific career. His first paper was published in 1824, and, like several others which followed it, the subject matter was geological or mineralogical. After a while, the finding of the perfect fossil skull of an ox and of several other fossil bones led him to study comparative anatomy in order that he might ascertain their nature; and, by degrees, he devoted himself more and more exclusively to the investigation of the fossil remains of vertebrate creatures, more especially those belonging to the reptilian and mammalian classes. Finding that the figures of fossil bones were frequently wanting in accuracy, at a time when he himself was devoid of any skill as a draughtsman, he resolved to learn drawing, and after a while he became the most skilful delineator of such objects. His papers, which are very numerous, are for the most part profusely illustrated with excellent lithographs executed by himself. These lithographs, which form some hundreds of plates, constitute one of the principal features of his works. The text by which they are accompanied abounds in descriptive details, which must have cost an immense expenditure of labour and time. But he did not confine himself to detail; for sometimes, when opportunity offered, he showed a deep vein of original thought and comprehensive generalization. His most important works consist of '*Palæologica*,' 8vo, Frankfurt, 1832; '*Zur Fauna von Vorwelt*,' 1845—1860; and the memoirs contributed to '*Palæontographica*,' of which he and Dunker were the editors. In the last two works mentioned are several monographs, which are the most complete of their kind; such as, for example, those on the carboniferous *Amphibia*, on the Saurians of the Muschelkalk, and on the reptiles of the lithographic slates of the Jurassic period. He also wrote or contributed to several other works of considerable note, such as the '*Beiträge zur Palæontologie Württembergs, enthaltend die fossilen Wirbelthierreste aus den Triasgebilden mit besonderer Rücksicht auf die Labyrinthodonten des Keupers*,' 4to, Stuttgart, 1844. He was the discoverer and first describer of a large number of extinct genera and species. He died April 2, 1869.

* MEYER, JAN LODEWIJK HENDRIK, a celebrated Dutch marine painter, was born at Amsterdam, in 1809. A scholar of W. J. Pienemann, he commenced with painting history, then tried landscapes, but ultimately found his true vocation in painting ships at sea. The Stanfield of the Hague, Louis Meyer, is familiar with every phase of the ocean, and learned in all maritime matters; and he renders with a firm and masterly hand what he so thoroughly understands. '*A Ship on Fire*,' '*A Wreck*,' '*Sunrise at Sea*,' '*A Fleet making for the English Coast*,' '*Dutch Ships of War off Flushing*,' are the titles of a few of his most admired pictures, and will serve to show his range of subjects.

* MEYER, JOHANN GEORG, German painter, known as MEYER OF BREMEN, was born at Bremen, October 28th, 1813. A pupil of Schadow, in the Düsseldorf Academy, his earlier pictures were mostly scriptural—'*The Prophet Elijah*,' '*Christ Weeping over Jerusalem*,' '*Hagar and Ishmael*,' &c. He acquired some celebrity in this line; but he gradually turned to more

secular and every-day subjects, and has long been famous as the painter of children. He seizes the characteristics of juvenile life and manners with singular skill and taste; and in such pictures as '*Children playing at Blindman's Buff*,' '*Girls listening to a Story*,' '*Mother and Children*,' '*The Little Brother*,' and the like, produces very charming and popular compositions. Herr Meyer has resided at Berlin since 1852.

MEYERBEER, GIACOMO [E. C. vol. iv. col. 216]. In the spring of 1859 a new opera by Meyerbeer, '*Le Pardon de Ploermel*,' was brought out at Paris with decided success. It was repeated shortly after at the Royal Italian Opera, London, in an Italian version with recitatives, the rehearsal of which the composer came over to direct—the title being changed to '*Dinorah*.' It was received with enthusiasm, and takes high rank among Meyerbeer's operas. He was growing old, but still kept up his habit of composition, little, however, being given to the public beyond a march for the coronation of Wilhelm of Prussia in 1861, and an overture for the opening of the International Exhibition, London, 1862, at the performance of which he was present. He had for many years kept in his portfolio an opera, '*L'Africaine*,' upon which he occasionally touched, but which he refused to allow to be performed, not finding a singer whom he considered competent to take the principal part. At length, deeming the circumstances more satisfactory, he went to Paris to make arrangements for its production, when he was seized with a fatal illness, and died there, May the 2nd, 1864, in the 70th year of his age. His remains were carried to Berlin, and interred with great solemnity. '*L'Africaine*' was performed at Paris in 1865, and has since been played at nearly all the principal opera-houses of Europe.

MICHAUD, JOSEPH FRANÇOIS, a French historian, poet, and publicist, was born on the 19th of June, 1767, at Albens, in Savoy, where his family had been honourably settled for several generations. His father, who was a notary, removing to Bourg-en-Bresse, Joseph completed his education at the Collège of that town. In 1786 he left home, in order to assist in a library at Lyons; and the revolutionary horrors which he witnessed in that city so deeply affected him as ever after to fix and intensify his natural tendency to monarchy and conservatism. He arrived in Paris early in 1791, and made his first literary venture by the publication of a small volume, in verse and prose, entitled, '*Voyage littéraire au Mont-Blanc et dans quelques Lieux pittoresques de la Savoie, en 1787*,' 8vo, Paris, 1791; which was followed almost immediately by an Eastern story, entitled, '*Origine poétique des Mines d'Or et d'Argent. Conte oriental*,' 8vo, Paris. After having been concerned with Cerisier in editing the '*Gazette Universelle*,' and with Esménard in the conduct of the '*Postillon de la Guerre*,' in which he attacked the enemies of the monarchy, he founded, in September, 1792, jointly with MM. Rippert and Riche, a daily journal called '*La Quotidienne*.' The conservative tone of the articles in this paper was naturally offensive to the party of revolution; and Michaud was arrested at Chartres, and, having been brought to Paris, was condemned to death, on the 5th Brumaire, An IV. (27th of October, 1795), by the military commission established at the Théâtre Français, for having constantly incited to revolt and to the re-establishment of royalty. By the efforts of his friend, M. Giguët, he was saved from the impending guillotine, and execution was done only on his effigy, in the Place de Grève. He has left a touching memorial of this episode in his career, in the shape of a volume, entitled '*Printemps d'un Proscrit. Poème en IV. Chants, précédé d'une Dissertation sur la Poésie descriptive, et de trois Lettres à M. Delille, sur le Sentiment de la Pitié*,' &c., 12mo, Paris, 1803, eighth edition, 8vo, Paris, 1827. In 1796, shortly after the establishment of the Directory, Michaud resumed the issue of '*La Quotidienne*,' but he was frequently harassed by interruptions and imprisonments, and was finally obliged to take refuge from the proscription—dated 18 Fructidor (September 4th, 1797)—of "*journalistes complices dans la conjuration royale*," amongst the Jura mountains, where he produced the '*Printemps*,' &c. After two years of exile, he returned in November, 1799, to Paris, where the Directory had been succeeded by the Consulate. The following year Michaud had to undergo an imprisonment of some months' duration in the Temple, on account of two powerful pamphlets, anonymously published, and entitled respectively '*Les Adieux à Bonaparte*,' 8vo, Paris, 1800, which went through many editions, and was translated into English as '*France after the Revolution of Bonaparte*, on the 8th of November, 1799,' &c., 8vo, 1800; and '*Les derniers Adieux à Bonaparte victorieux*,' 8vo, Paris, 1800, and frequently reprinted.

Again in the enjoyment of freedom, Michaud devoted himself to the production of his first historical work, 'Histoire des Progrès et de la Chute de l'Empire de Mysore, sous les Règnes d'Hyder-Aly et Tippoo-Saib,' 2 vols., 8vo, Paris, 1801. In 1806, Michaud was associated with his brother, Louis Gabriel, and two others, in the production of the 'Biographie Moderne: ou, Dictionnaire des Hommes qui se sont fait un Nom en Europe depuis 1789,' 4 vols., 8vo, Leipzig [really at Paris], 1806, which was the first published series of the biography of contemporaries, and which developed into the later and more elaborate work published in 1811, with the title of 'Biographie Universelle.' His royalist opinions began to yield to the force of circumstances, and he addressed an allegorical poem to the emperor, congratulating him upon his marriage, in the spring of 1810, with the Archduchess Maria Louisa, and entitled 'Le Treizième Chant de l'Énéide: ou, le Mariage d'Énée et de Lavinie,' which, on the birth of a son, as the issue of the marriage, March 20th, 1811, he followed up with 'Stances sur la Naissance du Roi de Rome.' These poems were afterwards grouped together in a reprint, under the title of 'L'Hymen et la Naissance.' Michaud now commenced the publication of the great work of his life, 'Histoire des Croisades,' &c., 7 vols., 8vo, Paris, 1812-22, "cinquième édition, revue, corrigée, et augmentée, d'après le Voyage de l'Auteur en Orient," 6 vols., 8vo, Paris, 1838, "sixième édition [the first posthumous one], faite d'après les derniers Travaux et les dernières Intentions de l'Auteur, et précédée d'une Vie de Michaud, par M. Poujoulat," 6 vols., 8vo, Paris, 1841, "nouvelle édition, augmentée d'un Appendice par M. Huillard Bréholles," 4 vols., 8vo, Paris, 1857, English translation, by W. Robson, 3 vols., 8vo, London, 1852, Danish translation, 'Korsfarerne og Korstogene. Historiske Skildringer af Kampen for det hellige Land. Hovedsagelig efter Michaud,' 8vo, Copenhagen, 1861. An epitome of Michaud's great work was made by himself and his friend and pupil, Jean Joseph François Poujoulat, and published as 'Histoire, &c., abrégée à l'Usage de la Jeunesse,' 2 vols., 12mo, Paris, 1838, 8vo, Tours, 1863, and again 8vo, Tours, 1867, forming part of the 'Bibliothèque de la Jeunesse Chrétienne,' German translation, by Gottfried Hertel, 'Geschichte der Kreuzzüge. Für die reifere Jugend und Gebildeten im Volke,' 12mo, Leipzig, 1846. In further illustration of his subject, Michaud published a valuable work on the bibliography of the crusades, 'Bibliothèque des Croisades,' 4 vols., 8vo, Paris, 1829, which is an analysis of both Eastern and Western records of the Crusades, the fourth volume, which contains the extracts from the Arabic chronicles, being the production of M. Reinaud. Another work, which should be mentioned in this connection, is a record of Michaud's extensive travels, made between May, 1830, and August, 1831, in company with M. Poujoulat, through those parts of the East traversed by the Crusaders, and is entitled, 'Correspondance d'Orient, 1830-31, par M. Michaud et M. Poujoulat,' 7 vols., 8vo, Paris, 1833-35. In 1813 M. Michaud succeeded M. Cailhava as one of the Forty of the Académie Française; his nomination having been ratified by the emperor on the battle-field of Leipzig. In May, 1814, on the 3rd of which month, the empire having been overthrown, Louis XVIII. made his public entry into Paris, Michaud re-established 'La Quotidienne'; but found it expedient to take refuge in the Département de l'Ain during the Cent Jours, of which, after the second restoration, he published an account, entitled, 'Histoire des quinze Semaines; ou, le dernier Règne de Bonaparte,' 8vo, Paris, first twenty editions, 1815, and, although of the slightest historical value, many times reprinted afterwards. Under the monarchy, M. Michaud held several posts of honour and emolument: he was censor-general of the press, reader to Louis XVIII. and Charles X., a free member of the Académie des Inscriptions et Belles-Lettres, and a member of the Chamber of Deputies for the Département de l'Ain, which he had come to regard as his native province. From the year 1833, he established himself at Passy, a cheerful retreat near Paris, where, in association with M. Poujoulat, he devoted himself to such literary activity as his failing health permitted. He died at Passy, on the 30th of September, 1839.

Besides the works already enumerated, Michaud produced 'Ermenonville: ou, le Tombeau de Jean-Jacques Rousseau,' 8vo, Paris, 1794; 'L'Immortalité de l'Âme. Poème,' about 1794; 'Petite Dispute entre deux grands Hommes [Chénier et Louvet], 8vo, Paris, An V. (1796); 'Notice sur Jeanne d'Arc surnommée la Pucelle d'Orléans,' 8vo, Paris, 1837, &c., in which he was assisted by M. Poujoulat, with whom he was likewise concerned in the compilation of his 'Nouvelle Collection des Mémoires pour servir à l'Histoire de France depuis le XIII^e Siècle jusqu'à

la Fin du XVIII^e: précédés de Notices pour caractériser chaque Auteur des Mémoires et son Époque: suivis de l'Analyse des Documents historiques qui s'y rapportent,' three series, 32 vols., 8vo, Paris, 1836-39.

*MICHEL, FRANCISQUE XAVIER, a French philologist and archæologist, who has devoted himself especially to the exposition of the life and literature of the Middle Ages, was born at Lyons, on the 18th of February, 1809, and was educated successively at Lyons and at the Collège Charlemagne, Paris. He contributed articles to the 'Cabinet de Lecture,' and to various periodicals, and published two historical novels in illustration of the Middle Ages, 'Mœurs du Moyen Âge. Job: ou, les Pastoraux,' 1251. Audefrois le Bâtard, 1272,' 8vo, Paris, 1832. In 1833, he was commissioned by M. Guizot, at that time Minister of Public Instruction, to visit England for the purpose of making researches in the libraries of this country, amongst the documents calculated to throw light on the history and literature of France; and in 1837 was entrusted by M. de Salvandy with the further prosecution of his task, especially in Scotland. He became, in 1838, a member of the Legion of Honour; and in the following year was appointed professor of foreign literature in the faculty of letters, at Bordeaux. On the 3rd of May, 1846, M. Michel was admitted Docteur-es-Lettres, on which occasion he produced, as his thesis, a work afterwards published as 'Histoire des Races maudites de la France et de l'Espagne,' 2 vols., 8vo, Paris, 1847; and has since become a member of various learned societies, having been named a correspondant de l'Institut (Académie des Inscriptions et Belles-Lettres), a member of the Committee of Historical Monuments (of France), a member of the Academies of Turin and Vienna, and of the Society of Antiquaries of France and England; and he is at present (July, 1871) residing in the last-named country, having just completed, for the Roxburghe Club, an edition of 'Le Mystère de Saint Louis, Roi de France, publié pour la première fois d'après un Manuscrit du XV^e Siècle,' &c., 4to, Westminster, 1871.

M. Michel, who is a valued contributor to the 'Athenæum' and to 'Notes and Queries,' has edited an immense number of works, many of which he has been the first to introduce to the public, produced in various languages between the 11th and the 14th century. Of these may be mentioned, 'Hugues de Lincoln: Recueil de Ballades Anglo-Normandes et Écossaises relatives au Meurtre de cet Enfant commis par les Juifs en 1255. Publié avec Introduction et des Notes,' &c., 8vo, Paris, 1834; 'Le Roman d'Eustache Lemoine,' 8vo, 1834; a collection of poems, published with the name of their author for its title, 'Tristan,' 2 vols., 12mo, London, 1835; Extracts and Documents relating to the History of England and Normandy, 'Chroniques Anglo-Normandes. Recueil d'Extraits et d'Écrits relatifs à l'Histoire de Normandie et d'Angleterre pendant les XI^e et XII^e Siècles, publié pour la première fois d'après les Manuscrits de Londres, de Cambridge, de Douai, de Bruxelles, et de Paris,' &c., 3 vols., 8vo, Rouen, 1836-1840; 'Lais inédits des XII^e et XIII^e Siècles,' 8vo, 1836; the Trouvère Benoit's 'Chronique des Ducs de Normandie,' 4to, 1837-44; 'Roman du Roi Flore et de la Reine Jeanne,' 8vo, 1838; 'Théâtre Français au Moyen Âge,' 8vo, 1839, edited by M. Michel jointly with M. L. J. N. Monmerqué; 'Chronique des Abbés de Saint-Ouen de Rouen, publiée pour la première fois d'après un Manuscrit du XIV^e Siècle de la Bibliothèque du Roi,' &c., 8vo, Rouen, 1841; 'Le Roman de Saint-Graal (en Vers), publié pour la première fois d'après un Manuscrit de la Bibliothèque royale,' &c., 12mo, Bordeaux, 1841; the Poems of 'Mellusine,' 8vo, 1854, and of 'Gerard de Rosillon. Chanson de Geste ancienne, publiée en Provençal et en Français, d'après les Manuscrits de Paris et de Londres,' &c., 16mo, Paris, 1856; and the 'Roman de la Rose' of Guillaume Lorris and Jean de Meung, 2 vols., 8vo, Paris, 1864.

M. Michel has produced French translations of several English standard authors, as for instance, 'Œuvres choisies de Shakespeare,' 3 vols., 8vo, 1866; 'Œuvres choisies de Goldsmith,' 8vo, Paris, 1838; Sterne's 'Sentimental Journey,' 'Voyage sentimental en France,' forming vol. xxviii. of a collection of 'Voyages imaginaires, Songes, &c.,' 8vo, Paris, 1787, &c.; and of Tennyson's 'Elaine,' folio, 1867; 'Viviane,' folio, 1868; 'Genievre,' folio, 1868; and 'Enide,' folio, 1869.

Of works of which M. Michel is more distinctively the author may be mentioned, 'Rabelais analysé: ou, Explication de 76 Figures gravées pour ses Œuvres par les meilleurs Artistes du Siècle dernier, augmentée de l'ancienne Clef et de celle de Le Motteux,' 8vo, Paris, 1830; 'Rapports à M. le Ministre de l'Instruction publique sur les anciens Monuments de l'Histoire et de la Littérature de la France qui se trouvent dans les Bi-

ibliothèques de l'Angleterre et de l'Écosse,' 4to, Paris, 1848; 'Livre d'Or des Métiers. Histoire des Hôtelleries, Cabarets, Hôtels garnis, Restaurants et Cafés, et des anciennes Communautés et Confréries d'Hôteliers, de Marchands de Vin, de Restaurateurs, de Limonadiers,' &c., 2 vols. 8vo, Paris, 1851—54, produced in conjunction with M. Ed. Fournier; 'Recherches sur le Commerce, la Fabrication, et l'Usage des Étoffes de Soie, d'Or et d'Argent et autres Tissus précieux en Occident, principalement en France, pendant le Moyen Âge,' 2 vols. 4to, Paris, 1852—54, a treatise which obtained the prize of the Institute; 'Étude de Philologie comparée sur l'Argot et sur les Idiomes analogues parlés en Europe et en Asie. Développement d'un Mémoire couronné par l'Institut de France,' 8vo, Paris, 1856; 'Le Pays Basque: sa Population, sa Langue, ses Mœurs, sa Littérature, et sa Musique,' 8vo, Paris, 1857; 'Les Écossais en France et les Français en Écosse,' 2 vols. 8vo, London, 1862; and a work to which the Gobert prize was allotted in 1868, entitled 'Histoire du Commerce et de la Navigation à Bordeaux, principalement sous l'Administration Anglaise,' 8vo, first volume, 1867.

MICHEL, JEAN BAPTISTE, French engraver, was born at Paris in 1748. He was a scholar of Pierre Chenu; went to London, where he resided many years, and acquired a high reputation; but returned to Paris before the Revolution, and died there in 1804. He engraved numerous plates for Boydell, including nineteen in the collection of pictures belonging to the Empress Catherine II. Among his most celebrated plates are, 'Moses striking the Rock,' after Poussin; 'The Three Graces,' and 'Faith, Hope, and Charity,' after Rubens; 'The Prodigal Son,' after S. Rosa; 'Alfred dividing his Last Loaf with a Pilgrim,' and two or three others, after West, &c.

MICHEL, PIETRO ANTONIO, botanist, was born at Florence, December 11, 1679. He was the son of poor parents. Desiring to know something about a particular plant, he consulted the works of Matthioli, and this led to his exploring the district around Florence for the purpose of collecting plants, and to his acquiring, without the assistance of a master, a knowledge of the Latin language. An account of some of the rarer plants found by himself attracted attention; he was allowed the free use of most of the best private libraries in Florence, and was made an assistant to Tili, the professor of botany at Pisa. Soon after he was furnished with the means of travelling in most parts of Europe. He formed large collections of natural-history objects, and made the most minute study of plants on the spots where they grew; but he was so diffident that he published very little. His earliest important work was 'Nova plantarum genera juxta Tournefortii methodum disposita,' 4to, Florence, 1729; it comprises 108 plates, and in it about 1400 new species are described. Micheli first made out the structure of the flower in grasses, and was the discoverer of the sporidia in Fungi and other cryptogams. He also wrote accounts of the principal gardens at Florence, some of which, as a 'Catalogus plantarum Horti Cæsarei Florentini,' fol. 1748, were published after his death, which took place January 2, 1737. His unpublished manuscript writings are very voluminous. He also left a large collection of plants, minerals, shells, fishes, and other zoological specimens. Linnæus held him in high esteem, and frequently sought his advice.

MIDDIMAN, SAMUEL, English landscape-engraver, was born in 1746. A pupil of Woollett, he in his best plates displayed a vigour, taste, and intelligence, and an adroit management of the graver, that would have done no discredit to his master. He engraved several of the pictures of Gainsborough, Barret, and Zuccarelli, as well as one or two of Berghem's, and some prints in Boydell's Shakespeare. Of a smaller size he published a series of 'Select Views of English Scenery,' which are in their way very excellent. He died in 1818.

* MIGNÉ, ABBÉ JACQUES PAUL, French priest and publisher, was born on the 26th of October, 1800; studied theology at Orleans; was made professor at the college of Châteaudun; was ordained priest in 1824, and served as curate at Puiseaux (Loiret). A difference with his bishop having caused him to resign his cure, he repaired to Paris, where he engaged in literary occupation, and founded, 1833, the violent ultramontanist journal, 'l'Univers.' In 1836 he quitted the journal in order to found the Imprimerie Catholique, which in the course of the next thirty years grew to be one of the most remarkable industrial establishments in Paris. The Abbé Migné's purpose was to provide a complete library for Catholics, whether laymen or ecclesiastics, and whatever might be their degree of culture. The books issued comprised a 'Collection

des Orateurs sacrés,' in 100 volumes (1846—1868); 'Patrologia Cursus completus,' of which 390 volumes were published; 'Encyclopédie Théologique: ou, Série de Dictionnaires sur toutes les parties de la Science religieuse,' large 4to, 1845, &c., of which 171 volumes were published, leaving only two or three to complete the work, when M. Migné's establishment was destroyed by a fire, February, 1868, and almost the whole of the vast stock was consumed, as well as the manuscripts, presses, type, and stereotype plates. Nor was this all. For M. Migné, far from confining his attention to literature, had gradually extended his operations till he produced on his premises church utensils, organs, statuary, pictures, ornaments, and almost all the paraphernalia of the Roman Catholic ecclesiastical system, and of these the stock in hand was also consumed. In the various branches of his establishment, which is said to have presented a model of organization, several hundred workpeople were constantly employed on the premises, besides a large literary and artistic staff.

MIGNON, ABRAHAM, a celebrated fruit and flower painter, born at Frankfurt in 1639, was a scholar of Jacob Moreels, and afterwards of J. D. de Heem, of whose manner he was an imitator. Mignon is usually classed with Jan van Huysum and De Heem as one of the three great masters, in this branch of art; but Mignon is inferior to both the others in composition and general effect. Nothing can, however, well surpass the almost microscopic accuracy and finish of the several parts of his pictures—whether principals or accessories, fruit or flowers, insects or dew-drops, birds, fish, plate, or porcelain. His pictures were eagerly purchased at high prices during his lifetime, and they have always maintained their value. He was a very industrious painter, and his works are found in most large collections; but genuine examples now seldom reach the public market. He died at Wetzlar in 1679.

MILLER, PATRICK, one of the inventors of steam navigation, was born about 1730, at Dalswinton, Dumfriesshire. A gentleman of ample means, but fond of mechanical invention, he spent a large portion of his time in making experiments and in fostering the inventions of others. One of his favourite subjects was the improvement of artillery; he was the main introducer of the short iron guns called carronades, held in great favour by artillerymen as a means of throwing shell and heavy shot at short ranges. But he is chiefly remembered for the part he took in improving ship-construction and propulsion. In 1785 he made experiments, on a loch near his estate at Dalswinton, on various new modes of propulsion; and published 'Elevations, Sections, Plans, and Views of a Triple Vessel, with Wheels; with Explanations . . . and an Account of the Properties and Advantages of the Invention,' folio, Edinburgh, 1786. This was a triple boat, with two water-spaces between, and paddle-wheels dipping into the water; the paddle-wheels were worked by men, through the medium of capstans. He also described a plan for propelling the same vessel with sails. One passage in his pamphlet attracted attention in later years, in controversies relating to priority of invention in steam navigation: "I have also reason to believe that the power of the steam engine may be applied to work the wheels, so as to give them a quicker motion, and consequently to increase that of the ship. In the course of this summer I intend to make the experiment; and the result, if favourable, shall be communicated to the public." Whether this idea first suggested itself to his own mind, or whether it was suggested to him by Mr. James Taylor, is a disputed point. Mr. Taylor went to reside at Dalswinton in 1785, as tutor to two sons of Mr. Miller; and he assisted him in his experiments on hand-worked boats in that and the two following years. On December 5th, 1787, Miller wrote to the Royal Society, describing the trial of a boat on the loch three days previously: the boat was 60 feet long, 14½ feet broad, and had one paddle-wheel; five men, at a capstan, turned the wheel, and propelled the boat about five miles an hour. With whomsoever the idea originated, Miller and Taylor worked together in substituting steam for manual power in working the paddles. Mr. Miller employed William Symington, a friend and school-fellow of Taylor, and at that time mechanical engineer at the Wanlockhead Lead Mines, to make the steam-engine. In October, 1788, a new double boat was launched on the loch, with a one-horse steam-engine on one side, a boiler on the other, and a paddle-wheel in the middle; it travelled at the rate of five miles an hour, although the cylinder was only four inches diameter. In 1789 a larger steamer was built, with an engine of 12-horse power, mounted on a frame on the deck; it was tried on the Forth and Clyde Canal. Mr. Miller was dissatisfied with the working of the engine, which communicated motion from

the piston to the paddle-wheels by means of chains, pulleys, and ratchet-wheels, producing much shaking and jerking. He appears to have tired of mechanical experimenting, on which he had, first and last, spent £30,000. The remainder of his life was chiefly passed in agricultural pursuits. He died at Dalswinton on the 9th of December, 1815, at the advanced age of eighty-five. For three years, 1788 to 1791, Robert Burns was a tenant of his, at Ellisland Farm.

Some years after Mr. Miller's death, the House of Commons appointed a committee to inquire into the facts relating to the invention of steam navigation. Immediately a host of claimants appeared, among them the representatives of the families of Miller, Taylor, and Symington. A controversy was begun, which has continued to this day. The known facts are narrated in the chief works on steam navigation; while special claims are discussed in the following:—'Memorial by the late Mr. James Taylor, of Cumnock, Ayrshire; presented to the Select Committee of the Honourable the House of Commons on Steam-boats,' 1824. 'A Concise History of the Origin of Steam Navigation; comprising its Invention by Mr. James Taylor, and Experiments by him, in conjunction with the late Patrick Miller, of Dalswinton, Esq. Compiled from authentic documents,' 1842. 'A Brief Account of the Rise and Early Progress of Steam Navigation, intended to demonstrate that it originated in the suggestions and experiments of the late Mr. John Taylor, of Cumnock, in connexion with the late Mr. Miller, of Dalswinton,' 1844. 'A Brief Narrative, proving the right of the late William Symington, Civil Engineer, to be considered the Inventor of Steam Land-carriage Locomotion, and also the Inventor of Steam Navigation,' by Robert Bowie, 1853. 'Biography of William Symington, C.E., Inventor of Steam Locomotion by Sea and Land; also a brief History of Steam Navigation, with Drawings, by J. and W. R. Rankine, Engineers,' 1862. 'A Letter to Bennet Woodcroft, Esq., F.R.S., vindicating the right of Patrick Miller, Esq. of Dalswinton, to be regarded as the First Inventor of Practical Steam Navigation, by Major-General Miller, C.B., late of the Madras Artillery,' 1862. The major-general discusses the claims put forth for Taylor and Symington, adduces facts on the other side, and ends with the declaration, "I claim the absolute right and title to the honour of being the true discoverer and originator of practical steam navigation for Patrick Miller, of Dalswinton." The final verdict will probably be that the credit of introducing steam navigation cannot be limited to *one* inventor only.

MILLER, WILLIAM ALLEN [E. C. vol. iv. col. 246]. The position of a scientific man in full work entails a large amount of exertion both of mind and body. Dr. Miller died on the 30th of September, 1870, at the early age of 53. At the time of his death he was professor of chemistry at King's College, London, and, as the oldest professor, he was naturally much consulted respecting the work of the college and the promotion of its interests. As assayer to the Mint and the Bank of England, his duties were heavy. As treasurer of the Royal Society and vice-president, his time was much occupied, not only in the Council and representing the President in his absence, but also on various scientific committees originating in, or connected more or less intimately with, the society; as, for instance, he was on the Government Grant Committee, the Melbourne Telescope Committee, on the committee of the Meteorological Department of the Board of Trade, and on Marine Meteorology; on the Library Committee of the Royal Society; on the Scientific Relief Committee; on the committee on Plans for a new House for the Society; on the committee on Deep-sea Researches; he was also a member of the Commission on Scientific Education; he was on the Kew Committee, and some others. He was also a member of the Council of the London University, and for some years one of the examiners. He was on the council of the British Association: he was one of the scientific advisers of government. In addition to all this, every item of which represents a large amount of hard work, he was frequently consulted by manufacturers on patent processes, and had to appear in courts of justice as an expert. He also had to prepare new editions of his large work on Chemistry, one or other of the three volumes of which was nearly always in hand for a new edition; and at the time of his death he had just completed the manuscript of an elementary work on Chemistry, which, in his last illness, he requested that his friend Mr. Tomlinson would revise and see through the press. And, as if all this mental work was not enough, he engaged in original researches on the photographic spectra of bodies, of which an elaborate memoir appeared in the 'Philosophical Transactions' for 1862. A

lecture which he had prepared on 'Spectrum Analysis,' and delivered at one of the evening meetings of the British Association at Manchester, was repeated at the Pharmaceutical Society, 15th January, 1862; after which his friend and neighbour, Dr. Huggins, returning home with him, proposed that they should unite in experiments on the spectra of the heavenly bodies. This led to more work, and, what is more trying, work carried on through the night, after the labours of the day; and when the result of this investigation had been published in the pages of the 'Philosophical Transactions,' there were claims upon him for a course of lectures at the Royal Institution on the 'Spectra of the Heavenly Bodies,' while at the meeting of the British Association at Exeter in 1869 he gave a lecture on the same subject to working men. Nor must it be supposed that these labours were light even to so experienced a lecturer as Dr. Miller; for he was so conscientious in the performance of his duties, that these lectures were all written out and carefully considered. They were afterwards published—the one in the 'Chemical News,' the other in the 'Popular Science Review.' He also gave the Rede Lecture at the University of Cambridge, in May, 1869, which on that occasion was on the 'Coal Tar Colours.' And still we do not exhaust the list of demands made upon him; for he was requested to prepare a paper on the relations between the Bible and science for the Church Congress at Wolverhampton, and the writer knows with how much care and thought this paper was prepared.

If the result of this vast amount of mental labour was fatal to the active brain that undertook it, we can only say that those laws which he studied and expounded with so much effect were not suspended in his case; but that he had to pay the penalty which accompanies their infringement. Those who knew him best, felt this by the side of his grave in Norwood Cemetery, on Wednesday, October 5th, 1870, where he was laid to rest in the tomb of his gentle, affectionate, and simple-minded wife, whom he survived one year.

Perhaps no man since Faraday (whom he greatly resembled in character) will be so much mourned and regretted. In a notice of his life, prepared by Mr. Tomlinson for the Chemical Society (over which he more than once presided), it is said:—"Although removed at the early age of fifty-three, he had passed a life which, measured by its results, cannot be called a short one. If we were asked to name in one word the most marked feature in Miller's character, we should say it was *sagacity*. Well acquainted with the scientific tendencies of the day, cautious in forming as well as expressing opinions, just in his dealings with others, his advice and assistance were sought by persons in various stations, from that of the cabinet minister down to the humble inventor and patentee. . . . He was one of the original founders of the Chemical Society, and has frequently occupied this chair, as well as a place at our council board. He has on several occasions contributed to our 'Journal,' but he was not often heard in debate. Indeed, he had a dislike to impromptu utterances, from a feeling that in the heat of debate rash things are often said, and the cause of truth and fair dealing endangered. The caution of his character is here again conspicuous, together with his love of truth. These were based on a deep religious belief which formed the mainspring of his whole life."

Dr. Miller bore his honours lightly, but it may be mentioned that he received the degree of D.C.L. at the University of Oxford in June, 1868, and that of LL.D. at the University of Cambridge in May, 1869. He also received the Gold Medal of the Astronomical Society, in conjunction with his friend and fellow-worker Dr. Huggins.

MILMAN, the VERY REV. HENRY HART, D.D., Dean of St. Paul's Cathedral. [E. C. vol. iv. col. 250.] Dean Milman published the concluding volumes of his 'History of Latin Christianity, including that of the Popes to the Pontificate of Nicholas V.,' 6 vols. 8vo, in 1856. Unlike his 'History of the Jews,' its ecclesiastical breadth provoked no serious censure, whilst its learning, candour, and literary excellence met with general acknowledgment, and the author lived to see a fourth edition of it published. A translation in verse of the Agamemnon of Æschylus, the Bacchæ of Euripides, and other Greek poems, was published by him in 1856, but many of the verses were the production of his early manhood. He also printed a sermon on Hebrew prophecy, preached before the University of Oxford in 1865, and prefixed a graceful biographical notice of the historian to the posthumous volumes of Macaulay's 'History of England.' But the work which occupied his chief attention during his last years, and which was looked forward to with

much interest, was his 'Annals of St. Paul's Cathedral,' but which, though he had the satisfaction to see it completed, he did not live long enough to carry through the press. He died at the Queen's Lodge, Ascot, on the 24th of September, 1868, and was interred in the cathedral over which he had for nearly twenty years presided. In his later years few men enjoyed a more honoured position than Dean Milnes. In private life he was universally esteemed; in the church his influence was great and worthily exercised; and in literature his reputation appeared to be to the last steadily on the increase.

MILNE-EDWARDS [EDWARDS, HENRI MILNE, E. C. vol. vi. col. 993].

MILNES, RIGHT HON. RICHARD MONCKTON, BARON HOUGHTON. [E. C. vol. iv. col. 253.] Mr. Milnes was raised to the peerage, with the title of Baron Houghton, August 20th, 1863.

*MINGHETTI, MARCO, an Italian statesman and publicist, member of a family who had attained considerable wealth in commerce, was born on the 8th of November, 1818, at Bologna. The premature death of his father devolved the responsibility of his education upon his mother, who proved herself fully equal to the occasion. After the completion of his studies, in the course of which he devoted himself first to physics and mathematics, and subsequently to the moral and social sciences, Minghetti traversed Italy, and made the tour of Germany, France, and England, occupying himself, especially in the last-named country, in the investigation of their various political, social, and economical institutions. One of his earliest public labours, after his return to Italy, was to deliver a lecture, March 1st, 1846, before the Società Agraria di Bologna, in which he advocated the principles of free trade, and which was published in the 'Transactions' of the society; and he followed up this first step by an energetic advocacy of the commercial principles of Mr. Cobden. In 1854 he delivered a discourse at the Accademia di Belle Arti of Bologna, in which he examined the reasons of the decay of the moderns in true æsthetic principles, as compared with the ancients, and found them in the decline of will and mental vigour; pressing upon the young artists the advice of Alfieri, "volere, fortemente volere, fortissimamente volere." Some years previous to the publication of the last-named lecture, Minghetti had made his début in public life, soon after the accession of Pius IX. to the papal throne, June 16th, 1846, by the establishment and direction, jointly with Antonio Montanari and Rodolfo Audinot, of a journal of liberal tendencies, entitled 'Felsineo,' which was distinguished at once for its firmness, moderation, and good sense; and had interested himself in the institution of agricultural conferences and other agencies having for their object the material and moral welfare of the country. Towards the end of 1847 he was called to Rome, where he became an influential member of the Consulta della Finanze; and was appointed Minister of Public Works in the administration formed on the 10th of March, 1848, of which Cardinal Antonelli was President and Minister of Foreign Affairs. Minghetti continued in office only till the 29th of April following, when, having learned to despair of the progress of Italian unity under the papal régime, he, in company with his colleagues, sent in his resignation; and, repairing to the camp of Charles Albert in Lombardy, in whom he believed to centre the last hope of Italian re-organization, was well received by the king, and appointed a staff-captain. He made the campaign of 1848; and after the battle of Goito, May 30th, in which an Italian force of 15,000 repulsed and completely routed an army of 50,000 Austrians, was promoted to a majority, whilst for his gallant conduct in the more disastrous engagement of Custoza, July 23rd, he received from the king the cross of the order of St. Maurice. On the conclusion of the war by the peace of Milan, Minghetti returned to Bologna, where he resumed his scientific pursuits; occupying himself with agriculture and political economy, and paying occasional visits to Turin, where he established confidential relations with Count Cavour, which endured till the death of the latter, and which were especially signalised in 1856, when Cavour consulted Minghetti upon the terms of the famous note or protest which impressed upon the representatives of the powers of Europe at the Peace Congress of Paris the necessity of providing efficaciously for the welfare of Italy, if the future tranquillity of Europe were to be ensured. In 1859 Minghetti was appointed by Count Cavour to be secretary-general to the Ministry of Foreign Affairs, and held this office until the peace of Villafranca, July 11th; after which he repaired to Bologna, where he was instrumental, in the fulfilment of various offices, in preparing the way for the accomplishment of Italian unity.

In October, 1860, at which time he represented the city of Bologna in the national Parliament of Italy, he became Minister of the Interior in the last administration of Count Cavour, after whose death he still continued to keep his portfolio in the cabinet of Ricasoli. Retiring from his office, he was elected vice-president of the Parliament for the session of 1861; and, after the fall of the Ratazzi ministry, assumed the presidency of the Council in association with the Ministry of Finance, in March, 1863. He held these offices until 1866; and in July, 1866, was appointed ambassador at the court of St. James's, returning to Italy to undertake the post of Minister of Agriculture, in the Menabrea administration of May, 1869. He has received various marks of honour and esteem from the King of Italy; and in February, 1864, was elected correspondent of the French Institute, and named grand officer of the Legion of Honour at the conclusion of the treaty of commerce between France and Italy.

Minghetti, though not gifted with the commanding oratory of Cavour, has delivered many important and influential speeches in the Parliament of Italy, upon the internal economy of that country; and several of these have been published in a substantive form. His most important works are, 'Della Economia pubblica e delle sue Attinenze colla Morale e col Diritto,' &c., 8vo, Florence, 1859, French translation, by M. Saint-Germain Leduc, with an Introduction by M. H. Passy, 'Les Rapports de l'Economie publique avec la Morale et le Droit,' 8vo, and 12mo, Paris, 1863, forming part of the 'Bibliothèque des Sciences morales et politiques,' the fundamental idea of which is the propriety of subordinating political economy to ethical principles; 'Statistica amministrativa del Regno d'Italia. Edita a Cura del Ministro dell' Interno, Marco Minghetti,' 4to, Turin, 1861; 'Ordinamento amministrativo del Regno d'Italia. Proposte di Legge rassegnate al Parlamento dal Ministro dell' Interno,' &c., 4to, Turin, 1861, French translation, 'De l'Organisation administrative du Royaume d'Italie,' 8vo, Paris, 1862; 'Discorso sulle Condizioni delle Finanze del Regno d'Italia detto alla Camera dei Deputati il Di 14 Febbraio, 1863,' 8vo, Turin, 1863; 'Discorso detto alla Camera dei Deputati nella Discussione sul Bilancio del Regno per l'Anno 1864,' 8vo, Turin, 1863, French translation, 'Royaume d'Italie. Discours prononcé à la Chambre des Députés,' &c., 8vo, Turin, 1863; 'Saggio di Provvedimenti di Finanza,' 8vo, Florence, 1866; and 'Chiesa e Finanza: Lettere,' &c., 12mo, Florence, 1866.

MINTO, GILBERT ELLIOT, second EARL OF [E. C. vol. iv. col. 259], died on the 31st of July, 1859, and was succeeded in the title by his eldest son, William Hugh Elliot-Murray-Kynynmound, born 1814.

MITCHEL, ORMSBY MACKNIGHT, American astronomer, was born on the 28th of August, 1810, in Union county, Kentucky. Receiving his early education at Lebanon, Ohio, he became a clerk in a store at Miami in his twelfth year. In 1825 he entered as a cadet in the Military Academy at West Point, where he graduated in 1829. For the next two years he was professor of mathematics at West Point. He then studied the law, was admitted to the bar, and practised at Cincinnati. In 1834 he was elected professor of mathematics, philosophy, and astronomy at Cincinnati College. In 1845, after much activity in collecting the requisite funds, he paid a visit to Europe, and purchased astronomical instruments in London, Paris, and Munich; with these he fitted up an observatory at Cincinnati, of which he was appointed director. In 1859 another observatory was placed under his direction at Albany. Apart from observatory duties, he was a popular lecturer on astronomy. When the civil war broke out in 1861, he threw in his lot with the North, laid aside his scientific pursuits, and joined the army as brigadier-general of volunteers in Ohio. He made a forced march southward, seized the Corinth and Chattanooga Railway, broke the Confederate line of communication, and captured several important positions in northern Alabama. He was raised to the rank of major-general for these services. In September, 1862, he was made commander of the department of the South; but, while making preparations for a vigorous campaign, was attacked with yellow fever at Beaufort, South Carolina, and died on the 30th of October in the same year. Mitchel took honourable rank among the defenders of the Union as a general; but his services to astronomy are associated with his lengthened occupancy of the posts of professor and director. He introduced an electro-magnetic recorder, for measuring right ascensions and declinations with a degree of minute accuracy never before attained. Among the works which he published were the following:—'A Course of Six Lectures on Astronomy,'

1848; 'The Orbs of Heaven; or, the Planetary and Stellar Worlds,' 1851; 'An Address delivered at the Dedication of the Observatory at Hamilton,' 1856. Later works, published in America and in England, under the title of 'The Planetary and Stellar Worlds' and 'Popular Astronomy,' appear to have been revised or adapted editions of his 'Orbs of Heaven.' Scientific papers by him in 'Silliman's Journal,' the 'Proceedings of the American Association,' and 'Gould's Astronomical Journal,' relate to observations on a Transit of Mercury; his new method of observing and recording Right Ascensions and Declinations; experiments on the Velocity of Electrical Waves or Currents; and on the Longitude of the Cincinnati Observatory, as determined by telegraphic operations in connection with the United States Coast Survey. A memoir of Mitchell, by Phineas Camp Headley, was published at New York in 1865.

MITELLI, AGOSTINO, an eminent painter of the Bolognese school, was born at Battidizzo, near Bologna, March 16th, 1609. He was a scholar of Dentone, and painted, like him, architectural interiors, elevations, buildings in ruins, &c.; but added a softness, variety, and grace which were seldom found in the works of his master; and he drew the figure with skill—an attainment he is said to have acquired in the school of the Carracci. Mitelli formed a warm friendship with Colonna; and as their styles blended well together, they worked in concert; and their paintings became universally popular as decorations of the public apartments of palaces, &c. They painted together, at Bologna, the chapel of Rosario, the hall of the Villa Caprara, the Bentavogli and Pepoli palaces, &c.; and elsewhere the archiepiscopal palace at Ravenna, and palaces and convents at Parma, Florence, Rome, Modena, and Genoa. By Philip IV. they were invited to Madrid, where they decorated a magnificent hall and three saloons. They remained at Madrid two years, and then Mitelli was taken ill and died, August 2nd, 1660.

MITELLI, GIUSEPPE MARIA, son and scholar of Agostino Mitelli, was born at Bologna in 1634. He painted the figures in some of his father's decorative works, and executed several frescoes in Bologna; but his reputation was never very high as a painter. As an engraver he was more esteemed. His prints are, however, slight, feeble, and often inaccurate. Among them are twenty plates of the History of Æneas, after the Carracci; the Cries of Bologna, in twenty plates, after An. Carracci; the Twenty-four Hours of Human Happiness, twenty-six plates, from his own designs; and various separate prints—in all nearly two hundred. He died in 1718.

MITSCHERLICH, EILHARD [E. C. vol. iv. col. 276]. This great observer in natural science first became so while a philological student; and, being anxious to visit Persia, he determined to study medicine, under the idea that, with his limited means, he might, in the character of a physician, be able to gain access to that country. But, in studying the introductory sciences at Göttingen, he became so fascinated with chemistry, that he gave up philology and the desire to travel. In 1818 he visited Berlin in order to get a license to lecture, and was allowed by Link to work in the laboratory of the University. Here he confirmed Berzelius's statement that phosphoric and arsenic acids contain each five equivalents of oxygen, while phosphorous and arsenious acids contain three equivalents; but he noticed that the similarly constituted phosphates and arseniates crystallize in similar forms. Feeling that he was on the eve of a great discovery, he studied the laws of crystallography, learned how to measure the angles of crystals, and soon became satisfied that the phosphates and arseniates are not merely similar, but identical in form, and consequently that bodies of dissimilar composition exist under the same crystalline form, and that these bodies are compounds, containing respectively the same number of equivalents. He studied a number of artificial salts, which enabled him to extend and confirm the doctrine of *isomorphism*, as it was called; these observations he embodied in a memoir which was presented to the Berlin Academy in December, 1819. In the preceding August, Berzelius visited Berlin, and conceived so high an idea of Mitscherlich that he suggested him to the minister as a proper successor to Klaproth in the chair of chemistry in the University of Berlin. The suggestion was not then adopted; but the minister allowed Mitscherlich to work for some time under Berzelius in Stockholm. Here he continued and extended his researches, and published a memoir in the 'Transactions' of the Swedish Academy. Berzelius regarded isomorphism as of the highest importance to the theory of chemical equivalents, inasmuch as it explained the exceptions to the law of definite proportions in his mineral

system. It was found from the crystallization of the mixtures of the different sulphates, that isomorphous bodies combine in all proportions, and that they replace one another in indefinite proportions in the composition of minerals.

In November, 1821, on his return to Berlin, Mitscherlich was elected a member of the Academy of Sciences, and was appointed professor extraordinary in the University. In 1825 he became professor in ordinary. In the winter of 1823—24 he worked with Berthier in Paris, and found that, by fusing the mineral constituents together in proper proportions, diopside, idocrase, and garnet were produced.

Mitscherlich's extended researches in crystalline form led to the discovery that even an elementary body, such as sulphur, may take different forms under different conditions. He had already shown that the acid phosphate of soda and carbonate of lime had each the same property of crystallizing under two different forms, and it now appeared that this property of *dimorphism* belonged to simple substances as well as to their chemical combinations. The memoir on the 'Dimorphism of Sulphur' was presented to the Academy in July, 1826. He also found, on carefully measuring the angles of natural crystals, differences in the angle between the same pair of cleavages amounting to 20"—a difference which, though small, was too large to be attributed to errors of pointing or reading. The observations in the morning differed from those made in the afternoon, when the temperature was higher. Hence it was concluded that the variation of the angle could only be due to the unequal expansion of the crystal in different directions. This was shown by immersing crystals in heated mercury, and by a variety of observations taken under different conditions, as explained in his memoir of March, 1825. He also contrived a smaller and more convenient goniometer, manufactured by Oertling, and described in the 'Memoirs' of the Berlin Academy for 1843, after its value had been tested by long use. In 1827 he discovered selenic acid and the isomorphism of seleniate of potash with sulphate of potash, and of other seleniates with the corresponding sulphates. He prepared a large number of salts, determined the systems to which they belonged, measured some of the angles, and drew by hand the figures of some of their principal combinations; but in 1833 his crystallographic labours were interrupted by the publication of his Treatise on Chemistry, for which he had long been preparing, and which contained a large amount of original matter. The fifth edition of this work was commenced in 1855, but not finished. In this year the author began his researches on the density of the vapour of bromine and other bodies, and its relation to their chemical equivalents. He also made researches on the constitution of organic combinations in which compound radicals are assumed to exist; also on catalytic action. He also became interested in geology, and during some years made journeys in the Eifel, examining the extinct volcanoes of that district, with the view to a theory of volcanic action. He also visited other volcanic districts in Germany, France, and Italy. His views of volcanic phenomena, with the exception of a few pages, distributed among the audience who attended his lectures in the winter of 1838—39, were never published; but his leading idea was that the explosive action of volcanoes is caused by the vapour of water in the form of high pressure steam. In the autumn vacation of 1861 he made his last excursion in the Eifel, and in the following December began to suffer from disease of the heart. The complaint increased in severity in the summer of 1862, and it was with difficulty that he completed his lectures. In the autumn he stopped some time in the house of his son-in-law, Professor Busch, near Bonn, where his health seemed to revive, and on his return to Berlin he commenced his winter course; but he had to give it up a fortnight before Christmas. In the spring of 1863 he retired to a country house at Schöneberg, near Berlin, where, on the morning of the 28th of August, he died without pain. His memory will be cherished for his versatility, his remarkable talent for observing, and that severe mental discipline which controls those great powers. He was a member of probably every Academy in Europe. He was elected foreign member of the Royal Society in 1828, and in the following year the Royal Medal was awarded to him for his discoveries relating to the laws of crystallization and the properties of crystals. In 1852 he was elected foreign associate of the French Institute in the place of Oersted.

MOCETTO, GIROLAMO, early Italian engraver, was born at Verona, about 1454. He was a pupil of Giovanni Bellini, and painted in the manner of his master; but very few of his pictures remain. He is now chiefly known as an engraver.

Mocetto is the earliest Venetian engraver whose name is appended to a print. He engraved from the designs of Andrea Mantegna, and his master Bellini, with a certain rude vigour and facility. Among the best of his prints are a 'Virgin in Glory' and a 'Judith with the Head of Holofernes.' Lanzi says that he did not live to the sixteenth century; but four views of Nola were drawn and engraved by him for A. Leone's 'De Nola Opusculum,' &c., folio, Venice, 1513. In all 19 plates are with certainty ascribed to him. (Bartsch; Passavant; Wiegell; Maffei.)

* MOHL, HUGO VON, botanist, was born at Stuttgart about 1801. He was educated at Tübingen, and at that place he subsequently became professor of botany and director of the botanic garden. All his writings are more or less illustrative of the physiology and anatomy of plants, in which department of knowledge he holds a foremost rank. He was the first to make precise observations on the physical structure of chlorophyll, and his papers on the subject published in 1838 and 1855 are amongst the most important yet written. His papers on the epidermis and stomates are much valued, as also are those which he has drawn up bearing on the tissues of plants. His elaborate essay on the stem-structure of palms formed the introduction to the great work on this family by Martius, 1824. In it he enunciated his ideas on the interior organization of the monocotyledonous stem, ideas which were widely different from those previously held, but which have since met with general acceptance. His views as applied to other monocotyledons formed an introduction to the work by Martius on the Brazilian cryptogams. His fame, however, depends less upon these researches than upon the investigations which he has made and the theories which he has formed as to the structure, functions, and development of the vegetable cell. Amongst his separate works, we may cite his 'Beiträge zur Anatomie und Physiologie der Gewächse,' 4to, Bern, 1834; 'Grundzüge der Anatomie und Physiologie der vegetabilischen Zelle,' 8vo, Brunswick, 1851, a reprint from Wagner's 'Handwörterbuch,' and 'Vermischten Schriften botanischen Inhalts,' 4to, Tübingen, 1845. The majority of his numerous papers are inserted in the 'Annales des Sciences Naturelles,' or in the 'Botanische Zeitung,' of which last he is one of the editors. Amongst them may be mentioned those on the structure and forms of pollen-granules (1835); the symmetry of plants (1837); the anatomy of the porous cells of *Sphagnum* (1838); upon the latex and its development (1843); and on cells and tissues, published at intervals since 1830.

MOHS, FRIEDRICH, mineralogist, was born at Gernrode, in Anhalt, January 29, 1773. In 1811, he was appointed professor of mineralogy at the Johanneum in Grätz; soon after, he succeeded Werner at Freiberg; and ultimately took the chair of mineralogy at Vienna, in 1826. He died September 29, 1839. He holds an important place in the history of mineralogical science, although his ideas, as he developed them, have not been established. Mohs was the first to insist upon the necessity of classifying minerals according to a combination of physical characters, much in the same way as is done with plants. He brought out prominently the relative value of such characters in forming the species, and thus did immense service by reducing into something like order the multitude of varieties, sub-species, etc., which had been founded on the most trivial characters. He however, erred in excluding the chemical properties as aids in classifying, and in resorting to a clumsy method of nomenclature. He gave the highest classificatory value to density; and, subsidiary to this, crystalline form and hardness. In the best modern classifications, the pre-eminence is given to the chemical composition; while the crystallographic and the other physical characters are considered to be of subsidiary importance. Mohs endeavoured to reduce the physical properties to absolute measurement, and this led to his forming the scale of hardness in general use by mineralogists. His principal writings are, 'Der Herrn J. F. von der Null Mineralien Kabinet nach einem durchaus auf äussere Kennzeichen gegründeten Systeme geordnet,' 3 abth., 4to, Vienna, 1804; 'Die Charaktere der Klassen, Ordnungen, Geschlechter, und Arten der naturhistorischen Mineral-systems,' 8vo, Dresden, 1820, of which an English translation appeared at Edinburgh in the same year; 'Grundriss der Mineralogie,' 2 parts, 8vo, Dresden, 1822—1824, English translation by Haidinger, 3 vols. 8vo, Edinburgh, 1825; and the first part of 'Anfangsgründe der Naturgeschichte des Mineralreichs,' 8vo, Vienna, 1832, the second part being by Zippe.

* MOIGNÉ, FRANÇOIS NAPOLEON MARIE, ABBÉ, was born at Guéméné (Morbihan), April 20th, 1804. After studying at the College of Pontivy, and in a Jesuit college, he

BIOG. DIV.—SUP.

entered the Jesuit Seminary of Montrouge in 1822, where he evinced a decided predilection for science. In 1836, the Jesuits founded a chair of mathematics for him in Paris. Here he formed an intimacy with Dumas, Ampère, Arago, Thenard, and other distinguished physicists and mathematicians. About 1841, the Père Boulanger, superior of the Jesuits, directed him to suspend his scientific pursuits, in order to teach history and Hebrew at the Seminary of Laval. Moigno resisted this order; and after a discussion protracted for three years, he renounced his connexion with the Society, and has since been known as a voluminous writer on science. His chief works are:—'Leçons de Calcul différentiel et intégral,' Paris, 4 vols. 8vo, 1840, &c.; Scientific Letters, written from various parts of Europe, and inserted in 'L'Époque,' 1845, &c.; 'Traité de Télégraphie Électrique,' 1849; 'Répertoire d'Optique Moderne,' 4 vols. 8vo, 1850; Scientific Letters, written for 'La Presse' and 'Le Pays,' 1850, &c.; 'Cosmos,' an encyclopædic review, established 1852; 'Sur le Stéréoscope,' 1853; and 'Sur la Saccharimètre,' in the same year; translation of Grove's 'Correlation of the Physical Forces,' 1856, 2nd edition, 1867; 'Annuaire de Cosmos,' 1859 et seq.; 'La Cotonisation de Lin,' 1861; 'Les Mondes,' a weekly review of science, commenced in 1863; 'Cours de Science Vulgarisée,' 8 vols. 8vo, 1864—6; translation of Tyndall's 'Radiation,' 1865; translation, with additions, of Hofmann on the 'Force of Combination of Atoms,' 1866; translation of two Essays by Tyndall, with a Dissertation on the 'Essence of Matter,' and 'Leçons de Mécanique Analytique,' 1867; 'Les Eclairages Modernes,' 1868; 'Mélanges de Physique et de Chimie pures et appliquées,' and 'Sur la Saccharimètre Optique, Chimique, et Mélassimétrique,' 1869. In 1848, he was appointed joint almoner of the Lyceum of Louis le Grand; and, in 1864, was decorated with the Legion of Honour.

MOLBECH, CHRISTIAN. [E. C. vol. iv. col. 287.] This eminent Danish scholar died at Copenhagen on the 23rd of June, 1857.

* MOLESCHOTT, JAKOB, physiologist, was born, August 9, 1822, at Herzogenbusch, in the Netherlands. In 1841 he went to Heidelberg, where his principal teachers were Bischoff and Tiedemann. In 1845 was published 'Kritische Betrachtung von Liebig's Theorie der Pflanzenernährung,' Haarlem, which was singled out for distinction by the Academy of Haarlem. As soon as he had obtained his degree of M.D., he went to Utrecht to practise his profession; but in 1847 he returned to Heidelberg for the purpose of teaching physiological chemistry and anthropology. During his studies he had paid much attention to the doctrines of Hegel, Spinoza, and Feuerbach, and in his lectures he advocated advanced materialistic ideas, which brought numerous controversial adversaries against him, and he was ultimately compelled to resign his post. He denied the existence of force, as distinct from matter, and maintained that man is simply food more or less metamorphosed, or, as he expressed it in German by a phrase of double meaning, 'Das Mensch ist was er isst.' In 1854, he took the chair of physiology at Zurich, and, in 1861, removed to the same chair at Turin. His materialistic notions have acquired him some notoriety; but his claim to notice is on account of his researches on the chemical changes which food undergoes in the animal system, and on numerous physiological phenomena. His books include, 'De Malignantia pulmonum vesiculis,' 8vo, Heidelberg, 1845; 'Die Ernährung in ihrem Zusammenhange mit dem Volksgeist,' 8vo, 1847, which has been translated into English, under the title of 'The Chemistry of Food,' forming vol. 8 of Orr's 'Circle of the Sciences'; 'Physiologie der Nahrungsmittel,' 8vo, Darmstadt, 1860; 'Physiologie des Stoffwechsels in Pflanzen und Thierwelte,' 8vo, Erlangen, 1851; 'Georg Forster, der Naturforscher des Volkes,' 8vo, Frankfurt-am-Main, 1854; 'Licht und Leben,' 8vo, Frankfurt, 1854; 'Die Einheit der Lebens,' 8vo, Giessen, 1864; 'Pathologie und Physiologie,' 8vo, Giessen, 1866; 'Della causalità nelle Biologia,' 8vo, Turin, 1867. He has also written numerous articles, mostly relating to the fluids of the body, and to the action of the nerves on the movements of the heart. The majority of these, more especially of the later papers, are inserted in the 'Untersuchungen zur Naturlehre des Menschen und der Thiere,' a periodical which he started in 1857, and of which he has been the sole editor.

MOLLER, GEORG. [E. C. vol. iv. col. 293.] This distinguished architect died on the 13th of March, 1852, aged 68; he was born on the 21st January, 1784.

* MOLTKE, HELMUTH KARL BERNHARD, GRAF VON, a Prussian field-marshal, renowned as the first strategist of the age, descended from an ancient Danish family, which has

furnished many distinguished men to the public service, was born on the 26th of October, 1800, at Guewitz, in Mecklenburg. He entered at first into the Danish service, which he exchanged in 1822 for that of Prussia. In 1832, his professional knowledge and ability had procured for him an appointment on the staff; and in 1835, upon the occasion of his visiting the East, he was presented to the Sultan, Mahmud II., whom he was permitted by the military authorities of Prussia to instruct in the most recent improvements in the art of war, as well as to superintend the reform of the Turkish army, with which he made the Syrian campaign of 1839, against Mehemet Ali. Returning to Prussia, he resumed his connection with the staff, and in 1846 was appointed aide-de-camp to Prince Henry, who resided at Rome, and who died in the following year. Previous to this appointment, Moltke had produced, as the result of his sojourn in the East, a work entitled, '*Der russisch-türkische Feldzug in der europäischen Türkei, 1828 und 1829*,' 8vo, "mit Karten und Plänen," folio, Berlin, 1845, English translation, '*The Russians in Bulgaria and Rumelia in 1828 and 1829*,' 8vo, London, 1854, French translation, by A. Demmler, with an 'Atlas' in folio, '*Campagnes des Russes dans la Turquie d'Europe en 1828 et 1829*,' 2 vols. 8vo, Paris, 1854. He became aide-de-camp to Prince Frederick William in 1856; and in 1858 was appointed chief of the staff of the army, and soon after promoted to the rank of lieutenant-general. When Austria and Prussia for a moment merged their jealousies in a common attack on Denmark, which commenced in December, 1863, Moltke had a large share in deciding upon the plan of operations, in the course of which he was attached, as chief of the staff, to Prince Frederick Charles, who, in April, 1864, planted the victorious standard of Prussia on the walls of Düppel. In the midst of the peace which followed, Moltke already began to form plans for the deferred but inevitable war between Austria and Prussia—plans which, having been matured and approved by Count Bismarck and General Von Roon, were faithfully carried out in the campaign which commenced in June, 1866. On the 29th of that month, the first news of victory to the Prussian arms arrived at Berlin; and on the following day, Moltke, by this time a general, left Berlin in the suite of the king, with Bismarck and Von Roon. On the 3rd of July, the Austrians sustained the crushing and decisive defeat of Sadowa, where Moltke was in attendance upon the king, who had the titular command-in-chief of the expedition. In the final days of July the preliminaries were settled in Count Mensdorff's castle of Nicolsburg, resulting in the peace of Prague, which was probably facilitated by the attitude assumed by the Emperor of the French, who, in his speech to the Chambers, claimed to have arrested the conqueror at the gates of Vienna. The Prussian troops made their triumphal entry into Berlin, on the 20th of September, when General Von Moltke, as chief of the general staff, rode in one rank, immediately before the king, with General Von Roon, the war minister, Count Bismarck, and Generals Von Blumenthal and Von Voigts-Rhetz. For his distinguished services in this short and decisive campaign, Moltke was rewarded by the king with the order of the Black Eagle. An account of the "Seven Weeks' War," as it has been graphically named, was drawn up under the superintendence of Moltke, of which a French translation, by M. Furey Raynaud, was published, with the title of '*Histoire de la Campagne de 1866*,' rédigée par la Section historique du Corps Royal d'État-Major, sous la Direction de Général de Moltke, &c., 8vo, Paris, 1868, &c. In the course of the Franco-Prussian war, conducted on one side with unbroken success, and on the other supported with unrelieved disaster, the eyes of the world were fixed by the astonishing foresight, and the unflinching accuracy of the calculations of Von Moltke, in whose hands was its supreme direction. The splendour of his strategy, and the success of his combinations, were rewarded on the 17th June, 1871, the day of the triumphant march of the returned Prussian troops into Berlin, with the rank of Field-Marshal.

In addition to the works already mentioned, Count Von Moltke has produced a volume of Letters on the circumstances of Turkey in the period 1835—39, entitled '*Briefe über Zustände und Begebenheiten in der Türkei aus den Jahren 1835—39*,' 8vo, Berlin, &c., 1841, with an introduction by Carl Ritter; and has superintended an official account of the Italian campaign of 1859, '*Der Italienische Feldzug des Jahres 1859*,' &c., 8vo, Berlin, 1862, second edition, 1863, French translation, '*La Campagne d'Italie en 1859*,' Rédigée par la Division historique de l'État-Major de Prusse, 8vo, Berlin, 1862.

MOLZA, TARQUINIA, a learned Italian lady, daughter of

Camillo Molza, and granddaughter of Francesco Maria Molza, a poet and novelist of some distinction, and a member of a noble family of Modena, was born in that city on the 1st of November, 1542. Her parts were so extraordinary that her father determined to give her an education more severe and systematic than generally fell to her sex; and she was carefully instructed in the various branches of elegant literature, music, eloquence, and poetry; and also in logic, philosophy, astronomy, and the physical sciences, to which was added the study of Latin, Greek, and Hebrew. It was her distinction that her various learning did not detract from the graces and amiability of womanhood, which she exhibited during nearly twenty years of married life. Upon the death of her husband, Paulo Porriño, on the 30th of August, 1579, she, being a childless widow, applied herself with more exclusive devotion than ever to her favourite studies. She was a trusted friend of the most cultivated men of the age; and, at Ferrara, where she spent some time after her widowhood, she not only attached herself to the society of the learned ladies, Livia Preparata and Ursina Cavealleta, but inspired Tasso with so great a respect for her judgment, that he, as well as Guarini and others, submitted his works to her critical opinion. The eulogies of which she was the object by contemporary writers are very numerous, and several dedications were made to her, especially by Francesco Patrizi, who inscribed with her name the third volume of his '*Discussioni Peripatetiche*.' But the most extraordinary honour that she received, was that of being presented with the citizenship of Rome, by the senate and people of that city, in a patent reciting her singular merits, and conferring upon her the title of Unica. She died at Modena on the 8th of August, 1617, leaving behind her several poems in Latin and Italian, and translations from Plato and other classical writers, which were incorporated with the works of her grandfather, F. M. Molza, in the later editions:—'*Delle Poesie volgari e Latine di Francesco Maria Molza, correte, illustrate, ed accresciute. Colla Vita dell' Autore scritta da P. A. Sarassi. Volume terzo: Opuscoli inediti di Tarquinia Molza. Vita di T. Molza da D. Vandelli*,' 3 vols. 8vo, Bergamo, 1747—54.

* MOMMSEN, THEODOR, a distinguished historian, antiquary, jurist, and philologist, was born on the 30th of November, 1817, at Garding, in Schleswig; and having received his early education from his father, who was pastor of that place, prosecuted his studies successively at the Gymnasium of Altona and the University of Kiel, from which he returned to act as a private tutor at Altona. His reputation as a scholar, and particularly as an expert in epigraphy, or the art of deciphering the inscriptions on monuments and other records of antiquity, occasioned his being subsidized by the University of Berlin during a tour which he made for scientific purposes in France and Italy between the years 1844 and 1847. Shortly after his return, he connected himself with the '*Schleswig-Holstein'sche Zeitung*,' of which he became the principal contributor, and subsequently the editor. In the autumn of 1848 he was appointed extraordinary professor of jurisprudence at the University of Leipzig, but was dismissed from his office in 1850 on account of his participation in the political events of 1848 and 1849. After his deposition he repaired to Switzerland, where, in the spring of 1852, he was called to be ordinary Professor of Roman Law at the University of Zurich, from which he migrated in the same capacity to the University of Breslau in 1854, and in 1858 to that of Berlin. His academical lectures have procured for him a high rank among jurists, whilst his researches in classical archaeology and philology have placed him by the side of the most eminent German scholars in this department. He is a member of the several Academies of Berlin, Munich, Vienna, Turin, and St. Petersburg, and an associate member of the Institute of France.

The principal works of Professor Mommsen are his '*De Collegiis et Sodaliciis Romanorum*,' &c., 8vo, Kiel, 1843; the Roman Tribe, considered administratively, '*Die römischen Tribus in administrativer Beziehung*,' 8vo, Altona, 1844; Oscan Studies, '*Oskische Studien*,' 8vo, Berlin, 1845; Supplement, &c., '*Nachträge zu den Oskischen Studien*,' 8vo, Berlin, 1846; Dialects of Lower Italy, '*Die unteritalischen Dialekte*,' 4to, Leipzig, 1850; On the Monetary System of the Romans, '*Ueber das römische Münzwesen*,' 4to, Leipzig, 1850; '*Inscriptiones Regni Neapolitani Latine*,' folio, Leipzig, 1852; Municipal Institutions of Salpensa, &c., '*Die Stadtrechte der lateinischen Gemeinden Salpensa und Malaca in der Provinz Baetica. Mit Nachtrag*,' 4to, Leipzig, 1855; '*Die römische Chronologie bis auf Caesar*,' 8vo, Berlin, 1858, second edition, 1859; History of the Roman Monetary System, '*Geschichte des römischen Münzwesens*,' 8vo

Berlin, 1860, which received, in 1861, the prize of the Académie des Inscriptions, and of which a French translation, by the Duc de Blacas, appeared as 'Histoire de la Monnaie Romaine,' 8vo, Paris, 1866, &c. The great work, however, by which Professor Mommsen is most widely and favourably known is his History of Rome, 'Römische Geschichte,' 3 vols. 8vo, Berlin, 1854—1855, fourth edition, 1865—1866, English translation, 'The History of Rome. Translated, with additions, by W. P. Dickson. With a Preface by L. Schmitz,' 4 vols. 8vo, London, 1862—1866, new edition, 4 vols. 8vo, London, 1868—1870, French translation, by C. A. Alexandre, 'Histoire Romaine,' 8vo, Paris, 1863, &c. His younger brother,

* CARL JOHANN TYCHO MOMMSEN, who is favourably known as a critic and philologist, was born at Garding in 1819; and, having devoted himself to the study of the classical languages, made a tour in Italy and Greece which extended from the year 1846 to 1848. After filling various academical appointments, he became a professor in the Gymnasium of Oldenburg, and finally, in the latter part of 1863, director of the Gymnasium at Frankfurt-am-Main. He is a member of several learned societies, especially of the Greek Society of Oldenburg, to whom, "in dulcis et fidelis sodalicii memoriam," he dedicated his edition of Pindar, 'Pindari Carmina, ad Fidem optimorum Codicum recensuit integram Scripturæ Diversitatem subiecit Annotationem criticam addidit,' 8vo, Berlin, 1864, abridged edition, wanting the introductions and many of the notes, 'Pindari Carmina, edidit Tycho Mommsen,' 8vo, Berlin, 1866, a work for which he had prepared during many years of study and investigation in various libraries of the Continent. He had already, as his earliest contribution to philological literature, published a dissertation on Pindar, 'Pindaros. Zur Geschichte des Dichters und der Parteikämpfe, seiner Zeit,' 8vo, Kiel, 1845; which he followed by a metrical translation of the same poet, 'Des Pindaros Werke, in die Vermaasung des Originals übersetzt,' &c., 4to, Leipzig, 1846; and, after a long interval, by a letter to Professor Friederichs, of Berlin, entitled 'Einige Bemerkungen über Kritik, Exegese, und Versabtheilung bei Pindar,' 8vo, Oldenburg, 1863. He is also favourably known as a Shakespearian scholar and editor. His brother,

* AUGUST MOMMSEN, who is also distinguished as a philologist and classical archaeologist, was born in 1821, at Oldeoloe; and, after having filled various academical offices, became at length professor at the Gymnasium of Parchim. His principal works have reference to the calendar of the ancients, 'Römische Daten,' 8vo, Parchim, 1856; Contributions to Greek Chronology, 'Beiträge zur griechischen Zeitrechnung,' 8vo, Leipzig, 1856; Second Contribution, &c., 'Zweiter Beitrag zur Zeitrechnung der Griechen und Römer,' 8vo, Leipzig, 1859; Antiquarian Researches on the Public Feasts of the Athenians, which received the prize of the Royal Scientific Society of Göttingen, entitled 'Heortologie. Antiquarische Untersuchungen über die städtischen Feste der Athener,' 8vo, Leipzig, 1864; 'Athenæ Christianæ,' 8vo, Leipzig, 1868.

MONGEZ, MARIE-JOSEPHINE-ANGELIQUE (by birth, LEVOL), a French historical painter, was born in the neighbourhood of Paris, May 1st, 1775, and died in that city, February 20th, 1855. She was a pupil of Regnault and of David; obtained several medals, and took the highest rank among the female painters of France, when the academic manner of her master, David, was the vogue. Her earlier works, which were chiefly classic in subject, include a Mars and Venus; an Orpheus, with thirteen figures of life-size; the Death of Adonis; Death of Astyanax; and the like. Later she painted ecclesiastical subjects and some portraits, as Napoleon I., for the city of Avignon, and Louis XVIII., for Toulouse. Madame Mongez drew the figures, three hundred in number, for her husband Antoine Mongez's 'Dictionnaire d'Antiquités.'

MONK, JAMES HENRY, Bishop of Gloucester and Bristol [E. C. vol. vi. col. 1014].

MONTAGNA, BENEDETTO, a painter and engraver of Vincenza, who flourished in the early part of the 16th century. As a painter he imitated Giovanni Bellini, but he is better known by his engravings. He was among the earliest and best of the Lombardo-Venetian engravers. His prints, mostly from his own designs, are chiefly of scriptural or mythological subjects, the latter exhibiting rather freely the nude female form. Montagna copied some of the plates of Albert Dürer, and profited by so doing. About 60 plates by him are known, but many more are ascribed to him without sufficient authority. The date of his death is unknown; he was alive in 1533.

MONTAGNE, JEAN FRANÇOIS CAMILLE, cryptogamist, was born at Vaudoy (Seine-et-Marne), on February 15, 1784. His

father was a surgeon, and he himself was intended for the same profession; but, owing to the death of his parents, poverty compelled him to abandon his scholastic education, and to enter the navy in his 14th year. He served with the French expedition to Egypt for four years, and in 1802 returned to France. He at once studied medicine, qualified himself as surgeon, and as such he served in various capacities at Boulogne, in Italy, in Spain, and at Sedan. In 1814 he was appointed surgeon-in-chief of Murat's army. In 1832 he retired from the service. While in service, his duties required him to travel over most parts of France and Spain, and he took advantage of the occasions offered for collecting new and rare plants, more especially cryptogams. On settling down in Paris after his retirement, he found that this group had received comparatively little attention from his countrymen, and he resolved to make it the object of his special studies. He entered into correspondence with all the principal botanists of Europe and America. Materials were sent to him in abundance, and for twenty years he devoted the greater portion of almost every day to working them up. In 1853 his labours were in part rewarded by his being unanimously selected as the successor to Achille Richard as a member of the Académie des Sciences—an honour which he had vainly sought in 1837. He died at Vaudoy, January 6, 1866. He described a large number of new species, and made many observations on the structure and mode of reproduction of this group of plants. His writings consist mainly of articles contributed to scientific journals, and of contributions made to the reports of the principal French expeditions, such as those commanded by Dumont d'Urville and A. d'Orbigny, and to elaborate natural-history monographic works, such as the 'Phytographia Canariensis' of Webb and Berthelot; the 'Historia física de las islas de Cuba,' by Ramon de la Sagra; and the 'Historia física de Chile,' by Gay.

MONTALEMBERT, CHARLES-FORBES, COUNT DE [E. C., vol. iv. col. 307]. M. de Montalembert signalled the anti-imperialist opinions with which he was prominently identified, and the reputation for which had caused his defeat in his own department in the general elections of 1857, by publishing in 'Le Correspondant' of October 25th, 1858, an article entitled 'Un Débat sur l'Inde au Parlement Anglais,' 8vo, London, 1858, and 8vo, Brussels, 1858, English translation, 'Montalembert on Constitutional Liberty. A Picture of England painted by a Frenchman,' &c., 8vo, London, first fifteen editions, 1858, for which he was arraigned, November 24th, before the correctional tribunal, on the charge of having written the article in a systematic spirit of disparagement, which continually drew out the contrast between the institutions of France and England, to the prejudice of the former. The offences of which he was more particularly accused were, (1) exciting to hatred and contempt of the imperial government; (2) attacking the respect due to the laws; (3) attacking the rights and authority held by the emperor from the constitution and the principle of universal suffrage; and (4) having endeavoured to trouble the public peace by exciting the contempt or hatred of citizens against each other. Of all but the last he was convicted, and sentenced to six months' imprisonment and a fine of 3000 francs; whilst M. Douniol, the manager and publisher of 'Le Correspondant,' who was tried with Montalembert, and in whose favour extenuating circumstances were discovered, was sentenced to a month's imprisonment and a fine of 1000 francs. Various records of the trial were published, and, besides others, 'Procès de M. le Comte de Montalembert: avec les Discours de MM. Berryer et Dufaure, précédé de sa Vie,' &c., 8vo, London, 1858; and 'The late State Prosecution in France. The Trial,' &c., 8vo, London, first two editions, 1858. An appeal was lodged in the superior court, which was so far successful that, whilst the fine was maintained, the term of imprisonment was reduced to three months; and Montalembert was compelled, against his will, to accept from the emperor a remission of all the penalties. In October, 1859, he published a pamphlet entitled, 'Pie IX. et la France en 1849 et en 1859,' 8vo, Paris, 1859, &c., protesting against the emperor's policy towards Rome; and giving the signal to the numerous brochures, amounting to two or three hundred, which that question was the means of calling out. This pamphlet was seized throughout France, and another prosecution was commenced against the author, which, however, was not proceeded with. M. de Montalembert was remarkable for his love of England and his admiration of her institutions; and he conceived for Ireland, to which he paid several visits, a great affection. The defects of the English people, indeed, as appears from the remarkable Introduction to the third volume of his

'Monks of the West,' may be generally summed up in their Protestantism and their ingratitude to the Pope, from whose official ancestors M. de Montalembert assumed they had derived their Christianity. Montalembert, as may be inferred, combined a singular reverence for the papacy, spiritual and temporal, with the utmost zeal for constitutional freedom. He escaped the solution of the question of reconciling his liberalism with the doctrine of papal infallibility by his death on Sunday, the 13th of March, 1870, a short time after his production of a striking letter on the existing policy of the Ultramontane party. He had long suffered from a malady that left little hope of his recovery, and the first symptoms of which he referred to the harassing effect upon mind and body of the efforts he made to stem the revolutionary torrent of 1848.

The later works of M. de Montalembert include two letters to Count Cavour on the Roman Question, 'Lettre à M. le Comte de Cavour,' 8vo, Paris, 1860, and 'Deuxième Lettre,' &c., 8vo, Paris, second edition, 1861; 'Une Nation en Deuil. La Pologne en 1861,' 8vo, Paris, 1861, &c.; 'Le Père Lacordaire,' 8vo, Paris, 1862, second edition, 12mo, Paris, 1862, English translation, 8vo, London, 1863; an Introduction to Jean de Beaugué's 'Histoire de la Guerre d'Ecosse,' 8vo, Bordeaux, 1862, first published in 1556, and interesting to Montalembert as being a record of the exploits of his ancestor, André de Montalembert, Comte d'Essé, "Lieutenant-général pour le Roi, commandant ses Armées en Ecosse;" 'L'Eglise libre dans l'Etat libre. Discours prononcé au Congrès Catholique de Malines,' 8vo, Paris, 1863; 'L'Insurrection polonaise,' 8vo, Paris, 1863; English translation, 'The Insurrection in Poland,' 8vo, London, 1863; 'Le Pape et la Pologne,' 8vo, Paris, 1864; and 'Le Général de Lamoricière. (Extrait du "Correspondant" du 23 Septembre, 1865),' 8vo, Paris, 1865; besides which may be mentioned the publication of nine volumes of his 'Œuvres,' 8vo, Paris, 1861-68. But the great work of M. de Montalembert's life is one which he undertook at the suggestion of the Pope, in defence of the monastic orders, and which, after many years of assiduous labour, he published with the title of 'Les Moines d'Occident, depuis Saint Benoît jusqu'à Saint Bernard,' of which five volumes (out of the six to which it was expected to extend) were issued in 8vo and 12mo, Paris, 1860-67, English (authorized) translation, 'The Monks of the West, from St. Benedict to St. Bernard,' 5 vols, 8vo, Edinburgh and London, 1861-67, the last three volumes of which were also issued as 'The Conversion of England: being a sequel to the Monks of the West,' 3 vols, 8vo, Edinburgh and London, 1867; whilst an extract from the third volume was published with the title of 'Saint Columba: Apostle of Caledonia,' 8vo, Edinburgh and London, 1868.

MONTANELLI, GIUSEPPE, an Italian lawyer, poet, statesman, and historian, was born on the 5th of January, 1813, at Fucecchio, in Tuscany, and was at first designed by his father, who was an organist, to follow the profession of music, for which he had a strong predilection. At nine years of age he was diverted from this plan, and was placed at the Collegio di Santa Caterina at Pisa, of which his uncle, Canon Montanelli, was the rector. In due course he entered the university, and, having devoted himself to the study of law, took a doctorate in that faculty at eighteen years of age, slightly before which, under the stimulating influences of the French revolution of 1830, he had begun to contribute to the 'Nuovo Giornale de' Letterati,' published at Pisa, and to the 'Antologia: Giornale di Scienze, Lettere, e Arti,' published at Florence, under the conduct of G. P. Vieusseux. In 1836 he published at Florence a volume of poems, which attracted considerable attention, and the pathos of many of the pieces of which was directly traceable to his grief for the loss of his mother. Upon the completion of his studies shortly afterwards, 1837, he acceded to the wishes of his friends, and threw all his energies into his profession of advocate, which for three years he practised with growing reputation and success; so that he was chosen by the government, in November, 1840, to fill the newly instituted chair of Tuscan law and commercial law, an appointment which he justified by the publication of his 'Introduzione filosofica allo Studio del Diritto commerciale positivo,' 8vo, Pisa, 1847. He continued as a professor to enunciate the liberal principles and patriotic aspirations which he had adopted in 1830; and the famous petition of the inhabitants of Pisa against the Jesuits, in February, 1846, which was the signal for petitions of a like nature from various cities of Italy, was the production of Montanelli, who thereby drew upon himself the distrust and hatred of the clergy and their party. In 1847 he founded a journal entitled 'Italia,' the watchwords of which were "Reform and Nationality;" and in the following year

took his place as a volunteer in the academical legion, composed of professors and students, who left their studies to strike a blow for Italian independence. He was shot through the chest at the battle of Curtatone, May 29, 1848; and having been left on the field for dead, was taken by the Austrians, whose prisoner he remained until after the capitulation of Milan, on the 5th of August. Upon his return he was elected to the Parliament of Florence, of which he became a member on the 27th of September; and, towards the end of the following month, was entrusted by the Grand Duke with the formation of a new cabinet and the office of president of the council of ministers. On the 7th of February, 1849, the Grand Duke Leopold II. quitted Florence for Gaeta; and on the 8th a provisional government was formed, and a republican triumvirate, consisting of Montanelli, Guerrazzi, and Mazzoni, was established by the Chambers. Montanelli resigned his functions, however, in favour of the dictatorship of Guerrazzi, by whom he was sent, at his own request, on a mission to Paris, for the purpose of organizing an auxiliary legion of four thousand men for the furtherance of Italian unity and freedom. The success of the Austrian arms, and the triumph of the counter-revolution, which restored the grand duke to the throne of Tuscany, changed the French mission of Montanelli into an exile, which continued for several years, and which he lightened by his devotion to historical, dramatic, and general literature. The most important result of his activity in this direction is his 'Memorie sull'Italia, e specialmente sulla Toscana dal 1814 al 1850,' 2 vols, 8vo, Turin, first two editions, 1853, French translation, by M. Fr. Arnaud, with a biographical notice of the author by M. Jean Reynaud, 'Mémoires sur l'Italie,' 2 vols, 12mo, Paris, 1857. Besides undertaking a translation of the 'Divina Commedia,' and a series of studies on Dante which have not yet been published, and contributing a variety of articles to the 'Revue de Paris,' he produced an Italian version of Legouvé's tragedy of 'Médée,' which, having been refused by Mademoiselle Rachel, was triumphantly produced by Madame Ristori, at the Théâtre-Italien, and afterwards published, with the French text, as 'Médée: Tragedie en trois Actes et en Vers. Medea. Tragedia,' &c., 12mo, Paris, 1856. He also produced for Madama Ristori a tragedy entitled 'Camma: Tragedie en trois Actes' (Italian and French), 8vo, Paris, 1857. After the peace of Villafranca, July, 1859, Montanelli, who had again served in the preceding campaign as a volunteer, was elected to represent his native town of Fucecchio, in the assembly which decreed the dethronement of the grand duke, who, on the 21st of July, abdicated in favour of his son, Ferdinand IV., and in which Montanelli protested to the last moment against the annexation of Tuscany to Sardinia, which was, nevertheless, accomplished on the 22nd of March, 1860. He died on the 17th of June, 1862; and on the evening of the 21st of the same month, a discourse was delivered by Doctor Tommaso Paoli, at an extraordinary meeting of the Associazione democratica Emancipatrice di Lucca, which was afterwards published with the title of 'Elogio Funebre del Prof. Giuseppe Montanelli, dettato dal Dott. Tommaso Paoli,' 8vo, Florence, 1862. The same society charged itself with the task of collecting subscriptions for a worthy monument to Montanelli, in the shape of a bust to be erected in the Camposanto of Pisa. Amongst the works of Montanelli hitherto unmentioned may be named his 'Li Scrittori e i Revisori dopo la Legge Toscana del 6 Maggio 1847: Discorso,' 8vo, Pisa, 1847; 'Nel Processo politico contro il Ministero democratico Toscano schiarimenti,' 8vo, Florence, 1852; and 'L'Impero, il Papato, e la Democrazia in Italia: Studio politico,' 8vo, Florence, 1859.

MONTEAGLE, THOMAS SPRING RICE, LORD [E. C. vol. iv. col. 310], died, after a long illness, at his seat, Mount Trenchard, near Limerick, on the 7th of February, 1866, and was succeeded by his eldest son, Thomas Spring, as second Baron Monteaule of Brandon, in the county of Kerry, Ireland.

MONTELUPO, RAFFAELLE DA, Italian sculptor and architect, was born about the close of the 16th century. The son and scholar of Baccio da Montelupo, a sculptor of some repute in his day—born 1445, died about 1534—he early surpassed his father as a sculptor, and was much employed on the decorations of churches, &c., executing, among other things, a St. Domenico, a Prophet, and a Sibyl for Michelangelo. He was appointed architect to the castle of St. Angelo, by Cardinal Crispo, who also employed him to erect a palace at Bolsena. Montelupo's architectural masterpiece was a chapel at Sta. Maria, Orvieto, for which he sculptured a nude figure of Christ and a marble statue of St. Peter bearing his cross. He also designed the marble chapel of Pope Leo X., and carved the tomb of the pontiff, placed within the chapel, as well as a marble

statue of him in the church of the Minerva at Rome. Montelupo died in 1588, and was buried with great honour in the church of Sta. Maria.

MONTEREAU, PIERRE DE, one of the most eminent of French mediæval architects, flourished towards the middle of the 13th century. Little is known of his personal history. His works include the refectory, dormitory, chapter-house, and chapel of the Abbey of St. Germain-des-Près, and the chapel of Vincennes, &c.; but his masterpiece is the exquisite Ste. Chapelle, Paris, erected by him in 1245—48, to contain the relics brought from the Holy Land by St. Louis. Though but small—being only a fragment of a grand design which St. Louis was unable to carry out—the Ste. Chapelle is generally regarded as the standard example of French Gothic architecture when at its greatest perfection, and as being consequently the most refined and graceful building of its class extant. De Montereau died in March, 1266, and was buried on the 17th of that month, in the chapel he had built at St. Germain-des-Près, where his effigy is carved on a tomb, holding in his hand a rule and compass.

MONTGOLFIER, JOSEPH MICHEL, the elder of two inventors of balloons, was born at Vidalon-lès-Annonay in 1740. When a young man he went to St. Etienne, engaged in chemical experiments, produced some new pigments and salts, and obtained a sale for them. He next resided in Paris for a time, but returned home to assist in the business of his father, a paper-manufacturer. Joined by his brother, he established two paper-mills, one at Voiron and the other at Beaujeu. It is uncertain which of the brothers first conceived the idea of *aërostation* or *aéronautics*; but in 1782 they began to pay joint attention to the subject. They made a bag of taffeta, heated the air within by lighting a fire beneath an opening at the bottom, rendered the bag by this means buoyant, and saw it ascend. They next tried a larger bag, and a third larger still. In 1783, in presence of the notabilities of Annonay, they sent up a balloon made of linen covered with paper; it was 35 feet high, 110 feet circumference, and weighed 430 lbs. When the air within it had been warmed, the balloon was liberated; it ascended to a height of 1000 toises, and fell in a vineyard half a mile distant. Invited to Paris by the Académie des Sciences, the brothers made a balloon which ascended from Versailles in presence of Louis XVI. and Marie Antoinette; two or three animals, attached to the balloon in a cage, descended safely. [Engravings of the Montgolfiers' first and second balloons, together with a detailed account of the proceedings of the brothers in *aërostation*, are given in *BALLOON*, E. C., Arts. & Sci. Div., vol. i. col. 809.] After being honoured and decorated by the king, and received into the Académie, the brothers continued to make further experiments, until the exhaustion of their means led to an abandonment of such enterprises. Joseph was appointed by Bonaparte Administrator of the Conservatoire des Arts and Métiers, and then to a post connected with commerce in the Bureau of the Interior, or Home Office. In 1802 he bore a chief part in the establishment of the Société d'Encouragement pour l'Industrie Nationale. Besides *aërostation*, he made many improvements and inventions in hydraulic rams, calorimeters, hydraulic presses, distilling apparatus, and desiccating apparatus; memoirs on these subjects were published by him, sometimes as separate pamphlets, sometimes in scientific journals. He died of apoplexy at Balaruc, June 26th, 1810. His wife survived him no less than thirty-five years, dying at Paris in 1845, at the advanced age, as is asserted, of 111 years.

JACQUES ETIENNE MONTGOLFIER, brother of Joseph Michel, was born January 7th, 1745. He was educated at the College of St. Barbe, Paris, and was a man of more varied attainments than Joseph. When conducting the paper-mill at Beaujeu (above adverted to), he displayed great ability in the invention and application of new processes and apparatus to the manufacture. After his balloon enterprises with his brother, Etienne returned to his paper-mill, filled various offices in his native district, and suffered much in fortune and in mind during the French Revolution. He died of heart-disease at Annonay, August 2nd, 1799.

*MONVOISIN, RAYMOND AUGUSTE QUINSAC, French historical painter, was born at Bordeaux in 1793. A pupil first of Lacour, and then of Guérin, his earlier works were chiefly from classic history and mythology, and of the huge dimensions in which French painters so commonly delight; as, 'Telemachus and Eucharis,' 1827, ten feet by eight, which was engraved by Laurichon. Later he painted subjects from ecclesiastical and national history, chiefly commissions from the government or the municipality of Paris; as, 'St. Gilles surprised by the Goths,'

twelve feet by ten, for the church of St. Leu; 'The Duke of Orleans taking possession of the Palais Royal;' the 'Birth of the Virgin,' for the church of Notre-Dame-de-Lorette; the 'Bataille de Denain,' for the Museum of Versailles, &c.; some genre-pictures and portraits. M. Raymond Monvoisin was nominated knight of the Legion of Honour in 1837, and promoted in 1857. He visited Valparaiso in 1842, and remained there about ten years.

MOOR, KAREL VAN, an eminent Dutch painter, was born at Leyden, February 22nd, 1656, and studied successively under Gerard Dow, A. Van den Tempel, F. Van Mieris, and G. Schalken. He painted historical and domestic subjects, of large as well as of cabinet size. Of the former class is his 'Judgment of Brutus,' painted for the council-chamber of the States of Holland. He excelled especially in life-sized portraits, like those of the Trustees of the Leprosenhuis, Amsterdam, and was generally considered one of the best portrait-painters of his time. He etched a few portraits, including himself, G. Dow, Mieris, and other painters. Van Moor died February 16th, 1738.

MOORCROFT, WILLIAM, a veterinary surgeon, who, in endeavouring to carry out his object of securing a superior breed of horses for the cavalry service of India, made extensive journeys in the Himalayan provinces of India and in Independent Tartary, and through regions which had not previously been visited by an Englishman. He was a native of Lancashire, and commenced his studies at Liverpool, with a view to following the surgical profession. He was afterwards induced to take up the study of veterinary medicine, and, as there was no school in England, he went to Paris. He settled in London, in partnership with a Mr. Field, as a veterinary surgeon, and soon acquired a considerable fortune. Much of this was, however, lost in a speculation for manufacturing cast-iron horseshoes; and he gladly accepted the post offered to him by the East India Company, to superintend the stud formed by them in Bengal with a view to improving the breed of horses obtainable for Indian service. Moorcroft found the stud in a very unsatisfactory state, but soon succeeded in raising the condition of the horses. He further urged the importance of introducing the English or the Turkoman horse, in place of the Arab. The company did not encourage his proposition. However, he determined to make a journey to Bokhara at his own risk, and without the leave of the company. In May, 1812, he and Lieutenant Hearsay started from Bareilly, crossed the Himalayas by the Niti Pass, visited Daba, Ghartok, the lakes Manasarawa and Ravan, or Lang Cho, and returned to Calcutta in November. In 1819 he obtained the reluctant consent of the company to his going to Bokhara, who, however, would not recognise him in any official capacity, nor furnish him with any letters of introduction. But he obtained much assistance from various persons who approved of his project of opening up, if possible, a line of commercial intercourse between India and the regions north of the Himalayas. He started along with Mr. George Trebeck in October. The route followed was by Srinagar and Mundi to Lahore; then from Mundi to Le, through Kashmir and Cabul; and from Cabul by Kulm and Balkh to Bokhara. Here a great number of horses were purchased, and the homeward journey commenced; but Moorcroft died at Andkho, about twenty miles to the east of Balkh, on August 27, 1825. Mr. Trebeck died shortly after, and the horses and other property were appropriated by various natives. Most of his papers were, however, secured, and ultimately passed into the possession of the Asiatic Society of Calcutta. The geographical information was chiefly collected by Mr. Trebeck; but, although the route indicated between Cabul and Bokhara was new to Europeans, Moorcroft's work afforded little new information, most of the ground having been more carefully examined and reported on by Burnes and by Elphinstone in the interval between his visit and the publication of his and Trebeck's 'Travels in the Himalayan Provinces of Hindustan and the Punjab; in Ladakh and the Kashmir; in Peshawur, Kabul, Kunduz, and Bokhara, from 1819 to 1825,' 2 vols. 8vo, London, 1841. Moorcroft wrote a few papers, of which we may notice 'A Journey to Lake Manafaravara in Un-dés, a province of Little Thibet,' in 'Asiatic Researches,' xii. pp. 375—534 (1816); and 'On the Pürk Sheep of Ladakh, and some other animals, principally of the Sheep and Goat kind,' in 'Transactions of the Asiatic Society,' i. pp. 49—55 (1827).

MOQUIN-TANDON, HORACE BENEDICT ALFRED, naturalist, was born at Montpellier, May 7, 1804. He was educated at Montpellier, and after having received his degree of doctor of science in 1824, and that of doctor of medicine in 1828, went to Marseille as professor of zoology at the Athenæum.

In 1833 he became professor of botany at Toulouse, and in 1853 he succeeded Achille Richard as professor of medical natural history at Paris, at the same time assuming the direction of the Jardin des Plantes. In 1854 he was elected a member of the Academy of Sciences, in succession to Auguste St. Hilaire. He died in December, 1864. His writings are numerous, varied, and of high merit. His earliest work was a 'Mémoire sur l'Oologie,' in the 'Mémoires de la Société Linnéenne de Paris,' iii. pp. 38—73 (1825); iv. pp. 141—177 (1826). In 1826 also appeared his 'Essai sur les dédoublements ou multiplications d'organes dans les végétaux,' 'Bibliothèque Universelle,' xxxiv. pp. 214—234. In 1827 was published a 'Monographie de la famille des Hirudinées,' which was considerably enlarged in 1846. Most of the subjects to which his attention was first given were followed up in later life. Several of his papers relate to eggs; and, amongst those of later date, we have 'Considérations sur les œufs des oiseaux,' in the 'Revue et Magasin de Zoologie,' for 1859, 1860, and 1861. His researches on the abnormal forms of plants led to his drawing up his 'Éléments de Tératologie,' 8vo, Paris, 1841, in which the subject was for the first time treated in a scientific way. Another of his more important works is a 'Histoire naturelle des Mollusques terrestres et fluviatiles de la France,' 2 vols. 8vo, with an atlas of 64 plates, Paris, 1855. He also wrote numerous papers on the anatomy and physiology of molluscs, and on botany, such as monographs or memoirs on the *Chenopodaceae*, the *Polygale*, the *Capparidæ* (in all which he co-operated with Auguste St. Hilaire), and on *Ancylus fluviatilis*.

MORANDO, PAOLO, called CAVAZZOLO, an eminent Italian painter, was born at Verona about 1484, studied painting under Francesco Morone, and, says Vasari, knew a great deal more than his master. He painted, with great success, in the manner of Giorgione, but died young—Vasari and Lanzi say at the age of thirty-one, the former asserting that his death was accelerated by his labours—at Verona, August 13th, 1522. Many of his works are yet preserved at Verona; and our own National Gallery possesses two pictures painted by him—No. 735, 'St. Rock with the Angel,' painted in 1518, and No. 777, 'Madonna and Child, with St. John the Baptist and an Angel, in a landscape,' figures nearly life-size (Vasari, Lanzi, Wornum).

MORETTO, IL, the name assumed by ALESSANDRO BONVICINO, a distinguished Italian painter, who was born at Brescia, about 1490. Originally a pupil of F. Ferramola, he afterwards studied under Titian, whose method of colour and composition he adopted, but later in life endeavoured to combine with the more elevated and ideal manner of Raffaele, of whom he was a devoted admirer. Il Moretto painted chiefly in Brescia and its neighbourhood, and hence, though a diligent worker, his productions were for long but comparatively little known. They have, however, steadily risen in esteem, and are now more than ever admired and sought after. Moretto's pictures are indeed of a very high order of excellence; pure and refined in design; elevated in character; full of feeling; noble in expression; and rich and varied in treatment. He painted both in fresco and oil, but in the latter vehicle with the greater success; and he excelled also in religious art and portraiture. A large number of his religious compositions are still preserved in the churches and ecclesiastical establishments of Brescia and its vicinity, and most of the great picture-galleries of the Continent possess specimens of his pencil. In the National Gallery, London, are two pictures by him—No. 299, a very fine portrait of Count Sciarra Martinengo Cesaresco of Brescia, and No. 625, 'St. Bernardino of Siena,' and other saints, 11 ft. 7 in. high, by 7 ft. 6 in. wide. Moretto died about 1560.

MORGAN, LADY. [E. C. vol. iv. col. 341.] At the close of 1858 Lady Morgan published a volume, entitled 'Passages from my Autobiography.' It consisted mainly of her notes and correspondence for the years 1818—19, and was announced as the first of a series of volumes of her unpublished autobiography; but her death, which occurred on the 13th of April, 1859, prevented the accomplishment of her purpose. A sufficiently ample selection from her papers appeared, however, in 1862, in 2 vols. 8vo, under the title, 'Lady Morgan's Memoirs: Autobiography, Diaries and Correspondence,' and is an amusing farrago of vanity, frivolity, and assumption.

MORLACCHI, FRANCESCO, Italian composer, was born at Perugia, June 14th, 1784. After learning violin, organ, and pianoforte playing, and studying the theory of music under Caruso and Mazetti, he began his musical career at the age of eighteen, by composing an oratorio, 'Gli Angeli al Sepolcro.' Aided with funds by Count Beglioni, he made further study

under Zingarelli at Loreto, and Mattei at Bologna. In 1805 and 1806, he composed a cantata for Napoleon's coronation as King of Italy, and many pieces of church music. In 1807 appeared his first opera, 'Il Ritralto,' and in the next three years eight more operas. In 1810 he became director of the Italian theatre at Dresden. Until this time his music had been in the light Italian manner, but he now studied the severer style of Germany. Nevertheless his music was very miscellaneous; in five years he composed two masses, two cantatas, a quantity of church music, canzonets, and two operas, one of which, 'Il Barbiere di Seviglia,' preceded by only one year Rossini's more celebrated opera on the same subject. In 1816 he was admitted a member of the Academy of Fine Arts at Florence, and was complimented by the Pope for his oratorio, 'La Passione.' In 1817, his 'Isaaco' introduced rhythmical chant instead of recitative. He made frequent visits to Naples, Milan, Venice, and other Italian cities, to superintend the bringing out of some of his operas, and the conducting of his masses at cathedrals and churches; but his life was chiefly passed at Dresden. One of his operas, 'Gianni di Parigi,' produced at Milan, had great success; it was afterwards played in London under the title of 'John of Paris.' Another opera, much lauded at the time, was 'Tebaldo ed Isolina.' Altogether, Morlacchi composed ten masses, three oratorios, numerous Te Deums and Misereres, a still greater number of minor pieces of church music, twenty-seven operas, twelve concertos, and several instrumental compositions. Another opera, 'Francesca di Rimini,' was left unfinished at his death, which took place at Dresden, October 28th, 1841.

MORLOT, CHARLES ADOLPHE, geologist and archaeologist, was born at Naples, March 22, 1820. He was educated first at Berne, and afterwards at Paris and Freiberg. His career began as a geological surveyor of the Austrian Alps. In 1851 he was appointed professor of geology at Lausanne, but the post was only intended to be temporary, and in 1854 he retired into private life, and devoted his time to archaic anthropology and to delivering popular lectures. He is best known for his writings on quaternary geology, and its application to elucidating the age of the oldest remains of human art. Thus he found three beds in the delta of the Tinière, a stream falling into the Lake of Geneva, which belonged to three distinct periods, designated as the Roman, the bronze, and stone ages. He made observations with a view to ascertaining the rate at which the delta has been formed, and in this way arrived approximately at the dates of the respective beds. He made extensive investigations on the lake-dwellings of Switzerland, as also on the primitive antiquities of Sweden, Denmark, and North Germany. He was a great lover of music, and gave considerable attention to the peculiarities of national music, as developed in the popular airs of various countries. At the time of his death, which occurred at Berne, February 10, 1867, he was occupied in arranging the archaeological museum of that town. His best known writings are, 'Leçons d'ouverture d'un cours sur la haute antiquité,' 8vo, Lausanne, 1861, 2nd edition, 1862; and 'Études géologiques-archéologiques en Danemark et en Suisse' in 'Bulletin de la Société Vaudoise des sciences naturelles,' vi. pp. 263—328 (1859), which has been translated both into German and English. The result of his investigations in Mecklenburg and other parts of North Germany have only been partially published. They relate to the stone and bronze ages, and to the facts indicating a transition between the two periods. In addition to the above works, he wrote numerous papers on the geology of Austria and Switzerland.

MORNAY, PHILIPPE DE, better known as DU PLESSIS MORNAY, Baron de la Forêt-sur-Sèvre, seigneur du Plessis-Marly, an eminent French Protestant statesman, author, and soldier, to whom the Catholics applied the sobriquet of *le Pape des Huguenots*, was born at the Château de Bui, in Upper Normandy, on the 5th of November, 1549. He was the second son of Jacques de Mornay, seigneur de Bui, a brave soldier whose life was divided between the camp and the pursuits of a country gentleman, and who, up to all but the final moments of his life, was a zealous Catholic. The death of Jacques de Mornay occurred in November, 1559, and the education of Philippe thereby devolved upon his mother, who was an adherent of the reformed doctrines. Under her influence, and the study of the New Testament, Philippe, who had been intended for the Church, in which a well-endowed abbacy and other preferments awaited his acceptance, put off the vestments of a prétendant à l'Eglise, and adopted the principles of the Reformation. In the beginning of 1562 he became a pupil at the Collège Boncourt, at Paris; but his studies were speedily interrupted by the breaking out of the tumults against the

Huguenots. After a stay of only three months, De Mornay was withdrawn from Paris, in order to pursue his studies in the quietude of home—a design which was frustrated by a tedious and alarming illness, which so seriously affected his mind that he forgot nearly all he had learned. In 1563, when his health and his desire for knowledge had alike revived, and safety was reassured to the Protestant inhabitants of Paris, he returned to that city, where for four years he devoted fourteen hours a day to study, becoming familiar with Greek, Hebrew, philosophy, and mathematics, in some of which he exhibited so ripe a proficiency as to reciprocate the instruction of his tutors. In 1567 the edicts favourable to the Huguenots were violated with more than usual boldness, and in the face of the revocation of them which was confidently rumoured to be impending, De Mornay took leave of Paris, and retired to his mother's château of Bui; and when hostilities at length broke out, he was prevented from taking the field on the side of the Protestants by the fracture of his leg, as he was on his way to join the army. At the time of his recovery the *petite paix* of six months, signed at Longjumeau on the 27th of March, 1568, was in force, and he was able to carry into effect a design he had formed of travelling into foreign countries. Accordingly, after great difficulty in accomplishing his exit from France, he arrived, about the middle of August, at Geneva; but, finding the city the scene of plague and of civil and religious commotion, he proceeded on his journey, passing through Switzerland into Germany, where he spent several months at Heidelberg, in the acquirement of the language and the study of civil law. In September, 1569, he repaired to Frankfurt, whence he proceeded to Italy, and further prosecuted the study of law at Padua, where also he extended his proficiency in various departments of learning and science, especially reading the greater part of the Old Testament in the original language, with the most learned of the Jewish rabbis. From Padua he proceeded to Venice, which he left for Rome in 1571, having been prevented from accomplishing a meditated tour of the East by the war then waging between the Turks and the Venetians for the island of Cyprus. From Rome, he returned to Venice, through Tuscany, the republic of Genoa, Piedmont, and Lombardy, and extended his tour to Vienna, from which by a circuit he passed through Hungary, Bohemia, Saxony, Thuringia, Hesse, and Franconia, to Cologne, where he spent the winter, occupying himself in religious, philological, and scientific studies and discussions. During his travels, as well now as at other times of his life, De Mornay combined the inquiries of the scholar, the soldier, and the statesman, observing the monuments, battle-fields, and general antiquities, and the origin, the progress, or the decline, and the several causes of these, of the social, religious, and political institutions of the countries in which he sojourned. In the spring of the following year, he passed through Flanders into England, whither the report of his talents and acquirements had preceded him, and where he was graciously received by Queen Elizabeth. After a few months' residence, he returned to France towards the end of July, 1572, and having passed some days with his mother at Bui, repaired to Paris in order to submit to his friend, Admiral Coligny, a 'Discourse' to the king, and a 'Remonstrance,' entitled 'Qu'il est juste et utile de faire la guerre à l'Espagnol,' the design of which was to procure some assistance for the oppressed Flemings against the tyranny of Spain. After the massacre of St. Bartholomew's-day, August 24, 1572, of which Coligny was one of the earliest and most prominent victims, and from which De Mornay with difficulty escaped, the latter took refuge in England, where he was well received by persons of all ranks. To divert his mind from the miseries of his native country, he had recourse to his studies; and he produced a considerable number of poems, as well as some short treatises, both in Latin and French, in which he besought Queen Elizabeth to succour the afflicted church to which he belonged, and repelled the calumnies with which its members had been assailed. He returned to France in the beginning of 1574, in answer to the urgent solicitations of the Protestant leaders, whose conduct in committing their religion to the ambition and the fortunes of the Duc d'Alençon, brother of Charles IX., he deemed so hopeless and impolitic, that he withdrew to the frontiers, and after the death of the king, May 30th, 1574, retired to Sedan, where he employed himself with literary pursuits, and where he became acquainted with Madame Charlotte Arbaleste de Pas de Fenquères, a Huguenot widow lady, who had escaped from the Paris massacre, and whom he afterwards married on the 3rd of January, 1576. It was at her request that, after their betrothal, he wrote his 'Discours de la

Vie et de la Mort,' 8vo, Lausanne, 1576, Latin version, by Arn. Freitagus, 'Vita Mortisque, atque adeo humanarum Actionum Christiana ac pia Consideratio,' 8vo, Frankfurt, 1585, &c., English translations by E[dward] A[ggas], 8vo, London, 1576, and by Mary Sidney, Countess of Pembroke, 'A Discourse of Life and Death,' &c., 4to, London, 1592, 8vo, London, 1600, 12mo, London, 1606, &c., and by M. A., 'A Pious and Christian Consideration of Life and Death and of all humane Actions,' &c., 8vo, London, 1699, and translated into Frisian and other European languages and dialects. Previous to his marriage, De Mornay took part in the unfortunate battle of Dormans, on the Marne, October 11th, 1575, against the Duc de Guise, where he was slightly wounded and made prisoner. He was admitted to ransom, however, after a detention of eleven days; and towards the close of 1576 attached himself to the King of Navarre, at that time the head of the Protestant party, and afterwards Henry IV. of France. Of this prince he became one of the most confidential advisers, serving him faithfully with sword, and tongue, and pen; and, after the breaking out of the sixth religious war, was accredited, April, 1577, by Henry, who had been declared Protector of the Protestant League, on a special mission to Queen Elizabeth of England, whom he sought to interest in the cause of the continental Protestants, and to obtain from her military and pecuniary assistance. Varying his diplomatic duties with learned and ecclesiastical studies, he composed his treatise on the Church, 'Tractatus de Ecclesia, quo præcipuè quæ hoc nostro Tempore de hoc Capite agitatæ fuerunt Quæstiones excutuntur,' 8vo, 1579 and 1594, "emendator, multis Locis locupletior," &c., 8vo, 1599, English translation, by J. Feilde, 'A Treatise of the Church,' &c., 8vo, London, 1579, 1581, &c., of which a French version, amongst others, was published as 'Traité de l'Eglise, auquel sont disputées les principales Questions qui ont esté menées sur ce Point en nostre Temps,' 12mo, Lausanne, 1587, "reveu et augmenté par l'Auteur," 4to, La Rochelle, 1599, 8vo, 1600, &c. Peace having been concluded in France on the 17th of September, 1577, the scene of De Mornay's mission was transferred, June, 1578, to Antwerp, where he represented the King of Navarre for about four years, during which, in the spring of 1580, when the King of Navarre was again in arms, he was despatched by him once more to England, to negotiate for succour, which, notwithstanding his personal acceptance with Queen Elizabeth, he failed to secure. At Antwerp he produced his work, 'De la Verité de la Religion chrestienne: contres les Athées, Epicuriens, Payens, Juifs, Mahumediistes, et autres Infidèles,' 4to, Antwerp, 1581, 8vo, Paris, 1582, 8vo, Geneva, 1583, &c., Latin translation by the author, 'De Veritate Religionis Christianæ Liber,' &c., 8vo, Antwerp, 1583, 8vo, Leyden, 1587, 1592, &c., 8vo, Herborn, 1609, 1632, &c., English translation, commenced by Sir Philip Sidney, and completed by Arthur Golding, 'A Woork concerning the Trewnesse of the Christian Religion,' &c., 4to, London, 1587, and 1592, "the third time published, and purged from faults," 4to, London, 1604, fourth edition, 8vo, London, 1617; Translation of the fifth and sixth Chapters, by Mr. Bellamy, 'The Lord M. du Plessis-Marly's Thoughts on the Trinity,' &c., 8vo, London, 1721. In 1582 De Mornay returned to France by the command of the king, by whom he was deputed in May, 1583, to attend the national synod assembled at Vitry, and employed in various other confidential services. He took part in the wars which followed the initiation of the famous League, after having drawn up a 'Declaration of the King of Navarre against the Calumnies of the League,' and was severely wounded in the great battle of Coutras, in Guienne, in which Henry defeated the royal army under the Duc de Joyeuse; and in the spring of 1589, after he had been instrumental in bringing about the reconciliation of the French king, Henry III., to the King of Navarre, received from the latter, to whom it had been ceded as a place of safety to the Protestants, the government of the town of Saumur. By the death of Henry III., on the 2nd of August of the same year, the King of Navarre succeeded to the throne of France, and De Mornay became counsellor of state. Political considerations induced a gradual coldness to Protestantism in the mind of Henry IV., who finally conformed to Romanism on the 25th of July, 1593—a step against which De Mornay energetically protested, and after which he withdrew by degrees from the court, and occupied himself with his studies, the duties of his government, and exertions in the cause of the Protestants. He took a very active part in the various negotiations between the king and his subjects of the Reformed communion, till the famous Edict of Nantes was obtained on the 13th of April, 1598; and he produced many controversial

works, one of which, on the Eucharist, gave occasion to a conference, on the 4th of May, 1600, before the king and all the court at Fontainebleau, between the author and Du Perron, Bishop of Evreux, and afterwards cardinal. He now lived in retirement at his government of Saumur for six years; and upon the assassination of Henry IV. by the Jesuit, Ravallac,* May 14th, 1610, he proclaimed and maintained the authority of Maria de' Medici, his widow, as regent. In 1621, Louis XIII. having determined to make war upon the Protestants, De Mornay remonstrated strongly against the injustice and impolicy of such a measure; and for his freedom on this occasion was deprived of his government of Saumur, receiving, as an indemnity, the sum of 100,000 livres. He now retired to his barony of Forêt-sur-Sèvre, in Poitou, where he died on the 11th of November, 1623.

Besides the works already described, De Mornay produced a great number of treatises, of which the principal are one on the Eucharist, which has been already referred to, 'De l'Institution, Usage, et Doctrine du Saint Sacrement de l'Eucharistie en l'Eglise ancienne: comment, quand, et par quels Degrez la Messe s'est introduit en sa Place, en IV. Livres,' 4to, La Rochelle, 1598, "seconde édition, reveue et augmentée," folio, Saumur, 1605, Latin version, 'De Sacra Eucharistia,' &c., folio, Hanover, 1605; 'Advertissement aux Juifs sur la Venue du Messie,' 4to, Saumur, 1607; 'Le Mystère d'Iniquité; c'est à dire, l'Histoire de la Papauté, par quels Progrès elle est montée à ce Comble, &c., où sont defendus les Droits des Empereurs, Rois, et Princes Chrestiens, contre les Assertions des Cardinaux Bellarmin et Baronius,' folio, Saumur, 1611, Latin version, 'Mysterium Iniquitatis,' &c., folio, Saumur, 1611, second edition, 8vo, Saumur, 1612, &c., English translation, by Samson Lennard, folio, London, 1612.

It is natural that about so prominent and distinguished a career as that of De Mornay many works would be conversant. They include, 'Mémoires de Messire Philippes de Mornay, &c., contenant divers Discours, Instructions, Lettres, et Dépêches par lui dressées ou écrites aux Rois, Reines, Princes, Princesses, Seigneurs, et plusieurs grands Personnages de la Chrestienté depuis l'An 1572 jusqu'à l'An 1589,' &c., 4 vols., 4to, vols. i. and ii. La Forest, 1624-25, vols. iii. and iv. Amsterdam, 1651-52, which have gone through numerous editions, the last of which bore the modified title of 'Mémoires et Correspondance de Duplessis-Mornay, pour servir à l'Histoire de la Réformation et des Guerres civiles et religieuses en France, sous les Règnes de Charles IX., de Henri III., de Henri IV., et de Louis XIII., depuis l'An 1571 jusqu'en 1623. Édition complète, publiée sur les Manuscrits originaux, et précédée des Mémoires de Madame de Mornay sur la Vie de son Mari, écrits par elle-même pour l'Instruction de son Fils,' vols. i.—xii., 8vo, Paris, 1824-25; 'Les derniers Heures de Messire Philippes de Mornay,' 4to, Leyden, 1624, by Jean Dailé; 'Histoire de la Vie de Messire Philippes de Mornay, Seigneur du Plessis-Marly,' &c., 4to, Leyden, 1647, composed by David de Liques, and by De Mornay's two secretaries, Meslai and Chalopin; 'Singularia Plessiaca: sive Memorabilia de Vita et Meritis, Fatis, Controversiis et Morte Philippi Mornæi de Plessis,' &c., 8vo, Hamburg, 1724, by Magnus Cousins, "S. R. M. Danicæ Legationis in Gallia Pastor. Præmissa est Præfatio D. Henrici Muhlîi, Theologi in Ecclesia ac Academia Holsatica Primarii;" and 'Duplessis Mornay, 1549—1623. Par Joachim Ambert, Officier supérieur de Cavalerie,' 8vo, Paris, 1847.

MORNY, CHARLES AUGUSTE LOUIS JOSEPH, DUC DE, French minister and politician, was born at Paris, October 23, 1811. After receiving his education at the Lycée Napoléon and the Collège Bourbon, he entered L'École d'État Major, which establishment he quitted in 1832 with the rank of sub-lieutenant. Joining the 1st Regiment of Lancers, he went to Algeria, served under General Changarnier at Mascara and Constantina, was wounded in the last-named engagement, saved the life of General Trézel, was favourably mentioned in despatches, decorated with the Legion of Honour, and raised to the rank of first lieutenant. Returning to France in 1838, he quitted the army, purchased an estate near Clermont, Puy de Dôme, entered largely into the cultivation of beet-root and the manufacture of beet-root sugar, wrote a pamphlet in advocacy of these branches of national enterprise, and was elected president of a society of beet-sugar manufacturers. In 1841 he became a member of the Council General of Agriculture and Commerce; and, in 1842, member of the Chamber of Deputies, where he took part in most discussions relating to the material welfare of the country, such as postal reform, the encouragement of new manufactures, the management of the national debt, the issue of bank notes, &c.

He was re-elected in 1846, and generally supported the Guizot government, though disapproving of some of the less liberal measures of that minister: an article by him in the 'Revue des Deux Mondes,' only one month before the Revolution of 1848, foreshadowed the probable result of the policy pursued. He retired from public life for a time, and attended to commercial and financial pursuits; but entered the Legislative Assembly in 1849, and warmly supported the Prince President, Louis Napoleon. When the coup d'état took place, in December, 1851, the Count de Morny was the most active partisan concerned in it. With the appointment of Minister of the Interior, upon him devolved the task of arresting the two hundred members of the National Assembly who showed resistance, and of signing decrees and ordinances. In 1852, disapproving of Napoleon's proposed mode of dealing with the Orleans property, he resigned, became president of the Council General of Puy de Dôme, was returned as deputy for Clermont, and in 1854 succeeded M. Billault as president of the Corps Législatif. In 1856 he headed a splendid embassy to St. Petersburg, on occasion of the coronation of the Emperor of Russia. During his sojourn in that country he arranged a treaty of commerce between Russia and France; and in 1857 he married a daughter of Prince Serge Troubezkoi. After this he engaged successfully in numerous speculative schemes, industrial and financial, connected with railways, canals, mines, discount banks, credit companies, &c. Several slight dramas and acting proverbs, suitable for private theatricals, were written by him under the pseudonym of St. Rémy. The emperor raised him to the rank of Duc in 1862. He died on the 10th of March, 1865; and his widow soon afterwards disposed of his fine gallery of pictures.

MORREN, CHARLES FRANÇOIS ANTOINE [E. C. vol. iv. col. 351], was born March 3, 1807, and died at Liège, December 17, 1858.

MORRIS, GOUVERNEUR, an American diplomatist and writer, was born at Morrisania, state of New York, January 31st, 1752. He graduated at King's (now Columbia) College, New York, in 1768, studied the law, and was admitted to practice in 1771. He became an active writer of newspaper articles, was chosen delegate to the Provincial Congress of New York in 1775, and, from that year till 1778, took a prominent part in public affairs. In 1781, an accident led to the amputation of one of his legs. He was one of the delegates appointed to draw up the Federal Constitution of the United States in 1787, and to him was assigned the task of giving to that important document its final form and expression. The following year he visited France, where he remained till 1790. In 1791 he was sent by Washington to England, to arrange some disputed points in the Treaty between the king and the newly formed republic. During 1792—94, he served as American minister at Paris. The next four years were spent chiefly in travelling in various parts of Europe. Morris's diary and letters give a vivid picture of the state of France and the continent generally, during this memorable period, and throw much light on the state of parties and the character of the revolutionary leaders. Returning to America, he sat from 1800 to 1803 in the United States Senate as representative of New York state, usually siding with the Federalists in politics. The remainder of his life was spent in easy retirement, maintaining a literary and political correspondence with friends in Europe, and taking part occasionally in public matters, by means of addresses and orations. He died suddenly on the 6th of November, 1816. He was a fluent speaker, but redundant and ornate. In person he is said to have borne so strong a resemblance to Washington, as to have stood as a substitute for him to the sculptor, Houdon. He was one of the earliest promoters of the Erie Canal, and was chairman of the Canal Commissioners. (*Life of Gouverneur Morris*, by Jared Sparks, 3 vols. 8vo, 1832.)

* MORRIS, JOHN, F.G.S., an eminent geologist and palæontologist, was born at Homerton, near London, in 1810. On the completion of his education in private schools at Clifton, Abingdon, and London—in the last of which he was associated with Thomas Griffiths, who subsequently became professor of chemistry in St. Bartholomew's Hospital—he was placed in the establishment of a chemist. This occupation he followed for several years, availing himself during the time of every opportunity for the pursuit of natural science, for which he had acquired a taste whilst at school. He became acquainted with Francis Crow, of Faversham, who had made an extensive collection of fossils from Sheppey and elsewhere, and his devotion to geology was further stimulated by an introduction (through Mr. W. Lonsdale, then Secretary of the Geological Society) to Mr. J. Prestwich, with whom he made many

excursions over the Tertiary districts of England, Belgium, and France. To assist his inquiries, he about this time commenced the preparation of a Table of Organic Remains, for the prosecution of which he received the award of the Wollaston Fund in 1842, as well as in other years. The first edition of the 'Catalogue of British Fossils' appeared in 1843, the second edition in 1854, and a new edition, enlarging the catalogue to the present condition of our knowledge, is very generally desired by geological students.

In 1853 and 1854 Mr. Morris accompanied Sir Roderick Murchison upon two excursions on the Continent, made with a view to the comparison and examination of the Palæozoic rocks. The Harz, Thuringia, Bavaria, and Bohemia were visited, and the results of the examination were embodied in a paper read by Sir R. I. Murchison before the Geological Society in 1855, 'On the Palæozoic and their associated rocks of the Thuringerwald and Harz.' In 1854, at the recommendation of Sir R. I. Murchison, Mr. Morris was elected to the professorship of geology at University College, London, a post he has continued to fill with eminent success to the present time. In 1860 Professor Morris was appointed examiner in geology and palæontology to the University of London: he held the office for five years, and was reappointed to it in 1870. He has also held the offices of examiner in geology and mineralogy to the Council of Military Education, and to the Board of Admiralty; and at the request of the members of the Coal Exchange, London, he has for some years given a series of lectures on 'Coal and Coal Mining,' in connection with the Coal Exchange Museum.

In 1867 Professor Morris was elected president of the Geologists' Association, and in 1871 one of the vice-presidents of the Geological Society of London. In 1871 he was nominated one of the examiners in natural science in Cambridge University, and in the same year was recommended by Professor A. Sedgwick as deputy Woodwardian Professor of Geology at Cambridge.

Professor Morris's writings, of which a list is appended, are of great value; but his distinctive merit is as a teacher. He is universally regarded as one of our ablest and most accomplished geologists, whilst as a teacher, whether in the lecture-room or the field, he is unequalled, and his rare stores of information have always been held unreservedly at the service of students and fellow-labourers in the science. The high esteem in which he is held by geologists generally was evinced by the presentation by Sir R. I. Murchison, in June, 1870, of a handsome testimonial contributed by the then president and some of the past presidents of the Geological Society, together with many other distinguished geologists, "in consideration of the degree in which this science has been advanced by his long and successful labours." "Always," it was said in the Address drawn up by Professor Phillips, of Oxford, "always working in the field, and classifying public and private collections, you have for many years been among the foremost and most diligent of the Students of geology and palæontology; your careful publications have their place among those of the Masters in every geological library; and your thoughtful lectures live, and will live, in the minds of your scholars."

Besides the 'Catalogue of British Fossils,' 1843 and 1854, already noticed, Professor Morris has written the following papers:—'Observations on the Strata near Woolwich,' 1835; 'On a Freshwater Deposit, containing Mammalian Remains, at Grays, Essex,' 1836; 'On some Deposits, containing Mammalian Remains, at Maidstone, Kent,' 1836; 'Remarks on the production of Crystals,' 1838; 'On the Deposits containing *Carnivora* and other Mammalia, in the Valley of the Thames,' 1838; 'A Systematic Catalogue of the Fossil Plants of Britain,' 1839; 'Description of a new species of *Nautilus*,' 1848; 'On the subdivisions of the genus *Terebratula*,' 1846; 'On Mammalian Remains at Brentford,' 1849; 'On *Neritoma*, a fossil genus of Gasteropodous Mollusks,' 1849; 'On Species of Belemnite and *Aptychus*,' 1852; 'Palæontological Notes,' 1851; 'On some Sections in the Oolitic district of Lincolnshire,' 1853; 'The Geology of Aylesbury and Hartwell,' 1856; 'On the occurrence of Allophane at Charlton, Kent,' 1857; 'On a Fern from the Coal Measures of Worcestershire,' 1859; 'Remarks upon recent and fossil Cycadææ,' 'Note on the genus *Siphonotreta*,' 'On Coal Plants,' 1862; 'On Coal: its Geological and Geographical position,' 1861; 'The Leadbearing districts of the North of England,' 'Geological Notes on parts of Northampton and Lincolnshire,' 1869; 'On the genus *Pollicipes* in the Oxford Clay,' 1850; 'On some new Species of the genus *Ancyloceras*,'

BIOG. DIV.—SUP.

1850; 'The Gems and Precious Stones of Great Britain,' 1868; 'On the genus *Æchmodus*,' 1869; and a useful 'Geological Chart,' showing the order of succession of the stratified rocks, their mineral characters, principal fossils, uses in the arts, &c.

* MORRIS, WILLIAM, an English poet, was born in 1834, and was educated at Exeter College, Oxford; after leaving which he devoted himself, with other members of the University, to the practical renovation of taste in domestic furniture, and the achievement of an æsthetic ideal in its form, harmony, and decoration. Mr. Morris habitually resides in London; and is now—July, 1871—engaged in a tour in Iceland, of which it has already been announced he purposes to write an account ('Athenæum,' April 29th, 1871), and in which he is accompanied by Mr. E. Magnússon, his collaborateur in several translations, and himself known for his skilful English translations of Icelandic poetry, especially of *Asgrimsson's 'Lilja' (the Lily)*, an Icelandic Religious Poem of the Fourteenth Century.

Mr. Morris has produced 'The Defence of Guenevere, and other Poems,' 8vo, London, 1858, &c., new edition, 1870, which, dedicated to the author's friend "Dante Gabriel Rossetti, Painter," circles through half its pages about the Round Table of Arthurian romance; 'The Life and Death of Jason. A Poem in Seventeen Books,' 8vo, London, 1867, fifth edition, 1871, which approaches to the epic in form and dimensions, and follows the career of Jason from his childhood, through all his adventures in search of the golden fleece, his exploits, perils, and triumphs, until he lies crushed beneath the fatal beam of Argo, and his faithlessness to Medea, who is of course a figure of co-ordinate importance with Jason himself throughout a considerable proportion of the narrative, which is couched in pure, simple, idiomatic English, and is extremely vivid and graphic in style and movement; 'The Earthly Paradise,' 4 parts, 8vo, London, 1868—70, a collection of tales in verse, comprising in parts I. and II., 8vo, 1868, sixth edition, 1871, and which for literary purposes are distributed over the months "March—August," or, "Spring and Summer," 'Atalanta's Race,' 'The Doom of King Acrisius,' 'The Story of Cupid and Psyche,' 'The Writing on the Image,' 'The Love of Alcestis,' 'Pygmalion and the Image,' 'Ogier the Dane,' and others: in part III., 8vo, London, 1869, fourth edition, 1871, with the motto of "Autumn," or "September, October, and November," 'The Death of Paris,' 'The Land East of the Sun and West of the Moon,' 'The Story of Accontius and Cydippe,' 'The Man who never laughed again,' 'The Lovers of Gudrun,' &c.: and in part IV., 8vo, London, 1870, third edition, 1871, inscribed as "Winter," or, "December, January, and February," 'The Golden Apples,' 'The Fostering of Aslaug,' 'Bellerophon at Argos,' 'Bellerophon in Lycia,' 'The Hill of Venus,' &c. Mr. Morris, who rather despairingly describes himself as "the idle singer of an empty day," and sees in the universe, too exclusively, a vast dominion of Death, has contributed to periodical literature one of his latest fugitive works, being a translation from the Icelandic of 'The Story of Frithiof the Bold,' which appeared in the magazine entitled 'Dark Blue'; and, in association with Mr. Magnússon, has produced a prose volume entitled 'Grettis Saga. The Story of Grettir the Strong. Translated from the Icelandic by Eiríkr Magnússon, Translator of "Legends of Iceland," and William Morris, Author, &c.,' 8vo, London, 1869; and another called 'Völsunga Saga. The Story of the Völsungs and Niblungs. With certain Songs from the Elder Edda. Translated from the Icelandic,' &c., 8vo, London, 1870.

* MORSE, SAMUEL FINLEY BREESE, one of the inventors of the electric telegraph, was born at Charlestown, Massachusetts, April 27th, 1791. After graduating at Yale College, in 1810, he commenced his career as an artist. In 1811, he came to England with Washington Allston, studied painting under Benjamin West, and formed a friendship with Leslie. In 1813 he obtained the Royal Academy gold medal for his sculpture model of the 'Dying Hercules.' Returning to America in 1815, he worked as a portrait painter in Boston, in New Hampshire, and then in South Carolina, and at length settled, in 1822, in New York, where he painted a full-length portrait of Lafayette, for the Corporation. In 1824 he joined other artists in forming a drawing-school in New York, which resulted in the establishment of the Academy of Design in 1826; of this academy he was president for sixteen years. In 1829, he started on a three years' artistic tour in Europe, and on his return in 1832, became professor of the literature of the arts of design in New York University. He lectured on this subject in 1835.

It was about this period that a change in Mr. Morse's pursuits gradually commenced. He had paid some attention to chemistry when at Yale College, and, after his first visit to Europe, had

attended scientific lectures given by Professors Silliman, Day, and Dana. On his return from his second visit, in 1832, a conversation with a fellow-passenger on ship-board led him to conceive the possibility of electro-telegraphy; and then it was, according to the accepted belief in America, that he formed the rough sketch of an electro-magnetic telegraph, with a chemical self-recorder. Devoting occasional time to the subject, he finished a model of his apparatus in 1835, and deposited it in New York University. This instrument could only send a message one way, to a distance of half-a-mile; but, by 1837, he had made improvements which enabled him to send currents in both directions. Failing to obtain the aid of Congress in developing his system, he visited England and France in 1838, but without much success. In 1842, he laid the first submarine telegraph in New York harbour; in 1843, suggested the idea of an Atlantic telegraph from America to Europe; and in the same year obtained a grant of 30,000 dollars from Congress, to enable him to lay down an experimental wire from Washington to Baltimore. The complete success of this wire demonstrated the value of the system, which thenceforward spread with amazing rapidity. It belongs to the historians of science, and to practical electricians, to determine the relative dates and values of the discoveries and inventions of Ronalds, Morse, Steinheil, Cooke, and Wheatstone; but it is indisputable that Morse's system is regarded as the most important on the continent, as well as in America. In 1851, Steinheil himself recommended the German governments to adopt this system, which they did. Professor Morse has since been admitted into many learned societies, and has been decorated by the sovereigns of France, Turkey, Spain, Denmark, &c. A conference of ten European governments, about the year 1860, presented him with an honorarium of 400,000 dollars, in recognition of the value of his invention. On his 80th birthday, 1871, a "telegraphic celebration" was held at his house in New York. Surrounded by friends, and with the apparatus invented by himself, he conversed with people all over the world, receiving congratulations and exchanging greetings.

MOSCHELLES IGNATZ [E. C. vol. iv. col. 357]. This distinguished musician continued to hold the post of Director of the Conservatory at Leipzig, till his death, which occurred on the 10th of May, 1870, within a few weeks of the completion of the 76th year of his age.

* **MOSELEY, HENRY, M.A., D.C.L., F.R.S.**; Chaplain in Ordinary to the Queen, Canon of Bristol, and Vicar of Olveston, was born in 1801, and at an early age directed his attention to mathematical pursuits. In 1818 he published a paper ('Tilloch's Phil. Mag.,' vol. lii.), 'On measuring the depths of Cavities on the surface of the Moon by means of their shadows.' In 1822 he entered St. John's College, Cambridge, and graduated in 1826 as seventh wrangler. In that year the following papers appeared from his hand: 'On the application of the method of Parameters to the determination of certain curves'—('Ann. Phil.,' vol. xi.; Tilloch's 'Phil. Mag.,' vol. lxxvii.); and 'On the equilibrium of the funicular curve when the string is extensible;' and in 1827 a paper on 'Caustics,' ('Phil. Mag.,' vol. ii., N.S.)

In 1828 he entered holy orders, and in 1830 published a 'Treatise on Hydrostatics and Hydrodynamics for the use of students in the University of Cambridge.' On the establishment of King's College, London, in the year 1831, he was appointed professor of natural and experimental philosophy in that institution, and he was also its first chaplain. In 1833 he published memoirs on 'A new principle in Statics, called the Principle of Least Pressure,' ('Phil. Mag.,' vol. iii., pp. 285—88); and on the 'Theory of Resistances in Statics,' ('Phil. Mag.,' vol. iii.) In 1834 a memoir on the application of 'The principle of Least Resistance to the theory of Resistance in Statics,' ('Phil. Mag.,' vol. v.). In 1835 he communicated to the Cambridge Philosophical Society a memoir on the 'Equilibrium of the Arch,' ('Camb. Phil. Trans.,' vol. v., pp. 293—314). In the same year he published an elementary treatise on 'Mechanics applied to the Arts;' and in 1836 'Lectures on Astronomy, delivered at King's College.' In 1837 he communicated to the Cambridge Philosophical Society a memoir on the 'Theory of the Equilibrium of Solid Bodies in Contact,' ('Camb. Phil. Trans.,' vol. vi.); and wrote the article on Definite Integrals in the 'Encyclopedia Metropolitana.' In 1838 he communicated to the Royal Society a memoir on the 'Geometrical forms of turbinated and discoid Shells,' ('Phil. Trans.,' 1838, pp. 351—70). His researches on this subject have been continued by C. F. Naumann, ('Poggendorff, Annal.,' i., pp. 223—236; ii., pp. 245—260; lxiv., pp. 528—542); D'Orbigny,

'Ossements Fossiles;' Macalister, 'Proc. Royal Society,' 1870, and others. In 1839 appeared his elementary work entitled, 'Illustrations of Mechanics.'

In 1841 he communicated to the British Association of Science the description of a machine for calculating the numerical values of definite integrals, ('Brit. Ass. Rep.,' 1841, pp. 35—39; and one to the Royal Society, on the 'Theory of Machines,' ('Phil. Trans.,' 1841, pp. 285—306); and in 1842 he published a 'Treatise on Astro-Theology,' and a paper on 'Conchylometry,' ('Phil. Mag.,' vol. xxi., pp. 300—5). He took an active part in the establishment of the department of practical science and engineering at King's College; and in 1842 published his work on the 'Mechanical Principles of Engineering and Architecture,' which has been reprinted in America, and edited, with notes, by Professor Mahan for the use of the Military School at West Point, and translated into German by Professor H. Scheffer, of Brunswick. In 1844 he was appointed one of Her Majesty's Inspectors of Schools, and especially charged with the inspection of Normal schools for teachers. From that year to 1855 his reports on education to the Committee of Council were published annually in their minutes. He wrote, moreover, various articles on public education in the Edinburgh and Quarterly Reviews about that time and afterwards. In 1848 he was elected Corresponding Member of the Institute of France. In 1850 he communicated to the Royal Society a memoir on the 'Dynamical Stability of Floating Bodies,' ('Phil. Trans.,' 1850). The dynamical stabilities of ships of war are all calculated by the formulæ given in this memoir, ('Trans. Soc. Nav. Arch.,' vol. i.) and in it the consideration of dynamical stability was first introduced in mechanics ('Fincham's Shipbuilding').

In the International Exhibition of 1851 he filled the office of chairman of Jury V.; and communicated, in that year, to the Royal Society, a paper on the 'Rolling Motion of a Cylinder.'

In 1852 he was appointed one of Her Majesty's Chaplains in Ordinary; and in 1853 he was presented, on the recommendation of Lord Aberdeen, to a canonry in Bristol Cathedral. In 1854 he resigned his office as H. M. Inspector of Schools, on his acceptance, from the Dean and Chapter of Bristol, of the vicarage of Olveston; and in that year communicated to the Royal Society a memoir on the 'Descent of Glaciers,' ('Proc. Royal Soc.,' vol. vii., pp. 333—342). In 1855 he took an active part in establishing the 'Bristol Diocesan Trade School.' In the following year he was entrusted by the Secretary for War with the direction of the first competitive examinations for admission to the Royal Military Academy at Woolwich; and was chairman of the committee of management of the Public Conference on Education, over which the Prince Consort presided. In 1857 he published in the 'Phil. Mag.' a memoir on 'Certain relations of the Experimental, Logarithmic, and Binomial Theorems.' In 1858 he became a member of the Council of Military Education. In 1862 he communicated to the Royal Society a second memoir on the 'Descent of Glaciers,' ('Proc. Royal Soc.,' vol. xi.); and in 1868 one on the 'Mechanical impossibility of the Descent of Glaciers by their Weight only' (ibid. 1869). The mathematical discussion of this question he published in the 'Phil. Mag.' of May of that year; and in the same magazine a paper on the 'Uniform motion of an imperfect fluid.' In 1869 he published a paper 'On the descent of a solid body on an inclined plane when subjected to alternations of temperature,' ('Phil. Mag.,' Aug., 1869); and in 1870 one on the 'Mechanical Properties of Ice' ('Phil. Mag.,' Jan., 1870); and another on the 'Veined Structure of the Ice of Glaciers,' ('Phil. Mag.,' April, 1870). In that year he delivered a lecture at the Royal Institution of Great Britain on the 'Cause of the Descent of Glaciers.' In 1871 the University of Oxford conferred upon him the honorary degree of Doctor of Civil Law. In that year he communicated to the Royal Society a memoir on the 'Uniform flow of a liquid.'

The greater part of Canon Moseley's life has been devoted to the cause of public education, and chiefly to that of the working-classes, of which he is an ardent advocate. His reports on the subject, and on the education of elementary schoolmasters, are to be found in the 'Minutes of the Committee of Council on Education' from 1844 to 1855. As it regards the teaching of middle or commercial schools, he recommends that, "It should be placed on a scientific, rather than on a literary basis—a basis of industrial science as distinguished from language.

"What is done with the head, with no relation to what is done with the hands, is," he says, "the business of the universities and public schools, and the occupation of the upper or non-working

classes. Pure work is the occupation of the working-classes. It seems the function of the middle-classes to apply the thought of the educated classes to the work of the uneducated. Their schools should therefore be schools of application.

"By the one side they are in contact with the workers, and by the other with the thinkers. Thinking in respect to working—the thought by which men are makers—therefore belongs to them, to guide the operation of the hand by the operation of the mind, and to know in respect to what is to be made. Other knowledge than that which may be applied, however valuable in itself and for other men, is foreign to them." 'Report on the Bristol Diocesan Trade School,' read at the Church Congress held in Bristol in the year 1864. (See 'Papers relating to the origin and progress of the Bristol Trade School,' Bristol, 1869.)

MOSTAERT, JAN, an eminent Dutch painter, was born at Haarlem, in 1474. He painted religious and historical subjects in a realistic manner, with much force and spirit, and introduced landscape backgrounds, with considerable feeling. He was also popular as a portrait painter. Among his extant works are a 'Mater Dolorosa,' in the church of Notre Dame, at Bruges; a 'Nativity,' and an 'Ecce Homo,' in churches at Haarlem; and a 'Deipara Virgo,' the Virgin with the Infant Saviour, standing surrounded by angels, and attended by prophets and sibyls: this, which is his most remarkable picture, is in the Antwerp Museum (No. 70), where are also two portraits by him. Jan Mostaert died in 1555 or 1556.

***MOTLEY, JOHN LOTHROP**, one of the most distinguished of modern historians, was born on the 15th of April, 1814, at Dorchester, Massachusetts. After graduating at Harvard College, in 1831, he followed up his studies, first for a year at the University of Göttingen, and then for another year at that of Berlin. He made the tour of several European countries—England, France, Germany, Switzerland, and Italy; and on his return to America, having devoted himself to the study of law, was admitted to the bar in 1837. The charms of literature diverted him, however, from the practice of his profession; and he made his first essay in authorship with a novel, entitled, 'Morton's Hope: or, the Memoirs of a Young Provincial,' 2 vols. 12mo, New York, a love story, pleasantly, rather than powerfully told, the scene of which is laid in New England, at the time of the Revolution. A disappointment of the heart forces the hero to visit Europe, where he passes some time among the University towns of Germany, of which, especially of Göttingen, the author introduces some graphic descriptions. 'Morton's Hope' was soon followed by the production of another novel, which, however, was not published until ten years afterwards, when it appeared with the title of 'Merry Mount. A Romance of the Massachusetts Colony,' 2 vols. 8vo, Boston and Cambridge (U.S.), 1849. In 1841, Mr. Motley became secretary of the United States Legation at St. Petersburg, in which office he continued for about eight months, and then returned to America, where he occupied himself chiefly with literary pursuits, contributing to the leading periodicals, especially to the 'New York Review,' to which he furnished papers respectively on De Tocqueville's 'Democracy in America,' and on 'Goethe and his Writings,' and to the 'North American Review,' for which he wrote, October, 1845, a striking article on 'Peter the Great.' He became interested in the history of Holland, for the illustration of which he began to collect authorities. He had already compiled enough to occupy two volumes, when, dissatisfied with the facilities offered to him in America for the prosecution of his subject, he embarked with his family, for Europe, in 1851. On his arrival, he established himself chiefly at Dresden, with the view of writing a history of the great struggle, at the close of which the Netherlands threw off the yoke of Spain—"the great agony," to use his own words, "through which the Republic of Holland was ushered into life." He devoted nearly five years to an examination of the most trusted authorities, chiefly in the libraries of Germany and the Netherlands, at the end of which he published his 'Rise of the Dutch Republic. A History,' 3 vols. 8vo, London, 1855, which was at once reproduced in New York. It was also reprinted in English at Amsterdam. Other editions followed, both in this country—3 vols. 8vo, London, 1858, and 2 vols. 8vo, Edinburgh, 1859, &c.—and in America; and its popularity was so great that its circulation in England had reached 15,000 in November, 1857, and in the United States had attained to nearly 8,000 in June, 1860. The 'History,' prefaced by a succinct historical introduction of ninety-two pages, was conversant about the period from the abdication of Charles V. in 1555, to the death of William the Silent, Prince of Orange, in 1584. 'The Rise of the Dutch Republic,' 6 vols. 8vo,

Leipzig, 1858, formed vols. 32 to 37 of Durr's 'Collection of Standard American Authors;' and a Dutch translation, under the superintendence of R. C. Bakhuizen van den Brink, chief Archivist of the Netherlands, with an Introduction and Annotations, was issued in numbers, as 'De Opkomst van de Nederlandsche Republiek. Met Inleiding en Aanteekeningen,' &c., 3 vols. 8vo, The Hague, 1857, &c., German translation, 'Der Abfall der Niederlande und die Entstehung des holländischen Freistaats,' &c., 3 vols. 8vo, Dresden, 1857—60, new edition, 3 vols. 4to, Dresden, 1862, French translations, 'Fondation de la République des Provinces-Unies. La Révolution des Pays-Bas au XVI^e Siècle. Traduit de l'Anglais par Gustave Jottrand et Albert Lacroix,' 4 vols. 8vo, Brussels, 1859—60, and a 'traduction nouvelle, précédée d'une Introduction par M. Guizot,' 4 vols. 8vo, Paris and Corbeil, 1859, &c. Mr. Motley visited the United States for a short time in 1858; but presently returned to Europe to prosecute his researches for the second portion of his work, which was published with the title of 'The History of the United Netherlands: from the Death of William the Silent, to the Synod of Dort, [or, as variously stated in the title-pages, "to the twelve years' Truce, 1609"]. With a full view of the English-Dutch Struggle against Spain, and of the Origin and Destruction of the Spanish Armada,' 4 vols. 8vo, London, 1860—67, new edition, 4 vols. 8vo, London, 1869. After the publication of the 'Dutch Republic,' its author was elected a member of various learned societies in Europe and America, and especially of the Institute of France, in succession to Mr. Prescott. In 1860, he received the degree of D.C.L. from the University of Oxford, and that of LL.D., from Harvard College, U.S.; and in the following year, 1861, again undertook an official mission, as Minister from the United States to the Court of Vienna. He was recalled in 1867; and was subsequently appointed to succeed Mr. Revard Johnson as Minister at the Court of St. James, with instructions to press more vigorously than ever the "Alabama claims." These were, however, taken out of his hands, and have, it is hoped, arrived at a final solution in the shape of a treaty agreed upon at Washington by a joint commission of English, American, and Canadian statesmen. Mr. Motley, after having been superseded by General Schenck, who arrived in London in June, 1871, has once more turned his attention to historical studies, and under circumstances that promise the most desirable results. He is at present, July, 1871, residing in Holland, at the suggestion of the Queen, where he is engaged in collecting materials for the continuation of his history of that state. He is a patriotic lover of the institutions of his native country, a circumstance the exhibition of which is continually recurring in his history; and which has inspired such minor productions as his 'Historic Progress and American Democracy. An Address delivered before the New York Historical Society, December 16th, 1868,' 8vo, New York, 1869; and 'Democracy, the Climax of Political Progress and the Destiny of advanced Races. An historical Essay,' 8vo, Glasgow and London, 1869.

MOULIN, PIERRE DU, known also as **MOLINÆUS**, an eminent French Protestant divine, and son of Joachim Du Moulin, was born on the 18th of October, 1568, at the Château de Buihi, the seat of the De Mornays, where his parents had been admitted to refuge from the persecution to which the Huguenots were at that time exposed. After the massacre of St. Bartholomew's day, August 24th, 1572, he was taken by his parents to Sedan, where he received his preparatory and collegiate education until 1588, when, having been sent by his father to England, he became a member of Corpus Christi College, Cambridge. After a stay of four years in this country, he embarked for Holland in the suite of the Duke of Wirtemberg, but was shipwrecked near fort Rammekens, on the coast of Zeeland. He celebrated his escape, which was made at the expense of his books and baggage, in a poem entitled 'Votiva Tabella,' which attracted both favour and reputation. Through the interest of the French ambassador, he was appointed to the chair of philosophy at the University of Leyden, which he filled with much distinction for several years, in the course of which he published 'Elementa Logica,' 8vo, Leyden, 1596, eighth edition, 8vo, Geneva, 1625, and many others, French version, 'Eléments de Logique,' 8vo, Sedan, 1621, English version, 'The Elements of Logick: translated out of the French Copie by Nathanael De Lawne,' 8vo, London, 1624. In obedience to a call to undertake the pastorate of the Protestant church at Charenton, Du Moulin left Leyden for Paris, where he arrived on the 28th of February, 1599, and conjoined with his ministerial office, that of chaplain to Catherine de Bourbon, sister to King

Henry IV., who had conformed to Romanism in 1593, and wife of Henry of Lorraine. The Pope pressed Henry IV. to exert his influence with Catherine to become reconciled with the Church of Rome; but she remained steadfast in her Protestantism, in which she was fortified by the arguments opposed by Du Moulin to those of the Papal champions, Perron and Cotton, chaplains to the King, and others. Their discussions and conferences were frequent, and their controversy of long continuance; and amongst the records of them may be mentioned 'Trente-deux Demandes proposées par le Père Cotton, avec les Solutions adjoustées au Bout de chaque Demande: item Soixante-quatre Demandes proposées en Contre-eschange,' 8vo. La Rochelle, 1607, 1608, &c., English translation, "with a new late challenge by a learned Divine to all Papists in twenty-four other Popish Articles," 4to. London, 1614, 1615, &c.

The assassination of Henry IV., May 14th, 1610, gave occasion to Du Moulin, anonymously, to charge that crime upon the doctrines of the Jesuits, and upon Cotton as a disseminator of them; which elicited from Cotton a defence and apology. In 1615, Du Moulin paid a second visit to England, at the invitation of King James I., with whom he had for some time corresponded, and at whose instance he was admitted to a doctor's degree at Cambridge, and collated to the fourth stall in the Cathedral of Christ Church, Canterbury; and for whom he drew up a plan for the reunion of the Protestant Churches, which Blondel has inserted in his 'Actes Antiques.' After a three months' stay, the short duration of which had been a condition insisted upon by his flock before they would allow him to depart, he returned to France; and in 1617, when the United Provinces desired the Reformed Churches of England, France, and Germany, to send deputies to the Synod of Dort, he was designated as one of the four intended representatives of French Protestantism. The formal prohibition, on pain of death, issued by Louis XIII., prevented their attendance; but Du Moulin compensated himself for the disappointment by the zeal with which he promulgated and defended the decrees of the Synod, and by obtaining for them the sanction of the national Synods of the Protestant Church of France. In 1620, he was moderator of the Synod of Alais; and about this time, having been pressed by Lord Herbert of Cherbury, the English ambassador at the French Court, to use his influence with James I. for the succour of that monarch's son-in-law, the King of Bohemia, found himself so obnoxious to his own government, who issued a decree of seizure and imprisonment against him for having solicited a foreign prince to take up arms in behalf of the Protestant Churches, that he was obliged to seek refuge at Sedan as the best means of providing for his safety. Here he was presently appointed to a chair of theology, and to the ministry of the church; and he continued to hold both his academic and pastoral offices to the time of his death. He paid a final visit to England in 1623, about the time of the publication of Cardinal Perron's book against King James, who requested Du Moulin to write a reply, which was published at Sedan, after the death of James, with the title of 'Novitas Papismi: sive, Perronii Confutatio, Regique Jacobi, sed magis satræ Veritatis, Defensio,' French version, 'Nouveauté du Papisme, opposée à l'Antiquité du vray Christianisme. Contre le Livre de M. le Card. du Perron, intitulé, "Replique à la Responce du Roy Jacques I.," folio, Sedan, 1627, "troisième édition, augmentée de divers Traitez par l'Auteur," 4to, Geneva, 1633, English translation, with the life of the author prefixed, by his eldest son, Dr. Peter du Moulin, 'The Novelty of Popery,' &c., folio, London, 1662. Between three and four years previous to his death, Du Moulin was severely injured by a fall from his horse; after which, although he never recovered from its effects, he still continued to prosecute the labours of his twofold vocation, until his death, in his ninetieth year, on the 10th of March, 1658.

The works of Du Moulin, sixty-five in number, are enumerated in Jean Aymon's 'Actes ecclésiastiques et civils de tous les Synodes nationaux des Églises réformées de la France,' 2 vols. 4to, Rotterdam, 1710, &c. As being to a very large extent polemical, and affected by the ecclesiastical and political colour of the time, they are not of absorbing modern interest. The principal of them, besides those which have been already mentioned, are, 'Apologie pour la Cène du Seigneur, contre la Présence corporelle et Transubstantiation,' 8vo, La Rochelle, 1607, 8vo, Geneva, 1608, "dernière édition, revue et augmentée, en laquelle est satisfait à toutes les Accusations des Adversaires," 8vo, Geneva, 1630, English translation, by Edward Skipwith, 4to, London, 1612; 'Heraclite: ou, de la Vanité et Misère de la Vie humaine,' &c., 8vo, Geneva, 1609, &c., English translations, by

R. S [tafford], 'Heraclitus,' &c., 12mo, Oxford, 1609, by Abraham Darcie, 8vo, London, 1624, and by Sir H. L'Estrange, 8vo, London, 1652; 'De Monarchia temporali Pontificis Romani Liber, quo Imperatoris, Regum, et Principum Jura adversus Usurpationes Papæ defenduntur,' &c., 8vo, London, 1614; 'Lettre à Messieurs de l'Eglise Romaine,' 8vo, Saumur, 1618, English translation, by Ry. Goring, 'A Letter unto them,' &c., 8vo, London, 1621; 'Bouclier de la Foy: ou, Defense de la Confession de Foy des Églises réformées du Royaume de France,' &c., 2 parts, 8vo, Charenton, 1618, Geneva, 1619, &c., 8vo, Paris, 1846, English translation, 4to, London, 1620, 1623, 1631, &c.; 'Anatome Arminianismi: seu, Eucleaticæ Controversiarum quæ in Belgio agitantur, super Doctrina de Providentia, de Prædestinatione,' &c., 4to, Leyden, 1619, 1620, &c., English translation, 4to, London, 1620; 'Du Combat Chrestien,' 8vo, Sedan, 1622; 'Oratio de Laudibus Theologiæ,' 8vo, Sedan, 1620; 'Du Juge des Controverses: Traitté auquel est defendue l'Autorité et la Perfection de la S. Escriture contre les Usurpations et Accusations de l'Eglise romaine,' 8vo, Leyden, 1630, English (partial) translation, by G. C., 8vo, London, 1632; 'Anatomie de la Messe,' &c., 8vo, Geneva, 1636, "troisième édition revue et augmentée," 12mo, Leyden, 1638, 8vo, Geneva, 1640, &c.; 'Latino Sermone donata a Lud. Molinæo, Authoris Filio,' 8vo, Leyden, 1637, English translations, by J. Mountaine, 8vo, London, 1641, by G. C., 12mo, Dublin, 1750, and by R. Shanks, 12mo, Edinburgh and Glasgow, 1833; 'Trois Decades de Sermons,' 8vo, Sedan, 1637—39; 'Le Capucin: Traitté auquel est descritte l'Origine des Capucins, et leurs Vœux, Reigles, et Disciplines examinées,' 8vo, Sedan, 1641, English translation, by Philanax Orthodoxus, 16mo, London, 1665; 'Opera Philosophica. Logica, physica, ethica,' 3 parts, 8vo, Amsterdam, 1645, French version, 'La Philosophie mise en François et divisée en trois Parties,' &c., 8vo, Paris, 1644, 12mo, Rouen, 1655, 1661, &c.; and 'The Papal Tyranny, as it was exercised over England for some Ages: set forth by his Son, Dr. Peter Du Moulin. With an Addition on the same Subject, and Reflections,' &c., 4to, London, 1674.

Of works illustrative of the career of Du Moulin, may be mentioned, besides the 'Life' prefixed to the English version of the 'Nouveauté du Papisme,' already alluded to, 'An Account of the last Hours of Dr. Peter Du Moulin,' &c. Translated out of the French Copy printed at Sedan,' 8vo, Oxford, 1658; a Life, by William Bates, in 'Vitæ Selectorum aliquot Virorum, qui Doctrina, Dignitate, aut Pietate inclaruere,' 4to, London, 1681; and another in Hone's 'Lives of Eminent Christians,' 8vo, London, 1834—43, issued by the Society for Promoting Christian Knowledge.

MOULIN, PETER DU, the younger, an Anglican divine, and the eldest son of the preceding, was born at Paris, about the year 1600, soon after his father's appointment to the pastorate of the Protestant church at Charenton. He received his education at the University of Leyden, where he took the degree of D.D., in which he was afterwards incorporated successively by the University of Cambridge, and by the University of Oxford on the 10th of October, 1656. Having repaired to England after his academical course at Leyden, he found a patron in Richard, Earl of Cork; whose sons, after he had resided at Lismore, Youghal, and Dublin, for some time after the pacification of Ireland by the Parliamentary forces, he accompanied to Oxford, where he spent two or three years as their governor. Whilst resident at the University, he was a frequent preacher at the church of St. Peter-in-the-East. He paved the way to royal favour by the publication of a work having reference to the execution of Charles I., entitled 'Regii Sanguinis Clamor ad Cœlum adversus Parricidas Anglicanos,' 8vo, and 4to, The Hague, 1652, which brought down upon its author the severe animadversions of the poet Milton. Almost immediately after the Restoration of Charles II., he was appointed chaplain in ordinary to the king, and was collated, June, 1660, to the fourth prebend in the cathedral of Canterbury, which had been formerly held by his father. He was also preferred to the rectory of Adisham; and, dying at Canterbury in October, 1684, was buried on the 13th of that month in the cathedral. He was a strenuous Protestant and a zealous Calvinist; and his last words are said by Anthony à Wood to have been:—"Since Calvinism is cried down, actum est de Religione Christi apud Anglos."

Besides translating and editing several of his father's works, Dr. Du Moulin was the author of various poems, sermons, and devout and polemical treatises. The principal of these are—'La Paix de l'Ame,' of which the best edition is said to be that

of Geneva, 12mo, 1729, but of which an English version, probably an original one from the hand of the author, had appeared, with a dedication to the Earl of Cork, entitled 'Of Peace and Contentment of Minde,' 8vo, London, 1657, third edition, 1678. A later English version was published with the title of 'A Treatise on Peace of Soul and Contentment of Mind. Written originally in French by Mr. Peter Du Moulin, the Son. A Work consisting of Devotion, Morality, Divinity, and Philosophy, adapted to every Capacity, and equally proper for all Christians in general. First corrected, improved, and re-published, with Notes, by Mr. Sartoris [Geneva, 1729, *ut supra*]. And now translated into English, with additional Notes, by John Scrope, D.D., 2 vols. 8vo, Salisbury, 1765; 'Πάρεργα,' Poematum Libri tres:—(I.) Hymni in Symbolum Apostolorum. (II.) Ecclesiae Gemitus. (III.) Sylva Variorum, 8vo, Cambridge, 1670; and 'Ten Sermons preached on Several Occasions,' 8vo, London, 1684.

MOUNIER, JEAN JOSEPH, a celebrated French politician and writer, was born at Grenoble, November 12th, 1758. After studying at the college in that town, he wavered for a time between the adoption of a military and a commercial life; but at length decided on the law, studied hard, and was received into the faculty of Advocates in 1779. His voice not being strong enough for a pleader in court, he became a chamber counsel, and established his fame as a sound lawyer. As a judge-royal, which appointment he obtained in 1783, his impartial administration of justice was conspicuous; and his range of knowledge was increased by the careful study of the best English writers on the laws and constitution of England. He was concerned in the earliest movements connected with the French Revolution; the struggles between the Central government and the provincial states; the convocation of the Notables; and the endeavours of Neckar to extricate the king from a clique of bad advisers. Mounier published an address to the king and Neckar, on the best mode of convening the States General and Provincial Assemblies. In 1789, he went to Versailles, to represent the Province of Dauphiné in the States General. When the nobles and the clergy refused to make one house with the Tiers État, and the latter resolved to form themselves into a National Assembly, Mounier sided with the popular party, but at the same time tried, with Mirabeau, to bring about amicable relations between the king and the nation. Although earnestly demanding a constitution, he maintained the right of the king to choose his ministers, and defended the rights of property against attacks which began to be frequently heard. The Assembly decided on having only one legislative chamber, against his advice to follow the English plan of having two. When elected president of the Assembly, he acted with dignity and impartiality; but, finding himself powerless to stem the revolutionary torrent, he resigned, and retired to Grenoble, where he published a defence of his conduct. But the resentment of the Assembly pursued him; he fled to Switzerland in 1790, remained there till 1792, then went to England, and afterwards to Weimar, supporting himself by teaching, and especially by conducting a school for high-class education at Weimar. Returning to France in 1801, he was, in the following year, made prefect of Ile-et-Vilaine, by Consul Bonaparte, and raised to the rank of Councillor of State. He died, January 26th, 1806. To mark the respect entertained for Mounier's integrity and abilities, his son was some years afterwards raised to the peerage. Mounier's writings were chiefly published during the earlier years of the Revolution. Among them were 'Considérations sur les Gouvernements, et principalement sur celui qui convient à la France,' 8vo, 1789, German translation by Gentz, Berlin, 1794; 'Observations sur les États Généraux de France'; 'Rapport du Comté chargé du travail sur la Constitution'; 'Recherches sur les Causes qui ont empêchés les Français de devenir libres,' 2 vols. 8vo, 1792; and 'De l'Influence Attribuée aux philosophes, aux francs-maçons, et aux illuminés, sur la Revolution de France,' Tübingen, 1801, Paris, 1821.

MOYREAU, JEAN, French engraver, was born at Orleans, January 19th, 1690. He executed a large number of plates, including a 'Lion Hunt,' after Rubens; 'Rebecca receiving Abraham's Presents,' after Paolo Veronese; and several others, after Rembrandt, Breughel, Claude, Watteau, &c.; but is perhaps best known by his series of eighty-nine plates of the works of Ph. Wouwermans, large folio, Paris, 1749—a series of very unequal merit. Moyreau was nominated Member of the French Academy in 1736, and died at Paris, in 1762.

* MÜCKE, HEINRICH, German historical painter, was born at Breslau, April 9th, 1806. After studying in the

Academy of his native city, he, in 1824, entered the Berlin Academy, and became pupil of Schadow, whom he accompanied to Düsseldorf a few years later. In 1833, he went to Munich, and afterwards visited Italy; but he settled in Düsseldorf, where he was appointed professor in the art-academy, and he is considered one of the most distinguished representatives of the Düsseldorf school. Herr Mücke has painted many subjects from sacred and ecclesiastical history, and many both in fresco and oil, from early German history. Of these, among the most celebrated, are the frescoes from the life of Barbarossa, in the château of Count Spec at Heltorf, near Düsseldorf; the larger ones from the life of Charlemagne, at Aix-la-Chapelle; and those executed for the council of Elberfeld. Among his religious subjects, may be named his large symbolical fresco, 'Christianity,' in the Andreaskirche, Düsseldorf; 'Saints Ambrose, Catherine, and Genevieve'; and 'St. John and the Angel of the Apocalypse.' The 'Taking of Jerusalem by Godfrey of Bouillon,' is well known by the engravings. Mücke deals in symbol and abstract sentiment, like the masters of the Düsseldorf school generally, and his works have, to one not familiar with the theories of the school, a cold, formal, and conventional character. He is an able draughtsman, skilful in composition, and by his countrymen is considered a good colourist.

* MÜLLER, FRIEDRICH MAX, generally known as Max Müller, an eminent orientalist and comparative philologist, is the son of Wilhelm Müller, a German lyric poet [E. C., vol. iv. col. 382], and was born on the 6th of December, 1823, at Dessau, at the Gymnasium of which, after having received a judicious preparatory training from his mother, who was left a widow in October, 1827, he was partially educated. Afterwards he was sent to Leipzig, where he became a pupil at the Nicolaischule, and an inmate of the house of Professor Carus; subsequently proceeding to the university for the prosecution of his philological studies, his proficiency in which, especially in Sanskrit, he signalled by his translation of 'Hitopadesa,' a collection of Sanskrit Fables, by Vishnûsarman, published as vol. xxxiii. of the 'Ausgewählte Bibliothek der Classiker des Auslandes,' and entitled 'Hitopadesa. Eine alte indische Fabelsammlung. Aus dem Sanskrit zum ersten Male in das Deutsche übersetzt,' &c., 12mo, Leipzig, 1844. In 1844 he repaired to Berlin for the further cultivation of his philological and philosophical studies, and for the consultation of the Sanskrit manuscripts of that city; and in 1845 proceeded to Paris, where, at the instigation of M. Eugene Burnouf, he began to collect materials for his 'Rig-Veda-Sanhita. The Sacred Hymns of the Brahmans; together with the Commentary of Sayanâchârya,' &c., 4 vols. 4to, London and Oxford, 1849—62, which was published at the expense of the East India Company, and for the prosecution of which he had left Paris, in June, 1846, for England, where he collated the manuscripts in the library of the East India House and the Bodleian. Afterwards he followed up his labours in the same field by the publication of the 'Rig-Veda: oder die heiligen Lieder der Brahmanen. Herausgegeben, &c. Mit einer Einleitung, Text, und Uebersetzung des Prâtisâkhyâ oder der ältesten Phonetik und Grammatik enthaltend,' 4to, Leipzig, 1856, &c., the third part of which was issued in 1857. In 1848 he took up his residence at Oxford, where in 1850 he was appointed deputy Taylorian professor of modern European languages; and in 1854, on the death of Dr. Trithen—having been admitted a member of Christ Church, and received the honorary degree of M.A. in 1851—was elected to the professorship, the patronage of which is vested in the curators of the Taylor Institution, by whom he has been re-elected at the end of every successive lustrum which forms the period of office. He was admitted to the full degree of M.A. in 1854; in 1856 was appointed one of the curators of the Bodleian Library, of the oriental department of which he subsequently became librarian; and was elected to a fellowship of All Souls' in 1858, at which time he was a member of the Royal Bavarian Academy, corresponding member of the Institute of France, of which he became an associate member in 1869, and an honorary member of the Royal Society of Literature. During the time of the Crimean war, he produced, at the suggestion of Sir Charles Trevelyan, a work entitled, 'The Languages of the Seat of War in the East. With a Survey of the three Families of Language, Semitic, Arian, and Turanian,' &c., 8vo, London and Leipzig, first two editions, 1855, in which he first exhibited to the general public his knowledge of languages and his original views on the philosophy of language. He contributed to the second volume of 'Oxford Essays,' 8vo, London, 1856, a valuable article on 'Comparative Mythology,' of which a French translation ap-

peared as 'Essai de Mythologie comparée,' 8vo, Paris, 1859; and a few years afterwards produced his 'History of Ancient Sanskrit Literature, so far as it illustrates the primitive religion of the Brahmans,' 8vo, London, 1859. To this succeeded his 'Lectures on the Science of Language,' 8vo, London, 1861, sixth edition, 1871, happily combining popularity with philosophical research and speculation, and originally delivered, in the months of April, May, and June, 1861, at the Royal Institution, London, of which a French translation, by MM. Georges Harris and Georges Perrot, appeared with the title of 'La Science de Langage: Cours professé à l'Institution royale de la Grande Bretagne. Traduit de l'Anglais sur le 4^e Edition,' &c. 8vo, Paris, 1864, German version, by Dr. Karl Böttger, 'Vorlesungen über die Wissenschaft der Sprache,' &c., 8vo, Leipzig, 1863, Polish version, by K. E., 'Odczyty o Umiejętności Języka,' &c., 8vo, Warsaw, 1867. In 1860 he contended unsuccessfully for the Boden professorship of Sanskrit, left vacant by the death of his friend, Professor Horace Hayman Wilson, on which occasion Professor Monier Williams, formerly of Haileybury, was the successful candidate. Since this time, as indeed before, the life of Professor Max Müller has been devoted almost exclusively to academical and literary activity, broken by a momentary passage of political controversy during the earlier stages of the late Franco-German war, when he took occasion to publish in a letter to the 'Times' of August 31, 1870, a defence of Count Bismarck's position.

The principal of the works of Max Müller, besides those which have been already mentioned, include an annotated translation of Kalidasa's 'Meghadūta: oder der Wolkenbote dem Kalidasa nachgedichtet und mit Anmerkungen begleitet,' &c., 8vo, Königsberg, 1847; 'Proposals for a Missionary Alphabet,' &c., 8vo, London, 1854, which formed also one of several papers contributed by Max Müller to the third and fourth volumes of Baron Bunsen's 'Christianity and Mankind'; 'Buddhism and Buddhist Pilgrims. A Review,' &c., 8vo, London, 1857; 'The German Classics from the Fourth to the Nineteenth Century. A Reading-Book,' &c., 12mo, London, 1858; 'Chips from a German Workshop,' 2 vols. 8vo, London and Oxford, 1867, 1868, &c., the name of which was suggested to the author by an expression used by his friend, Baron Bunsen; 'A Sanskrit Grammar for Beginners, in Devanāgarī and Roman Letters throughout,' 8vo, London, second edition, revised and accentuated, 1870. In the series entitled 'Handbooks for the Study of Sanskrit,' Müller has edited 'The First Book of the Hitopadesa,' and 'The Second, Third, and Fourth Books,' &c., and, besides works of minor importance, Professor Theodore Benfey's 'Sanskrit-English Dictionary,' 8vo, London, 1866; whilst to J. Bellowes' 'Outline Dictionary for the Use of Missionaries,' 8vo, London and Gloucester, 1867, he contributed an Introduction 'On the Proper Use of the ordinary English Alphabet in Transcribing Foreign Languages.' He has contributed largely to the periodical literature of England, France, and Germany: in this country to the 'Edinburgh Review'; the 'Times'; the 'Contemporary Review,' in which last his most remarkable articles are 'A Chapter of Accidents in Comparative Theology' (April, 1870), and 'On the Migration of Fables' (July, 1870); and to 'Fraser's Magazine,' in which appeared, in the numbers for April, May, and June, 1870, the three 'Lectures on the Science of Religion,' which had been shortly before delivered at the Royal Institution, respectively on the 19th and 26th of February, and the 5th of March.

MULLER, JAN, Dutch engraver, was born at Amsterdam, about 1570. He was a scholar of H. Goltzius, whose manner he imitated and exaggerated. He engraved a large number of plates in a free and spirited, but somewhat monotonous style. Among the best of his subject-plates are the 'Martyrdom of St. Sebastian,' after J. Van Aachen; the 'Raising of Lazarus,' after A. Bloemart; the 'Passion,' after Lucas Van Leyden; and a large print of the 'Camp of Ulysses,' after Cornelis. Besides many more after these, and other celebrated masters, he engraved a large number of his own designs, and several portraits, some of which are much esteemed. His prints range from 1589 to 1625. He died about 1630.

MULLER, JOHANNES [E. C. vol. iv. col. 379], the eminent German physiologist, died at Berlin, April 28, 1858.

MULREADY, WILLIAM, R.A. [E. C. vol. iv. col. 383]. To the Academy exhibition of 1862, Mr. Mulready contributed a large picture, 'The Toy Seller,' the only one of any consequence exhibited by him after the publication of the memoir in the E. C. The picture was unfinished, and far inferior to earlier and smaller paintings, but was not a little remarkable as the work of a man who had been an academical for almost half a century,

and of whose artistic efforts an encomiastic account had been published nearly 60 years before. (See 'The Looking Glass. . . A True History of the Early Years of an Artist. By Theophilus Marcliffe,' [William Godwin], 12mo, London, 1805). The 'Toy Seller' was the veteran's last effort. He died at his house, Linden Grove, Kensington, on the 7th of July, 1863, at the age of 77. His great artistic ability has been already spoken of at sufficient length, and his chief works enumerated. How he achieved eminence, the earnest persistent industry, and conscientious, student-like feeling with which, for over half a century, he pursued his chosen occupation, may be seen in the remarkable series of drawings and studies which the nation possesses, alongside his finished pictures, at South Kensington. The earliest engravings from his designs are in Marcliffe's 'Looking Glass,' referred to above, and in a series of once popular children's books, published by William Godwin, between the years 1807 and 1810, under the titles, 'The Butterfly's Ball,' 'The Lions' Parliament,' 'Cats' Concert,' and the like. Examples of his art at its highest are given in 'The Masterpieces of William Mulready. Memorials of William Mulready,' by F. G. Stephens. Illustrated by 14 photographs of his most celebrated paintings, 4to, 1866.

MUNCH, PETER ANDREAS [E. C. vol. iv. col. 385]. This indefatigable Norwegian antiquary and philologist died on the 25th of May, 1863, at Rome, where he had gone for the second time to examine the MSS. in the library of the Vatican.

MUNRO, ALEXANDER, sculptor, was born in Sutherlandshire, in 1826; studied in Edinburgh, and when about five-and-twenty, came to London, where, under the patronage of the Sutherland family, he found ample occupation. He first attracted public notice by reliefs of a poetic character, and by some statues of children, and it was in these that he continued to excel, though he found the making of busts and portrait statues the more profitable employment. His statues and groups of children were distinguished by rare elegance and loveliness, and there was much fancy though not much vigour in his poetic medallions. In larger works he was less successful. Of his busts and statues the chief merit was their fidelity as likenesses. For some years the state of his health rendered necessary a winter residence in a warmer climate than that of England. He built for himself a villa (La Tourelle) at Cannes, and there he died, on the 10th of January, 1871.

MURE, WILLIAM, an eminent Greek scholar and historian, member and subsequently head of a landed family which had been settled for four or five centuries in the counties of Ayr and Renfrew, was born at Caldwell, in Ayrshire, on the 9th July, 1799. He was educated successively at Westminster and the University of Edinburgh; and repaired for the completion of his studies to the University of Bonn, where he imbibed or developed his tendency to the investigation of classical antiquity. He early attracted the notice of Jeffrey by the ability which he displayed in articles contributed on Spanish Literature and other subjects, to the 'Edinburgh Review,' in 1824 and 1825; a few years after which he produced his first work, the result of an investigation into the true era of Sesostris, or Rameses, the first king of the nineteenth Egyptian dynasty, whose accession he placed between 1410 and 1400 B.C., which was entitled, 'Brief Remarks on the Chronology of the Egyptian Dynasties. Showing the Fallacy of the System laid down by Messrs. Champollion in two Letters on the Museum of Turin,' 8vo, London, 1829. This work was succeeded by 'A Dissertation on the Calendar and Zodiac of Ancient Egypt; with Remarks on the first Introduction and Use of the Zodiac amongst the Greeks,' 8vo, Edinburgh and London, 1832, a learned and elaborate treatise, in the first section of which the peculiarities of the form of year used by the Egyptians are generally treated; the three following sections being devoted to a more minute analysis of the primitive form and probable origin of the Egyptian calendar, astrological and civil; and the fifth and concluding section to the examination of the probable period and circumstances of the first introduction of the Zodiac into Greece. Having spent much time abroad, and especially having wintered at Rome in 1836-37, and having subsequently sojourned at Florence, Colonel Mure—who derived his military title from being commandant of the Renfrewshire militia—embarked at Ancona on the 17th of February, 1838, for Corfu, after which he spent more than two months in acquainting himself directly with the topography and antiquities of other parts of Greece, insular and continental. The record of his Hellenic travels, after which he resumed for a season his intermitted residence at Florence, was published with the title of 'Journal of a Tour in Greece and the Ionian Islands,

with *Remarks on the Recent History, Present State, and Classical Antiquities of those Countries*, 2 vols. 8vo, Edinburgh and London, 1842. On the 8th of December, 1846, he was elected without opposition to a seat in the House of Commons as member for Renfrewshire. He was again returned in the general elections of 1847 and 1852, and on each occasion without opposition; but in 1855, in the face of failing health, retired from parliamentary life by the acceptance of the Chiltern Hundreds. Towards the end of 1847 he was elected Lord Rector of the University of Glasgow, and on the 4th of January, 1848, delivered, and subsequently published, his 'Inaugural Address,' &c., 4to, Edinburgh, 1848. Colonel Mure, who was J. P. and D. L. for Renfrewshire, was a zealous and efficient commanding officer of militia, warmly interested in the furtherance of Scottish agriculture, and generally in every movement which had for its object the improvement of the condition of his fellow-countrymen. He died on Sunday, April 1st, 1860, at Kensington Park Gardens, London, leaving behind him the great literary work of his life in a state of incompleteness. This work was his 'Critical History of the Language and Literature of Ancient Greece,' of which he lived to publish 5 vols. 8vo, London, 1850—57, second edition, 4 vols. 8vo, London, 1859, a work of profound and comprehensive learning, written in a style at once thorough, genial and liberal. The first three volumes of the 'History,' are exclusively occupied with the mythical period of ancient Hellas, embracing biographical and critical sketches of the epic, cyclic, and lyric poets; whilst the fourth and fifth volumes are conversant about the Greek historians, from the fragmentary or traditional predecessors of Herodotus, and the "Father of History" himself, to Thucydides, Xenophon, and others of minor importance. At the time of his death, Colonel Mure was engaged on a sixth volume, to be devoted to the exposition of the Attic drama. He was the author of several fugitive papers, and was to a slight extent engaged in controversy, chiefly, however, in the defence of his opinions from the attacks of hostile critics, to some of whom he was obnoxious as being too conservative of old and long-received traditions. In 1854, he prepared for the press, and presented to the Maitland Club, 'Selections from the Family Papers preserved at Caldwell,' illustrative of the local history of the Counties of Renfrew and Ayr, and enriched with valuable notes from his own pen.

MUSHET, DAVID, the chief founder of the iron manufacture in Scotland, was born at Dalkeith, in 1772. He was brought up as a metal founder, and in 1791, became connected with the Clyde Iron Works, near Glasgow. Although engaged only as an accountant, he soon took an interest in the progress of the manufacture, and made many experiments in his leisure hours on the smelting of iron, and its conversion into steel. For some time he worked in this way until two or three o'clock in the morning, resuming, nevertheless, his duties in the counting-house at six o'clock. He first followed Fourcroy's rules in his treatment of the metal and its ores, but afterwards resolved to work out his results in his own way; and became so skilled in chemistry as to be regarded as the best assayer at the works. In 1794, he discovered the metal titanium in the hearth of the blast-furnace; and, in 1800, took out a patent for a new mode of combining iron with carbon in the production of steel. The managers of the works became, after a time, jealous of his independent research, and dismissed him. In 1801, an incident occurred, which was of great importance to the iron manufacture, at that time small in Scotland. He was engaged, with a partner, in erecting the Calder Iron Works. Crossing the river Calder one day, near Old Monkwell, he picked up and took home a bit of ironstone. On analysing it, he found it to be so rich in metal as to yield 50 per cent. of protoxide of iron. Examining the country around, he ascertained that rich beds of this stone exist in the western counties of Scotland, belonging to the upper part of the coal formation; and he found that there is also so much coal with the iron as to permit of smelting with only a small portion of extra fuel. Hence the introduction of the celebrated *black-band* carboniferous ironstone. The old ironmasters at first ridiculed it as "wild coal," but it has enriched Scotland with millions sterling in the last seventy years. As an iron manufacturer, first in Scotland, and then in Dean Forest, Mr. Mushet introduced many improvements in metallurgic processes—in ascertaining the best temperature for fusing malleable iron; preparing steel from bar iron by a direct action of carbon on the iron; ascertaining the influence of oxide of manganese on iron and steel; determining the qualities of different oxides of iron in the puddling furnace; showing that anthracite, aided by the hot blast, might be employed as fuel for smelting iron, &c. His

discoveries concerning manganese were instrumental, through the medium of Heath's patent, in giving a vast impetus to the steel manufacture; while the great smelting works at Merthyr Tydvil were almost equally benefited by his researches on anthracite. For thirty seven years, from 1798 to 1835, he contributed papers to the 'Philosophical Magazine,' and other journals, on a large number of important matters connected with the manufacture, such as the qualities of ores; the blast furnace; assaying; fuel for iron smelting; air furnaces for cast-iron; the conversion of iron into steel; crystallization of iron, &c. These were collected in 1840, into a valuable volume, 'Papers on Iron and Steel.' He also wrote 'Blast Furnace,' and 'Blowing Machine,' for Rees's Cyclopædia; and 'Iron,' for the supplement to the Encyclopædia Britannica. Mr. Mushet died at Monmouth, June 13th, 1847. The services which he rendered to the iron and steel manufactures are traced in Smiles's 'Industrial Biography.'

MUSPRATT, JAMES SHERIDAN, chemist, was born at Dublin, March 8, 1821. He received his education at Liverpool, where his father, Mr. James Muspratt, had established extensive chemical works. After travelling in France and Germany, he joined the Andersonian University at Glasgow. He studied under the late Thomas Graham, whom he followed to London when the latter became professor of chemistry at University College. Before he had completed his seventeenth year, he was entrusted with the chemical management of Peel Thompson's Print-works at Manchester. After this he went to America, joined in a partnership which proved unsuccessful, and returned to England. In 1843 he went to Germany, and studied under Liebig at Giessen. Here he remained some years, and attracted attention by papers published in Liebig and Wöhler's 'Annalen,' on the sulphides and other chemical compounds. He was associated with Hofmann (who was then, like himself, a pupil of Liebig) in the discovery of toluidine and nitraniline, two of the organic bases among the coal-tar series. In 1843 he published an English translation of Plattner's 'Treatise on the Blowpipe,' and made considerable additions to it in later editions. In 1848 he married Miss Susan Cushman, the American actress. In 1849 appeared his 'Outlines of Quantitative Analysis.' About 1850 he established a College of Chemistry at Liverpool, which has been the means of training many practical chemists. In 1854 he commenced writing a 'Dictionary of Chemistry,' his chief work; this has had a large sale in England and America, and has been translated into French and German. His scientific papers, inserted in Liebig and Wöhler's 'Annalen,' the 'Chemist,' the 'Proceedings of the British Association,' the 'Pharmaceutical Journal,' the 'Proceedings of the Edinburgh Royal Society,' the 'Annals of Pharmacy,' the 'Dublin Royal Society's Journal,' the 'Chemical News,' and other journals, relate to bleaching powder, the acids and salts, the blowpipe, mineral waters, coal-tar products, the action of metallic compounds on the organs and tissues of the body, &c. He also wrote several memoirs of chemists in the 'Lancet' and the 'Medical Times.' Dr. Muspratt died at West Derby, near Liverpool, February 3, 1871. He was Ph.D., a fellow of the Chemical Society and of the Royal Society of Edinburgh, and a member of the Royal Irish Academy.

MUSSCHER, MICHIEL VAN, a celebrated Dutch painter, was born at Rotterdam, in 1645. He was a scholar of A. Van Tempel, but studied also under Metz, and A. Van Ostade. He painted chiefly small portraits, and conversation-pieces, in both exhibiting great beauty of colour and chiaroscuro, and a pleasing, quiet manner, without much originality. His pictures, which are not numerous, have of late years risen much in the estimation of English collectors; in his own country they have long been highly valued. There are excellent examples of his pencil in the Hague Gallery, and in the public and private collections of Amsterdam and Rotterdam. Musscher died at Amsterdam in 1705.

MUSSET, LOUIS CHARLES ALFRED DE, commonly known as Alfred de Musset, a celebrated poet and man of letters, who has sometimes been called the French Tennyson, was born at Paris, on the 11th of November, 1810. He was a son of M. Victor Donatien de Musset, better known as Musset-Pathay, a government official, who died chief of the bureau of military justice, and biographer of J. J. Rousseau, and editor of his works, 'Œuvres Complètes,' &c., 22 vols. 8vo, Paris, 1818-20, and other editions; and was educated at the Collège Henri Quatre, where he early distinguished himself, and formed a friendship with the Duc de Chartres, afterwards Duc d'Orléans, who was one of his fellow-students. He is said to have produced a tragedy so early as 1826; in 1827, carried off a prize in philosophy; and in

1828, published a slight dramatic piece of which De Quincey supplied the motive, entitled, 'L'Anglais Mangeur d'Opium.' Various professions—medicine, law, art, and finance—which he tried successively, failed to fix his attention; and in 1830, having been encouraged in his literary predilections by intercourse with Charles Nodier and Victor Hugo, he produced his first important work, entitled, 'Les Contes d'Espagne et d'Italie,' comprising tales and dramas in verse, which presented a remarkable combination of vigour, fancy, and erotic breadth and boldness. To this volume succeeded, in 1833, a second collection, which varied as dramatic, pathetic, and Byronic, entitled, 'Le Spectacle dans un Fauteuil,' and 'La Confession d'un Enfant du Siècle,' 2 vols. 8vo, Paris, 1836, new editions, 2 vols. 12mo, Paris, 1840—45, and 12mo, Paris, 1859, which was published after a tour in Italy with Georges Sand. From 1833 to 1840, he published several poems in the 'Revue des Deux Mondes,' amongst which the most remarkable were 'Rolla,' notorious for the startling impiety of its apostrophes, 'Lettre à Lamartine,' 'Espoir en Dieu,' and 'Les Nuits,' which comprised 'La Nuit de Mai' (May 18th, 1835), 'La Nuit de Décembre' (December 1st, 1835), 'La Nuit de Août' (August 15th, 1836), and 'La Nuit d'Octobre' (October 15th, 1837), four poems which have been regarded as marking the culmination of his lyrical achievements. During the political complications of 1840, he answered Becker's German war-song in regard to the Rhine, with a poem commencing "Nous l'avons eu, votre Rhin allemand," which was much on the tongues of the Paris people during the very earliest stages of the war of 1870—71, between France and Prussia. Whilst engaged in the constant exercise of his literary powers, he was appointed to the office of librarian to the ministry of the interior, an appointment which he owed to the influence of the Duc d'Orléans, whose death, July 13th, 1842, the result of a fall from his carriage, he celebrated in one of his most pathetic and powerful poems.

After the revolution of 1848, M. de Musset was deprived of his office, in which he was subsequently reinstated by the Emperor Napoleon III., and with which he conjoined the appointment of reader to the Empress. The irregularities of his life enfeebled the force of his genius, and a volume of verse, 'Poésies Nouvelles,' 12mo, Paris, 1850, new edition, 12mo, Paris, 1862, gave evidence of the premature decline of his intellectual energy. He was, nevertheless, selected in February, 1852, to fill the seat in the Académie Française left vacant by the death of M. Dupaty; and still carrying out, so far as his impaired faculties would allow, the desultory pursuits of his literary life, he died at Paris on the 1st of May, 1857, leaving behind him several unpublished works, and an unfinished drama.

M. Alfred de Musset was a prominent contributor to the 'Revue des Deux Mondes,' to which he supplied dramas, comedies, proverbs, novels, poems, and critical and miscellaneous articles, many of which were afterwards re-published, in various forms and groupings, and in several editions. Of his dramatic works thus first issued may be mentioned, 'André del Sarto : Drame en deux Actes et en Prose,' 12mo, Paris, 1851; 'Les Caprices de Marianne : Comédie en deux Actes, en Prose,' 12mo, Paris, 1851; 'Un Caprice : Proverbe en un Acte,' 1847, new edition, 12mo, Paris, 1864, English (adapted) translation, entitled, 'A Good Little Wife : A Comedy in One Act,' forming vol. xvii. of 'Lacy's Acting Edition of Plays,' 12mo, London, 1860, &c.;

'Fantasio,' of which an English version was published in 12mo, London, 1852 (?); 'On ne badine pas avec l'Amour : Comédie en trois Actes et en Prose,' 8vo, Paris, 1861, which was first produced at the Théâtre Français, on the 18th of November, 1861, and was played in London, in the season of 1871, by M. Got and his company of the Comédie Française. The foregoing dramatic works were included, with others, in a collection of 'Comédies et Proverbes,' 2 vols. 12mo, Paris, 1840, 1848, 1851, "seule édition complète, revue et corrigée par l'Auteur," 2 vols. 12mo, Paris, 1856, 1861, &c.

Amongst the novels first contributed to the 'Revue des Deux Mondes,' may be mentioned 'Les Deux Maîtresses,' 'Emmeline,' 'Le fils du Titien,' and 'Frédéric et Bernerette,' the last of which has been regarded as his best, and all of which were included in a collection entitled, 'Nouvelles,' &c., 2 vols. 8vo, Paris, 1840, 12mo, Paris, 1860, &c.

Various collections, or partial collections, have been made of the several productions, both in prose and verse, of Alfred de Musset, in his lifetime and since his death. These include 'Poésies Complètes,' 12mo, Paris, 1836, "nouvelles éditions, revues, corrigées et très augmentées," 12mo, Paris, 1847, 1849, 1851, &c.; 'Œuvres Posthumes,' 12mo, Paris, 1860; and 'Œuvres Complètes : avec Lettres inédites, Variantes, Notes, Index, Fac-simile, Notice biographique par son Frère. Édition dédiée aux Amis du Poète, ornée de 28 Dessins de M. Bida, gravés sur Acier, sous la Direction de M. Henriquel Dupont, et d'un Portrait d'Alfred de Musset, gravé par M. Danguin, d'après l'Original de M. Landelle,' 10 vols. 4to, Paris, 1865. Amongst the critiques called forth by the works and the career of Alfred de Musset, may be mentioned one which was contributed by Mr. F. T. Palgrave, to the first annual volume of 'Oxford Essays,' 8vo, 1855. His elder brother,

PAUL EDMOND DE MUSSET, born at Paris, November 7th, 1804, has also distinguished himself as a novelist and dramatist. He edited the 'Œuvres Complètes,' 10 vols. 4to, Paris, 1865, of his brother, Alfred de Musset, of whom he also furnished a biography.

MYLNE, WILLIAM CHADWELL, son of ROBERT MYLNE (E. C. vol. iv. col. 413), was born 6th April, 1781. While still a boy he assisted his father in engineering works, and at the age of thirty succeeded him as engineer to the New River Company. The rapid extension of the metropolis and the competition of rival water companies rendered the post an arduous one. The old wooden pipes, which up to 1810 were the chief water conduits, would not now stand the increased pressure; cast-iron pipes, at the cost of nearly half a million sterling, were substituted under Mylne's direction. He also had a large engineering practice in the Fen country and elsewhere; he erected a number of bridges, such as the single arched iron bridge over the Cam at St. John's College, Cambridge; and he was architect of the church of St. Mark's, Clerkenwell. He also succeeded his father as surveyor to the Stationers' Company, and was much engaged before Parliamentary Committees on Water, Dock, and Drainage works. In 1852, in conjunction with his son, he undertook new works for the New River Company to the extent of three quarters of a million sterling. He was during many years the guiding hand in the Society of Engineers known as the 'Smeatonians.' He was elected into the Royal Society in 1826. He died on the 25th of December, 1863.

N

* **NADAR**, a name assumed by FELIX TOURNACHON, French designer, writer, and aeronaut. He was born at Paris, April 5, 1820. Under the pseudonym of Nadar he, about 1840, began writing for periodical publications, to which he contributed a large number of light and ephemeral papers. Amongst other undertakings, he commenced a gallery of contemporary celebrities, under the title of 'Panthéon Nadar,' but though it had some success abroad he did not long continue it. For a time he practised photography, and his portraits were awarded more than one medal. At the same time he continued his publishing speculations, and contributed both with pen and pencil to the

'Charivari,' the 'Journal pour Rire,' 'Polichinelle,' &c., and wrote some light dramatic pieces and pantomimes which lived their hour on the stage. In 1863 he turned his attention to aërostation, and attracted notice by the large dimensions and assumed excellence of a great balloon called the 'Géant,' of which and a voyage made in it he published an account, 'Mémoires du Géant : A Terre et en l'Air,' 18mo, Paris, 1864. His ascents and schemes in that and subsequent years are briefly noticed in BALLOON, E. C. S., ARTS AND SCIENCE DIVISION.

NAPIER, VICE-ADMIRAL SIR CHARLES JOHN, K.C.B., M.P. [E. C. vol. iv. col. 442]. The narrative and

defence of the Baltic expedition referred to in the memoir just cited appeared in 1857 in a very thick 8vo volume, with the title of 'The History of the Baltic Campaign of 1854, from Documents and other Materials furnished by Vice-Admiral Sir C. Napier, K.C.B. Edited by G. Butler Earp;' but this injudicious book did nothing to remove the feeling of dissatisfaction with which the conduct of the campaign was generally regarded. Admiral Napier died on the 9th of November, 1860. In 1862 was published, 'The Life and Correspondence of Admiral Sir Charles Napier, K.C.B.; from personal Recollections, Letters, and Official Documents, by Major-General Elers Napier,' 2 vols. 8vo.

* NAPIER, ROBERT CORNELIS, BARON NAPIER OF MAGDALA, was born in Ceylon, December 6, 1810. After receiving his education at Addiscombe Military Academy, he went to India, entered the Bengal Engineers in 1826, and was engaged for nearly twenty years in the Public Works Department. His chief work was the construction of the military station at Umballa, with the finest barracks at that time existing in India; this was commenced in 1842, at which time he bore the rank of captain. When the Sikh war broke out in 1845, he obtained leave of absence from his civil duties, and took part in the battles of Moodkee, Ferozeshah, and Sobraon. With the rank of major, he was appointed engineer to the Durbar of Lahore, and constructed extensive barracks near that city. In 1848 he was senior engineer at the reduction of Mooltan; then he accompanied General Whish to the Chenab, served under Lord Gough at Gujerat, and was promoted to the rank of colonel. In 1849 Earl Dalhousie appointed him engineer-in-chief of the newly-annexed Punjab. During the next eight years his skill was well displayed in the making of roads, the construction of irrigation canals, and the erection of barracks and public buildings; indeed Napier was one of the best assistants of the Lawrences in their development of the resources of the Punjab. When the mutiny broke out in 1857, he was in England on sick leave; but, hastily returning to Calcutta, he became chief of the staff to Outram's relieving force at Lucknow, where he was wounded. With the rank of brigadier; he was engineer-in-chief at the same place under Sir Colin Campbell (afterwards Lord Clyde), and was knighted for his services. In 1858 he joined Sir Hugh Rose in the harassing campaign in Central India and Rajpootana, where they had the fierce and astute rebel chieftain Tantia Topee against them; during the whole of the summer months, from March to September, long marches and severe fighting were almost incessant, amid the vicissitudes of intense heat and heavy rains. In 1860 he commanded a division of Sir Hope Grant's army in China, and took part in that short but decisive campaign. In 1861 he was raised to the rank of major-general, made a knight of the Bath, and succeeded Sir James Outram as military member of the Governor-General's Council. In 1865 he became commander-in-chief of the Bombay army, with the military rank of lieutenant-general. When the British government decided on sending a military expedition to Abyssinia in 1867, they gave the command to Sir Robert Napier. He organized the greater part of the arrangements at Bombay, sent off the pioneer force in September, and the main body in October. He issued a proclamation to the chiefs and people of Abyssinia in November; but did not himself land in that country till January, 1868. On the 2nd of April he arrived before Magdala; and by the 13th King Theodore was dead, and the fortress stormed. By the exercise of great forethought and activity, Napier brought back the whole of his army to the coast before the rainy season began; and ended his campaign with a smaller loss of life than was ever known in a force of such magnitude. In July he landed at Dover. A vote of thanks to him and his army was agreed to by both Houses of Parliament; he was raised to the peerage; and an annuity of 2000*l.* a year was granted to him and his next heir male. He was also made G.C.B. and knight of the Star of India. The extreme costliness of the Abyssinian expedition led to the appointment of a Commission of Inquiry; and this Commission reported, in 1870, that the cost had in part been occasioned by divided authority in India and in England; but no direct blame was attached to Lord Napier on this ground. He was appointed commander-in-chief of the army of India in 1870, and assumed the duties of this post on the 9th of April.

NAPIER, LIEUT.-GENERAL SIR WILLIAM FRANCIS PATRICK, K.C.B. [E. C., vol. iv. col. 424]. In 1857 Sir William Napier published a memoir of his brother, Sir Charles James Napier—'The Life and Opinions of General Sir Charles James Napier, G.C.B.,' 4 vols. 8vo—in which the idolatry of the BIOG. DIV.—SUP.

Napiers was carried to the extremest fanaticism, and every one who had by any chance interfered with the plans or prospects of either of the brothers was attacked with the most contemptuous acerbity. In 1858 General Napier edited 'William the Conqueror: a Historical Romance. By General Sir Charles J. Napier, G.C.B., &c. He died on the 12th of February, 1860. A marble statue has been erected to his memory in St. Paul's Cathedral.

* NAPOLEON III. CHARLES LOUIS NAPOLEON [BONAPARTE, E. C. vol. i. col. 805]. The Congress of Paris completed its labours on the 30th of March, 1856, when articles of peace were signed, and a treaty entered into and guaranteed. The epistolary and other demonstrations made by the Emperor in the cause of Italian liberty and independence were not of a nature sufficiently active to satisfy the aspirations of the wilder patriots, and the impatience of Tibaldi, Bartolotti, Grilli, and others broke out into a plot against the life of the Emperor, which, having become known to the police, was forestalled, July, 1857, by the arrest of the conspirators, who were convicted and sentenced to various punishments. In August following, the Emperor and Empress visited Queen Victoria at Osborne; and, on the 25th of September, the Emperor Napoleon met the Emperor of Russia at Stuttgart. Upon the unsuccessful attempt made by Orsini and others, January 14th, 1858, on the life of the Emperor of the French, the latter forthwith made a demand upon the British Government for an alteration of the laws affecting political and other exiles in England, to meet the case of Dr. Bernard and other refugees in London, who were supposed to be implicated in the attempt of Orsini. This demand produced little result, except the downfall of the administration of Lord Palmerston, who, in his 'Conspiracy to Murder Bill,' had evinced too great a readiness to comply with its terms; but in France the plot led, February 18th, to the passing of the Public Safety Bill, or 'Loi des Suspects,' which continued in force till the 31st of March, 1865. On the 11th of March, 1858, a pamphlet was issued with the title of 'Napoléon III. et l'Angleterre,' a sort of state-paper or manifesto, addressed alike to the people of France and England, and calculated to soothe the aggrieved feelings of the latter towards the Emperor, by whom the brochure was legitimately believed to have been inspired. The great increase in the naval and military strength of France, of which the purpose was undefined, caused uneasiness in England; but this feeling was considerably allayed by the Emperor's invitation to Queen Victoria to be present at the maritime fêtes at Cherbourg, where her Majesty met the Emperor on the 4th and 5th of August.

The threatening words addressed by the Emperor to the Austrian ambassador at Paris, January 1st, 1859, caused a panic throughout the exchanges of Europe; and a few months after, Louis Napoleon, regarding the invasion of Sardinia, his ally, by the Austrians, as a declaration of hostilities, quitted the Tuileries on the 10th of May for the seat of war in Italy, having previously appointed the Empress to be Regent in his absence. He landed at Genoa on the 12th, and, assuming the chief command of his army, took part in the combats and victories of the allies until the battle of Solferino, June 24th; and France and Italy believed that he intended to achieve the independence of the latter, and to make her free "from the Alps to the Adriatic." But in this expectation they were disappointed. On the 6th of July an armistice was abruptly proposed to the Emperor of Austria, who, on the 11th, met the Emperor of the French at Villafranca, where, on the following day, a peace was agreed to, the conditions of which were subsequently ratified by the treaty of Zurich, which, after protracted conferences between the Austrian and French envoys, was signed on the 10th of November. This temporising treaty, which fettered and crippled all patriotic aspiration after peninsular "unification," was annulled by the formation of the kingdom of Italy in 1861, when Napoleon III. recognised, June 4th, the title of Victor Emmanuel. Meanwhile the Italian campaign resulted in the territorial aggrandisement of the empire by the acquisition of Nice and Savoy, the treaty for the correlative cession and annexation of which was signed on the 24th of March, 1860. A further portion of Italian territory was acquired early in February, 1861, by the purchase, for four millions of francs, of the principality of Monaco.

The Emperor of the French had been for some time preparing the way for the abolition of the restrictions on commerce, when he announced a free-trade policy; and, assisted by the experience and counsel of Mr. Cobden, who was charged with a confidential mission for that purpose by the British

Government, a treaty of commerce between France and England was drawn up, which, being signed on the 23rd of January, 1860, went far to re-establish the Emperor in the same favour with the people of England as he had enjoyed in the earlier stages of the Crimean war. This good feeling was further developed by the concession to English subjects of a free entry into France without the necessity of passports, which took effect on the 1st of January, 1861.

The massacre of the Maronites by the Druses, in June, 1860, stirred the sympathy of the Emperor Napoleon, who undertook the protection of the Catholic population of Turkey, whither he despatched troops, who were withdrawn only after the suppression of the insurrection by the arms of the Sultan, and in deference to the expostulations of the British Government. With the latter he joined about this time in fitting out an expedition for the punishment of the Chinese for the acts of treachery of which they had been guilty towards the European powers with whom they had contracted commercial engagements. The Anglo-French army accomplished a victorious march up to Peking, where they destroyed the summer-palace of the Emperor, and dictated to his Government the terms of a peace, which was signed with much ceremony on the 26th of October, 1860, and which included articles of indemnification for the expenses of the war. An expedition against Cochin China resulted in the acquisition of six of the provinces of that country, March 28th, 1862.

In June, 1860, the Emperor of the French met the German sovereigns at Baden; and on the 6th of October, 1861, received the King of Prussia at Compiègne. In September, 1860, accompanied by the Empress, he visited Savoy, Corsica, and Algiers; in reference to the last of which he afterwards expressed peculiarly benevolent sentiments. "I repeat it," he wrote in a letter, dated February 6th, 1863, "Algiers is not a colony, properly speaking, but a realm. The natives have, like the colonists, an equal right to my protection, and I am as much Emperor of the Arabs as I am Emperor of the French." In the latter part of 1861, France, England, and Spain agreed to despatch a joint expedition to Mexico, for the purpose of exacting the redress of injuries of long continuance against the subjects of the respective allies, and the enforcement of pecuniary claims which were obstinately contested by the government of President Juarez. From this expedition the English and Spanish Governments receded in April, 1862; after which the French army alone continued the quarrel, and on the 10th of June, 1863, entered the capital amidst many demonstrations of enthusiasm, and succeeded in initiating an imperial form of government, of which the Archduke Ferdinand of Austria, thenceforth known as the Emperor Maximilian of Mexico, consented to be the head [MAXIMILIAN FERDINAND JOSEPH, E. C. S., col. 868]. France, at length, was obliged to abandon the enterprise—notwithstanding that it represented what the admirers of Napoleon regarded as "la plus grande idée du règne"—being threatened with war by the United States of America; and the last detachment of the French army was withdrawn from Mexico early in 1867, and in June of that year the Emperor Maximilian was dethroned, and executed at Queretaro.

On the 4th of November, 1863, the Emperor Napoleon issued a circular of invitation to a congress, for the purpose of considering the various questions that threatened to disturb the peace of Europe, and several of the powers promptly acceded to the proposal; but, having been declined by England on the 25th; it was never carried into effect. In the aggressive war against Denmark, waged by the allied forces of Prussia and Austria, in 1863-64, for the recovery of Schleswig-Holstein to Germany, England and France, notwithstanding the treaty of London, 1852, took no part; and this inactivity was the occasion of much animadversion and misapprehension. So far as France is concerned, it has been surmised that the Emperor was already under the influence of Count Bismarck, who held out the expectation of territorial advantages on the condition of his non-interference in the count's schemes of aggrandisement for Prussia. The official justification of the quiescent attitude assumed by the Imperial Government in this question contains passages which, read in the light of subsequent events, are interesting enough for transcription. "The Emperor," it said, "has always been disposed to pay great regard to the feelings and aspirations of nationalities. It is not to be denied that the national feelings and aspirations of Germany tend to a closer connection with the Germans of Holstein and of Schleswig. The Emperor would feel repugnance to any course which should bind him to oppose in arms the wishes of Germany. It may be comparatively easy

for England to carry on a war which can never go beyond maritime operations of blockade and capture of ships. Schleswig and England are far apart from each other. But the soil of Germany touches the soil of France, and a war between France and Germany would be one of the most burthensome and one of the most hazardous in which the French empire could engage."

On the 15th of September, 1864, the Emperor concluded a convention with the Italian government, which stipulated, on condition of the Papal government being at that time in a condition of competent self-defence, and of non-interference from without by the King of Italy, for the evacuation of Rome by the French troops two years after the arrangement of the treaty. The last detachment of the French army of occupation accordingly evacuated Rome on the 11th of December, 1866. In the course of events this movement, however, was only for a time; for threatened political complications, chiefly arising from the impatience of Garibaldi in 1867, was made to justify the temporary renewal of the occupation of the Eternal City. On the 11th of June, 1866, the Emperor, after having alarmed Europe by the expression at Auxerre, May 6th, of his detestation of the treaties of 1815, declared that "France would observe an attentive neutrality in the war between Austria and Prussia," then impending; after the close of which, by the peace of Prague, the Emperor, in his speech at the opening of the French Legislature, February 14th, 1867, claimed to have "arrested the conqueror at the gates of Vienna." The early part of 1867 was characterised by various political reforms; and during the continuance of the International Exhibition, which was opened at Paris on the 1st of April, the Emperor was the host of several crowned heads, notably, in June, of the Emperor of Russia and the King of Prussia. The Emperor of Austria, who met Napoleon III. at Salzburg, in August, was also received later in the year, at Paris, October 23rd—November 5th. The *jour de l'an* of 1868 was marked by a friendly reception of the diplomatic body; but also by a bill, which passed into law in February following, by which the army was raised to a force, virtually, of 1,200,000 men. In June, the press laws underwent considerable relaxation; and after an election in which an increased number of opposition deputies was returned, the Emperor issued a message to the Legislature, July 12th, 1869, announcing important political changes, by which, *inter alia*, the responsibility of ministers was introduced; and on the 10th of September a new constitution was promulgated, by which the Emperor abdicated personal government, and invited the nation to a participation in the management of its affairs. The 15th of August, 1869, the centenary of the birth of Napoleon I., was signalled by a general amnesty to political offenders, and by the granting of increased pensions to the survivors of the *grande armée*. The progressive concessions to freedom on the part of the Emperor attracted new friends and conciliated old foes, so that at length a new liberal ministry was formed, January 3rd, 1870, by M. Emile Olivier, who for a long series of years had been in opposition, and to whom the Emperor addressed a letter, dated March 22nd, agreeing to certain alterations in the constitution of the Senate. "I request you," the Emperor wrote, "to come to an understanding with your colleagues, and lay before me the draught of a *Senatus Consultum*, which shall firmly fix the fundamental dispositions derived from the *plébiscite* of 1852; and which shall divide the legislative powers between the two Chambers, and restore to the nation that portion of constituent power it had delegated to me." The *Senatus Consultum* was received with favour; and the "liberal modifications introduced since 1860" were approved by a *plébiscite* which showed a majority of 7,527,379 supporters of the Emperor and the recent political changes, against a minority of 1,530,909 who voted against them. The ceremony of formally announcing to the Emperor the result of the *plébiscite* was performed on Saturday, May 21st, in the Salle des États of the Louvre; and the Olivier ministry, with slight modifications, continued its existence until the 9th of August, 1870, having, especially in its earlier stages, done good service to the empire, which it carried successfully through the trying circumstances attending the shooting of Victor Noir by Prince Pierre Bonaparte, on the 10th of January, at Auteuil.

For some time there had been a growing jealousy, on the part of the government and the people of France, of the increasing power and prestige of Prussia, fortified as these were by the military successes against Denmark, in 1864, and against Austria, in 1866—a feeling which was not lessened by the fact that Prussia had succeeded in baffling the designs of France upon Luxembourg, in 1867, although at the price of the neutrality, and the destruction of the fortifications, as decreed by a congress held in

London, between the 7th and 11th of May, in the same year. Other causes, whether secret or open, of misunderstanding, were not wanting, and the opportunity of an appeal to arms was eagerly embraced by both countries—an opportunity which was found, or made, in the circumstances attending the candidature of Prince Leopold of Hohenzollern-Sigmaringen for the throne of Spain, in the beginning of July, 1870. This candidature was violently denounced by the French Government, and in deference to the outraged feelings of France, and in accordance with the representations of Great Britain and the consent of the King of Prussia, the prince on the 12th of July declined the proffered crown. The French Government, not content with a simple renunciation, sought to exact a guarantee from the King of Prussia that such an offer, if repeated, should not be accepted. The King of Prussia not only refused the guarantee demanded, but declined to receive Count Benedetti, the French ambassador, when the latter sought to intrude upon his privacy, on the 13th of July, at Ems. All representations made in favour of peace by friendly neutrals were powerless to allay the animosity of the parties to the interchange of insults; and the Emperor Napoleon, driven to take that step, as he afterwards told Count Bismarck, by the pressure of French public opinion, declared war against Prussia, on the 15th of July, amidst the enthusiastic and almost unanimous approbation of the Chambers. On the 28th he set out to undertake the chief command of the army, and on the same day issued from Metz a proclamation, in which he warned his soldiers that the war would be long and severe. The sequel revealed in catastrophe the rottenness of the military system of France. Disaster followed disaster in rapid succession, until the emperor felt compelled to surrender himself at Sedan, on the 2nd of September, to the King of Prussia, who allotted him Wilhelmshöhe, near Cassel, as his residence, where he arrived on the evening of the 5th, having, the day before, been formally deposed from the empire, on the motion of M. Jules Favre. The flight of the Empress from Paris was almost coincident with the sentence of personal and dynastic deposition; and she repaired to Hastings, which she reached on the 8th of September, her arrival having been anticipated by that of her son, the Prince Imperial, on the previous day. The Emperor continued for several months at Wilhelmshöhe, where, on the 31st of October, he received a short visit from the Empress, and where he assisted in the production of a pamphlet, in which he sought to evade the responsibility of recent disasters, entitled, 'Note sur l'Organisation Militaire de la Confédération de l'Allemagne du Nord,' Wilhelmshöhe and Brussels, January, 1871. In March the Emperor regained his freedom, and repaired to England, being met at Dover by the Empress and the Prince Imperial, whom he accompanied to their residence at Camden House, Chiselmhurst, where they have hitherto found a home.

The reign of the Emperor Napoleon III., although closing in misfortune and gloom, and chequered throughout its course by many shadows, had on the whole been for France a continued progress in splendour and prosperity. Treaties, commercial and otherwise, were entered into with the leading powers of Europe, as well as with a few of those of Asia; the city of Paris, under the lavish and imperious administration of Baron Haussmann, grew from one stage of magnificence to another; the fleet was re-organised and developed; and the army, down to the last abrupt and fatal catastrophe, had a prestige equal to that of any other state in the world; the whole system of public instruction was remodelled; and science, art, and letters were fostered by the establishment of new sanctions and encouragements, especially of the quinquennial prize of 100,000 francs, called the Prix de l'Empereur, August 12th, 1864. But to all this there was a dark reverse: luxury, enervation, and moral and mental depravity spread from the court outwards, corruption and decay were rapidly germinating, and hence in the hour of trial the entire imperial system collapsed.

Besides directing a voluminous issue of the 'Correspondance' of Napoleon I., and either producing or inspiring various political pamphlets, in which the position of France and her ruler was, from time to time, defined or expounded, with reference to the current affairs of Europe, the Emperor Napoleon III. is the admitted author of two volumes—the third and concluding one being indefinitely postponed—entitled, 'Histoire de Jules César,' 4to and 8vo, Paris, 1866-66. In this work, which has been translated into English, German, Dutch, Spanish, Russian, and Hungarian, the imperial author seeks, in a phase of ancient Roman history, an analogy and a justification for the events of the *parvenu* empire of his own family. Other works, either produced by the Emperor or intimately connected with him,

include, 'Œuvres de Napoléon III.,' 4 vols. 8vo, Paris, 1864-67; 'Discours, Messages, Lettres, et Proclamations de S. M. Napoléon III. (1849-1861),' &c., 8vo, Paris, 1861; 'La Politique Impériale exposée par les Discours et Proclamations de l'Empereur Napoléon III., depuis le 10 Décembre, 1848, jusqu'en Février, 1868,' 8vo, Paris, 1868.

NARRIEN, JOHN [E. C. vol. iv. col. 458], died on the 30th of March, 1860, in his 78th year.

NARVAEZ, MANUEL RAMON MARIA, DUKE OF VALENCIA, a Spanish general and politician, was born on the 5th of August, 1800, at Loja, in Andalusia. Early following his inclination for a military career, he became a cadet in the Walloon Guards of Ferdinand VII., in 1815, the year after that monarch's restoration, and received his commission in 1820, just at the period when an insurrection forced the despotic king to return to constitutionalism. In 1822 and 1823 Narvaez opposed the insurrectionary and military movements of the party of reaction; and when the latter triumphed, by the help of a French army, in October of the latter year, he retired to his native place of Loja, where he continued till the death of Ferdinand (September 29th, 1833). In 1834, he fought with great courage and distinction on the queen's side, against the Carlists; and on the 25th of November, 1836, being in command of a division under the orders of Espartero, totally defeated Gomez at Majaceite. In 1838, after a successful campaign of three months against the brigands of La Mancha, he was named Captain-General of Old Castile and general-in-chief of the army of reserve; which commands he resigned, owing to the increasing influence of Espartero, whose rival for the highest offices he had for some time been considered. He retired to Loja; but having interested himself in an unsuccessful insurrection which broke out in November, 1838, at Seville, a city which sent him as deputy to the Cortes, he was obliged to seek refuge in France, whither Maria Christina, the queen-mother, after being deprived of the regency by Espartero, in October, 1840, also repaired. After a series of movements and intrigues for the restoration of Queen Christina and the overthrow of Espartero, who had assumed the regency in May, 1841, Narvaez placed himself at the head of a movement which was successful in both its issues. Landing at Valencia on the 27th of June, 1843, he marched upon Madrid, which he entered in triumph on the 24th of July. Espartero was compelled to retire to England; Queen Christina returned to Spain; and after the declaration of the majority of Isabella II., in November, 1843, and the promotion of Narvaez to be Lieutenant-General of Spain, the latter became, in May, 1844, President of the Council and Duke of Valencia, and, later in the same year, captain-general of the army. His administration, which lasted till March, 1846, was an open and declared reaction against the liberal party. In April, 1847, he accepted the post of ambassador to France, from which he returned to become, October 4th, the head of a new cabinet, over which, with a slight intermission caused by a misunderstanding with the Queen-Mother, he presided till January, 1851. He once more became President of the Council on the 12th of October, 1856, and laboured with much hardness and severity to restore the absolute integrity of the royal prerogative; and although his measures met with little opposition in the country, the intrigues of the court compelled his resignation in October, 1857. He returned to power on the 16th of September, 1864; and, resigning on the 21st of June, 1865, was succeeded by O'Donnell, whom he assisted, in June, 1866, to suppress a great military revolt at Madrid. In the following month, in association with Bravo Murillo, he succeeded O'Donnell in the administration of the government, and signalised his rule by extreme severity, exactions, and sentences of exile. In December, 1867, after a long suspension of its sittings, he convoked the Cortes, from which he subsequently obtained an indemnity for all the acts done by him without its authority or participation. Various attempts were made to destroy his power, by political votes, street-risings, and military insurrections; but, although both O'Donnell and Prim, the idol of the army, took part in them, they were all unsuccessful. Narvaez died on the 23rd of April, 1868, bearing down to the grave with him the last hope of the government of Queen Isabella, to whom he had been a loyal subject, and for whom he had pursued such courses of rigour and unscrupulousness as to entail upon his memory the reprobation of all friends of liberty, progress, and enlightenment.

* NAUMANN, KARL FRIEDRICH, mineralogist, was born at Dresden, May 30th, 1797. He was educated at Freiberg, Leipzig, and Jena; and the most influential of his teachers were Werner and Mohs. During the years 1821 and 1822, he made a

scientific tour in Norway, and after teaching, in a subordinate capacity, at the universities of Jena and Leipzig, he was appointed professor of crystallography at Freiberg, in 1826, and in 1835 professor of geognosy. In 1842 he removed to Leipzig, on receiving the professorship of mineralogy and geognosy in the university of that town. Besides some ninety or more papers relating to minerals, rocks, the geology of Saxony and Norway, the measurement of shells, and the special forms of the curves developed in shells, he has also written several works, some of which have had a large circulation as text-books. His 'Beiträge zur Kenntniss Norwegens,' 2 parts, 8vo, Leipzig, 1824, which was the main result of his Norwegian excursion, formed an excellent repository of what was then known of the rock-structure of Norway. Amongst his mineralogical works, we have 'Grundriss der Krystallographie,' 8vo, Leipzig, 1826; 'Lehrbuch der reinen und angewandten Krystallographie,' 2 vols., 8vo, Leipzig, 1830; 'Elemente der Mineralogie,' 8vo, Leipzig, 1846, eighth edition, 1871; 'Elemente der theoretische Krystallographie,' 8vo, Leipzig, 1856. His geological works comprise a 'Geognostische Skizze des Königreichs Sachsens,' contributed to the 'Gaea von Sachsen,' 8vo; descriptive explanations of some of the sheets of the geological survey map of Saxony; and of a 'Lehrbuch der Geognosie,' 2 vols., 8vo, 1850—1854, with an atlas, second edition, 3 vols., 8vo, 1858—1868, which last is almost an exhaustive manual of general lithology, stratigraphy, and palæontology. His system of mineralogy, first published in 1828, and subsequently modified, possessed considerable merits, inasmuch as he employed both the external characters and the chemical composition in drawing up his system, and thus succeeded in forming several natural groups.

NAUMANN, JOHANN ANDREAS, ornithologist, was born at Ziebigk, April 13, 1747. He was a man of wealth, who devoted himself to the study of birds, and who is known on account of some ornithological works he wrote, more especially a 'Naturgeschichte der Land- und Wasservögel des nördlichen Deutschlands und angrenzender Länder,' 22 parts, 8vo, Köthen, 1795—1804. It has passed through several editions, the latest being a much enlarged one, by his son, J. F. Naumann, assisted by Blasius, Baldamus, and Sturm, 8vo, 1822—1860, Leipzig and Stuttgart. He died May 15, 1826.

NAUMANN, JOHANN FRIEDRICH, son of the preceding, was, like his father, an ornithologist. He was born at Ziebigk, near Köthen, in Anhalt, February 14th, 1780, was educated at Dessau; and from there was called home in order to help in managing the family property. He is best known on account of his ornithological works, more particularly the edition of his father's work on the birds of Germany; 'Taxidermie,' 8vo, Halle, 1815, second edition, 1848; and in conjunction with C. A. Buhle, 'Die Eier der Vögel Deutschlands und der benachbarten Länder in naturgetreuen Abbildungen und Beschreibungen,' 8vo, Halle, 1818—1828. He also wrote a few papers on birds. He died at Ziebigk, August 15th, 1857.

NECKAM, ALEXANDER, whose name varies as Neckham, Necham, and Nequam, and who is also known as Alexander de Sancto Albano, an eminent scholar of the 12th and 13th centuries, was born at St. Albans in September, 1157, on the same night that King Richard I., who became his foster-brother, was born at Windsor. Not much is known of his personal history, except from a few autobiographic passages and allusions which occur in his works, especially in his poems, and from a small number of brief statements which are scattered through the pages of chroniclers and other writers of a date only a little more recent than his own. He received his earlier education at the Abbey of St. Albans; and became so proficient in learning that he was soon entrusted with the government of the dependent school of Dunstable. Desirous of a wider field, he did not continue long in this office; and in 1180 he is ascertained to have been acting as a professor of the seven arts, and particularly of logic, in the University of Paris, where, also, in the character of a student, he applied himself to canon law, theology, and medicine. He returned to England in 1186 or 1187, and resumed his functions of master of the school of Dunstable, which he again relinquished, after a tenure of about twelve months, for the purpose of entering one of the monastic orders. Being displeased at the levity with which the Abbot of St. Albans—who punned upon one of the forms, Nequam, of his name—received his application for admission into his society, which was of the Benedictine order, he assumed the habit of an Augustine canon in the monastery of Cirencester, of which he was elected abbot in 1213, having possibly, but not certainly, acted for some time previously as prior of St. Nicholas, at Exeter. His death,

according to the best authorities, took place in 1217, at Kemsey, in Worcestershire; and he was buried at Worcester.

Neckam attained the reputation of being a universal scholar, proficient in the whole circle of the sciences, including canon law, medicine, and theology. He was, besides, one of the most accomplished Latin poets of his time; and his language is distinguished by considerable purity and elegance. The greater part of his works exhibit a decided tendency to grammatical studies, his chief treatises in this kind being 'Isagogicum de Grammatica,' or an Introduction to Grammar; 'Corrogationes de Tropis et Figuris'; 'Repertorium Vocabulorum'; 'Distinctiones Verborum'; and 'De Accentu in mediis Syllabis'; some of which are preserved in the British Museum and in the libraries of Oxford and Cambridge. His work entitled 'De Utensilibus,' or 'De Utensiliis Nominibus,' is an early specimen of a class of tract at once descriptive and philological, which begins by giving an account of the various apartments of a house, from the bed-room to the kitchen, together with the furniture and apparatus proper to each; and which then proceeds to castles and other dwellings of strength or greatness, and finally to agricultural operations and the conduct of different trades and professions. This work, with the title of 'De Utensilibus,' is incorporated with 'A Volume of Vocabularies, illustrating the Condition and Manners of our Forefathers, as well as the History of the Forms of Elementary Education and of the Languages spoken in this Island from the tenth Century to the fifteenth. Edited from MSS., in public and private Collections, by Thomas Wright, Esq., M.A., F.S.A., &c., 4to, 1857, privately printed; and, with the title of 'De Utensiliis Nominibus,' is the second of three treatises which form the volume 'Lexicographie Latine du XII^e et du XIII^e Siècle. Trois Traités de Jean de Garlande, Alexandre Neckam, et Adam du Petit-Pont. Publiés, avec les Glosses françaises, par M. Aug. Scheler, Dr.Ph., 8vo, Leipzig, 1867. The most elegant of Neckam's poems is one on the monastic character, which is of frequent occurrence in manuscript, and is probably identical with that which, under the title of 'Ad Viros religiosos,' is generally cited as one of his lost productions. His most important poem, however, is a scientific treatise in elegiac verse, distributed into ten 'Distinctiones,' or books, which treat successively (1) of the creation; (2) of the orders of angels; (3) of stars, planets, and the heavenly bodies generally; (4) of meteorology and other branches of natural philosophy; (5) of the form of the earth and its geographical features; (6) of geology, and the nature and qualities of the metals and precious stones; (7) of the medicinal qualities of different plants; (8) of fruits, seed, &c.; (9) of the natural history of animals, with some remarks on the brain and senses of man; and (10) of the seven arts, and of science in general. Of his prose works on science the most popular is his 'De Naturis Rerum,' which to a great extent follows the order of the poem of which an analysis has just been given, and in which his natural-history sections are enlivened by anecdote. These two works have been published as one of the volumes of the series entitled 'Rerum Britannicarum Medii Ævi Scriptores: or, Chronicles and Memorials of Great Britain and Ireland during the Middle Ages,' published under the direction of the Master of the Rolls, and has for its special title, 'Alexandri Neckam, "De Naturis Rerum. Libri duo:" with the Poem of the same Author, "De Laudibus Divinæ Sapientiæ. Distinctiones decem." Edited by Thomas Wright, Esq., M.A., F.S.A., &c., 8vo, London, 1863. The theological treatises of Neckam are numerous and varied, expository, homiletic, and exegetical; and he is said to have produced commentaries on the Gospels, on Ecclesiastes, and the Song of Solomon, as well as on the Psalms, the Book of Proverbs, and the Prophecy of Ezekiel. His miscellaneous profane commentaries are conversant about some of the writings of Aristotle; the 'Metamorphoses' of Ovid; and a portion of Martianus Capella. He produced, likewise, a translation into Latin elegiac verse of Æsop's Fables; and his skill as a fabulist is attested by the incorporation of his 'Novus Avianus,' or portions of it, with two volumes of recent issue, entitled respectively, 'Poésies inédites du Moyen Âge, précédées d'une Histoire de la Fable Ésoopique par M. Édilestand du Méril,' 8vo, Paris, 1854, and 'Aviani Fabulæ xxxii. ad Theodosium, ex Recensione et cum Instrumento critico Gulielmi Froehner,' 8vo, Leipzig, 1862.

NECKER, LOUIS ALBERT, geologist, mineralogist, and zoologist, was born April 10, 1786. He was educated at Geneva. He inherited from his mother, Madame Necker de Saussure, and his uncle, Horace Benedict de Saussure, that love for natural-history studies which has rendered his mother's family so well known

in science. In 1806 and 1807, he lived at Edinburgh, and made some long excursions to the Hebrides. In 1810, he became the assistant professor of mineralogy and geology in the Academy of Geneva, and shortly after attained full professorial rank. As a professor he acquired most fame by the success which attended his field-excursions; and his best lectures were those which he delivered to his students in explanation of the mountains amidst which they were rambling. He made numerous excursions on his own account, and thus traversed most parts of France, Switzerland, Italy, and the whole chain of the Alps; but the country about the Lake of Geneva received most of his attention. Finding the climate too humid for his constitution, he established himself, in 1840, at Portree, in the Isle of Skye, where he devoted himself to the quiet though constant observation of natural phenomena; and it was at this small town that he died, November 20, 1861. All his works were published prior to 1842; but he collected many notes at Portree. His writings relate to a wide range of subjects, viz., mineralogy, physical geography, birds, but chiefly geology. A few of these may be noticed. One of the first subjects which he studied, was the migration of birds; and, after many years' observation, he published the result of his inquiries in a very interesting 'Mémoire sur les Oiseaux des environs de Genève,' which appeared in the 'Mémoires' of the Physical Society of Geneva, vol. ii. pp. 29-122, (1823). His first visit to Scotland furnished materials for his 'Voyage en Ecosse et aux îles Hébrides,' 3 vols. 8vo, Geneva, 1823. He proposed publishing a series of volumes on the Alps, under the title of 'Études géologiques dans les Alpes,' the first volume appeared in 1841, but no other has succeeded it. It contains a full account of the country about Geneva; and is noticeable as an application of the principles of the Lyellian school to the explanation of the geological phenomena occurring in his native district. One of his best papers was a 'Mémoire sur la Vallée de Valorsine,' published in vol. iv. of the 'Mémoires' of the Physical Society of Geneva, pp. 209-246 (1828). He proposed a natural method of classifying minerals, which was given in his 'La règne minéral ramené aux méthodes de l'histoire naturelle,' 2 vols. 8vo, Paris, 1835. (De Candolle, *Mémoires de la Société de Physique et d'Histoire naturelle de Genève*, vol. xvi. pp. 452-456).

NEES VON ESENBECK, CHRISTIAN GOTTFRIED, botanist and entomologist, was born near Erbach, in the Odenwald, February 14, 1776. He studied at Darmstadt, where his taste for natural history was first imbibed, and at Jena, where he graduated as doctor of medicine. On leaving the university, he settled at Frankfurt-am-Main, as a practising physician. While thus occupied, he published some works on freshwater algae and on mushrooms, which attracted so much attention, that, in 1818, the University of Erlangen appointed him professor of botany and director of the botanical garden. In the same year he became the editor of the 'Nova Acta Academiæ Cæsareæ Leopoldino-Carolinæ Naturæ Curiosorum;' and this important scientific serial received his editorial supervision for forty years. In 1819 he removed to Bonn, on being appointed professor of natural history, and established a botanical garden, which was managed by himself and his brother, T. F. L. Nees von Esenbeck. In 1831 he was transferred to the botanical chair at Breslau. In 1848 he was elected a member of the German parliament, and soon became a leader of the popular party. The powerful influence of his eloquence and personal character rendering him obnoxious to the government, he was removed from his professorship in 1851. By this event he was deprived of his means of subsistence, and during some of his last years he was reduced to the utmost penury. He died at Breslau, March 16, 1858. He was a most laborious worker, and his numerous writings stamp him as one of the leading systematic botanists of the present century. His services in connection with the academy *Naturæ Curiosorum* were also important; for he it was who revived it, after it had been dormant more than a quarter of a century, and he was largely instrumental, partly as its president for many years and partly as the editor of its works, in maintaining its high character. His most important or noticeable works were, 'Die Algen des süßen Wassers nach ihren Entwickelungsstufen dargestellt,' 8vo, Bamberg, 1814; 'Das System der Pilze und Schwämme,' 2 plates, Würzburg, 1816; 'Handbuch der Botanik,' 2 vols. 8vo, Nürnberg, 1820-21; 'Hepatica Hedwigii,' and 'Agrostologia Brasiliensis,' forming portions of volumes i. and ii. of Martius's 'Flora Brasiliensis'; 'Naturgeschichte der Europäischen Lebermoose,' 4 vols. 8vo, 1833-38; 'System Laurinearum,' 8vo, Berlin, 1836; 'Monographie der Ichneumoniden,' 2 vols. 8vo, Stuttgart, 1838; and 'Hymenopterorum Ichneumonibus

Affinium Monographiae,' 2 vols. 8vo, Stuttgart, 1834. Besides other botanical books, he also wrote numerous papers, some of which are important descriptive and classificatory monographs of groups of plants, such as those on the *Acanthaceæ*, contributed to De Candolle's 'Prodromus,' and the *Solanææ* of the East Indies, in the 'Transactions of the Linnean Society,' vol. xvii., pp. 37-82. He assisted in the works written by his brother, Bischof, and other naturalists, and published several works on politics and on mesmerism. He won high repute as a lecturer, and drew together very large classes.

NEES VON ESENBECK, THEODOR FRIEDRICH LUDWIG, brother of the preceding, and like him a botanist, was born near Erbach, July 26, 1787. He was occupied first as a druggist, next as the inspector of the botanical gardens at Leyden, and last as the professor of pharmacy at Bonn. He died at Hyères, December 12, 1837. Besides helping his brother in various ways, he wrote numerous works and papers which chiefly relate to the plants which are used for medical purposes. Amongst these the most noticeable are, 'De Muscorum Propagatione Commentatio,' 4to, Bonn, 1820; 'Beschreibung officinellen Pflanzen,' 3 vols. folio, Düsseldorf, 1828-29, to which he was only one of several contributors; 'Handbuch der medicinisch-pharmaceutischen Botanik nach den natürlichen Familien des Gewachsreichs,' 3 parts, 8vo, Düsseldorf, 1830-32, in which he was associated with Ebermaier; 'Icones plantarum medicinalium,' folio, Düsseldorf, 1833, with 120 plates; and 'Genera Plantarum Floræ Germanicæ iconibus et descriptionibus illustrata,' 8vo, Bonn, 1835-39, of which he drew up the first sixteen numbers, others being added by Spenner and Endlicher.

*NEHER, BERNHARD, German historical painter, was born in 1806, at Biberach, in Württemberg. After preparatory training under his father, a painter of ability, he entered the Stuttgart Art Academy, and thence passed into that of Munich, where he was for a while a pupil of Cornelius. He then went as exhibitor to Rome, where he stayed four years, and attracted the notice of Ludwig of Bavaria, at whose invitation he returned to Munich to paint a fresco of the 'Return of the Emperor Ludwig, after his victory over Frederick of Austria,' on the exterior of the Isarthor; and others of the Virgin and St. Benno. In 1836 he was recalled to Weimar in order to paint a series of seven large pictures in the Schiller Gallery, from Schiller's ballads and dramas; and afterwards in the Goethe Gallery, several from the poems of Goethe. These he completed in 1847, and then proceeded to Leipzig, where he had been appointed director of the Art Academy. He had also been nominated professor of painting in the Stuttgart Academy. Herr Neher has painted several frescoes for churches, including a large altar-piece for the new church of St. Peter at Hamburg, numerous oil paintings from religious and secular history, and made cartoons for church windows. His works are characterised by elevation of sentiment and poetic feeling.

NEILSON, JAMES BEAUMONT, one of the improvers of the iron manufacture, was born at Shettleston, near Glasgow, June 22nd, 1792. He was the son of a millwright, whom he assisted, when a youth, in making and erecting mining pump-machinery. In 1814 he was mechanical engineer (at that time called 'engine-wright') at the Irvine Colliery, Ayrshire. He went to Glasgow in 1817, and became engineer to the first gas-works established in that city. In the twenty years of his employment in this situation, he introduced many improvements in gas-making; among these were the substitution of clay retorts for iron, the use of refuse tar as liquid fuel to heat the retorts, and the removal of ammonia from the crude gas by means of sulphate of iron. He was one of the first introducers of workmen's institutions, encouraging the men employed at the gas works to efforts at mental improvement in leisure hours. The discovery by which he afterwards acquired distinction had, however, no immediate connexion with his duties as a gas-engineer. Discussing, with an ironmaster, the probable cause of certain irregularities of the blast in smelting furnaces, they sought to ascertain whether there is too much sulphur in the air in summer, or an excess of aqueous vapour, or a deficiency of oxygen. A paper by Mr. Neilson, read before the Glasgow Philosophical Society in 1825, shows that he had at that time very crude notions on the subject. He obtained permission from the proprietors of the Clyde and Dundyvan Ironworks to make experiments with their blast-furnaces; and at length he arrived at the capital discovery, that if the air-blast for a smelting-furnace be used hot instead of cold, a double economy results: the same furnace can produce an increased quantity of pig-iron per week,

and the cost of production is very materially lessened. A patent was taken out in 1828; Mr. (afterwards Lord) Brougham is said to have "written the title" of it. Neilson having no capital, the patent was obtained in partnership by him, Mr. Dunlop of the Clyde Iron Works, Mr. Wilson of the Dundee Iron Works, and Mr. Macintosh. So favourable was the use of the hot blast in smelting the Scotch blackband ore discovered by Mr. Mushet, and so great was the yield of the furnaces, that almost all the smelters in Scotland gradually adopted the plan. As some of them, however, disliked paying one shilling per ton for the use of the patent right, they entered into a combination to dispute the validity of the patent. Trials and appeals followed one another during a long series of years: one of the trials occupied sixteen days, and led to the examination of a hundred and forty witnesses; this was merely one, for there were twenty actions going on simultaneously. The decision was finally in favour of Neilson and his partners; but not before the enormous sum of 40,000*l.* had been paid in law expenses. Those enquirers who have traced the influence of the hot blast on the progress of the iron-manufacture estimate at something like 30*s.* per ton the economy effected by its use, and thus attribute to Mr. Neilson "the saving of several millions sterling annually to the country;" but it would not be safe to adopt so broad an estimate without close scrutiny, especially as the cold-blast products are better fitted for some purposes than the hot-blast. Still, the vast importance of the discovery is unquestionable. Mr. Neilson (who was a fellow of the Royal Society and of the Chemical Society, and a member of the Institution of Civil Engineers) died at Queenshill, Kirkcudbrightshire, January 18th, 1865.

NESBIT, CHARLTON, a celebrated wood-engraver, was born in 1775, at Swalwell, near Gateshead. At the age of fourteen he was articled to Bewick, and whilst with him engraved most of the cuts in the editions of Parnell and Goldsmith, published in 1796, and some of the tail-pieces in the first volume of Bewick's 'British Birds.' On the termination of his apprenticeship he engraved a view of St. Nicholas Church, Newcastle-on-Tyne; it was the largest woodcut which had up to that time been produced in England, and for it young Nesbit was awarded the medal of the Society of Arts. In 1799 he came to London, where he remained till 1815, when he returned to his native place. There he continued to practise his profession till 1830, when he again settled in London, where he died, November 11th, 1838. Charlton Nesbit was the best of the many pupils of Bewick, and one of the ablest wood-engravers of his day. His cuts are always carefully engraved, and are remarkable for their skilful rendering of surface and texture.

NESELRODE, KARL ROBERT, COUNT VON [E. C., vol. iv. col. 461], died at St. Petersburg on the 23rd of March, 1862. His autobiography has since been published in French and German.

NEUKOMM, THE CHEVALIER SIGISMOND [E. C., vol. iv. col. 463], died at Paris on the 3rd of April, 1858, in the 80th year of his age.

* NEUMANN, KARL FRIEDRICH, a German orientalist and historian, member of a Jewish family in humble circumstances, was born on the 22nd of December, 1798, at Reichmannsdorf in the neighbourhood of Bamberg, and at an early age entered a counting-house at Frankfurt-am-Main. In 1816 he repaired to the University of Heidelberg, after which he studied successively at the Universities of Munich and Göttingen, at the former of which he became a convert to Protestant Christianity. His earliest work was entitled 'Rerum Creticarum Specimen,' 8vo, Göttingen, 1820; and in 1822 he was appointed professor of history at the Gymnasium of Speier, but was obliged to vacate his office in 1825, on account of the liberality of his opinions. The same year he published his Historical Essays, 'Historische Versuche,' 8vo, Heidelberg, 1825; and he thereafter employed himself as a private tutor at Munich till 1827, when he repaired to Venice, and took up his residence at the Convent of San Lazzaro, for the purpose of acquiring the Armenian language. In 1828 he migrated to Paris, in order to study the oriental languages, which, especially those of India and China, he further prosecuted in London, where he spent a portion of the year 1829, having previously published his 'Mémoire sur la Vie et les Ouvrages de David, Philosophe Arménien du V^e Siècle de Notre Ère, et principalement sur ses Traductions de quelques Écrits d'Aristote,' 8vo, Paris, 1829. In April, 1830, he left London on a scientific voyage to India and China, with a commission to purchase a library of miscellaneous Chinese works, at that time an almost total blank in the libraries of Germany; and returned in the

following year with about ten thousand volumes in various departments of literature, of which more than 2,400 were placed in the royal library of Berlin. Before setting out on this expedition he had contributed to a German periodical, called 'Hermes,' an article on Chinese Philosophy and Literature, which was published independently as 'Chinesische Philosophie und Literatur,' 8vo, Leipzig, 1829; and shortly after his return in 1831, was appointed to a chair in the University of Munich, the duties of which embraced not only lectures on the Chinese and Armenian languages and literatures, but also on the political and literary history of the leading nations of Asia. During his incumbency of this office he produced several important works, amongst which were one on the Pilgrimages of the Buddhist Preachers of China and India, 'Pilgerfahrten buddhistischer Prediger aus China und Indien,' 8vo, Leipzig, 1833; a History, compiled from Russian and Armenian sources, and chiefly from the Russian of S. Glinka, of the Emigration of forty thousand Armenians, &c., 'Geschichte der Uebersiedlung von vierzig Tausend Armeniern, welche im Jahre 1828 aus der persischen Provinz Aderbaidshan nach Russland auswanderten. Nach dem russischen und armenischen Originale frei bearbeitet, und mit einer Einleitung versehen,' 8vo, Leipzig, 1834; an Essay on the History of Armenian Literature, &c., 'Versuch einer Geschichte der Armenischen Literatur, nach den Werken der Mechitaristen frei bearbeitet,' 8vo, Leipzig, 1836; the first volume of Asiatic Studies, 'Asiatische Studien,' 8vo, Leipzig, 1837; a Journey to Circassia, 'Reise nach Tscherkessien,' 8vo, Stuttgart, 1840; 'Russland und die Tscherkessen,' 8vo, Stuttgart, 1840, forming a part of 'Reisen und Länderbeschreibungen der älteren und neuesten Zeit;' a History of the Anglo-Chinese War, 'Geschichte des Englisch-Chinesischen Krieges,' 8vo, Leipzig, 1846, new edition, 1855; and the first volume of an Epitome of the History of the smaller States of Germany, 'Kurzer Abriss der Geschichte der Kleineren Staaten Deutschlands,' &c., 8vo, Treves, 1847. Once more, however, the freedom of Professor Neumann's political speculations and opinions rendered him obnoxious to the authorities; and for a too frank expression of his democratic sympathies in 1848, he was, in 1852, deprived of his academic chair.

A few of his more important works remain to be mentioned, including a treatise on the people of Southern Russia, &c., 'Die Völker des südlichen Russlands in ihrer geschichtlichen Entwicklung. Eine von dem Königlichen Institut von Frankreich gekrönte Preisschrift,' 8vo, Leipzig, 1847; Contributions to Armenian Literature, 'Beiträge zur armenischen Literatur,' 8vo, Leipzig, 1849; History of the English Empire in Asia, 'Geschichte des englischen Reiches in Asien,' 2 vols. 8vo, Leipzig, 1857; History of Eastern Asia from the first Chinese War, &c., 'Ostasiatische Geschichte vom ersten chinesischen Krieg bis zu den Verträgen in Peking (1840—60),' 8vo, Leipzig, 1861; and a History of the United States of America, 'Geschichte der vereinigten Staaten von Amerika,' 8vo, Berlin, 1863, &c. Professor Neumann has also published English and German translations of Chinese and Armenian works, and has edited 'Die Reisen des Venezianers Marco Polo,' &c., 8vo, 1845; Gützlaff's History of the Chinese Empire, 'Geschichte des chinesischen Reiches,' &c., 8vo, 1847; and the 'Reisen des J. Schiltberger aus München in Europa, Asia, und Africa von 1394 bis 1427,' &c., 8vo, 1859.

* NEUREUTHER, EUGEN, German designer, was born at Munich in 1806. The son of Ludwig Neureuther, a landscape painter of much local celebrity (born 1775; died 1830), he studied under his father at Bamberg, and afterwards in the Munich Art Academy. At first he painted landscapes for his patron, King Maximilian, after whose death he was employed by Cornelius in painting arabesques and other decorative work in the Trojan Hall of the Glyptothek and the arcades of the Hofgarten. By the advice of Cornelius, he resolved to devote himself to the designing of illustrations of popular writers. His first essay was a series of lithographic illustrations to Goethe's ballads and novels (fol., 1829—39), which received the warm approbation of the great poet. Neureuther has since published a large number of these illustrations, which have met with abundant acceptance from his countrymen. They include illustrations to Wieland's Oberon, Herder's Cid, the Nibelungenlied (in conjunction with Julius Schnorr), Bürger's Leonora, Becker's Rhine song, Bavarian mountain songs, and many besides, and have been often re-issued under the title of 'Randzeichnungen.' They are varied, usually well done, and exhibit considerable invention and fancy; but have a certain hard, heavy, narrow nationality, which will always interfere with their general enjoyment. Of late years he has painted many oil pictures. In 1848

he was appointed director of the artistic department of the royal porcelain works at Nymphenburg.

NEUWIED, PRINCE ALEXANDER PHILIP MAXIMILIAN OF, naturalist and traveller in Brazil and other parts of America, was born at Neuwied, September 23, 1782. In early life he entered the Prussian army, and having acquired the rank of major, he retired from the service in 1806, for the purpose of following out investigations in natural history. In 1815 he went to Brazil, and spent nearly two years in exploring the interior of that country. In 1833, he commenced extensive travels in North America. The results of his journeys were embodied in some expensive works, which formed valuable contributions to the knowledge of the regions described in them. Their titles are, 'Reise nach Brasilien in den Jahren 1815—1817,' 2 vols. 8vo, with a folio atlas, Frankfurt-am-Main; 'Beiträge zur Naturgeschichte von Brasilien,' 4 vols. 8vo, Weimar, 1825—1833, with 'Abbildungen,' in folio, 1822—1831; 'Reise in das innere Nord-America in den Jahren 1832 bis 1834,' 2 vols. 4to, with folio plates, Coblenz, 1839—1841; and 'Verzeichniss der auf seiner Reise in Nord-Amerika beobachteten Säugethiere,' 8vo, Berlin, 1862. A sketch of the birds observed during this last North American journey appeared in Cabanis's 'Journal für Ornithologie' for 1858. He died February 3, 1867.

* NÈVE, FÉLIX JEAN BAPTISTE JOSEPH, a Belgian Orientalist, was born on the 13th of June, 1816, at Ath, in Hainault, and, after having received his earlier education at the College of Lille, pursued his studies successively at the Universities of Leyden, Bonn, and Munich. Subsequently he repaired to Paris, where he further prosecuted his researches into Oriental philology and philosophy, under Burnouf and others. In 1838, he graduated as doctor in philosophy and letters; and, in 1841, became a tutor of ancient literature and the Oriental languages at the Catholic University of Leyden, where he was appointed in the years 1844 and 1853, respectively, to the extraordinary and the ordinary professorship. In 1860, he was elected a member of the Académie Royale of Belgium.

The works of Professor Nève, which have been devoted, to a great extent, to an exposition of Buddhism and of the Vedas, include, 'Études sur les Hymnes du Rigvéda, avec un Choix d'Hymnes traduits pour la première fois en français,' 8vo, Leyden, 1842; 'Introduction à l'Histoire générale des Littératures orientales: Leçons faites à l'Université catholique de Louvain,' 8vo, Paris, 1844, 8vo, Leyden, 1845; 'De l'État présent des Études sur le Bouddhisme et de leur Application,' 8vo, Ghent, 1846; 'Essai sur le Mythe des Ribhavas, premier Vestige de l'Apothéose dans le Véda. Avec le Texte sanscrit et la Traduction française des Hymnes adressés à ces Divinités,' 8vo, Paris, 1847; 'Relations des Suffridus Petri et d'autres Savants du XVI^e Siècle avec l'Université de Louvain. E. Henschling, et les derniers Temps de l'Enseignement de l'Hébreu au Collège des Trois-Langues,' 12mo, Leyden, 1848; 'De l'Origine de la Tradition indienne du Déluge,' 8vo, Paris, 1849, originally contributed to the 'Annales de Philosophie chrétienne,' in which he further discussed 'La Tradition indienne du Déluge, dans sa Forme la plus ancienne,' 8vo, Paris, 1851; 'Le Bouddhisme, son Fondateur et ses Écritures,' 8vo, Paris, 1853, reprinted from the 'Correspondant'; 'Les Pouranas. Études sur les derniers Monuments de la Littérature sanscrite,' 8vo, Paris, 1855; 'Mémoire sur la Vie d'Eugène Jacquot de Bruxelles,' 4to, Brussels, 1856; 'Coup d'Œil sur les Monuments du Christianisme primitif, publiés récemment en syriaque,' 8vo, Paris, 1856; 'Mémoire historique et littéraire sur le Collège des Trois-Langues à l'Université de Louvain,' 4to, Brussels, 1856, which obtained the prize of the Royal Academy of Belgium; 'Des Portraits de Femme dans la Poésie épique de l'Inde. Études morales et littéraires,' 8vo, Brussels, 1858; 'Exposé des Guerres de Tamerlan dans l'Asie occidentale,' 8vo, Brussels, 1860; 'L'Église d'Orient et son Histoire d'après les Monuments syriaques,' 8vo, Paris, 1860; 'Quelques Épisodes de la Persécution du Christianisme en Arménie au XV^e Siècle. Traduits de l'Arménien [principally of Thomas of Medzolph] en français,' &c., 8vo, Leyden, 1861; 'Saint-Jean de Damas sous les premiers Khalifes,' 8vo, Brussels, 1861; 'De l'Invocation du Saint-Esprit dans la Liturgie Arménienne,' 8vo, Leyden, 1862; 'Frédéric Windischmann et la haute Philologie en Allemagne,' 8vo, Paris, 1862; 'Calidasa; ou, la Poésie Sanscrite dans les Raffinements de sa Culture,' 8vo, Paris, 1864; 'Le Sanscrit et les Études Indiennes dans leur Rapport avec l'Enseignement classique,' 8vo, Bruges, 1865; and 'Du Beau littéraire dans les Œuvres du Génie Indienne,' 8vo, Brussels, 1865. Besides the

periodical publications to which it will have been incidentally seen that Professor Nève has furnished articles, it may be mentioned that he is also a contributor to several others, amongst which are the 'Journal Asiatique'; the 'Revue Catholique,' of Leyden; and the 'Messager des Sciences historiques de Belgique.'

NEWCASTLE, HENRY PELHAM CLINTON, FIFTH DUKE OF [E. C., vol. iv. col. 464]. On the formation of the Palmerston ministry, June, 1859, the Duke of Newcastle returned to office as Secretary of State for the Colonies; and in that capacity accompanied the Prince of Wales on his visit to Canada and the United States. He continued to preside at the Colonial Office till March, 1864, when the state of his health compelled him to resign. He retired to his seat, Clumber, Nottinghamshire, where he died on the 18th of October following, at the age of fifty-three.

NEWCOMEN, THOMAS, one of the inventors of the steam-engine, was born in the second half of the seventeenth century; but little is known of his early history. While employed as a smith at Dartmouth, Devonshire, he made himself acquainted with scientific subjects, and carried on a correspondence with Dr. Robert Hooke, who communicated to him the facts relating to the inventions of Papin and the speculations of the Marquis of Worcester on the possibility of working machinery by steam-power. Savary, a captain or manager of one of the Cornish mines, adopted a plan of condensing the steam in the cylinder after the piston had made its upward movement, by the action of cold water contained within a jacket outside the cylinder; while a little water was also kept on the top of the cylinder. Whether the idea was due to Newcomen is not clear; but a new form of atmospheric engine was devised, depending on the condensation of steam by the admission of water into the cylinder. A patent was obtained for the invention in 1705, by Newcomen, Savary, and a glazier at Dartmouth named John Cawley. The cylinder was open at the top, and communicated at the bottom by a short pipe with the steam boiler. The piston was packed with hemp and tallow round the edge, to render it steam-tight. Water flowed from a small tank over the cylinder, down a pipe, and into the bottom of the cylinder, where it spread out in a spray of fine rain. The force of the steam drove up the piston; the spray condensed the steam, and made a partial vacuum; the atmospheric air drove the piston down again; and the reciprocating action thus produced worked the beam of a pumping-engine. At first the spray-jet was turned on and off by hand; but, by 1712, a self-acting apparatus for this purpose was in use. Newcomen's atmospheric engine was afterwards greatly improved, and came into general use, especially for pumping water from mines. It prepared the way for Watt's inventions. Newcomen is supposed to have died about 1713.

NEWTON, REV. JOHN [E. C. vol. vi. col. 1014].

NEWTON, SIR WILLIAM JOHN, miniature painter, was born in London in 1785, and very early acquired popularity as a miniature painter. The elegance of his style, and the exquisite finish of his best works, won for him the patronage of the highest circles, which the urbanity of his manners did much to promote. For a long series of years he was the favourite miniature painter of the court and aristocracy, and, like Reynolds, he could boast that three generations of the noblest and loveliest in the land had been painted by him. Though hardly to be ranked with the greatest painters in his particular branch of art, he was one of the very best of his time, and the rank and character of his sitters give great interest to his works. In his later years he made various essays in religious and historical design, but they were not of much value. He was an early and zealous student of photography, and in various ways an accomplished gentleman. He was miniature painter in ordinary to the queen, and in 1837 received the honour of knighthood. He died at his residence, Cambridge Terrace, Hyde Park, on the 22nd of January, 1869, in the 84th year of his age.

NICCOLINI, GIOVANNI BATTISTA, an Italian dramatist and patriot, member of a noble Florentine family, and descending, through his mother, from the lyric poet Filicaja, was born at the Bagni di San Giuliano, about four miles from Pisa, where his father filled a subordinate public employment. The date of his birth, about which many mistakes are prevalent, is ascertained by Napoleno Giotti, his biographer in 'I Contemporanei Italiani,' to have been the 31st of October, 1782. He received his earlier education at Florence, and after the completion of his studies, chiefly in philosophy and law, at the University of Pisa, and the production of several laudable poetic pieces, was appointed, in 1807, to be secretary and professor of history and

mythology in the Accademia delle Belle Arti, at Florence. After the restoration of the grand-ducal government in the person of Ferdinand III., in September, 1814, he was appointed by that prince to be librarian at the Palazzo Pitti; but shortly resigned his office in order to resume his old functions at the Accademia, in the discharge of which he appeared to enjoy a more complete independence. Some time after, he produced his tragedy of 'Nabucco,' 8vo, London, 1819, new edition, 1830, which was strikingly conversant with the events of the career of Napoleon, who was symbolised by Nabucco, or Nebuchadnezzar, whilst Pope Pius VII. and Carnot were represented respectively by Mitrane and Arsace, and these three pairs again stood for the three typical forces of the world. A French translation of 'Nabucco,' by Prince Pierre Napoléon Bonaparte, was published as 'Nabuchodonosor. Tragédie, traduite en Vers français,' &c., five *livraisons*, 4to, Paris, 1861. The life of Niccolini was, speaking generally, one continued period of dramatic production, interrupted for a few years, during which he signalled his sympathy with the deeper literary awakening that agitated Italy, employing his pen on philosophical subjects, and especially producing a work entitled, 'Del Sublime e di Michelangiolo. Discorso,' &c., 8vo, Florence, 1825. To this epoch belong also his 'Elogio di L. B. Alberti,' &c., 8vo, Florence, 1819; and his intimate connection with a review published by Vieusseux, and entitled, 'Antologia,' Florence, 1819—1832. In his latter years he was engaged upon an important prose work, the History of the House of Hapsburg, which, although frequently announced as being on the eve of publication, was left unfinished at the time of his death, which took place at Florence, on the 20th of September, 1861. His funeral was celebrated with great pomp and circumstance in Santa Croce, where an oration was pronounced over his grave by his friend, Professor Vannucci; and one of the latest evidences of the gratitude and favour with which his name is still regarded is to be found in a small publication entitled, 'Festa letteraria commemorativa di G. B. Niccolini, celebrata nel R. Liceo Niccolini di Livorno il 17 Marzo, 1868. Relazione e Discorsi,' 8vo, Florence, 1868.

The principal of the works of Niccolini, besides those already mentioned, comprise his 'Polissena: Tragedia in cinque Atti,' 8vo, Florence, 1810, second edition, 1813, and forming part of the 'Teatro Classico Italiano,' 8vo, 1829, a work which obtained the prize of the Accademia della Crusca; 'Medea: Dramma tragico in cinque Atti,' new edition, 8vo, Florence, 1825; the tragedies of 'Ino e Temisto,' 'Edipo,' and 'Matilde,' the first and last of which were reprinted in 8vo, Florence, 1825; 'Antonio Foscari: Tragedia in cinque Atti,' &c., 8vo, Florence, 1827, a work which gave rise to considerable controversy, and was received with corresponding favour; 'Giovanni da Procida: Tragedia in cinque Atti,' &c., 8vo, Bologna, 1831, in which the author gave utterance to all his impatience and detestation of foreign domination; 'Ludovico Sforza,' 1834; 'Rosmonda d'Inghilterra,' 1839; 'Arnaldo da Brescia: Tragedia in cinque Atti,' &c., preceded by a Life of Arnold, 12mo, Florence, 1843, and 12mo, Marseille and Paris, 1843, of which a reimpression was for a long time interdicted in Tuscany, on account of its ardent aspirations after liberty, German translation, Berlin, 1845, English translation, by T. Garrow, 12mo, London, 1846; 'Filippo Strozzi: Tragedia in cinque Atti,' &c., corrected d'una Vita di Filippo e di Documenti inediti, 8vo, Florence, 1847; 'Lezioni di Mitologia ad Uso degli Artisti,' 2 vols., 8vo, Florence, 1855, which, notwithstanding its late publication, had been produced in earlier life; and various selections and collections of his works, none of which have any claims to completeness; 'Prose,' 8vo, Florence, 1823; 'Tragedie,' 2 vols., 12mo, Capolago, 1831; 'Opere in Verso e in Prosa,' 3 vols., 8vo, Florence, 1831, new edition, 3 vols., 12mo, Florence, 1844, "edizione ordinata e rivista dall'Autore: quarta Impressione," 3 vols., 12mo, Florence, 1858; 'Tragedie scelte ed altre Rime,' 32mo, Paris, 1840, &c.; 'Poesie,' inserted in 'Rime scelte di vari Poeti moderni,' 32mo, Paris, 1844; and 'Poesie Nazionali,' &c., 8vo, Florence, 1859. To the labours of Professor Niccolini as an editor of the works of others, we owe the 'Poesie di A. d'Elci. Con la Vita dell'Autore, scritta dal Sig. G. B. N.,' 8vo, 1827; F. Bechi's 'Prose, edite e inedite,' 12mo, 1845; 'La Divina Commedia. Prima edizione originale italiana, eseguita sotto la Direzione dei Proff. G. B. Niccolini e G. Bezzuoli,' 8vo, 1840, &c.; and 'La Divina Commedia di Dante, &c., ridotta a miglior Lezione da G. B. N.,' 12mo, 1846.

NICHOL, JOHN PRINGLE, astronomer, was born at Brechin, Forfarshire, in 1804. He passed with great credit through King's College, Aberdeen; and then for several years

filled the office of schoolmaster successively at Dun, Hawick, and Cupar-Fife, where he edited a Liberal newspaper. About 1824 he was appointed rector of Montrose Academy, an office he resigned in 1833 on account of ill-health. He had long abandoned his original intention of entering the Church; but his mathematical studies, and his popularity as a lecturer, led to his appointment, in 1836, as professor of practical astronomy in the university of Glasgow. During his twenty-three years' occupancy of this post, although he made no special discoveries in astronomy, he did much, both as a lecturer and a writer, to diffuse a knowledge of the progress of the science. Among other works he published, 'Architecture of the Heavens,' 8vo, Edinburgh, 1837, 9th edition, 1868; 'Phenomena and Order of the Solar System,' 8vo, 1838; 'Thoughts on some important Points relating to the System of the World,' 8vo, 1846; 'The Stellar Universe: Views of its Arrangements, Motions, and Evolutions,' 8vo, 1848; 'The Planet Neptune: its Exposition and History,' 8vo, 1848; 'Order and Structure of the Planetary System,' 1851; 'The Importance of Literature to Men of Business': an Address delivered before the School of Art at Stirling, 1852; 'Cyclopedia of the Physical Sciences,' 8vo, 1857, 2nd edition, 1860—his most extensive work. A paper by him, in the 'Proceedings of the Edinburgh Royal Society' for 1844, was entitled, 'Remarks on the Illustrations presented by the Surface of the Moon, respecting certain Geological Phenomena'; and another, 'Remarks on the Chronology of the Formation of the Moon,' in the 'Proceedings of the British Association,' 1855. He died, September 19th, 1859, and was succeeded in the professorship at Glasgow by Mr. Robert Grant.

NICHOLLS, SIR GEORGE, K.C.B. [E. C., vol. iv. col. 485]. This excellent public servant died on the 24th of March, 1865, in the 80th year of his age.

* NICHOLSON, SIR CHARLES, distinguished for his services in New South Wales, was born November 23rd, 1808, of a Westmoreland family. After graduating as M.D. at Edinburgh University, he went to Australia in 1833, and settled at Sydney as a physician. When parliamentary government was established in New South Wales, he took an active part in the proceedings, and was at various times speaker of the Legislative Assembly, and president of the Legislative Council. He received knighthood in 1852. Sydney University, the most important educational establishment in the southern hemisphere, was greatly aided by him in its inception and organisation; he was vice-chancellor in 1853, and chancellor or rector in 1854 and subsequent years. He received the degree of D.C.L. at Oxford in 1857, and that of LL.D. at Cambridge, in 1858, and was soon afterwards made a baronet. Since his residence in England, he has taken part in many schemes of educational and social improvement, and was one of the commissioners for Australia at the London International Exhibition of 1871.

NICHOLSON, BRIGADIER-GENERAL JOHN, an able Indian officer, was born at Vergemont, county of Dublin, December 11th, 1822. His uncle, Sir J. W. Hogg, a director of the East India Company, sent him in 1839 to India, where he at once assumed active duties as a cadet, and became, in 1841, ensign of the 21st Native Bengal Infantry. He went to Afghanistan in 1840; was at Ghuznee, under Colonel Palmer, in 1842, at the time of the disaster at the Khyber Pass; and was kept in confinement until the defeat of Akbar Khan by Sir Robert Sale and Sir George Pollock. He was promoted to the rank of lieutenant in 1842, and captain in 1845. In 1845—46 he served in the Sutlej, watching the movements of the Sikhs, and taking part in the actions at Moodkee and Ferozeshah. As major, he was appointed assistant to the Resident at Lahore. During the second Sikh war he was associated with Major Herbert Edwardes in the brilliant operations which were so instrumental in bringing the Punjab under British rule; and aided Henry Lawrence at the battle of Chillianwallah. With the rank of colonel, he was mostly engaged in civil duties from the period of the second Sikh war to that of the mutiny, in the district of Dera Ismail Khan—visiting England in the meantime. When the mutiny began in 1857, Nicholson displayed great sagacity and decision in preventing the native troops in the Punjab from joining those at Delhi. He hastily got together a flying column, disarmed some doubtful regiments at Phillour, Umritsir, and Jhelum, and marched on towards Delhi. Brigadier-general Nicholson (for that was now his rank, although only in his thirty-fifth year) was known to the natives as the "Lion of the Punjab," and some of the tribes almost worshipped "Nikkul Seyn" as a superhuman being. His intrepidity was well shown in his extraordinary march from the Punjab to

Delhi, in fiercely hot weather, with only 1200 Europeans, an equal number of Punjabees, whose fidelity was not assured, and through the territories of native princes who were wavering in their loyalty. Nicholson arrived outside Delhi on the 8th of August, and his column a few days afterwards. With 2000 men, he started on the 25th to overtake a rebel force of 7000 at Najuffhur, and after fourteen hours of incessant marching and fighting, completely defeated the enemy. When the storming of Delhi took place on the 14th of September, Nicholson headed the first column, consisting of 1000 men. In one of many attacks on the Lahore Gate, when the troops had to advance along a narrow lane swept by the enemy's grape shot and musketry, a bullet struck Nicholson, who had taken the lead of his men, and he fell mortally wounded. The queen granted the posthumous dignity of Knight Commander of the Bath, in respect for his name; and the East India Company made a special grant of 500*l.* a year to his widowed mother. The iron constitution of John Nicholson came in aid of his skill and daring. An officer who served with him during the Mutiny, said, "The day we marched to Murdan, he was twenty-six hours in the saddle, following up the mutineers."

* NICOL, ERSKINE, A.R.A., was born at Leith in July, 1825. He was apprenticed to a house painter in Edinburgh, but in his spare hours studied so diligently in the Trustees' Academy, that, on the expiration of his apprenticeship, he was found qualified to fill the office of teacher of drawing in the Leith Academy. Whilst occupying this post he laboured with success to obtain more artistic culture, and about 1847 established himself in Dublin as a portrait painter and teacher. The peculiarities of Irish character attracted his attention, and he was induced to dedicate his pencil to the representation of scenes of familiar Irish life. He returned to Edinburgh in 1850, and the following year contributed to the exhibitions of the Royal Academy, London, and the Scottish Academy, in both cases with decided success—his subjects being 'Done Up Intirely'; 'Spirits an' Tibbaksy.' Of this class of pictures, including the well-known 'Did it pout with its Betsy'; 'Toothache'; 'Guinness's Best'; 'Waiting an Answer'; 'The Hope of the Family'; 'A Deputation'; 'The Lease Refused'; 'Children's Fairing'; 'Both Puzzled'; &c.; mostly of small size and skilful execution, he continued to furnish examples to the exhibitions, and the oddities of Irish expression and character being rendered with a good deal of dry humour, they have obtained a large share of popularity. Mr. Nicol, who had been for some years an associate of the Scottish Academy, removed in 1862 to London, and in 1866 was elected associate of the Royal Academy. Several of his pictures have been engraved.

NIEDERMAYER, ABRAHAM LOUIS, musical composer, was born at Nyon, Canton de Vand, Switzerland, April 27th, 1802. He went at an early age to Vienna, where he studied composition under Forster, and the pianoforte under Moscheles; and thence to Italy to complete his education under Fioravanti and Zingarelli. He began to compose in 1820. In 1828, he went to Paris, and received advice and encouragement from Rossini. In 1833—34 he was a teacher of the pianoforte at Brussels. Returning to Paris, he produced his best opera, 'Stradella,' in 1837. In 1843, he compressed this work from five acts into three. In 1845, Louis Philippe decorated him with the Legion of Honour. In 1846, he assisted Rossini in adapting his 'Donna del Lago' for the French stage. About the year 1853, Niedermayer organised a plan for a school of religious music for the training of composers, singers, organists, and chapel-masters; he devoted much attention to this establishment, writing and composing for it, with the aid of a government subvention, and educating many pupils who became good ecclesiastical musicians. Besides 'Stradella,' his chief compositions, before this period of his life, were the following:—'Il Reo per Amore,' opera, 1820; 'Casa nel Bosco,' two act opera, 1828; 'Marie Stuart,' five act opera, 1844 (a romance in this work became very popular); 'La Fronde,' five act opera, 1853. He composed many melodious vocal pieces, somewhat in the style of Schubert, under the titles, 'Le Lac,' 'L'Isolément,' 'Le Soir,' 'L'Automne,' 'La Voix Humaine,' 'L'Âme du Purgatoire,' &c. He also composed several masses, pianoforte pieces, and organ pieces. In 1855 he published 'Traité d'Accompagnement du Plain Chant,' in conjunction with M. d'Ortigue, in which they developed some new views which have attracted the attention of scientific musicians. In 1856 he commenced a new journal of religious music, 'La Maîtrise,' which he edited for two years. He was preparing an extensive work on organ accompaniment when attacked with his final illness; he died at Paris, March 14th, 1861.

BIOG. DIV.—SUP.

NIEL, ADOLPHE, marshal in the French army, was born at Muret, Haute Garonne, October 4th, 1802. In 1821 he entered L'École Polytechnique, and two years afterwards L'École d'Application at Metz. He was promoted to the rank of lieutenant of Engineers in 1827, and captain in 1830. Proceeding to Algiers in 1832, he distinguished himself at the taking of Constantina. He became chief of battalion in 1837, lieutenant-colonel in 1842, and colonel in 1846. In 1849 he was attached to the expedition to Rome as chief of the engineering staff; was made general of brigade, and presented the keys of Rome to the Pope at Gaeta in the same year. On returning to France, he became head of the engineers' department in the Ministry of War, and one of the military advisers of the government; to which was added the rank of general of division in 1853. When the Russian war broke out, he commanded the engineers in the Baltic, and was made aide-de-camp to the Emperor for his services at the capture of Bomarsund. Early in 1855 he was sent to the Crimea to report upon the state of the French army outside Sebastopol, and on the best mode of prosecuting the siege. His views meeting with approval, he was appointed to the command of the Engineers in the Crimea, and took a prominent part in the operations which brought the war to an end. A history of these operations, 'Le Siège de Sebastopol,' was published by him, 1858, 4to, with atlas. For these services he was made Grand Cross of the Legion of Honour. He became senator in 1857. In 1858, as aide-de-camp to the Emperor, he went to Italy, to demand the hand of the Princess Clotilde for Prince Napoleon. When war broke out with Italy in 1859, he took command of the first army corps, and for his services at Solferino was raised to the rank of marshal of France. During the next few years he was quietly occupied as president of the Council General of Haute Garonne. In 1867 he succeeded Marshal Randon as Minister of War, made great changes in the organisation of the army, introduced the Chassepot rifle, and formed a new kind of militia under the name of the Garde Mobile. He died rather suddenly, August 13th, 1869, before he had completed his plan for strengthening the army in numbers and organisation; and France, when plunged in war with Germany, had cause to regret his loss.

NIÉPCE DE SAINT VICTOR, CLAUDE FÉLIX ABEL [E. C. vol. iv. col. 507]. In 1857—58 M. Niépce de Saint Victor published an account of a singular property which he believed he had discovered in light of becoming, under certain circumstances, latent or absorbed ('Mémoire sur une Nouvelle Action de la Lumière,' three papers). Great interest was excited by the announcement, and the experiments were repeated and varied by numerous investigators, with the result that the phenomena could be produced by heat as well as by light. Later he published memoirs on the action of light on vines, in electricity, &c. He also continued his efforts to produce colour in photography, and he sent to the International Exhibition of 1862 heliochromes, or photographs in the natural colours, obtained from models, drawings, &c. The colours were, however, faint and fugitive, and though he continued his experiments, he failed to discover any means of fixing the colours. To the same exhibition he also sent numerous specimens of his process of heliographic engraving, which appeared full of promise, but has not been made commercially successful. He died from an attack of apoplexy in April, 1870. A collection of his letters has since been published by M. Victor Fouqué, with an introductory notice, in which the merit of rendering the discovery of photography available, if not the actual discovery, was claimed as due to M. Niépce de Saint Victor rather than to M. Daguerre.

NITZSCH, CHRISTIAN LUDWIG, zoologist, was born at Benaha, a small village, near Leipzig, September 3, 1782. His education was received partly at Wittenberg, and partly at Gotha. His taste for natural history was early developed, so that even when a boy he used to spend his leisure evenings in studying the works of Linnæus, which studies were encouraged by the two Erdmanns, one of whom was professor of physic at Dresden, the other professor of medicine at Wittenberg. In 1808 he took his M.D. degree, and shortly after became the extraordinary professor of zoology and botany at Wittenberg. In 1816 he was transferred to the chair of zoology at Halle, with which was comprised the directorship of the Zoological Museum. In 1827 and 1835 he made extensive tours through Europe for the purpose of forming the acquaintance of the principal naturalists, and of ascertaining the condition of science in the various centres of learning. He died August 16, 1837. Nitzsch gave his especial attention to birds, and although he was a con-

stant and laborious worker, he produced comparatively little, owing to his peculiar temperament, his method of working, and his short life. He formed an elaborate plan of investigation, in accordance with which he collected an immense mass of material, but his life was not sufficiently long to permit of his elaborating it into memoirs. His design was to work out every part of his subject before publishing any isolated papers respecting it, and the great aim of all his investigations was to discover the truly natural system of birds. For his purpose he found that three branches of investigation required especial attention, viz., the internal structure, the arrangement of the feathers, and the parasites. The latter two subjects he made especially his own. One of the earliest papers was entitled 'Pterographische Fragmente,' and was published in 'Voigt's Magazin' for 1806. When he had passed his 50th year his health began to give way, and he thought it desirable to hasten the publication of the principal results of his labours. He had already, in 1818, issued one instalment, viz., that on parasites, in Germar's 'Magazin für die Entomologie' for that year, under the title of 'Die Familien und Gattungen der Thierinsecten (Insecta epizoica) als Prodrum einer Naturgeschichte derselben.' He now commenced the second on pterylography, but at the time of his death the work was not completed; he left, however, sufficient material for the standard work on the subject, which was published after his death under the editorship of H. Burmeister, under the title of 'System der Pterylographie,' 4to, Halle, 1840. He wrote comparatively little respecting the third branch of his subject, that on internal structure. The principal contribution published during his lifetime was 'Observationes de Avium de arteria carotide communi,' 4to, Halle, 1829, in which he gives a classification based upon the form and position of this artery. The manuscripts left by him furnished materials for several papers, which have appeared in the 'Zeitschrift für die gesammten Naturwissenschaften' for 1859 and subsequent years. They include papers on the anatomy of parrots, sparrows, and *Vultur fulvus*; on epizotic parasites; and on *Entozoa*.

NOBILI, LEOPOLD, was born in 1784, and died at Florence, 5th August, 1835. In the earlier part of his life he served in the army, but having a taste for science he quitted it, retired to Reggio, and published some theoretical speculations on magnetism and light. In 1825 he directed his attention to experimental science, and invented the galvanometer with two needles; also, in conjunction with M. Melloni, the thermomultiplier, which has rendered so many services to the science of heat. He published several papers on electro-physiology, on thermo-electricity, on chemical action, magnetism, and electricity. He is also known for his researches on the colours developed on metallic plates by voltaic action. He named the new process 'Metallochromy.' His papers were published in the 'Bibliothèque Universelle,' but translations of a number of them appeared in Taylor's 'Scientific Memoirs.' A long notice of him will be found in Tipaldo's 'Biografia degli Italiani illustri,' vol. v.

* NÖGGERATH, JOHANN JACOB, mineralogist, was born at Bonn, October 10, 1788. In 1814 he was appointed one of the mining commissioners for the district of Ourthe, and in the following year he was nominated to a similar office in connection with the Roër, Rhein, and Moselle districts; so that he was officially connected with nearly the whole mining area of the province of the Lower Rhine. In 1822 he took the chair of mineralogy and oryctognosy at Bonn—first as the extraordinary professor, and subsequently, in 1828, as the ordinary professor. He has published numerous works and papers on minerals, rocks, and fossils, more especially those which occur in the Prussian provinces bordering on the Rhine below Mayence. The whole district was thoroughly well known to him, and this circumstance, combined with the opportunities which his official posts afforded him, enabled him to contribute a large amount of information respecting it. Some of the earliest works are amongst those which are best known, as, for instance, 'Mineralogische Studien über die Gebirge am Nieder-rhein,' 8vo, Frankfurt-am-Main, 1808; and his account of the lignite beds at Putzberg. He also wrote a more general work, in which J. Burkart was his coadjutor, which has for title, 'Der Bau der Erdrinde nach dem heutigen Standpunkte der Geognosie,' fol. Bonn, 1838. Science is also indebted to him for accounts of several earthquakes which have been felt in the Rhine valley, of two or three remarkable falls of hail, and of the agate quarries of Oberstein, in which last paper he describes the means employed for artificially colouring these stones. A genus of ferns

which flourished in the Devonian and Carboniferous periods has been named after him.

NORDEN, JOHN, topographer and surveyor, was born about 1548. He was admitted a commoner of Hart Hall, Oxford, in 1564; graduated B.A. in 1568, and M.A. in 1573. He commenced his career as an author, by the publication of several devotional treatises, which, though now exceedingly scarce, appear to have been long held in much esteem. Of these the first probably was 'The Sinful Man's Solace,' 8vo, London, 1585, a tract of 12 pages, partly in verse; and it was followed by 'A Pensive Man's Practice,' 4to, 1585, fortieth edition, 12mo, 1629; 'Mirror for the Multitude,' 8vo, 1586; 'Antithesis or Contrarietie between the Wicked and the Godlie. Set forth in form of a Pair of Gloves fit for every man to wear,' 1587; 'Poor Man's Rest,' eighth edition, 12mo, London, 1620, fifteenth edition, 1641; 'Progress of Piety,' London, 1596, reprinted by the Parker Society; 'Christian Comfort and Encouragement unto all English Subjects not to dismay at the Spanish Threats,' 8vo, London, 1596; 'Mirror of Honour,' 4to, London, 1597; 'Interchangeable Variety of Things,' 4to, London, 1600; 'The Labyrinth of Man's Life, or Virtue's Delight,' 4to, London, 1614; 'Loadstone of a Spiritual Life,' 16mo, London, 1614; 'Pensive Soul's Delight,' 12mo, London, 1615; 'An Eye to Heaven in Earth,' 12mo, London, 1619; 'Help to True Blessedness,' 12mo; 'Pathway to Patience in all manner of Afflictions,' 8vo, London, 1626.

What led Norden to adopt surveying as a profession is unknown. He resided in the neighbourhood of London, first at Fulham, and afterwards for many years at Hendon, and he was patronized by Lord Burleigh and other distinguished persons. In 1593, he published 'Speculum Britanniae, the first parte. An historical and chorographical description of Middlesex,' small 4to, with a dedication to Queen Elizabeth, followed by an address to Lord Burleigh, a work of great interest to the county antiquary, not merely as for the curious information it furnishes respecting the condition of Middlesex towards the end of the 16th century, but on account of its containing original maps of Middlesex, London, and Westminster. Other works of this class were 'Preparative to his Speculum Britanniae,' 4to, 1596; 'Speculi Britanniae Pars. The description of Hartfordshire,' 4to, 1598, reprinted 1610, and again 1618: the previous works were issued together in 1637, with the title 'England. An Intended Guide for English Travellers, shewing in general how far one Citie, and many Shire-Townes in England, are distant from other. Together with the Shires in particular; and the Cheife Townes in euery of them. With a general Table of the most of the principall Townes in Wales,' 4to, 1625. Norden left in MS. 'Speculi Britanniae pars altera; or a Delineation of Northamptonshire,' which was published in 8vo, 1720; 'Speculi Britanniae Pars. A Topographical and Historical Description of Cornwall,' published in 4to, 1728; 'Speculi Britanniae Pars: an Historical and Chorographical Description of the County of Essex,' printed by the Camden Society in 1850; accounts of Kent and of Surrey, noticed by Gough and Rawlinson, as still in existence; and a 'Survey of Windsor Forest,' printed in fac simile, folio, 1845. Norden explained his practice as a surveyor in a 'Surveyor's Dialogue, divided into five books,' 4to, 1607, "with a sixth book newly added," 4to, 1610, third edition, 1618, fourth edition, 8vo, 1738. Several surveys by Norden remain in MS. in the British Museum, the archiepiscopal library at Lambeth, and other great collections. Norden was made surveyor to the King's Woods about 1607, prior to which he appears to have been in distress, caused, according to the statements prefixed to his volumes, by the expenses incurred in making his surveys and preparing them for publication. According to Granger, his stipend as crown surveyor was 50*l.* per annum: his son was associated with him in the office. John Norden died about 1626.

NORDENSKIÖLD, NILS, mineralogist and geologist, was born in 1792 or 1793. He commenced the study of mineralogy at a very early period of his life, and was a pupil of Berzelius. Thus, in 1815, his first paper, on Rumänzouite or Romanzouite, was published; and in 1821, no fewer than ten of his papers were published. In 1820 he gave the results of the numerous excursions he had made in Finland, in the form of an octavo volume, on the mineralogy of that country. In 1824, he was appointed chief director of the mines of Finland, and retained the office till 1855. Hence most of his more important investigations relate to the country with which he was so long connected. His high official post gave him special facilities for obtaining and examining the minerals of the Russian empire.

generally. He is one of the principal authorities on Swedish minerals. He is, however, best known on account of his researches on the glacial phenomena of Finland, which he illustrated by a new map of that region and by a memoir entitled 'Beitrag zur Kenntniss der Schrammen in Finland,' 8vo, Helsingfors, 1863. One of the most important results of these researches, was his clear demonstration of the fact that the glaciation of Finland was due to icebergs drifted along by oceanic currents; and not to terrestrial glaciers. He died at Frugard, February 21, 1866. His son, Professor Adolph Nordenskiöld, is well known as an explorer of Spitzbergen and the Arctic regions.

NORMANBY, CONSTANTINE HENRY PHIPPS, K.G., FIRST MARQUIS OF [E. C. vol. iv. col. 522]. Lord Normanby retained the post of Minister Plenipotentiary at the Court of Tuscany till 1859, when he was recalled. In 1857, he published 'A Year of Revolution. From a journal kept in Paris in 1848,' 2 vols. 8vo. He was, it will be remembered, the English Ambassador at Paris, in 1848, and the recklessness of his statements and the strictures in which he indulged on the various actors in the revolution, called forth much animadversion and several replies. But, with all its small scandal, the book was too dull a one to attract attention beyond the circles immediately interested. After his return from Florence, Lord Normanby took a rather frequent part in the debates in the House of Lords, and published one or two political pamphlets. He died on the 28th July, 1863, and was succeeded by his eldest son, **GEORGE AUGUSTUS CONSTANTINE PHIPPS**, second Marquis of Normanby, born 1819, who has been Treasurer and Controller of the Household, and a Lord-in-waiting to the Queen; Governor of Nova Scotia, and, 1871, Governor of Queensland.

* **NORTHCOTE, RIGHT HON. SIR STAFFORD HENRY, M.P.**, eldest son of the late Henry Stafford Northcote, Esq., who died without having enjoyed the family honours, February 22nd, 1850, was born in Portland Place, London, on the 27th of October, 1818. He was educated successively at Eton and at Balliol College, Oxford, where he took his B.A. degree, in 1839, when he was first-class in classics, and third-class in mathematics; proceeded M.A. in 1842; and was admitted to the honorary degree of D.C.L. in 1863. On the 19th of November, 1847, he was called to the bar by the Society of the Inner Temple, and became legal secretary to the Board of Trade, to the then president of which, Mr. Gladstone, he had acted as private secretary. By the death of his grandfather, Sir Stafford Henry Northcote, March 17th, 1851, he succeeded to the baronetcy; and on the 25th of October, in the same year, was gazetted C.B. of the civil division, in consideration of the zeal and ability with which he had performed his duties as "one of the Secretaries to the Commissioners of the Exhibition of Industry of all Nations." He was returned to the House of Commons as Conservative member for Dudley, in March, 1855, and continued to represent that constituency until April, 1857. He sat as member for Stamford, from July, 1858, to May, 1866, when he was elected for North Devon, which he had unsuccessfully contested in 1857. Sir Stafford's official career has varied with the political fortunes of his party. He was financial secretary to the Treasury, between January and June, 1859; was appointed, July, 1866, to the presidency of the Board of Trade, in the third administration of Lord Derby; and held this office till March, 1867, when he became Secretary of State for India and President of the Council for India. During his tenure of office, which continued till December, 1868, he distinguished himself for the practical interest he manifested in the spread of education amongst the people of India, and especially for the establishment of the "Northcote Scholarships," since withdrawn, for the purpose of enabling the most promising youth of India to complete their education in England. Sir Stafford Northcote was one of the English Commissioners appointed to treat with the Commissioners of America, for the settlement of the Alabama claims, and other vexed questions between the two countries; and their joint labours, which were carried on at Washington, happily resulted in the Treaty named after that city, and ratified by the respective Governments, July, 1871. Sir Stafford is an elder brother of the Trinity House, and chairman of the Hudson's Bay Company; whilst his local offices in his own county of Devon include a justiceship of the peace and a deputy-lieutenancy (1854); and in 1851 he became a captain in the first Devon Yeomanry Cavalry. His literary productions are few, the principal of them being 'A Statement of Facts connected with the Election of the Right Hon. W. E. Gladstone as Member for the University of Oxford in 1847,

and with his Re-elections in 1852 and 1853,' 8vo, Oxford and London, 1853; and 'Twenty Years of Financial Policy. A Summary of the Chief Financial Measures passed between 1842 and 1861, with a Table of Budgets,' 8vo, London, 1862.

NÔTRE, ANDRÉ LE [LE NÔTRE, ANDRÉ, E. C. S. col. 796.]

NUTTALL, THOMAS, botanist, was born at Settle, in Yorkshire, in 1786. He was apprenticed to a printer, and served as a journeyman printer for several years at Halifax and Liverpool. The occupation not proving satisfactory, he went to the United States in 1808. Soon after his arrival in America, he was introduced to Professor Barton, became intimate with him, and was by him induced to apply himself to botanical research. In order to extend his knowledge of plants, he made many and long journeys. Thus, in 1809, and the two following years, he joined Mr. John Bradbury in an expedition up the Missouri valley; and he spent the summer months of several succeeding years in botanical excursions, while the winter months were mainly occupied in arranging the objects collected, and in submitting them to critical examinations. In 1818, he and several friends performed a perilous voyage of 5000 miles through unexplored districts in the region of the Arkansas, and the north-west portions of North America. In 1822, he was appointed curator of the botanic gardens at the Harvard University. In 1834, he made an overland journey to the Pacific, and visited the Sandwich Islands. In 1842 he returned to England, where some property had been bequeathed to him by a relative, one of the provisions in whose will was that Mr. Nuttall should reside on the property for a certain time every year. He only revisited the United States once, for a few months, in 1852. He died at his residence, Nutgrove, near Wigan, Lancashire, September 10th, 1859. Although originally an artisan, Mr. Nuttall became, by dint of hard study and exertion, one of the foremost botanists of America. But his studies were by no means confined to plants. He also gave considerable attention to birds and molluscs. His earliest work, excepting a few papers, was 'The Genera of North American Plants, and a Catalogue of the Species for the year 1817,' 2 vols. 8vo, Philadelphia, 1818. It was in great part set up in type by himself, and large portions were composed without any copy. This work had a great influence in advancing the accurate knowledge of the plants of the United States. His 'Journal of Travels into the Arkansas Territory, during the year 1819,' 8vo, Philadelphia, 1819, contains much information respecting the inhabitants and the meteorology of the regions passed through. Amongst his other works may be noticed his 'Manual of the Ornithology of the United States, and of Canada,' 12mo, Boston, 1834, second edition, 1840; 'The North American Sylva,' 3 vols. 8vo, Philadelphia, 1842-49; and numerous diagnostic botanical papers contributed to American scientific periodicals. His biographer, Elias Durand, says of him that "no other explorer of the botany of North America has, personally, made more discoveries; no writer on American plants, except, perhaps, Professor Asa Gray, has described more genera or species."

NYE, PHILIP, a prominent nonconformist divine of the 17th century, was born of what Anthony Wood calls a "genteel family" in Sussex, in or about the year 1596. On the 21st of July, 1615, he was entered a commoner of Brasenose College, Oxford, from which he shortly afterwards migrated to Magdalen Hall, of which he continued a member until his graduation as B.A. on the 24th of April, 1619, and M.A. on the 9th of May, 1622. He was curate of St. Michael's, Cornhill, London, in 1630; and three years later, in order to escape the imperious measures of Laud, he took refuge in Holland, where, with Dr. Thomas Goodwin, who had also become a refugee, he undertook the co-pastorate of an English congregation, constituted on the Independent model, at Arnheim, in Guelderland. He returned to England late in 1640, and by the favour of Lord Kimbolton, afterwards Earl of Manchester, a partisan of the Long Parliament, was appointed to the living of Kimbolton, in Huntingdonshire. In July, 1643, he was sent, with Stephen Marshall, whose daughter he had married, and others, to Edinburgh, as a member of the commission appointed to treat with the Scotch for their co-operation in the measures agitated by the English Parliament; before both Houses of which he preached, after his return, on the occasion of their taking the Covenant (September 25th) which he had gone to Scotland to expedite. He became the leader of the "dissenting brethren" in the Assembly of Divines at Westminster, which met on the 1st of July in the Jerusalem Chamber. His various services were rewarded by presentation to the rectory of Acton, Middlesex, in succession to Dr. Daniel Fairclough, *vulgariter* Featley, who was ejected

from this and his other preferments. In 1648 Mr. Nye was one of the chaplains who attended the commissioners to King Charles I., then detained at Carisbrook Castle, in the Isle of Wight; and in 1653 was appointed one of the triers of ministers under the Protector, by whose orders he was also concerned as a principal person in managing the meeting of the Congregational Churches at the Savoy, where the 'Declaration of the Faith, Order, and Practice of the Congregational Churches in England' was agreed upon by their elders and messengers, October 12th, 1658. This document, which is of considerable importance, was published in 1659, and was translated into Latin by Professor Hornbeck, or Hoornbeck, at the end of his 'Epistola de Independentismo: cum Independentium in Anglia Confessione,' 8vo, 1661. Nye's political action had been so free and so prominent against Charles I., that, after the Restoration, it was seriously debated by the "Healing Parliament," for several hours, whether he and John Goodwin should be "excepted for life" from the Act of Indemnity (August 29th, 1660), and it was finally determined that, "if Philip Nye, clerk, should, after the first of September following, accept or exercise any office, ecclesiastical, civil, or military, he should, to all intents and purposes in law, stand as if he had been totally excepted." His papers were seized in accordance with an Act of Parliament, and lodged in the archiepiscopal palace at Lambeth; and he is said by Wood, a bitter adversary, to have been "vehemently suspected" of complicity in the conspiracy against the Government, for which Philips, Tonge, Gibbs, and Stubbs were executed, December 22nd, 1662. After Nye's ejection, 1660, from the rectory of St. Bartholomew behind the Exchange, a benefice which he had enjoyed for several years, he preached privately, as opportunity offered, to a congregation of Dissenters, until his death, on the 27th of September, 1672. He was buried in St. Michael's Church, Cornhill, leaving behind him a reputation which has been heartily assailed and vindicated

according to partisan prepossessions. In 'Hudibras' there are two or three uncomplimentary allusions to him, and in Butler's 'Genuine Remains,' occurs an entire poem of over a hundred lines 'Upon Philip Nye's Thanksgiving Beard,' an appendage which Nye, in common with many of the contemporary puritan clergy, cultivated with great care.

Nye is the author of several works, many of which, once of vital importance in the controversies of his time, are now of little but historical interest. They include an 'Exhortation to the Taking of the Solemn League and Covenant, for Reformation and Defence of Religion,' &c., 4to, London, 1643, and several times reprinted; 'The Excellency and Lawfulness of the Solemn League and Covenant, set forth in a Speech to the House of Commons and the Reverend Assembly of Ministers, at the taking of the said Covenant, 25 September, 1643,' 4to, London, second edition, 1660; 'Beams of former Light: discovering how evil it is to impose doubtful and disputable Forms for Practices upon Ministers, especially under the Penalty of Ejection for Nonconformity unto the same,' &c., 4to, London, 1660; 'Case of great and present Use,' &c., 8vo, London, 1677; 'The Lawfulness of the Oath of Supremacy, and Power of the King in Ecclesiastical Affairs. With Q. Elizabeth's Admonition,' &c., 4to, London, 1683, which was printed, for the third time, with a modified title, in 1687, with a dedication to James II., by Henry Nye, the author's son; 'Vindication of Dissenters: proving that their particular Congregations are not inconsistent with the King's Supremacy in Ecclesiastical Affairs,' which was incorporated in a volume with 'The Lawfulness,' &c., 4to, London, 1683. Nye produced many works jointly with other divines of his party; and was concerned, with Thomas Goodwin, in editing a work entitled 'Bowels Opened; or, a Discovery of the neare and deare Union betwixt Christ and the Church, in divers Sermons on the Canticles, by that reverend and faithful Minister of the Word, Dr. Sibbs,' 4to, London, 1641.

O

O'DONNELL, LEOPOLDO, DUKE OF TETUAN, Count of Lucena, a grandee of the first class, a statesman, and a marshal of Spain, the third of the four sons of the Count of Abisbal, a distinguished officer of artillery, was born, according to the more probable authorities, on the 12th of January, 1809. He was descended from a family of Irish refugees, who left Donegal and settled in Spain in the beginning of the last century. At fifteen he joined the army, in which it is said he had held a lieutenant's commission since his eleventh year; was promoted to a company at nineteen; and in his twenty-fifth year had already attained the rank of colonel. In the civil war which followed the death of Ferdinand VII., September 29th, 1833, O'Donnell declared himself in favour of the new law of succession and of the regency of Maria Christina, the Queen-Mother; whilst his brothers, yielding to the influence of their mother, between whom and the Princess Maria Francisca, wife of Don Carlos, an intimate friendship subsisted, took up arms for the Pretender. O'Donnell distinguished himself by the courage and conduct which he displayed as a soldier of Queen Isabella, and it was remarked that he hardly ever went into action without being wounded, sometimes severely, and once so dangerously that he was obliged to retire from active service for a year. His sufferings were compensated, however, by the rapidity of his professional promotion, which was accelerated by the warm interest of Espartero in his favour. After the second siege of Bilbao, 1836, he was promoted to the rank of general of brigade, and was named to the command of the army of Guipuzcoa, and held the post until he was summoned to the head-quarters of Espartero at Logroño, in January, 1839. He was soon transferred to the command of the army of the centre, and, having compelled Cabrera, who was at the head of the Carlist forces in Aragon, to raise the siege of Lucena, which in fact put an end to the war in that part of Spain, as it had terminated in the northern provinces, he was created Count of Lucena, and promoted to be a lieutenant-general. In 1840,

having been appointed Captain-General of Valencia, he used all his influence on the side of the Queen-Regent, in an endeavour to counterbalance the power of his benefactor Espartero, who, in spite of this combination, was declared Regent during the minority of the young Queen, by the Cortes, in 1841. Hereupon O'Donnell was obliged to resign his command, and to seek refuge in France, where he joined the Queen-Mother, in whose interest, when the military conspiracies broke out all over Spain, he repaired to Pampeluna, where he placed himself at the head of an insurrectionary movement against the Regent, whilst an attempt was almost simultaneously made at Madrid, by General Diego Leon and others to gain possession of the palace. Both enterprises failed, and O'Donnell returned to France, where he continued to carry on his machinations against the Regent, whose overthrow was at length accomplished by the military movement which resulted in the triumphal entry of Narvaez into Madrid, on the 24th of July, 1843. For his share in this success, O'Donnell was presently rewarded with the lucrative post of Captain-General of Cuba; and, having left Spain a poor man, went back thither, after a few years of office, with a fortune of a million dollars, a sum which he could not have amassed out of the savings of his salary, and which has been roundly described as made up of "the perquisites of his underhand connivance with the slave trade which he had been sent out to prevent." On his return to Spain, he became a member of the Senate, and was soon afterwards appointed, under the Narvaez administration, to the post of director-general of the Infantry, which he held until 1851. After the fall of Narvaez, in January of the last-named year, O'Donnell continued in opposition to the succeeding ministries of Roncali, Lersundi, and Sartorius. Against Sartorius, who is otherwise known as the Count of San Luis, a vast conspiracy, numbering both Moderados and Progresistas amongst its members, was organised, and of this conspiracy O'Donnell was the leading spirit. On the 28th of June, 1854, he placed himself at the

head of the revolution which resulted in a national demand for the return to power of Espartero, under whom O'Donnell accepted the office of Minister of War, August 1st, 1854. In July, 1856, O'Donnell, who, after a time, had begun to quarrel with Espartero, supplanted the latter as Prime Minister and President of the Council, and maintained himself in his position with much severity and bloodshed until Narvaez again succeeded to the premiership in 1857. O'Donnell was again called to power, however, on the 1st of July, 1858, as Minister of War and President of the Council; and, as a variety from the monotonous repetition of domestic massacre, declared war against Morocco on the 23rd of October, 1859, and himself undertook the command-in-chief of the army. The war was a uniformly victorious one on the part of Spain; and O'Donnell, after he had dictated the terms of peace, found himself at such a height of popularity, that he was able to extend the duration of his administration until his resignation, February 26th, 1863, so concluding a term of office without parallel in the political history of Queen Isabella's reign. In acknowledgment of his services in Morocco, O'Donnell was promoted to be a field-marshal, was created a grandee of Spain, and Duke of Tetuan, his title being commemorative of the brilliant victory won on the 4th of February, 1860, in the neighbourhood of that town, and of its capture two days afterwards. He was succeeded as war minister by General Concha; but, after a short interval of a Narvaez cabinet, he was again installed in office on the 22nd of June, 1865. He was assisted by Narvaez in suppressing a great military revolt at Madrid, June 26th, 1866; and, upon his resignation in the following month of July, his administration was succeeded by the Narvaez-Murillo cabinet. He died at Biarritz, whilst waiting the turn of events in Spain, on the night of the 5th of November, 1867, of an asthmatic complaint of some years' standing. His remains were conveyed to Madrid, where his obsequies were celebrated with much pomp and ceremony. Against the habitual treachery and tergiversation which characterised the career of O'Donnell, causing him to lose sight of the dishonour of the means so that the end did but appear desirable, it is to be recorded to his credit that he looked farther forward and around than either of his colleague-rivals, Narvaez and Espartero, and exhibited on the whole more of statesmanship than any recent Spanish politician.

OERSTED, ANDERS SANDÖE [E. C. vol. iv. col. 553]. This eminent Danish statesman and author ended his long and chequered career on the 1st of May, 1860, in the 82nd year of his age. The promised continuation of his autobiography has not appeared, and probably was not written.

* OFFENBACH, JOACHIM, musical composer, was born at Cologne, June 21st, 1819 (or, according to other authorities, July 20th, 1822). He studied music as a pupil at the Conservatoire, and in later years became chef d'orchestre at the Théâtre Français. He was first known as a composer by adapting some of La Fontaine's fables to music; each fable constituting a musical scene, vaudeville, or operetta di camera. They were popular as specimens of light and gay composition. In 1855, he undertook the directorship of the Théâtre des Bouffes Parisiens; and it is there that the operas were produced which have made his name celebrated. In sixteen years he has written more than thirty of these operas, not all short, but all sparkling and merry, some of them puerile, and some associated with scenes and language characteristic of the low moral tone of the second empire. The best known among them are 'Orphée aux Enfers,' 'La Belle Hélène,' 'La Barbe Bleue,' 'La Grande Duchesse,' 'La Princesse de Trebizonde,' 'Vert Vert,' 'La Perichole,' and 'Les Brigands.' During the Exhibition year, 1867, M. Offenbach is said to have received no less than 240,000 francs for royalty or copyright on the representation of his operas. It was especially 'La Grande Duchesse' which drew large audiences; but this was due rather to the manner in which the principal character was portrayed by a Parisian actress, than to the merit of the music. In 1870-71, during the closing of the Paris theatres by war, several French companies visited England, and Offenbach's operas were largely represented in London. Notwithstanding the want of depth, science, and refinement in his music, there is much that is sparkling and brilliant in the melodies and arrangement.

OGLETHORPE, GENERAL JAMES, founder of the Colony (now State) of Georgia, America, was the third son of Major-General Sir Theophilus Oglethorpe, and was born in Westminster on the 1st of June, 1689. He matriculated at Corpus Christi College, Oxford, in 1714, but had entered the army as ensign in 1710, and in 1714 was captain-lieutenant in the First

Queen's Life Guards. To improve his military knowledge, he volunteered to serve under Prince Eugene, and gained honourable notice at the siege of Belgrade in 1717. By the death of his elder brother, he succeeded to the family estate, Westbrook, Surrey, and in 1722 was elected M.P. for Haslemere, which town his father and brother had represented before him. His family had strong Jacobite tendencies, and his elder brother had joined the Pretender in France; but James Oglethorpe remained loyal to the reigning dynasty, though in the House he took an independent course. He came prominently forward in 1728, when, having become acquainted with the inhuman treatment of prisoners confined for debt in the Fleet Prison, he brought the subject before the House of Commons, supporting his case by so terrible an array of facts that a Prison-Visiting Committee was appointed, with Oglethorpe for chairman. The committee did their work thoroughly; the prisons throughout the country were visited; the reports presented to the House displayed so fearful an amount of cruelty that measures were adopted for greatly ameliorating the condition of the unfortunate prisoners; and the keepers of the Fleet and Marshalsea Prisons were by an Act disabled from holding their office, and afterwards tried for murder but acquitted. Oglethorpe had devoted three years to this self-imposed duty, but he felt that his task was only half accomplished unless he could provide a means of subsistence for those he had been instrumental in setting free, and open a channel for the profitable employment of others in like circumstances. His thoughts had been directed towards the unoccupied territory south of the Savannah river, lying between the colony of South Carolina and the Spanish province of Florida in North America, as a promising country for colonization. He accordingly matured a large scheme for founding a colony, and succeeded in inducing a number of opulent persons to join him in advancing funds and to assist in the management. He and his associates obtained a charter, dated June 9th, 1732, for "settling and establishing the Colony of Georgia in America," the colony being so named in honour of George II., by whom the charter was granted. In furtherance of his scheme, Oglethorpe published two pamphlets, 'A New and Accurate Account of the Provinces of South Carolina and Georgia,' and 'An Essay on Plantations,' 8vo, London, 1732; and the trustees appealed to Parliament and the public to enable them to provide free passage, clothes, and provisions for the emigrants, and to meet the necessary expenses. The House of Commons voted them 10,000*l.*, and 26,000*l.* more in the next two years, and considerable sums were furnished by public bodies and private benefactors. On the 16th of November, 1732, the ship *Anne* sailed from Gravesend with the first body of emigrants, about 120 in number, for Georgia. Oglethorpe accompanied them, with the title of governor of the colony, he having however stipulated that he was "to receive no salary or other recompense" for his service. They reached Charleston Harbour, South Carolina, on the 13th of January, 1733, and arrived at Savannah on the last day of the month. Here Oglethorpe landed his followers, and marked out the site of his first town. One of his earliest measures was to obtain an interview with the native chiefs, and enter into a treaty of alliance with them, and to settle terms for a cession of territory, it being, as he said, his hope "that the settlement of Georgia may prove a blessing, and not a curse, to the native inhabitants." He now set about clearing and sowing the ground, building houses, making roads and defences, and forming a plan of government, he himself living all the time under canvas. Other emigrants arrived, including a band of persecuted Protestants from Saltzburg, to whom Oglethorpe had offered a home, and having explored the country and ascertained its capabilities, he sailed for England, April, 1734, taking with him some Indian chiefs, his purpose being to obtain additional emigrants of a better class, and to interest the home authorities in the welfare of the Indians. He remained in England till October, 1735, when he again set sail, this time taking with him John and Charles Wesley as chaplains and missionaries. He again returned to England in November, 1736. The conduct of the Spaniards making it necessary to concert measures for the defence of the infant colony, Oglethorpe received the appointment of general of the forces in Georgia, but the material assistance afforded by the home government was slight and inefficient. Oglethorpe, however, returned to Georgia, and during the five years he remained there was able to repel every inroad of the Spaniards, and to inflict upon them serious losses, though he failed in an attempt to take St. Augustine, mainly through want of co-operation on the part of the commander of the fleet. Oglethorpe had admirably organized and disciplined

the settlers, had founded several new towns, put the colony into a good state of defence, and established terms of close friendship with the natives, who regarded him with unbounded esteem and reverence; but he was overburdened with liabilities, the home treasury having dishonoured his drafts for military and other expenses, and he felt that it was necessary to return home. He left Georgia for good, July 25th, 1743. Arrived in England he had to meet new troubles. An officer who had served under him in Georgia preferred charges of misconduct, which, after adjournment for the production of witnesses from America, were tried before a board of general officers, June 4th, 1744, and pronounced to be "groundless, false, and malicious," and the accuser, Lieut.-Col. Cooke, was dismissed from the service. Oglethorpe was appointed one of the general officers to oppose the threatened French invasion, and in 1745, having been promoted to the rank of major-general, was sent at the head of a regiment of rangers he had raised for service in Georgia, to join the forces marching against the Young Pretender, who had defeated the troops in Scotland and entered England. Oglethorpe joined the main army of the Duke of Cumberland, and took part in the engagement at Clifton Moor. He seemed to have done all that was practicable, but the Duke was dissatisfied, and on his return to London had Oglethorpe brought before a court-martial for "lingering on the road." He was honourably acquitted, September 29th, 1746, and the following year was made lieutenant-general, but does not seem to have been again actively employed. He however continued to take part in the debates in the House of Commons, especially on military topics and the improvement of the condition of the soldier, as he had before been active in endeavouring to improve the condition of the sailor. In 1754 he lost his election for Haslemere, after having represented it for 32 years. He now retired from public life; but though he had reached his 65th year he had lost little of his vigour and activity of body and mind, and for the next 30 years he continued to retain both, living much in society, and much sought after on account of his remarkable career as well as of his personal character and great age. He had founded a colony, and not only lived to see it become "the most flourishing colony on the continent" (Bancroft, vol. v. p. 105), but an independent state. In early life "his strong benevolence of soul" had been celebrated by Pope and Thomson; in his old age he lived in familiar intercourse with Johnson, Burke, and Goldsmith. "At last," as Boswell records, "he was carried off by a violent fever," at his seat, Cranham Hall, Upminster, Essex, on July the 1st, 1785, having completed his 96th year a month before. He had become general by seniority in 1765, and was for many years the oldest officer in the service. (R. Wright, *A Memoir of General James Oglethorpe*, 1867.)

OHM, GEORGE SIMON, was born 16th March, 1787, at Erlangen, in Bavaria, where his ancestors during several generations had carried on the trade of locksmith. His father having acquired an amount of knowledge, including mathematics, unusual in his station of life, determined to give his boys (George and Martin) a superior education, and, accordingly, after they had passed through the elementary school, he sent them to the Gymnasium. Here they made such progress that the mathematician Langsdorf foretold that some day they would emulate the brothers Bernoulli. Hence their father relinquished his intention of bringing them up to his business, and consented to their pursuing a scientific career. George entered the University of Erlangen, but left it after eighteen months in order to give instruction in mathematics in Switzerland. He became a mathematical tutor in the Institute of Gottstadt, near Nidau, in the canton of Berne, where he remained two years and a half. He then became a teacher of mathematics in Neufchâtel. In 1811 he returned to Erlangen, and, after taking his degree, became privat-docent at that place. After this he held a tutorship at the Real-schule of Bamberg, which was soon dissolved. In 1817 he became teacher of mathematics in the Great (Jesuits') Gymnasium at Cologne, where his skill as a teacher was soon recognised. Here he engaged in original inquiries, and was led to discover the true explanation of the then enigmatical phenomena of the voltaic current. In 1826 he obtained leave of absence in order to proceed to Berlin to perfect and publish his new theory, which appeared in 1827 under the title, 'The Galvanic Circle mathematically treated.' His work, however, failed to attract notice, either from the leading scientific men of the day or from the authorities then at the head of affairs in education in Prussia. With feelings of mortification and grief he threw up his appointment at Cologne, and passed seven years in private life with

scarcely any means of subsistence. In 1833, however, the Bavarian Government appointed him professor in the Polytechnic School at Nürnberg. His theory gradually rose into favour, and in 1841 the Royal Society of London awarded him their highest honour, the Copley medal, and in the following year elected him a foreign member. He now became recognised as one of the most eminent philosophers of Germany, and "Ohm's Laws" were introduced into all elementary works on physics. He now engaged in a work on molecular physics, with a view to throw a new light on the nature and co-relations of light, heat, electricity, and magnetism. The first volume of this work was published in 1849 under the general title of 'Contributions to Molecular Physics,' and with the special title of 'Elements of Analytical Geometry of Three Dimensions, according to the system of oblique-angled Co-ordinates.' He deemed this introduction to be necessary because the ordinary mathematical methods did not apply themselves to his ideas with sufficient simplicity and conciseness. He dedicated this work to the Royal Society of London, "whose approbation," he says, "tempered his courage, which had previously been softened by disheartening treatment, to renewed efforts in the field of science." While working at this great undertaking he was, in 1849, called to fill the vacant post of Conservator of the Physical Collection at Munich. Congenial as this appointment was to his tastes, it is to be regretted that his new duties left him no time for the prosecution of his great work. But he published a memoir of great interest on 'The Phenomena of Interference in Uni-axial Crystals.' In 1852 he became professor of Experimental Physics in the High School at Munich, and devoted much time to the preparation of a text-book on physics, in which many of the subjects are treated in a very original manner. This work was published in 1854, in which year he was suddenly carried off by an attack of apoplexy on the 7th of July. His biographer, Dr. J. Lamont, who prepared a detailed memoir on his life and writings for the Royal Academy of Science at Munich, says: "Thus ended the noiseless life of a simple and easily contented, but highly gifted man, who lived solely for science, and who had neither sought nor found social advantages, honours, wealth, or what the world is accustomed to consider as chiefly contributing to happiness." He contributed twelve papers to the Journals of Schweigger and Poggendorff, of which two relate to Acoustics, one to Physical Optics, and the remainder are on electrical subjects.

* OHM, MARTIN, younger brother of the preceding, was born at Erlangen, May 6th, 1792. He studied first at the Gymnasium, then at the University in his native town, and in 1811 became privat-docent. In 1817, he was appointed director of mathematical studies at the Gymnasium of Thörn. In 1824 he was named extra, and, in 1829, ordinary professor at the University of Berlin. He held, also, a professorship at the Bau Akademie, 1824-31; at the Kriegsschule, 1826; at the Artillerie-und-Ingenieurschule, 1833-52. His life has been passed almost wholly in the fulfilment of his duties as professor and tutor, except that, from 1849 to 1852, he was a member of the Prussian Parliament at Berlin, when he took rank as what is called a liberal-conservative. Martin Ohm's writings are numerous and of much value. His great work is 'Versuch eines vollkommen consequenten Systems der Mathematik,' 9 vols. 8vo, 1822-1852, third edition of the early volumes, 1855, &c. His other works include, 'Aufsätze aus dem Gebiete der höheren Mathematik,' 1823; 'Lehre vom Grössten und Kleinsten,' 1824; 'Reine Elementar Mathematik,' 1826; 'Lehrbuch der niederen Analysis,' 2 vols. 8vo, 1828-29; 'Lehrbuch der höheren Analysis,' 5 vols. 8vo, 1829-32; 'Lehrbuch für den gesamten Mathematischen Elementarunterricht,' 1836; 'Lehrbuch der Mechanik,' 3 vols., 1836-1838; 'Geist der Mathematische Analysis,' 2 vols., 1842-1845; 'Übungen in der Anwendung der Integral Rechnung,' 8vo, 1856; 'Die dreieinigkeit der Kraft,' 1856; 'Kurzer Leitfadend und wissenschaftliche Grundlage der gesamten Elementar Analysis,' 1862. He has also published papers on the 'Transformation of trigonometrical Functions,' and other mathematical subjects, in Ferussac's 'Bulletin des Sciences Mathématiques,' the 'Memoirs of the Imperial Academy of St. Petersburg,' and Crelle's 'Journal.'

* OLLIVIER, OLIVIER ÉMILE, a French lawyer and sometime minister, was born at Marseille on the 2nd of July, 1825; and, after having received his general education at Sainte-Barbe, studied law at Paris, to the bar of which city he was admitted as an advocate in 1847. Through the influence of Ledru Rollin, who was a friend of his father, he was nominated, February 27, 1848, to be commissary-general of the Republic in the Bouches-du-Rhône, and in June following was confirmed in his appoint-

ment by General Cavaignac, with the title of *préfet*. He left this office in July to undertake the prefecture of the Haute Marne, the duties of which he fulfilled until January, 1849; after which he resumed his practice at the bar, and was concerned in the conduct of several important cases. In the general election of 1857, he was returned to the Chamber of Deputies as representative of the third circumscription of the Department of the Seine, when, in his character of Opposition candidate, he polled 11,005 votes against the 10,006 of M. Varin, the Government nominee. He took part in the most important questions that came before the Chamber, and generally in a sense extremely hostile to the regime of the Emperor, whose proffered distinctions he declined to the extent of coldly refusing to dine at the Tuileries in April, 1858. Of the five members of the Opposition in the Chamber of Deputies, known as the "Cinq," the one most indulgently heard by the majority was M. Ollivier; who, for the opening of his defence of M. Vacherot, when the latter was prosecuted for his book entitled '*La Démocratie*,' was suspended for three months (December, 1859) from the performance of his functions as an advocate. In 1863 he was re-elected for Paris, and in the first session of the new legislature exhibited so much moderation as to occasion coldness and distrust amongst the more extreme members of his party, whose opposition threatened to overpass the limits of the constitution. "M. E. Ollivier," it was said in one of the journals, "a été républicain pour être préfet, il devient bonapartiste pour essayer d'être ministre." Henceforth his course became more independent, his votes for or against the Government being less and less influenced by the fignment of party consistency. In 1865 he was elected a member of the Conseil général of the Var; and, in July of the same year, having accepted the appointment of commissary-general of the Viceroy of Egypt, at Paris, retired from the general practice of the bar. He was afterwards chosen by the Emperor as arbitrator with reference to the complications occasioned by the formation of the Isthmus of Suez canal. The process of his reconciliation with the Imperial Government was accelerated by the Emperor's decree of the 19th of January, 1867, which embodied various political reforms; and he soon afterwards published an exposition of his political action, for which he claimed good faith and consistency, with the title of '*Démocratie et Liberté* (1861—1867),' 8vo, Paris, &c., 1867. The volume was dedicated to his constituents, and contained his "principaux discours, ses diverses professions de foi, ses articles de journaux depuis 1861;" and he expressed the comfort which he derived against imputations and suspicions from the experience of Washington, Lafayette, Carnot, Benjamin Constant, Casimir Périer, Lamartine, Cavour, Daniel Manin, and Deak. In view of the general elections of 1869, he published in March of that year a kind of manifesto entitled '*Le 19 Janvier*,' which went through several editions, but was not convincing enough to ensure his return by his old constituency, who, in the following June, rejected him in favour of M. Bancel, a candidate of the radical opposition. M. Ollivier was, however, triumphantly returned for the first circumscription of the Var; and, on the 27th of December, was charged by the Emperor with the formation of the first parliamentary cabinet, a task which he succeeded in accomplishing on the 3rd of January, 1870, reserving to himself nominally the Ministry of Justice, and really the direction and responsibility of the administration. His task was to form what was in fact a coalition ministry into a homogeneous cabinet which should faithfully represent the majority of the Legislature, and therewith to lay the "foundation of French liberty." After anxious consideration it was determined to appeal to a *Plébiscite*, on the ground that "it would be shortsighted and dangerous," as M. Ollivier stated, "not to require for the new Constitution the sanction which alone made the strength of the old Constitution. It is the liberal modifications introduced since 1860 that we propose to submit to the approval of the people. We do not intend to submit to a vote that which was supremely decided in 1852, and by again submitting to discussion the principle of the state and of the dynasty to convert the hereditary empire into an elective empire." The *Plébiscite* was taken in May, and resulted in an overwhelming majority approving the position of the Emperor and the measures of the preceding ten years, of which the popular sanction was invited. The opinions which were expressed and the prophecies which were hazarded as to whether the *Plébiscite* would be found to work as the real, or only as the apparent and superficial basis of constitutional freedom, had no time to be brought to the issue. On the 15th of July war was declared against Prussia, a war into which M. Ollivier declared, in an unfortunate expression, which was frequently used against him,

France entered "au cœur léger." The disasters of the Imperial arms speedily led to the necessity of a ministry more specially adapted for the carrying out of a military programme, and the administration of M. Ollivier was superseded on the 9th of August by a "Ministry of Public Safety," which, having been summoned by the Empress-Regent, was characterised by its inclusion of several members who were remarkable chiefly for the pure imperialism of their prepossessions.

M. Ollivier is the author of numerous juridical articles contributed to the '*Revue de Droit pratique*,' which, jointly with MM. Mourlon, Demangeat, and Ballot, he founded in 1856; and he was associated with the first of these gentlemen in the production of a '*Commentaire de la Loi portant Modification des Articles 692, 696, 717, 749a, 779, et 838, du Code de Procédure civile sur les Saisies immobilières et sur les Ordres*,' 8vo, Paris, 1859. Besides other publications of legal or political significance, he has also produced a '*Commissaire de la Loi du 25 Mai, 1864, sur les Coalitions*,' 12mo, Paris, 1864.

OLMÜTZ, WENZEL (or, WENCESLAUS), VON, one of the earliest German engravers, is believed to have been a native of Olmütz, in Moravia. The years of his birth and death are unknown: his engravings are dated from 1480 to 1512. He was a goldsmith as well as an engraver. As an engraver he was an imitator, and probably a scholar, of Schongauer, several of whose prints he copied. He also copied some of the prints of Albert Dürer, and these were formerly attributed to Michael Wohlgemuth. His best prints are those, chiefly of scriptural subjects, made from his own designs. His satirical print, '*Roma caput Mundi*,' dated 1496, is the earliest known in which etching is employed. From the signature to his '*Martyrdom of St. Andrew*,' and one or two others, he appears to have resided for some time at Cologne. Bartsch described fifty-seven prints by Olmütz; but Brulliot, Nagler, and Passavant have raised the number to eighty-two; among them, however, two or three are, at least, of doubtful authenticity.

* OLOZAGA, SALUSTIANO, a Spanish lawyer and politician, was born about 1803, at Logroño, where, after having completed his preparatory study of the law, he commenced his career as an advocate. The liberality of his opinions made him obnoxious to the Government of Ferdinand VII., against whom, in 1831, he was suspected of having conspired. He contrived to escape from the imprisonment to which he was in consequence subjected, and took refuge in France; from which the death of Ferdinand, September 29th, 1833, and the subsequent relaxations of the laws against political offenders, made his return possible. He was elected, in the same year, as deputy to the Cortes, of which his political fervour and his oratory presently rendered him a prominent member, as well as a valuable ally to the liberal administration of Mendizabal, September 1836. In 1840, he was appointed ambassador at Paris, where he remained until, after the declaration of the majority of the young Queen Isabella, in November, 1843, he was recalled to Madrid, in order to form a cabinet, in which he undertook the combined offices of President of the Council and Minister for Foreign Affairs. His administration was of only ten days' continuance. He had brought forward M. Lopez as a candidate for the presidency of the Chamber of Deputies, which rejected him, and named M. Pidal to the office. Olozaga, defeated on this point, demanded, it was asserted, with violence, that the Queen should dissolve the obnoxious Chamber. Upon her refusal, the administration resigned, and Olozaga after a defensive speech in the Lower House, directed especially against Narvaez and his friends, retired to Portugal, and, subsequently, to England, where he remained about three years. Having been elected a deputy in two provinces to the Cortes that assembled on the 31st of December, 1846, he entered Navarre from Bayonne, on his way to Madrid, to take his seat. Notwithstanding the perfect order of his passport, the inviolability of his person as a deputy, and the fact that no prosecution, regular or irregular, existed against him, he was arrested near Buytrago, about New Year's day, 1847, and committed to the citadel of Pampeluna. From this place he transmitted to the Cortes an energetic protest against his imprisonment; and, on the 30th of March, the ministers signed a permission for his return to Spain, simultaneously with a "spontaneous" act of grace on the part of the Queen, conferring the same favour. A few days afterwards he took his seat in the Cortes, where he distinguished himself as a leading member of the liberal party; and was instrumental in bringing about, in 1848, the return to Spain of the ex-regent, Espartero, under whose administration, founded on the Revolution of July, 1854, he was sent a second time as ambassador to France. He was

superseded by Serrano in this office not long after the accession of Narvaez to power in October, 1856. After a series of years, during which he devoted himself consistently to the advocacy and defence of monarchical liberalism, worn out at length with the deferred hope of royal reformation, he gave his enthusiastic adhesion to the Revolution which forced Queen Isabella from the throne of Spain, September 29th, 1868, although he declined at first to take any part in the Government. He was, however, presently admitted to the Council of Ministers, and, on the 23rd of December, returned to Paris as the ambassador extraordinary and plenipotentiary of the Provisional Government. After some time he was recalled to Madrid to assist in the labours of the constitutional commission appointed by the Cortes, of which he was named president, in March, 1869; once more resuming, about two months later, his intermitted functions as ambassador in France. He was recalled in December, 1870, on the ground that although the Spanish Government had recognised the Government of the National Defence, it had not recognised the French Republic; which, on the other hand, had at that time no representative at Madrid. On the 3rd of January, 1871, the day after the young King Amadeo I. had taken the oaths to observe the laws of Spain and the Constitution of 1869, Olozaga, Zorrilla (who was President of the Cortes), and others, were consulted by his Majesty respecting the constitution of the ministry, which, under such auspices, was formed, two days later, on comprehensive and constitutional principles, under the presidency of Marshal Serrano.

* OMALIUS D'HALLOY, JEAN BAPTISTE JULIEN D', geologist, was born at Liège, February 16, 1783. Besides being a man of varied accomplishments in science, he has spent much of his life in filling high official posts. In 1807 he was the mayor of Skeuvre; in 1811, mayor of Brabant; in 1814 the deputy-governor of the arrondissement of Dinant; in 1815 the governor of the province of Namur, and subsequently a member first of the State Council of Belgium and then of the Senate, of which last he was for several years the vice-president. He is a leading authority on the geology of Belgium and France. His first important paper was an essay on the geology of the north of France in the 'Journal des Mines' for 1808, which led to his being requested by the French minister of the interior to draw up similar accounts of other parts of the kingdom. These, together with similar papers relating to neighbouring areas, were collected in his 'Mémoires pour servir à la description géologique des Pays-Bas, de la France et de quelques contrées voisines,' 8vo, Namur, 1828. A work of a similar character is his 'Coup d'œil sur la Géologie de la Belgique,' 8vo, Brussels, 1842. He has also written a text book on geology, which has had a large circulation. It first appeared as two separate works, one entitled 'Éléments de Géologie,' 8vo, Paris, 1831; the other, 'Introduction à la Géologie,' 8vo, Paris, 1833; which were intended to be the first and second parts of a more extended cyclopaedic series of volumes on the elements of inorganic natural history. They were subsequently combined under the title of 'Abrégé de Géologie,' of which the seventh edition appeared in 1862. His 'Précis élémentaire de Géologie,' 8vo, Paris, 1843, reached an eighth edition in 1868. Another popular work is 'Des Races humaines, ou Éléments d'Ethnologie,' 8vo, Paris, 1845, fourth edition, 12mo, 1859. He has also written books and papers on minerals and rocks, on natural geographical divisions, and other subjects.

OMER PASHA. [E. C. vol. iv. col. 570.] Subsequent to the Crimean campaign, Omer Pasha seems to have been regarded with some disfavour by the Sultan. He however received the appointment of governor-general of Bagdad, and on the revolt of the Montenegrins assuming a serious aspect he was sent to suppress it. Later he was employed in various civil as well as military services, but not such as to place him prominently before the public. He died in April, 1871, at the age of 70.

OMMEGANCK, BALTHASAR PAUL, a distinguished Belgian landscape painter, was born at Antwerp, in December, 1755, resided there all his life, and there died on the 18th of January, 1826. He was a scholar of H. J. Antonissen. He painted best local pastoral scenes, with cattle or sheep browsing. All his pictures exhibit close regard to the peculiarities of the season of the year, and the hour of the day; his drawing is good, his management of aerial perspective excellent, and his groups of animals are introduced and painted with great skill. On the other hand, his execution is not pleasing, nor is his colour satisfactory. Ommeگانck made his way as a painter at first slowly, but eventually he became extremely popular; his pictures were eagerly sought for, abroad as well as at home, at high prices, and he was generally regarded as one of the first landscape

painters of his time. Several of his best pictures are in the great private collections of England. At the time of his death he was a member of the Institut royal des Pays-Bas, and of the academies of Antwerp, Brussels, Ghent, Amsterdam, Munich, and Vienna.

OOST, JACOB VAN [VAN OOST, JACOB, E. C. vol. vi. col. 282].

OPPEL, ALBERT, geologist and palaeontologist, was born in December, 1831, at Hohenheim in Württemberg. He was educated at Stuttgart and Tübingen. While yet a student, he entered zealously into the study of natural history, and more especially of the liassic beds of Suabia; so that, in 1856, he gained the prize, for a treatise on the middle lias of that area, from the Tübingen University. In 1853, he took his degree of doctor, and then determined to make the study of the jurassic group of beds the work of his life. For this purpose he travelled through France, England, and Germany, examining every section and every collection of fossils to which he could obtain access. In 1858, he became Wagner's assistant as conservator of the palaeontological museum at Munich; and in 1861, his successor, as also professor of palaeontology in the university of that city. When he was first entrusted with the care of the museum it was in anything but a satisfactory condition, but he soon converted it into one of the finest of its kind in Europe. He died of typhoid fever, December 22nd, 1866, at the early age of 34. His principal works and papers are 'Die Mittlere Lias Schwabens,' in the 'Jahreshefte' of the Society for the Study of Nature in Württemberg, vol. x. pp. 39—136 (1854); 'Die Jura Formation Englands, Frankreichs und der südwestlichen Deutschlands,' in the same periodical, vol. xii. pp. 121—556; xiii. pp. 141—396; xiv. pp. 129—291; 'Palaeontologische Mittheilungen aus dem Museum der Königl. Bayer. Staates,' pts. i—v., 1862—65; and 'Die thionische Étage,' published in 1865.

* OPPERT, JULIUS, or JULES, a distinguished orientalist, by extraction a Jew, by birth and education a German, and a Frenchman by letters of naturalisation, was born on the 9th of July, 1825, at Hamburg. After receiving his preparatory education at the Johanneum of his native city, he repaired, in 1844, to the University of Heidelberg for the study of law; from which being diverted by the superior attractions of oriental philology, he migrated successively to the Universities of Bonn and Berlin, and, in 1847, was admitted to the degree of Ph.D. at the University of Kiel. Soon after, having devoted himself to the study of the Zend and the ancient Persian, he published a treatise on the vocal system of the latter language, 'Lautsystem des Altpersischen,' 8vo, Berlin, 1847; and later in that year repaired to France, where the path of academical preferment was more easy than in Germany to a man of his religious persuasion. He was appointed to the German professorship successively at the Lycées of Laval and Rheims; and presently commenced to contribute to the 'Revue Archéologique,' and the 'Journal Asiatique,' various articles having reference to Persian literature and antiquities, which were subsequently collected in a volume, entitled, 'Les Inscriptions des Achéménides,' 8vo, Paris, 1852. His talent and erudition attracted the attention of the French Institute, and he was appointed to be a member of the scientific expedition sent out by the Government to Mesopotamia, under M. Fulgence Fresnel, in 1851. Of this expedition he published an account, entitled, 'Expédition scientifique en Mésopotamie, exécutée par Ordre du Gouvernement, de 1851 à 1854, par MM. Fulgence Fresnel, Félix Thomas, et Jules Oppert, et publiée sous les Auspices de S. Exc. M. Achille Fould, Ministre d'État et de la Maison de l'Empereur,' 2 vols. 4to, with an Atlas in folio, Paris, 1857—64. On his return to France in July, 1854, M. Oppert devoted himself to the deciphering of cuneiform inscriptions, his inclination for which had been determined by his intercourse, during his eastern sojourn, with Sir Henry Rawlinson, to whom, as "son premier Professeur de Cuneiformes Ninivites," he dedicated 'Les Inscriptions de Dour-Sarkayan (Khorsabad), provenant des Fouilles de M. Victor Place, déchiffrées et interprétées par Jules Oppert,' folio, Paris, 1870. In 1855 and 1856, he was engaged in the execution of a Government commission for the investigation of the monuments collected in the museums of Germany and England, and, on his return, his various services were acknowledged by his admission to the Legion of Honour, and his appointment to the professorship of Sanskrit in the Bibliothèque Impériale. M. Oppert is a member of various learned societies, being especially a member of the Conseil de la Société Asiatique; and is a contributor to various periodicals, from which many of his works have been reproduced. He contributed one of the four translations, after-

wards published, in parallel columns, and showing a gratifying amount of agreement, by the Royal Asiatic Society, with the title of 'Inscription of Tiglath Pileser I., King of Assyria, B.C. 1150, as translated by Sir Henry Rawlinson, Fox Talbot, Esq., Dr. Hincks, and Dr. Oppert,' 8vo, London, 1857. His other works include, 'Grammaire Sanscrite,' 8vo, Berlin and Paris, 1859, second edition, 1864; 'Les Inscriptions cunéiformes déchiffrées une seconde fois. Lecture des Textes cunéiformes par M. le Comte A. de Gobineau, Paris, 1858,' &c., 8vo, Paris, 1859, republished from the 'Revue Orientale et Américaine'; 'Duppe Lisan Assur. Eléments de la Grammaire Assyrienne,' 8vo, Paris, 1860, second edition, 8vo, Paris and Leipzig, 1868, first published in the 'Journal Asiatique'; 'Remarques sur les Caractères distinctifs des différentes Familles linguistiques,' 8vo, Paris, 1860, extracted from the 'Revue de l'Orient'; 'État actuel de Déchiffrement des Inscriptions cunéiformes,' 8vo, Paris, 1861, extracted from the 'Revue Orientale et Américaine'; 'Les Faistes de Sargon, Roi d'Assyrie (721 à 703 avant Jésus-Christ): traduits et publiés d'après le Texte Assyrien de la grande Inscription des Salles du Palais de Khorsabad,' folio, Paris, 1863, produced jointly with Joachim Ménant; 'Histoire des Empires de Chaldée et d'Assyrie d'après les Monuments depuis l'Établissement définitif des Sémites en Mésopotamie jusqu'aux Séleucides,' &c., 8vo, Versailles, 1865, &c., extracted from the 'Annales de Philosophie Chrétienne'; 'Le Livre de Judith,' 8vo, Paris, 1865, extracted from the 'Annuaire de la Société d'Ethnographie'; 'Les Inscriptions commerciales en Caractères cunéiformes,' 8vo, Versailles, 1866, extracted from the ninth volume of the 'Revue Orientale'; 'Un Traité Babylonien sur Brique, conservé dans la Collection de M. Louis Le Clercq,' 8vo, Paris, 1866, extracted from the 'Revue Archéologique'; 'Babylone et les Babyloniens,' 8vo, Paris, 1866, extracted from the 'Encyclopédie du XIX^e Siècle'; and 'La Chronologie Biblique fixée par les Eclipses des Inscriptions cunéiformes,' 8vo, Paris, 1868, first published in the 'Revue Archéologique.'

ORBIGNY, ALCIDE DESSALINES D', French zoologist, was born at Coueron, September 6, 1802. On completing his education at La Rochelle, he devoted himself to natural history studies; and soon became connected with the Museum of Natural History at Paris—a connection which continued during all his working life. Before this connection was established, however, he had written a memoir on the *Foraminifera*, which he erroneously considered to be closely allied to the *Cephalopoda*. Prior to his taking up the study, these minute and frequently microscopic shells had been almost overlooked; and their introduction to scientific notice was mainly due to him. In 1826 he started for South America as travelling naturalist to the Museum of Natural History; and in the course of the following eight years he personally explored the whole breadth of the central portion of that continent, comprising, wholly or partially, Brazil, the Argentine Confederation, Patagonia, Chili, Bolivia, and Peru. He formed extensive and varied collections illustrative of the history and products of the countries visited; obtained books and manuscripts relating to history; and formed a collection of drawings of various kinds. His specimens comprised some 7000 species of animals, upwards of 2000 species of plants, and numerous samples of the rocks. His labours were immediately appreciated, as the Geographical Society of France awarded him one of its annual prizes for his geographical discoveries, and the French Government sanctioned the publication of a great monographic work on South America. The occupation of bringing out this work extended over twelve or thirteen years. While engaged upon it, however, he conceived another task of stupendous magnitude. His scheme was to form a collection of all the French fossils, and to publish an exhaustive palæontological account of France. The first part of the work appeared in 1840, and his attention was mainly devoted to its completion from that period to the time of his death. He made repeated excursions to various parts of France, and collected about 100,000 specimens, which were ultimately purchased by the French Government. In 1853 a chair of palæontology was specially created for him at the Jardin des Plantes. He died at Pierrefitte, near Paris, June 30, 1857. His works are chiefly remarkable for magnitude of conception. He was the first to describe a large number of genera and species; but in many cases the descriptions have lost much of their value, owing to his having formed his diagnoses upon drawings, fragments of specimens, and other imperfect data. His association of the *Foraminifera* with *Cephalopods* was a cardinal mistake, but he subsequently rectified it by placing them near the *Polypes*. In his works on this group of organisms he pointed out that different forms may coexist in

BIOG. DIV.—SUP.

close contiguity in the same sea—a fact which has recently been brought into prominence as one of the principal results of deep-sea dredging explorations. He also framed the stratigraphical nomenclature which is now usually employed in France. Besides nearly a hundred papers, and contributions to Ramon de la Sagra's work on Cuba, he wrote several works, of which the following are the most noteworthy:—'Voyage dans l'Amérique méridionale,' 7 vols. 4to, 415 plates and 18 maps, Paris, 1835—1849; 'L'Homme Américain (de l'Amérique méridionale) considéré sous les rapports physiologiques et moraux,' 2 vols. 8vo, Strasbourg, 1839; 'Paléontologie française. Description zoologique et géologique de tous les Animaux mollusques et rayonnés fossiles de France, comprenant leur application à la reconnaissance des couches. Terrain Crétacé,' 6 vols. 8vo, 1018 plates, 1840—1860; 'Terrain Jurassiques,' 2 vols. 8vo, 432 plates, 1842—1860; this work was left incomplete, but has been, and is still being, continued by a committee of palæontologists; 'Cours élémentaire de Paléontologie et de Géologie stratigraphique,' 3 vols. 12mo and 4to, 1849—1852; 'Prodrome de Paléontologie stratigraphique universelle des Animaux mollusques et rayonnés, faisant suite au Cours élémentaire de Paléontologie,' 3 vols. 12mo, 1850—1852; and 'Mollusques vivants et fossiles,' 8vo, 1845.

* ORBIGNY, CHARLES DESSALINES D', naturalist, and brother of the preceding, was born at Coueron, December 2, 1806. Like his brother, he was educated at La Rochelle, and in 1835 he became assistant to Cordier, the professor of geology at the Museum of Natural History in Paris, with which establishment he is still connected. He has written several geological and palæontological papers, and also some independent works of the same character; but he is best known as a natural-history cyclopædist, having contributed articles to several cyclopædies in addition to that which he edited under the title of 'Dictionnaire universel d'Histoire naturelle,' 16 vols. 8vo, Paris, 1841—1849, to which Arago, Brongniart, Milne-Edwards, Jussieu, and other eminent scientific men contributed. His other works comprise a treatise on the practical application of geology, an account of the geology of Paris and its neighbourhood, and a manual on rocks, drawn up for the most part from the materials which Cordier left after his death.

ORELLI, JOHANN CASPAR VON, a distinguished Swiss philologist, descended from a noble Italian family which took refuge in Switzerland at the time of the Reformation, was born on the 13th of February, 1787, at Zurich, at the Carolinum of which city he received his education. In 1806 he was ordained; and in the following year undertook the pastorate of the Reformed church at Bergamo, where he continued until 1813, conducting his pulpit and other ministrations in German, in French, and, principally, in Italian. Here he produced his contributions to the History of Italian Poetry, 'Beyträge zur Geschichte der Italiänischen Poesie,' 2 parts, 8vo, Zurich, 1810; and in 1813, having become uneasy in his theological position as pastor at Bergamo, accepted a call to a professorship in the cantonal school of Chur, or Coire, the capital of the Grisons, which he left in 1819, in order to fill the chair of eloquence in the Carolinum at Zurich. In 1831 he was appointed city-librarian; and in 1833, after the foundation of the University of Zurich, in the accomplishment of which he had much interested himself, he added to his existing academical employments the office of extraordinary professor of ancient literature in that institution. He died at Zurich on the 6th of January, 1849.

The reputation of Orelli rests especially on his valuable and learned editions of various Greek, Latin, and Italian authors, some of which he accompanied with excellent commentaries. He edited the works, or selections from the works, of Isocrates, Hesiod, Theognis, Plato, Cicero, Phædrus, Horace, and Tacitus; as well as of Tasso and Ariosto, and the 'Physiognomik,' 16mo, 1846, and the 'Ausgewählte Schriften,' 8vo, 1859, of Lavater. He likewise produced, early in his career as an author, the 'Cronichette d'Italia. Vi s'aggiunge la Vita di Dante Alighieri [translated from the German of J. Wismayr], 2 vols. 8vo, Chur, 1822. A biographical sketch of Orelli was issued nearly two years after his death, with the title of 'Lebensabriss von Johann Caspar Orelli. Aus dem Neujahrsblättern der Stadtbibliothek in Zurich besonders abgedruckt,' 4to, Zurich, 1851.

ORFILA, MATTHIEU JOSEPH BONAVENTURE, is the correct name of the eminent French chemist and toxicologist noticed in the E.C. [vol. iv. col. 589] as P. ORFILA.

ORLOV, GENERAL ALEXIS [E. C. vol. iv. col. 589], was made president of the council of the Russian empire in 1857. He died at St. Petersburg, of brain-disease, on the 21st of May, 1861, in his 74th year.

OS, PIETER GERARD VAN [VAN OS, P. G., E. C. vol. vi. col. 282].

* OSBORN, CAPTAIN SHERARD, R.N., was born in 1820. He entered the Royal Navy at an early age; was midshipman of the 'Hyacinth' in the engagement at Canton in 1841, and of the 'Clio' at the capture of the batteries of Woosung in 1842. With the rank of mate, he served in the 'Excellent' gunnery ship in 1843, and then accompanied the 'Collingwood' to the Pacific. Raised to the post of lieutenant, he rejoined the 'Collingwood' in 1846, and served on board that ship for several years. In his next service he accompanied Sir Leopold M'Clinck's expedition to the Arctic Seas in 1850-51; he edited, while at Beechy Island, the curious ship-newspaper, called the 'Illustrated Arctic News'; and, on his return, published 'Stray Leaves from an Arctic Journal,' 8vo, 1852, of which an American edition appeared in the same year. He was then promoted to the rank of commander; in 1851 he rose to the post of captain. In 1856 he edited M'Clure's 'Discovery of the North-West Passage, by H.M.S. Investigator, 1850-54,' 8vo, 1856-57; new edition, 1865. Consequent on a period of service in the China and Japan seas, he published 'Quedah: or, Stray Leaves from a Journal in Malayan Waters,' 8vo, 1857, second edition, 1860; 'The Fight in the Peiho'; 'Japanese Fragments. With Facsimiles of Illustrations by Artists of Yedo,' 8vo, 1861; and the 'Past and Future of British Relations in China,' 1860. 'Quedah: or, my Cruise in Japanese Waters,' 8vo, 1859, new edition, 1865, may be regarded as a continuation of the 'Quedah' already cited. In 1860 appeared his 'Career, last Voyage, and Fate of Sir J. Franklin.' In 1864 he was placed in command of H.M.S. 'Royal Sovereign,' to test the merits of Captain Cowper Coles's turret-system of arranging the guns; his report on the working of the 12-ton guns, the largest at that time used in the navy, encouraged the Admiralty to adopt the same system in new ships of great magnitude. Since that date, Captain Osborn has taken part in the discussion of many questions of great public importance connected with ships, guns, and the naval service generally.

OTTOKAR VON STEIERMARK (Styria), whose name varies as Ottocar and Ottakcher, an early German poet and chronicler, was born in Styria about the middle of the 13th century; and until recently was erroneously identified with another Ottokar, a member of the noble family of Horneck, who was his contemporary. He is now ascertained to have been a minstrel-retainer of Otto von Lichtenstein, governor of Styria, and son of the celebrated Ulrich von Lichtenstein, with whom he appears to have resided at his various fortresses in the valley of the Upper Mur, and to have taken part at various times in the solemn festivities and pageants held at Vienna, Prague, and Presburg. He died in 1318. His principal work, and one of much value to the student of the history of the time, is his rhythmical Chronicle of Austrian Affairs, 'Austriac Chronicon Germanicum,' which, written in the Bavarian dialect, is over eighty thousand lines in length, and contains a narrative of the events in which Austria, Styria, and the neighbouring countries were interested from 1250, the year of the death of the Emperor Frederick II., to 1309. This work was edited, with a Glossary and Annotations, by a Benedictine named Jerome Pez; and the title, although it involves the error of confounding Ottokar with his namesake of Horneck, will convey a sufficient idea of the scope of the volume:—'Ottocari Horneckii Chronicon Austriacum rhythmicum, ab Excessu Friderici II., Imp., id est, ab Anno MCCL, ad Annum usque MCCCIX, perductum continetur: ac potissimum Rudolphi I., Alberti I., Imp. Rom. Friderici pulchri Austriaci Gesta: Res etiam Styriacæ, Carinthiacæ, Bohemicæ, Hungaricæ, Bavaricæ, Salisburgenses, aliarumque Nationum denarrantur. Nunc primum ex Codd. MSS. Bibliothec. partim augustissimæ Vindobonensis, partim celeberrimi Monasterii Admontensis, Ord. S. Benedicti in Styria, in Lucem publicam vindicatum. Accedit Glossarium, quo Germanicæ Voces obscuriores ac obsoletæ in hujus Auctoris Opere occurrentes explanantur. Edidit R. D. P. Hieronymus Pez, &c., folio, Ratisbon, 1745. A critical and expository work, by Theodor Schacht, conversant about Ottokar's 'Chronicon,' and throwing light upon the history, literature, and public life of Germany in the 13th century, but which perpetuates the confusion of persons already objected to, is entitled 'Aus und über Ottokar's von Horneck Reimchronik, oder Denkwürdigkeiten seiner Zeit. Zur Geschichte, Literatur, und Anschauung des öffentlichen Lebens des Deutschen im dreizehnten Jahrhundert,' &c., 8vo, Mainz, 1821; whilst another, by Theodor Jacobi, which at length separates demonstrably the identity of the two Ottokars,

appeared more recently with the title of 'De Ottocari Chronico Austriaco,' 8vo, Breslau, 1830. Besides the 'Austriac Chronicon Germanicum,' Ottokar produced a rhythmical Chronicle of the World, entitled 'Daz Buch der Kaiser,' which is preserved in MS. in the Imperial Library of Vienna, and in which the author, following Latin authorities, traces the fortunes of several nations until the death of the Emperor Frederick II., the date which forms the starting-point of his later and principal chronicle.

* OUDINÉ, EUGÈNE ANDRÉ, a French sculptor and medallist, was born at Paris, January 1st, 1810. He studied under A. Galle, and in the Académie des Beaux-Arts, where, in 1831, he carried off the grand prize for medal-engraving, which entitled him to study in Rome. In that city he was a pupil of Petitot and Ingres. Here he executed a statue of the 'Wounded Gladiator,' which appeared in the Salon in 1837. From this time he continued to practise, and with nearly equal success, both as a sculptor and a medallist; receiving, in 1847, 1848, and 1855, medals of the second class, and in 1843 one of the first class, for sculpture; and in 1839 a first-class for medal-engraving, and two prizes in 1848. In 1844 he was appointed engraver to the Post Office, and later medal-engraver to the Mint; in 1857 he was nominated knight of the Legion of Honour. As a sculptor M. Oudiné has executed several statues for Versailles, the Louvre, the Luxembourg, and other state buildings, and for various churches, as well as many poetic figures, portrait-statues, and busts of private persons. His medals are numerous and of a high order of merit. Among the more celebrated of these are the 'Apotheosis of Napoleon I.,' a medal of unusually large size, the apotheosis being designed by Ingres, whilst on the obverse is the head of Napoleon in very high relief; several state medals executed for the Emperor Napoleon III.; the great medals of the Exposition Universelle of 1855; those of the Battles of Inkermann and Villafranca; the Académie des Beaux-Arts, &c. They are designed with much spirit, and engraved in a masterly manner. A frame of some of the more remarkable among them was in the International Exhibition of 1862.

OUTRAM, LIEUTENANT-GENERAL SIR JAMES, a distinguished officer in the Indian army, was born at Butterley Hall, in Derbyshire, January 29th, 1803. His father, Mr. Benjamin Outram, was a civil engineer, whose name is associated with the introduction of 'outram,' or 'tram' roads, smooth causeways of iron or stone for the wheels of vehicles to run upon. Left an orphan at the age of two years, James Outram was sent to Scotland to be reared and educated, first at Udnay, in Aberdeenshire, and afterwards at Marischal College, Aberdeen. He went out to India as a cadet in 1819, was placed under an officer in command of a body of irregular troops, and received the rank of lieutenant and adjutant of the 23rd Bombay Native Infantry. He went in 1828 to serve in Khandeish, and was for several years engaged in disciplining the wild Bheel tribes. From 1835 to 1838 he had duties with the regular forces in Gujerat. In the last-named year, as aide-de-camp to Lord Keane, he took part in the Affghan war, and distinguished himself by a ride from Khelat through the Bolan Pass. After the capture of Ghuznee, in which he assisted, he became in succession political agent at Gujerat, Commissioner of Upper Sind, and British Resident at Hyderabad. When appointed, in 1842, to negotiate with the Ameers of Sind, he boldly took their part against Sir Charles James Napier, whose terms appeared to him unnecessarily harsh and severe. The controversy between the two distinguished men was hot and angry, but each acknowledged the other's honesty of motive; and Napier gracefully designated Outram "the Bayard of India, sans peur et sans reproche." Outram showed his sincerity by handing over his share of the prize money to the Bombay charities; and the East India Company afterwards endorsed the correctness of his views. He visited England on furlough in 1843, but returned to India in 1844, and took a command in the Mahratta country. He was, at different times, British Resident at Sattara and Baroda. When filling a responsible post at Bombay, his fearless exposure of abuses raised violent acrimony; but, as he was unquestionably in the right, he gained credit in the end for his firmness. Earl Dalhousie, on annexing Oude, appointed Outram British Resident and Commissioner at Lucknow; but this situation was held only for a short time: Outram came to England for the benefit of his health in 1856. When war was declared against Persia shortly after, Outram was appointed commander of the expeditionary force. He left England on the 20th of November, landed at Bournemouth, January 30th, 1857, defeated the Persians in many engagements in the next three months,

brought the war to an end, and returned to Bombay to find that his services were urgently needed in the suppression of the Mutiny. The Governor-General appointed him Military Commander of the Dinapore and Cawnpore division, at a time when Havelock was heroically struggling against almost overwhelming difficulties. Outram organised a plan, in conjunction with Sir Colin Campbell, reached Dinapore from Calcutta August 18th, arrived at Allahabad September 1st, and at Cawnpore on the 15th. Outram now showed the nobleness of his character: although of higher rank than Havelock, he waived his right, leaving the command to one who had so well deserved it, and offered to fight under Havelock until Lucknow was relieved. How that relief was effected, on the 25th, is recorded in the military history of that eventful period; as are the subsequent detention of Outram and Havelock for two months longer in Lucknow, and the wonderful evacuation of that place by Campbell, Outram, and Havelock, with all the English civilians, women, and children, on the 23rd of November. Outram commanded the first division of infantry when Campbell finally regained possession of Lucknow in March, 1858. Soon after this event he was appointed military member of the Governor-General's council. His services were rewarded with a baronetcy, the rank of lieutenant-general, the Order of the Grand Cross of the Bath, and the thanks of parliament. He was one of the original recipients of the Star of India in 1861, and was much pressed to become a member of the Council of India in London; but his health had given way under the influence of climate and exposure, and his day for labour was passed. In 1862 he received the degree of D.C.L. at Oxford University. The state of his health led to the selection of France as a residence, and he died at Pau, March 11th, 1863. He was buried at Westminster Abbey, and was followed to the grave by Lord Clyde and Sir John Lawrence as mourners. Two works from his pen are, 'Rough Notes of the Campaign in Sind and Affghanistan, in 1838—9; being extracts from a Personal Journal kept while on the Staff of the Army of the Indus,' privately printed, Bombay, 1840; and 'Our Indian Army; Minute of Sir James Outram, in opposition to the proposed Amalgamation of the European and Native Forces,' London, 1860. A colossal bronze statue of Outram was erected in the gardens of the Thames Embankment in August, 1871.

OVERBECK, FRIEDRICH [E. C. vol. iv. col. 605]. This eminent painter died at Rome on the 13th of November, 1869, having completed his 80th year in the preceding July.

OWEN, DAVID DALE [E. C. vol. iv. col. 619], geologist, was born at Broxfield House, Lanarkshire, June 24, 1807. His education was received at Hofwyl, in Switzerland. In 1828 he accompanied his father to the United States; but in 1831 he returned to Europe for the purpose of completing his studies. He learned drawing at Paris, and chemistry (under Dr. Turner) and geology in London. In 1833 he joined the geological survey of Tennessee as a volunteer, and in 1837 he was commissioned to make a geological reconnaissance of Indiana. Subsequently he surveyed Iowa, Wisconsin, Minnesota, Kentucky, and Arkansas. His published works consist chiefly of geological reports, of which the following may be mentioned:—'First Report of a Geological Reconnaissance of the northern counties of Arkansas, made in 1857 and 1858,' 8vo, Little Rock, 1858; 'Second Report, &c.,' 8vo, Philadelphia, 1860, in which the middle and southern counties, surveyed in 1850 and 1860, are dealt with; 'Reports of the Geological Survey of Kentucky,' 3 vols. 8vo, 1856—1857; 'Report of a Geological Survey of Wisconsin, Iowa, and Minnesota, and incidentally of a portion of the Nebraska Territory,' 4to, Philadelphia, 1842; and 'Report of a Geological Reconnaissance of the State of Indiana, made in the year 1837,' 8vo, Indianapolis, 1839. He died at New Harmony, Indiana, November 13, 1860.

OWEN, ROBERT [E. C. vol. iv. col. 618]. In the autumn of 1858, though in his 88th year and infirm in health, Mr. Owen made a long journey to Liverpool in order to take part in the second congress of the Social Science Association. He was anxious to explain and defend some of his views, but the travel and excitement were more than he could bear. He fainted on the platform, and although, after a brief rest, he was able to return home, he never fairly rallied. He died at his native place, Newtown, Montgomeryshire, on the 17th of November, 1858. His latest public appearance was at a Social Science meeting; but Owen had long been more concerned in the consideration of Spiritualism (to which he, with other members of his family, had become a convert) than Socialism. (W. L. Sargent, *Robert Owen and his Philosophy*, 8vo, 1860; A. J. Booth, *Robert Owen, the Founder of Socialism in England*, 8vo, 1869.)

P

PACINI, GIOVANNI, musical composer, was born at Syracuse, in Sicily, in 1796. He was sent at an early age to Rome, to receive a musical education; went thence to Bologna, where he studied harmony and counterpoint under Marchesi and Mattei; and thence to Venice, where he received further instruction from Furlanetto. He composed a few pieces of church music, but speedily turned his attention to operas, of which he poured forth a profusion during a period of forty years. At the age of eighteen he wrote his first opera, 'Annetta,' which was produced at Venice. At Pisa, in 1815, appeared his 'Evacuazione del Tesoro;' and at Florence, in the same year, 'Rosina.' At Milan he produced no less than four slight operas in 1817. By the age of thirty he had composed thirty operas, of which the most successful were 'Adelaide e Comigio' and 'L'Ultimo Giorno di Pompeia.' His opera of 'Niobe,' written for Madame Pasta, met with but an indifferent reception. At Trieste, Turin, and other Italian cities, he brought out upwards of thirty operas between the years 1826 and 1847. One of these, 'Giovanna d'Arco,' although supported by Rubini, Tamburini, and Madame Lalande, met with so cold a reception as to disgust him for a time with writing for the stage; but he soon resumed his habit of rapid composition. In 1836 he was appointed director of the Conservatorio at Viareggio. He composed a few stringed quartettes; but his operas, on which his fame rests, were—like those of many recent Italian composers—written hastily, and without much power or originality, although possessing some graceful melody. He died at Pescia on the 6th of December, 1867.

PADOVANINO [VAROTARI, ALESSANDRO, E. C. vol. vi. col. 291].

PAESIello, GIOVANNI [PAISIello, GIOVANNI, E. C. vol. iv. col. 633].

* PAGE, THOMAS, civil engineer, was born in 1810. After being educated as a surveyor, he studied engineering under Sir Mark Isambard Brunel, whom he aided for many years in the difficult works connected with the Thames Tunnel. When he afterwards became a civil engineer on his own account, he constructed several works for the Government, and others for private companies. He was engineer of the suspension bridge over the Thames at Chelsea, in which he introduced some new features of tension and support; it was finished in 1860; and a minute account of its details of structure, by Mr. George Gordon Page, was read before the Society of Engineers in 1861. A more important work was the beautiful new bridge at Westminster, planned by Mr. Page in 1855 in conformity with the ideas of the late Sir Charles Barry, and finished in 1862. In 1861 he was one of the competitors who tendered plans for the Thames Embankment. In the same year he sent in a design for a new bridge at Blackfriars; it was for a structure of iron and granite, 76 feet wide, with three arches, and was provisionally accepted by the Corporation; but the final decision was in favour of a design by Mr. Cubitt. In 1863 Mr. Page read a paper on the 'Foundations of Bridges,' before the British Association for the Advancement of Science; it was published *in extenso* in the 'Civil Engineer and Architect's Journal.' When the projects for some kind of railway or tunnel to connect England and France were

under discussion in 1869 and 1870, Mr. Page prepared plans for a tunnel-tube of wrought iron, made in quarter-mile lengths, which were to be towed out and sunk in their proper places. These were to be connected with eight conical double iron shafts, or towers, which were also to be built on shore, towed out, and sunk. The tops of the towers were to be above water-level, and each surmounted by a lighthouse.

* **PAKINGTON, RIGHT HON. SIR JOHN SOMERSET**, K.C.G.B., F.R.S., second son of the late William Russell, Esq., of Powick Court, Worcestershire, was born there on the 20th of February, 1799, and was educated successively at Eton and at Oriel College, Oxford. By the death of his father and elder brother, he became heir to his maternal uncle, Sir John Pakington, of Westwood Park, by whose decease on the 6th of January, 1830, the baronetcy of the old creation became extinct, and whose name he presently afterwards assumed. He became an active magistrate in his native county, and in 1834 became chairman of the quarter sessions. In the general election of 1837 he was returned to the House of Commons as member for Droitwich, a borough for which he has been twelve times re-elected, and which he still, October, 1871, continues to represent. From the first he acted with the Conservatives, and turning to advantageous account the knowledge he had acquired during a tour in America in 1833, he exercised considerable influence on the legislative measures affecting the interests of Canada, Newfoundland, and the West Indies. He withdrew his support from the government of the late Sir Robert Peel, of which he had previously been an adherent, on the introduction of the bill for the abolition of the Corn Laws. Sir Robert Peel, however, when on the eve of quitting office, recommended him, as a reward for former support, for the honour of a baronetcy, and the title was accordingly conferred upon him on the 27th of June, 1846. On the 27th of February, 1852, he became Secretary of State for the Colonies, in the late Earl of Derby's first administration, and was sworn a member of the Privy Council; but had little opportunity to vindicate the propriety of the appointment before the resignation of the cabinet in December following. On the 15th of May, 1852, he was appointed a member of the Committee of Council for Education; and, after his vacation from ministerial duties, he devoted himself to the education question, and came to the conclusion that the system, as administered by the committee of the Privy Council, was inefficient and unequal in its operations. He took an active part in promoting the Manchester and Salford Education Bill of 1854; and in the spring of the following year moved for leave to introduce a bill of his own, which, although it anticipated several of the principles affirmed by the measure of 1870, he was obliged to withdraw. His speech on this occasion was published with the title of 'General Education.' Speech delivered in the House of Commons, March 16, 1855, on moving for leave to introduce a Bill for the better Promotion of National Education, 8vo, London, 1855; and this was followed by the issue of a pamphlet entitled 'National Education. Address delivered to the Members of the Manchester Athenæum, November 18, 1856,' 8vo, London, 1856. In Lord Derby's second administration, Sir John Pakington took office as First Lord of the Admiralty, February 26, 1858; and on the 15th of June, 1859, four days after the resignation of the cabinet, was gazetted K.C.G.B., civil division, as an acknowledgment of the ability with which he had laboured for the improvement and extension of the navy. On the formation of Lord Derby's third cabinet in July, 1866, he was re-appointed First Lord of the Admiralty, exchanging this office in March, 1867, for that of Secretary of State for War, which he continued to hold until the resignation of the Conservative administration in December, 1868. Sir John Pakington is a D.L. for Worcestershire (1832); Lieutenant-Colonel of the Worcestershire Yeomanry Cavalry (1859); an Elder Brother of the Trinity House; and a Vice-President of the Society of Arts. Several of his speeches on naval, ecclesiastical, social, and educational topics have been published.

PALGRAVE, SIR FRANCIS. [E. C. vol. iv. col. 642.] Sir Francis Palgrave died at Hampstead, on the 6th of July, 1861, after having devoted the leisure of the last four years of his life to the completion of the third volume of his 'History of Normandy and of England,' of which the fourth volume, the last which has been issued, had been previously written. These two volumes were of posthumous publication, and were brought out in 1864, under the editorial care of his eldest son—

* **FRANCIS TURNER PALGRAVE**, who was born on the 28th of September, 1824, and educated at Charterhouse School and at Balliol College, Oxford, of which he was a scholar, and from which he migrated on his election to a fellowship at Exeter

College. After having officiated for about five years as Vice-Principal of the Training College for Schoolmasters at Kneller Hall, and acquiring other preparatory experience, he was appointed to a situation under the Education Committee of the Privy Council, which he still continues to hold. He is principally known as a poet and art-critic; and in the latter capacity has produced handbooks to various exhibitions, and a volume entitled 'Essays in Art,' &c., 8vo, London and Cambridge, 1866, besides contributing the explanatory text to an illustrated work entitled 'Gems of English Art of this Century,' 4to, London, 1869. His poetical works consist chiefly of two volumes, entitled respectively, 'Idylls and Songs,' 8vo, London, 1854, and 'Hymns,' 16mo, London, 1867, second edition, enlarged, 1868. He contributed to the 'Oxford Essays,' 8vo, 1855, a critique on 'The Works of Alfred de Musset;' and wrote the 'Memoir' prefixed to A. H. Clough's 'Poems,' 8vo, London, 1862, &c. He has likewise edited 'Songs and Sonnets by William Shakespeare;' 'The Golden Treasury of the best Songs and Lyrical Poems in the English Language,' 8vo, Cambridge, 1861, forming part of the 'Golden Treasury Series;' 'A Selection from the Works of William Wordsworth,' 8vo, London, 1865, forming part of 'Moxon's Miniature Poets;' and has furnished a 'Biographical and Critical Memoir,' prefixed to the 'Globe Edition' of the 'Poetical Works of Sir Walter Scott,' 8vo, London, 1866. His younger brother,

* **WILLIAM GIFFORD PALGRAVE**, who has acquired a reputation for his Eastern travels, and his vivid literary record of them, was born on the 24th of January, 1826, and educated successively at the Charterhouse and at Trinity College, Oxford. Having received a commission in the Indian army in 1847, he served for some years in the 8th Regiment of Bombay Native Infantry, from which he retired in August, 1853. He became a member of the order of Jesuits, and for several years devoted himself to missionary work in Syria; and in 1862, being still a member of that society—which he renounced in 1865—commenced a tour in Arabia, the expenses of which were defrayed by the Emperor Napoleon III., with "the hope," as he has himself expressed it, "of doing something towards the permanent social good of those wide regions; the desire of bringing the stagnant waters of Eastern life into contact with the quickening stream of European progress; perhaps a natural desire to know the yet unknown, and the restlessness of enterprise not rare in Englishmen." The account of his adventures, which was welcomed as a valuable contribution to the literature of travel, was published with the title of 'A Narrative of a Year's Journey through Central and Eastern Arabia, 1862—1863,' 2 vols. 8vo, London, 1865; French translation, by E. Jonveaux, 'Une Année de Voyage,' &c., 8vo, Paris, 1866, &c., of which an abridged edition, by J. Belin de Launay, was published in 8vo, Paris, &c., 1869. Mr. Palgrave was afterwards employed in the Eastern Consular Service.

PALISOT DE BEAUVOIS, AMBROISE MARIE FRANÇOIS JOSEPH, BARON DE, a French botanist and traveller, was born at Arras, July 27, 1752. After filling some military and official posts, he devoted himself almost exclusively to botanical studies, giving his attention more particularly to the cryptogamic plants. In 1786 his passion for travelling induced him to leave his wife and property, his intention being to return in about four years. He proceeded to the Guinea coast of Africa, and explored a wide tract of country on the right side of the Lower Niger river, making also large collections, which were, however, subsequently destroyed. Most of the crew of the ship in which he went died of yellow fever, a disease with which he was himself struck, so that in 1788 he was compelled to leave for San Domingo. Various causes led to his residence in the West Indies being prolonged far beyond the period he intended, so that he did not revisit his native country until August, 1798. His subsequent time was spent in publishing the scientific results of his travels. His works on cryptogamic plants formed a valuable addition to scientific literature. His principal works are, 'Flore d'Oware et de Benin,' 2 vols., with 120 plates, fol., Paris, 1804—21; 'Insectes recueillis en Afrique et en Amérique,' with 90 plates, fol., Paris, 1805—21; 'Essai d'une nouvelle Agrostographie, ou nouveaux genres de Graminées,' 4to and 8vo, Paris, 1812; 'Musculogie, ou traité sur les Mousses,' 8vo, Paris, 1822. In addition to these, he wrote one or two other books and several articles. He made numerous observations on the organs of fructification of grasses, mushrooms, and mosses. He died at Paris, January 21, 1820.

PALISSY, BERNARD, born at the Chapelle Biron, Périgord, about 1510, was the son of an artisan, received little education, and was brought up as a worker in glass. Having to practise

glass-painting, he studied chemistry, and afterwards natural history, and acquired a sufficient knowledge of art to earn money by painting portraits. Whether from restlessness of disposition, the desire to extend his knowledge, or the feeling that his native place did not afford a fair field for his energy, he travelled through a large part of France and Germany, supporting himself by his calling, and eventually married and settled at Saintes, 1539, where he added to his other occupations that of land-surveying, a knowledge of which he had acquired in his journeyings. In this last line he met with employment in preparing maps of the isles and district of Saintonge and L'Aunis, required for establishing the gabelle. But his attention was about 1553 turned to a subject that soon absorbed all his thoughts and energies. The sight of an enamelled earthenware vase, probably of the kind known as majolica, then in the highest repute, aroused in him the desire to produce ware that should rival or even excel it. His first effort was to find a white enamel, then to procure suitable earths and combine them so as to bear the necessary heat. Years of unremitting toil were spent seemingly in vain, and he was reduced from comparative prosperity to extreme poverty. He has himself related how he was constrained not only to do the whole of the manual labour, even to fetching the water, mixing the clays, grinding the stone, and tending the furnace, but that his fuel having failed he was compelled to burn the fences of his garden, his chairs and tables and even the flooring of his house, to keep the furnace heated. Meanwhile, worn down by anxiety, disappointment, and insufficient food, ragged, barefoot, and haggard in countenance, his neighbours, he says, had come to regard him as a madman, or a fool, and his wife and family covered him with reproaches. But his zeal and perseverance were at length amply rewarded; and the name of Bernard Palissy stands one of the most remarkable in the honoured list of those who have accomplished a great purpose by indomitable resolution and industry. Palissy had in fact introduced a new branch of art manufacture into France, and laid the foundation for the brilliant successes which the French have since achieved in this line. As the result of fifteen or sixteen years of ceaseless labour, he was able to produce a paste of perfect plasticity, and a range of enamel-colours and glazes that furnished him with all he required, and he had attained entire mastery of the furnace. Thus master of the technicalities of pottery, his artistic skill and acquaintance with natural history enabled him to strike out a path that was entirely new. He invented what he called "les rustiques figulines," bowls or vases with figures in relief, in their natural colours, and where possible of the natural size, of shells, fish, lizards, snakes, &c., depicted with a truth and naïveté which only rare habits of observation and a peculiar genius could have rendered possible. These soon became wonderfully popular. It was the age when choice specimens of porcelain and pottery were looked on as gifts worthy of princes, and Palissy received from Catherine de Medicis the title of "inventeur des rustiques figulines du Roy et de la Roynne Mère." Only the credit he had thus won saved him from a miserable death. He had adopted the reformed faith, and was the most conspicuous member of the little congregation of his village. He had taken the precaution to obtain letters of protection from the Duc de Montpensier, but his workshop was entered and seized as a place of religious assembly, and himself arrested and imprisoned at Bordeaux. The Constable de Montmorency, for whom he was engaged in executing various decorations for his château d'Ecouen, applied to the Queen-Mother, who ordered his release, and gave him, for his greater security, permission, as royal potter, to set up his furnaces and laboratory within the precincts of the Tuileries, 1563. Here he found abundant occupation, and for a few years his career was one of unchequered prosperity. He was now thoroughly master of his craft; he had improved his taste by the study of ancient Roman and modern Italian models; he was in favour with the king, and his ware was purchased as fast as produced by princes and nobles. During the terrible massacre of St. Bartholomew he was left unmolested. Around him were gathered in 1575 the leading savans of Paris, to hear an exposition of his views on the origin of fossils—views then for the first time put forth, but now universally admitted. These lectures were repeated annually for several years; their substance was embodied in a series of Dialogues published in 1580, on the 'Nature of Waters and Fountains, as well natural as artificial, of metals, salts, and salt-springs, stones, earths, fire, and enamel, with many other excellent secrets respecting natural things.' The time was at hand, however, when royal patronage was to fail. In 1588, Palissy was arrested as a heretic and cast into the Bastille. His reputation,

the intercession of powerful friends, it is said the intervention of the king, saved him from the stake; he was offered liberty if he would recant, but he would not yield, and he remained in prison till his death, "from natural causes," in or about 1590. Palissy wrote, 'Recepte véritable, par laquelle tous les hommes de France pourront apprendre à multiplier et augmenter leurs trésors,' small 4to, Rochelle, 1563, second edition, 1564; 'Discours admirables de la nature des eaux et fontaines, tant naturelles qu'artificielles, des métaux, des sels et salines, des pierres, des terres, du feu et des émaux, avec plusieurs autres excellents secrets des choses naturelles,' &c., small 8vo, Paris, 1580: these were published together, in two small 8vo volumes, in 1636, under the title of 'Le Moyen de devenir riche.' A pamphlet is attributed to him which appeared in 1557 as a 'Déclaration des Abus et Ignorance des Médecins: par Pierre Brailleur.' His 'Œuvres, avec des Notes de Faujas de Saint-Fond et Gobet,' 4to, Paris, 1777, and 'Œuvres complètes de Bernard Palissy, conforme aux textes originaux imprimés du vivant de l'auteur, avec des notes et une notice historique par Paul-Ant,' 18mo, Paris, 1844, contain all his known writings. The Palissy ware continued for several years to be made by his sons, but with inferior taste and skill. At the present time it is largely imitated in England, as well as in France. Fine specimens of original Palissy ware command extraordinary prices. The best collection extant is that of the Louvre; but many good specimens are contained in the South Kensington Museum. (A. Dumesnil, *Bernard Palissy*, 1851; H. Morley, *Palissy the Potter*, 2 vols. 8vo, 1852; Camille-Duplessis, *Étude sur Palissy*, 1855; L. Audiat, *Bernard Palissy: étude sur sa vie et ses travaux*; Laborde, Jacquemart, &c.)

*PALMER, SIR ROUNDELL, M.P., Q.C., F.R.S., &c., a distinguished lawyer and politician, second son of the Rev. William Jocelyn Palmer, of Mixbury, Oxfordshire, was born in that place on the 27th of November, 1812, and was educated successively at Winchester and at Trinity College, Oxford. He obtained the Chancellor's prize for Latin verse in 1831, and Sir Roger Newdigate's prize for "a copy of English verse of fifty lines, and no more, in recommendation of the study of the ancient Greek and Roman remains of Architecture, Sculpture, and Painting," in 1832; gained an Ireland scholarship in the same year; and an Eldon Law scholarship in 1834. On the 17th of May, 1834, he graduated as B.A. in first-class classics; and having become a fellow of Magdalen College, proceeded M.A. as a member of that society, of which he is still an honorary fellow, on the 10th of November, 1836. He received the degree of D.C.L. in 1862; and is at present counsel to his University, and a deputy-steward. He was called to the bar by the Society of Lincoln's Inn, on the 9th of June, 1837; and became a bencher on his appointment as Queen's counsel in April, 1849. He was first returned to Parliament in 1847 as member for Plymouth, which he represented till July, 1852; and again from June, 1853, to March, 1857. In July, 1861, he was elected for the borough of Richmond; and this constituency he has ever since continued to represent. He was appointed Solicitor-general on the 9th of July, 1861, and on the 16th of the following month received the honour of knighthood; was promoted to be Attorney-general on the 2nd of October, 1863; and resigned with his party in July, 1866, to make room for the third administration of the late Earl of Derby. He is understood to have missed, if not to have refused, the appointment of Lord Chancellor in the Gladstone administration of 1868, on account of his opposition to the Premier's resolution for the disestablishment and disendowment of the Irish Church. Sir Roundell Palmer has taken a conspicuous part in the discussion in Parliament, and the consideration in committee, of various legal, judicial, international, and ecclesiastical questions; and several of his speeches have been separately published, especially those on 'The North American Blockade,' 8vo, London, 1862; on the 'Alabama Question,' 8vo, London, 1863, American edition, 16mo, Cambridge, Mass., 1864, and, with additions, 1866; and on 'The Disendowment of the Irish Church. A Speech delivered in the House of Commons, March 22, 1869, on the Second Reading of the Irish Church Bill,' 8vo, London, 1869. Sir Roundell Palmer has laboured to extend the basis and the advantages of university education; and has lately prominently identified himself with a movement for the establishment of a legal university, whose degrees in law are to be compulsory before admission to practice. One result of this agitation has been a recent regulation by the benchers of the Inner Temple, by which that society will for the future demand that a student shall have satisfactorily passed a professional examination before

being called to the bar. Sir Roundell Palmer has devoted a portion of his leisure to various literary pursuits; and he has published 'The Connection of Poetry with History. A Lecture delivered before the members of the Plymouth Mechanics' Institute,' &c., 8vo, London, 1852; 'English Church Hymnody. A Lecture read at the Church Congress, York, October 11, 1866,' 8vo, London and Cambridge, 1867; and a Selection of Hymns, forming part of the 'Golden Treasury Series,' entitled 'The Book of Praise. From the best English Hymn Writers,' &c., 8vo, London and Cambridge, 1863, new editions, 1864, 1865, &c.

PALMERSTON, HENRY JOHN TEMPLE, VISCOUNT. [E. C. vol. iv. col. 650.] A combined opposition, March, 1857, carried a resolution declaring the course pursued by Sir John Bowring and the British officers in China to be unjustifiable, and consequently censuring Lord Palmerston's administration for having approved that course. Of the alternatives of resignation and an appeal to the country, Lord Palmerston elected the latter; and Parliament was dissolved on the 21st March. Two days after, the Premier, in his address to the electors of Tiverton, declared his policy to be peace abroad, on the conditions of honour and security; and, at home, economy, progressive improvements, the continued diffusion of education among the people, and well-considered measures of reform. The majority he secured in the new Parliament was sufficient to enable him to continue his administration until February, 1858, when he was compelled to resign on account of his reputed anxiety to accommodate the Emperor of the French, at the expense of English honour and independence, exhibited in the Conspiracy to Murder Bill. He was succeeded by the late Earl of Derby, whom he in turn displaced in June, 1859; and signalled an administration, which endured till his death on the 18th of October, 1865, by his conclusion of a commercial treaty with France, by the sympathy which he manifested in the welfare of Italy, by his moderation and firmness in his relations with the United States of America, and by the prudent rather than chivalrous manner in which he extricated himself from the obligations of the treaty of London, 1852, in reference to the Schleswig-Holstein question (1863-64). This question was so intricate that Lord Palmerston claimed to have been one of two persons—the second being then dead—who ever understood it. Lord Palmerston preserved his health and mental vigour until a very short time before his death; and, in spite of his advanced age, his career was considered to have been prematurely closed by imprudent exposure to the sudden coldness of the season. It was his own desire to be interred in the cemetery at Romsey; but Lady Palmerston yielded to the express wish of the Queen and the vehemence of the national desire that he should be buried in Westminster Abbey. Here he was accordingly interred on the 27th of October, when his funeral was attended by the Prince of Wales, the Duke of Cambridge, the representatives of fourteen foreign states, and deputations from various public bodies, whilst ten cabinet ministers bore his pall.

The tidings of his death, as that of a typical Englishman, of whom his political friends and foes, as Sir Robert Peel said of him, were alike proud, were received all over the kingdom with demonstrations of the vivid regret and sympathy due to a personal bereavement—a feeling which he had earned by his own boundless sympathy with all classes of his countrymen. His death, as it was said at the time, marked an epoch in English politics; and his name, once the terror of the Continent, still promises to be cherished by posterity along with the brightest memories of the present reign. The later honours of his life included those of Lord Warden of the Cinque Ports, and Governor or Constable of Dover Castle (1861); D.C.L., Oxford, conferred at the commemoration of 1862, in which year he was also elected Lord Rector of the University of Glasgow; Knight Grand Cross of the Bath; Knight of the Garter; Knight of the Tower and Sword of Portugal; an elder brother of the Trinity House; and honorary colonel of the First Cinque Ports Artillery Volunteers. A marble statue of him was erected in Westminster Abbey, 1869; another erected in the market-place of Romsey, and a memorial window in the Abbey Church of that town, were inaugurated on the 21st of July, 1868; and a statue in one of the public parks of Southampton, of which town he was a burgess, was inaugurated on the 2nd of June, 1869. The death of Lady Palmerston, who had been for more than twenty years a discreet and able fellow-worker for his lordship's political success, and a sharer in his social popularity, took place on the 11th of September, 1869, at Brocket Hall, Hertfordshire.

After the early efforts which have been already mentioned, Viscount Palmerston devoted himself as little as possible to the

task of literary production; which, indeed he seems to have regarded chiefly as a diversion or a political instrument. A valuable insight into many of his views, and his manner of stating them, is given in the instalment of a work by the Right Hon. Sir Henry Lytton Bulwer (Lord Dalling and Bulwer), entitled, 'The Life of Henry John Temple, Viscount Palmerston: with Selections from his Diaries and Correspondence,' vols. i. and ii., 8vo, London, 1870. Other biographical works, of a slighter and more ephemeral kind, are 'Lord Palmerston. A Biography,' 8vo, London, 1865, by John MacGilchrist; and another, by James Ewing Ritchie, entitled 'The Life and Times of Viscount Palmerston: embracing the diplomatic and domestic History of the British Empire during the last Half-Century,' 8vo, London, 1866.

PALMEZZANO, MARCO, sometimes called **MARCO DA FORLÌ**, an eminent Italian painter, was born at Forlì about 1456; was a pupil of Melozzo da Forlì; and was much employed in painting for the churches and religious houses of the Romagna, where he was very popular. The year of his death is unknown; a painting by him, formerly in the Ercolani gallery, Bologna, is dated 1537. His pictures are marked by the hardness and severity of the painters of the Quattrocenti, but some display considerable grace, tenderness, and finish. Specimens of his works are in the Brera, Milan, and the Museum, Berlin. The National Gallery has a large 'Deposition in the Tomb,' No. 596, originally the lunette of an altar-piece in the Cathedral of Forlì.

PANDER, CHRISTIAN HEINRICH, embryologist and palæontologist, was born at Riga, July 24, 1794. He was educated at Riga, Dorpat, Berlin, Göttingen, and Würzburg. While at this last-mentioned place, he commenced, at the instigation of Professor Döllinger, a series of investigations on the development of the chick in the egg, which was afterwards carried on by D'Alton and Baer, so as to lead to important results. It was soon followed by a rapid advance in embryological science generally. Pander's share of the work appeared in the 'Archives générales de Médecine,' vol. i. pp. 178-206; 346-359 (1823), in a paper entitled, 'Historia metamorphoseos, quam ovum incubatum prioribus quinque diebus subit,' but was published first in a shorter form in Oken's 'Isis,' for 1817. When this work was finished, he and D'Alton made an extensive journey through most parts of Europe, for the purpose of examining the anatomical museums, and of collecting marine animals. On returning to Russia he became naturalist to an embassy sent to Bokhara in 1820, and was afterwards attached to the Imperial Academy of Science at St. Petersburg. In the latter capacity he arranged the zoological collection and investigated the geology of St. Petersburg and its neighbourhood. In 1827 he resigned his post and retired to his property at Zarnikau, in Livonia. In 1842 he again entered into official life, accepting an appointment in connection with the School of Mines at St. Petersburg. He died September 22, 1865. Pander took a leading share in developing the knowledge of the palæozoic strata of Russia. In 1831, he published 'Contributions to the Geognosy of the Russian Empire,' which was the first general work on the Silurian beds of Russia. He was the first to discover the remains of fishes in the Devonian strata of Russia, although Sir R. I. Murchison published details before him. His own researches appeared in the form of a valuable monograph on the Devonian fishes, under the title of 'Die Ctenodipterinen des Devonischen Systems,' St. Petersburg, 1853; and 'Ueber die Saurodipteren, Dendrodonten, Glyptolepiden, und Cheirolepiden des Devonischen Systems,' 1860. The hooklets and spines from the lower Silurian near St. Petersburg, which he called conodonts, and which he ascribed to fishes, have proved to belong not to fishes, but to crustaceans and other invertebrate classes.

* **PANIZZI, SIR ANTONIO**, or **ANTHONY**, according to the English form which he has adopted since his knighthood, a distinguished bibliographer and librarian, was born on the 16th of September, 1797, at Brescello, in the Duchy of Modena, and was educated successively at the Lyceum at Reggio and at the University of Parma, where he studied law, and took his doctor's degree in 1818. The political disturbances in the north of Italy, about two years after, in which he was to a considerable extent concerned, rendered it expedient that he should leave his native country; and he succeeded in reaching England, where, through the influence of Lord Brougham and Mr. Roscoe, he was appointed, in 1828, professor of Italian at University College, London. In April, 1831, he was appointed Assistant-Keeper of the Printed Books at the British Museum, to the Keepership of which he was promoted in June, 1837. In July, 1856, he became Principal Librarian, and held this

office until his retirement on full pay in June, 1866; and in 1869 he received the honour of knighthood, in acknowledgment of his successful labours in the improvement of the library and the compilation of a new catalogue, 'Catalogue of Printed Books in the British Museum (A—ZZ)', folio, London, 1841. He has the merit of originating the scheme of a single and sufficient structure for the accommodation of students in the library, which resulted in the erection of the magnificent new reading-room, which was built in the inner quadrangle of the Museum, and was completed in 1857, though the first conception and publication of the idea must be assigned to the late Mr. Thomas Watts [BRITISH MUSEUM, E. C., Arts and Sciences Div., vol. ii. col. 372]. Sir Anthony Panizzi has compiled Guide Books to several of the departments of the British Museum; and is the author of a pamphlet 'On the Supply of Printed Books from the Library to the Reading-Room of the British Museum,' 8vo, London, 1846, privately printed. He has also written a work, of which 250 copies were privately printed, entitled 'Chi era Francesco da Bologna?' 16mo, London, 1858; and has edited the works, or portions of the works, of various standard Italian authors—Bojardo's 'Orlando Innamorato,' 1830; Ariosto's 'Orlando Furioso,' 1832; and a superb comparative edition, in parallel columns, of the first four editions of Dante's 'Divina Commedia,' entitled 'Le Prime quattro Edizioni della Divina Commedia letteralmente ristampate,' &c., folio, London, 1858. In his professorial character he produced 'Extracts from Italian Prose Writers,' 12mo, London, 1828; and 'An Elementary Italian Grammar,' 12mo, London, 1828.

PANOFKA, THEODOR, German archæologist, was born at Breslau, February 25th, 1801, and, on the completion of his course at the University of Berlin, went, in 1822, to Rome; thence in 1824 to Sicily with Baron von Stackelburg, and afterwards to Paris. From Paris he went to Naples to draw up a description of the Blacas Museum, and thence proceeded to Nola to direct the excavations in progress there, and of which he published an account in the 'Kunstblatt.' For a time he filled the post of secretary of the Archæological Institute at Rome, but was recalled to Berlin, nominated a member of the Academy, and, in 1844, professor in the University. He died on the 20th of June, 1858. Panofka was a man of sound judgment and ripe learning, and his archæological writings are of great value. Among them may be named—'Vasi di Premio,' Florence, 1826; 'Museo Bartoldiano,' Berlin, 1827; 'Neapels Antiken,' Stuttgart, 1828; 'Recherches sur les noms des vases grecs,' Paris, 1829; 'Musée Blacas: les vases peints,' 4 parts with plates, folio, Paris, 1830—33; 'Terracotten des königl. Museums zu Berlin,' 4to, 1842; 'Bilder antiken Lebens,' Berlin, 1843; 'Griechinnen und Griechen nach Antiken skizzirt,' 1844; 'Parodien und Caricaturen aus Werken der classischen Kunst,' 1851; 'Ueber merkwürdige Marmorwerke im königl. Museum zu Berlin,' 1857, and many good monographs and occasional papers.

PAPILLON, JEAN, French wood-engraver, born at St. Quentin in 1661, was the son of a wood-engraver of some note in his day—Jean Papillon, of Rouen, born 1639; died 1709. Jean Papillon the younger was the pupil, first of his father, and then of N. Cochin, of Paris. He executed a large number of cuts, some of which are of much merit; and to him is ascribed the invention, about 1688, of printing wall-papers, called "paper-hangings," as being at first an imitation of tapestry. He died in 1723.

PAPILLON, JEAN-BAPTISTE-MICHEL, nephew of the preceding, was born at Paris, June 2, 1698. His woodcuts are found in many of the illustrated works of the period; the best are considered to be those he engraved from the designs of Bachelier, for the folio edition of La Fontaine's Fables. Papillon, who was an enthusiastic admirer of wood-engraving, published in 1776 a work on the art in two volumes, 'Traité historique et pratique de la gravure sur bois,' illustrated by a large number of excellent cuts. The work was long regarded as the chief authority on the subject; but, as a history, it has been superseded by later works, containing the result of more extended research. A collection of his engravings made between 1712—60 was published in three folio volumes. J. B. M. Papillon died in 1776.

PAPIN, DENIS, was born at Blois (it is supposed) in 1647. He was brought up to the study of medicine, and graduated at Paris. He afterwards visited England; became associated with Boyle in his pneumatical experiments, and through his means became a fellow of the Royal Society in 1681. There are several papers of his in the 'Transactions' dating from 1675, and also in the 'Mémoires de l'Académie.' He also published in 1674 a work on the air-pump. He was during a long time Boyle's

amanuensis, and conducted a number of experiments suggested by Boyle. In 1684 he became curator to the Royal Society, with a salary of thirty pounds a year, and he was expected to show at least one experiment at each meeting of the Society. In 1687, he was appointed Professor of Mathematics in the University of Marburg, which he held until his death in 1714 (Arago says, 1710). This writer claims for him the invention of the atmospheric steam-engine, and also that of the steamboat. See 'Annuaire pour l'an 1837,' p. 245, and 'Chemical News,' vol. xvi. pp. 29 and 43.

PARIS, PIERRE ADRIEN, French architect, was born at Besançon in 1747. The son of an architect, he studied first under his father, and then at Paris under Trouard, architect to the king. In 1772 he went as royal pensioner to Rome. The fruits of his studies in that city appeared in his 'Examen des Edifices de Rome,' fol., plates; and his 'Restauration du Colysée,' 45 folio plates. M. Paris also published a 'Recueil de dessins et études,' in 9 vols. folio, which contains many of his own designs; and he made drawings of ancient monuments for Saint-Non's 'Voyage à Naples' and other works. The chief buildings erected by M. Paris were the Hôtel de Ville, Neufchâteau; the portal of the Cathedral of Orleans; and the Hospital of Bourg; but he disavowed the last on account of alterations made whilst it was in progress. In 1778 he was nominated designer to the king, and to him was confided the entire charge of the fêtes of Versailles, Marli, and Trianon. He was also architect to the Opera. He was elected a member of the Academy in 1781, and created knight of St. Michel, in 1788. Deprived of all his employments by the Revolution, he lived in strict seclusion till 1806, but employed his leisure in translating Dickson's 'Agriculture of the Ancients,' and some of the works of Arthur Young, Marshall, and other standard English writers on agriculture. In 1806 he went to Rome, where he for a short time presided over the French Academy. He remained in Italy till 1817, chiefly employed in completing the works above cited. He died at Besançon, August 1st, 1819.

PARKER, THEODORE, an eminent American preacher, lecturer, and writer, the descendant of "six generations of farmers," whose ancestors, originally belonging to Yorkshire, emigrated to America in 1635, and settled at Lexington, Massachusetts. Here Theodore was born on the 24th of August, 1810. He entered Harvard College on the 23rd of August, 1830, and, as the youngest of six children, found it necessary to become a teacher, first in Boston, and afterwards at Watertown, in order that he might continue to be a student. His talents were great, his application ardent, and his acquirements soon presented a very uncommon range and variety, whether in scientific, philosophical, or theological subjects; and he early gave promise of the powerful oratory for which he subsequently achieved a reputation. In 1834 he entered the middle class at the divinity school in Cambridge; and, in concert with some of his fellow-students, became a joint editor of the 'Scriptural Interpreter,' to which he contributed exegetical articles which staggered the partisans of the conventional Unitarianism in which he had been trained, by the extent to which they radiated and reflected the free speculations of Eichhorn and other German rationalists in the department of Biblical criticism. During the autumn of 1836 and the following winter he preached in various places in Massachusetts, as a candidate for the ministry; and in June, 1837, undertook the pastorate of the Unitarian church of West Roxburg, in the neighbourhood of Boston. Here he gradually denuded his creed of the articles which embodied what he regarded as Bibliolatry and superstition; and had already thereby shut himself out from the pulpits of many of his brethren, when his reputation for heresy, infidelity, and pantheism was established by his delivery and subsequent publication of a sermon entitled 'The Transient and Permanent in Christianity,' 8vo, Boston, 1841. This discourse was reviewed and condemned in the 'Christian Examiner and Religious Miscellany,' a magazine to which he was at that time a regular contributor of articles which he presently afterwards collected and published with the title of 'Critical and Miscellaneous Writings,' 12mo, Boston, 1843, second edition, 1856, English edition, 12mo, London, 1849. Later in the year of the first publication of this work, the author also put forth his translation of De Wette's 'Critical and Historical Introduction to the Canonical Scriptures of the Old Testament,' &c., 2 vols. 8vo, Boston, 1843, new editions, 1850, 1859, &c. In the winter of 1841—42 he accepted an invitation to deliver at Boston a course of lectures which he afterwards published as 'A Discourse of Matters pertaining to Religion,' 8vo, Boston, 1842, 4th edition, 8vo, 1856, English edition, 8vo,

London, 1848, in which he discusses (Book i.) 'Religion in general;' (ii.) 'The Relation of the Religious Sentiment with God;' (iii.) 'The Relation of the Religious Sentiment with Christianity;' (iv.) 'The Relation of the Religious Sentiment with the Bible;' and (v.) 'The Relation of the Religious Sentiment with the Church.' He sought in Europe a respite from the odium and antagonism to which this statement of his views rendered him obnoxious; coming over in September, 1843, and devoting nearly twelve months to travelling in England, France, Italy, and Germany. In the autumn of 1844 he returned to his charge at West Roxbury, where for a few months he struggled against an almost universal excommunication; and then migrated to Boston, where he began to preach on the 16th of February, 1845, in a building whose secular avocations included concerts and dramatic representations, called the Melodeon, where, in the spring of 1846, he organised a congregation to which he gave the name of 'The Twenty-eighth Congregational Society in Boston.' Here the clearness, frankness, and eloquence with which he stated his views presently attracted overflowing congregations; and some of his 'Sermons,' published from short-hand notes taken at the time of delivery, are calculated to have "reached a circulation of many hundreds of thousands of copies." Up to this time, besides the writings already mentioned, his more remarkable productions had been articles contributed to the 'Dial,' the 'Boston Quarterly Review,' the 'Christian Register,' and the 'Christian Examiner;' and in December, 1847, he became the founder and leading editor, in association with two others, of a political and theological review, entitled the 'Massachusetts Quarterly Review,' which he conducted during its three years' term of existence, and to which he contributed articles on Emerson, Channing, 'Prescott as a Historian,' and on the 'Political Destination of America.' Besides the delivery of sermons at the Melodeon, in which he discussed nearly every kind of subject, whether of morals, charity, political or social economy, reform, war, and slavery—the last of which he detested, and for his outspoken denunciation of which on a particular occasion he laid himself open to a prosecution in April, 1855—he engaged extensively in lecturing in various parts of the country. In 1852 it was found necessary to procure for his hearers more spacious accommodation in the Music Hall, where he delivered his first sermon on the 21st of November. His congregation was very large, and was constantly increased by the attendance of strangers from various distant places; and his labours as "Sunday preacher, lyceum lecturer, radical leader, and practical philanthropist, were simply such as to apply half-a-dozen distinct suicides to the abbreviation of a single life." ('Atlantic Monthly,' October, 1860.) His health was fitful, and already clouded over by consumption; but his will proved stronger than his infirmities until the morning of the 9th of January, 1859, when, about four o'clock, he was seized with a severe attack of pulmonary hæmorrhage, a few hours before the intended commencement of his service at the Music Hall. For the recovery of his health he repaired first to Santa Cruz, where he recovered sufficiently to address to his congregation, who had sent him a very affectionate letter, an autobiographic retrospect, entitled 'Theodore Parker's Experience as a Minister,' &c., 12mo, Boston, 1859, third edition, 12mo, London, 1859; and the intense summer heat of which he evaded by proceeding to Europe, where he made a leisurely and sometimes painful tour through England, France, and Switzerland. He passed the winter of 1859–60 at Rome, from which he set out in April, in a very enfeebled condition, for Florence, where he died on the 10th of May, 1860, and was buried on Sunday, the 13th, in the small Protestant cemetery near the Pinti Gate.

The principal of the works of Theodore Parker, besides those already mentioned, are 'Speeches, Addresses, and Occasional Sermons,' 2 vols. 12mo, Boston, 1852, and 'Additional Speeches, Addresses, and Occasional Sermons,' 2 vols. 12mo, Boston, 1855; 'Ten Sermons of Religion,' 12mo, Boston, 1853, second edition, 8vo, Boston, 1855, English edition, 12mo, London, 1853; 'A Discourse occasioned by the Death of Daniel Webster, preached at the Melodeon, on Sunday, October 31, 1852,' 8vo, Boston, 1853; and 'The Life of Daniel Webster,' 12mo, London, 1853; 'Sermons on Theism, Atheism, and the popular Theology,' 12mo, Boston, 1853, second edition, 8vo, 1856, English edition, forming No. 1 of Chapman's 'Quarterly Series,' 12mo, London, 1853; 'Prayers,' 8vo, London and Birmingham, 1862, "edited by R. L. and M. G.," 'Lessons from the World of Matter and the World of Man. Selected from Notes of unpublished Sermons, by R. Leighton. Edited by Frances Power Cobbe,'

8vo, London and Bungay, 1865, German translation, by Johannes Ziethen, of his complete works, 'Sämmtliche Werke,' 5 vols. 8vo, Leipzig, 1854–61, &c.; 'The Collected Works of Theodore Parker, containing his theological, polemical, and critical Writings, Sermons, Speeches, and Addresses, and literary Miscellanies. Edited by Frances Power Cobbe,' 12 vols. 8vo, London, 1863–65; and a new edition of his 'Works,' in 14 volumes, now in course of issue at Boston, Massachusetts. Of the crowd of publications conversant about the career and the works of Theodore Parker, may be mentioned his 'Life and Correspondence,' 2 vols. 8vo, London, 1863, New York, 1864, by John Weiss; and Albert Réville's 'Théodore Parker: sa Vie et ses Œuvres. Un Chapitre de l'Histoire de l'Abolition de l'Esclavage aux États-Unis,' 12mo, Paris, 1865, English translation, 'The Life and Writings of Theodore Parker. A Memoir,' 8vo, London and Bungay, 1865. It should be added that Parker bequeathed the chief part of his library, more than 13,000 volumes, to the Free Public Library of the city of Boston.

PARKES, JOSEPH. [E. C. vol. vi. col. 1016.] Mr. Parkes died on the 11th of August, 1865, in the 70th year of his age. During many years, he had occupied his spare time in collecting evidence respecting the title of Sir Philip Francis to the authorship of Junius. He amassed a large quantity of materials, and he commenced a life of Francis, but did little more. The work was continued by Mr. Merivale, and eventually appeared under the title of 'Memoirs of Sir Philip Francis, K.C.B., with Correspondence and Journals. Commenced by the late Joseph Parkes, Esq.; completed and edited by Herman Merivale, M.A.,' 2 vols. 8vo, 1867. It cannot be said to have done much towards elucidating the Junius mystery.

* PARLATORE, FILIPPO, botanist, was born at Palermo, August 8, 1816. He was educated chiefly at Palermo, but a portion of his time was spent in the country, owing to the weak state of his health. During this retirement he amused himself with, and imbibed a liking for, botany. In 1834 he took his degree of doctor in medicine, and commenced medical practice. In 1837, Palermo was visited with cholera, and he carefully studied the disease, on which he wrote an octavo treatise. Botany, however, soon occupied more of his attention than pathology. In 1840 he made a botanical tour through Italy and Switzerland. In 1841 he urged the importance of a herbarium at Florence. Shortly afterwards one was formed, and Parlatore was appointed to take charge of it. This was followed by the re-establishment of the professorship of botany, which had been suppressed, expressly in order that Parlatore might fill it. He made extensive journeys through northern Europe, principally for the purpose of collecting materials for a work he proposed on the geographical distribution of plants. Parlatore is a member of numerous societies, and has received honours from several of the sovereigns of Europe. He has written numerous works and notices, amongst others 'Lezioni di Botanica comparata,' 8vo, Firenze, 1843; accounts of his travels in the Alps and in the North of Europe; lists of the seeds in the museum attached to the Royal Botanical Garden of Florence; and a monographic work on the Italian flora, 'Flora Italiana,' which was commenced in 1848, and is still in progress. He also contributed to Webb's work on the Canary Islands.

PARSONS, or PERSONS, ROBERT, a factious Jesuit, was born in 1546, at Nether Stowey, near Bridgewater, in Somersetshire, and received his education from John Hayward, or Haywood, vicar of that parish, who enabled him to proceed to the University of Oxford, where he was entered of Balliol College, in the latter end of 1563. He graduated as B.A., on the 31st of May, 1568; became successively probationer and chaplain-fellow of his college; and proceeded M.A. on the 2nd of December, 1572. Having caused some scandal by his manner of performing the offices of bursar and dean, he obtained permission to resign his fellowship on the 13th of February, 1574. Although he was allowed to retain his rooms and his pupils, for the sake of keeping up a fair face to the world, Balliol soon became intolerable to him, and he quitted it for London. Thence in the following June he passed over to Calais, and proceeded by way of Antwerp and Louvain to Padua, where he stayed for some time, dividing his studies between medicine and law, which he at length relinquished, and repairing to the English college at Rome, was there admitted into the Society of Jesus, on the 4th of July, 1575. After going through a preparatory course of divinity, and fulfilling certain probationary offices, he was selected, in 1580, to proceed as superior missionary to England, in company with Campian and others, for the purpose of advancing the interests of Romanism. For this object he had recourse to various schemes,

and sought to achieve his ecclesiastical designs by political instruments; and secretly stirring up the Roman Catholics to a rebellion against Queen Elizabeth, seemed to have everything ready for an insurrection, when, by the vigilance of Lord Burleigh, Campian was arrested, convicted, and executed, whilst Parsons himself was forced to seek refuge at Rouen, where he employed himself in the production of several works, which he caused to be craftily exported, and to be circulated in England for the furtherance of his cause. In 1583 he returned to Rome, where the management of the English mission was confided to him; and in 1586 the students in the English seminary at Rome, chose him for their rector. In 1588, the year of the Armada, he was sent by the general of the order into Spain, where he employed every engine to promote the designs of Philip II. for the conquest of England; and was instrumental in planting several English seminaries, a condition of entrance into which he made the subscription to the right of the Infanta of Spain to the crown of England. After the failure of the Armada, he endeavoured to incite Philip to a second invasion of this country; and, when he was unsuccessful in this attempt, laboured to disturb the succession to the crown of England, and especially to divert it from King James VI. of Scotland, whose claims were opposed in a treatise which he published, under the assumed name of Doleman, with the title of 'A Conference about the next Succession of the Crown of England,' otherwise known as 'The Book of Titles,' two parts, 8vo, 1593—94, &c. For two years after the latest date of this publication, Parsons continued in Spain; and, in 1597, after the death of Cardinal Allen, repaired to Rome, with the hope of succeeding him in the cardinalate. Here, however, he found himself in such evil odour that he was fain to retire to Naples, where he devoted himself to his official duties, and to literary activity, until some time after the death of Pope Clement VIII. (March 5th, 1605), when he returned to Rome; and, dying there on the 18th of April, 1610, was interred in the chapel of the college of which he was rector. Parsons was a voluminous author, and his works, besides those which have been already mentioned or indicated, and which vary as controversial, political, and devotional, include, 'A Christian Directorie, or Exercise, guiding Men to their eternal Salvation,' 8vo, 1583, &c., "put into modern English," 8vo, London, 1700, a book which, commonly called 'The Resolution,' has been highly extolled by writers of the author's communion; 'A Manifestation of the great Folly and bad Spirit of certayne in England calling themselves secular Priests,' 4to, 1602; 'A Treatise of three Conversions of England from Paganisme to Christian Religion,' three parts, 8vo, 1603—4, &c.; and a multitude of others, the interest of which has entirely evaporated, except as they throw light on the polemics, strife, and general history of the time.

PASLEY, GENERAL SIR CHARLES WILLIAM, K.C.B. [E. C., vol. iv., col. 683], was born at Eskdale-muir, Dumfriesshire, 8th September, 1780. He received a solid preliminary education in Scotland, and joined the Royal Military Academy at Woolwich in August, 1796. He died 19th April, 1861.

PASS, DE PASSE, or, as the elder Pass signed his plates, VAN PAS, the name of a family of engravers of considerable celebrity, natives of Utrecht. The following are the most eminent: the dates of birth and death are for the most part only approximations—authorities varying both as to birth and death from ten to twenty years:—CRISPIN DE PASS, the elder, born about 1560, was a pupil of Theodor Coernhert. He designed well; was a man of some literary culture; and mixed with good society. Having attracted the notice of Prince Maurice, he was sent by him to Paris; and whilst there he designed and, with the assistance of his son, engraved, under the direction of M. Pluvinel, riding-master to Louis XIII., the prints to the works entitled 'Instruction du Roy en l'exercice de monter à cheval,' fol., 1616, and 'Manège Royal,' fol., 1623, in which he introduced portraits of the French monarch and his principal courtiers. Crispin de Pass is supposed to have spent some years in England. His English portraits are highly valued. The most celebrated is that of Queen Elizabeth, in sumptuous attire, with crown, globe, and sceptre. Others are portraits of Elizabeth in the dress in which she went to St. Paul's, after the destruction of the Armada; James I.; Prince Charles; Sir Philip Sidney, &c. The latest of his English prints is dated 1635; but he lived some years longer, as he published in 1643—44 his celebrated drawing-book, 'Della Luce del Dipingere et Disegnare,' at Amsterdam, where he published several other illustrated works, including portraits of kings and princes; Ovid's Metamorphoses; Garden of Flowers,

BIOG. DIV.—SUP.

&c.—CRISPIN DE PASS, the younger, eldest son, scholar, and assistant of the preceding, was born about 1585, and was living in 1659. He engraved portraits and subject-pieces largely in connection with his father.—WILLIAM DE PASS, second son of Crispin, was born probably before 1590. He learned design and engraving under his father, whom he accompanied to England, and is believed to have remained here the better part of his life. Zani speaks of him as being alive in 1640; but, as he engraved an equestrian portrait of the Protector Cromwell, he must have lived at least till 1653. The prints of William de Pass are very numerous and much esteemed, especially the portraits, most of which are of persons of historical note. Among the best are those of James I., on his throne, surrounded by his family; and George Villiers, Duke of Buckingham, on horseback.—SIMON DE PASS, youngest son and scholar of Crispin, born probably about 1591, spent about ten years in England, and engraved whilst here a large number of historical portraits, book-prints, &c. He then entered the service of the King of Denmark, and was living in that country in 1644.—MAGDALEN DE PASS, daughter and scholar of Crispin, born about 1583, engraved mythological subjects after Elsheimer and others; landscapes, and portraits in a very neat style. She was living in 1623.

PASSAROTTI, BARTHOLOMEO, Italian painter, born at Bologna about 1530, was a scholar and assistant of Taddeo Zuccaro, at Rome. He had a profound knowledge of anatomy, drew well, and composed and painted with great facility, and his works were applauded by his contemporaries; but he is of the period of the decline of Italian painting, and his example helped forward that decline. Passarotti established an academy at Bologna, and numbered Agostino Carracci and other noted painters among his scholars. His chief works are a 'Martyrdom of St. Paul,' at St. Paul's near Rome; an Annunciation, in the Church of S. Giacomo Maggiore, Florence; and an 'Adoration of the Magi,' in St. Peter's. But his portraits are more esteemed than his compositions. There are several admirable etchings by him. He died in 1592.

PASSAVANT, JOHANN DAVID, German writer on art, was born in 1787, at Frankfurt-am-Main; on the completion of his school education, studied painting at Paris, under David and Gros, and then went to Rome, where he spent many years, much of his time being occupied in historical investigations. Here, and after his return to Frankfurt, he painted a few pictures, the best known being that of the Emperor Henry II., in the Kaisersalle, at Frankfurt; but he soon laid aside the pencil, and, having received the appointment of Director of the Städtische Gallery, devoted himself to the study of the history and principles of art, visiting, for the purpose of his inquiries, most of the great collections of Europe. His principal publications are, 'Ansichten über die bildenden Künste,' &c., Heidelberg, 1820; 'Entwürfe zu Grabdenkmälern,' Frankfurt, 1828; 'Kunstreise durch England und Belgien,' Frankfurt, 1833, of which a translation appeared under the title of the 'Tour of a German Artist in England,' 2 vols., 12mo, London, 1836; 'Rafael von Urbino und sein Vater Giovanni Santi,' 2 vols., Leipzig, 1839, supplementary volume, 1859, by far the best life of the great Roman artist extant, especially in the revised French version, 1860; 'Die christliche Kunst in Spanien,' Leipzig, 1858; and his elaborate supplement to Bartsch, 'Le Peintre-Graveur,' 6 vols. 1860—64, the last four volumes being of posthumous publication. He also contributed various papers to the 'Kunstblatt.' He died August the 12th, 1861. Passavant was one of the most learned, laborious, and conscientious of recent writers on art. His opinions, however, are often open to dispute, and his critical judgment is not always to be relied on.

*PASTEUR, LOUIS, chemist, is principally known on account of his experiments in connection with "spontaneous generation" and fermentation. He was born at Dôle, December 27, 1822, studied at Arbois, Besançon, and Paris, and commenced teaching in 1846. At first he was Balard's chemical assistant; in 1848, professor of physics at the Lyceum, Dijon; in 1849, professor of chemistry at Strasbourg, and, in 1854, at Lille. In 1857, he became the head master and director of the scientific studies of the École Normale, in Paris; in 1863, professor of geology, physics, and chemistry at the École des Beaux-Arts; and, subsequently, professor of chemistry at the Sorbonne. His earlier writings are, for the most part, papers on crystallization. He found, by the employment of polarized light in these researches, that racemic acid is separable into two acids, lævo-tartaric and dextro-tartaric, in which most of the physical and chemical properties are identical, the principal exceptions being that the crystals are asymmetrical and hemihedral, but in the form

of reflected images one of the other; that the one form rotates the plane of polarization to the left hand, the other to the right. Their relations to pyro-electricity are also opposite, the positive electricity always being developed on the side with the hemihedral faces. He also discovered other forms of tartaric acid, one being like racemic or tartaric acid, but not separable, as that is, into the two varieties mentioned above; while another is like the ordinary form, from which it is produced by the action of heat, but is less soluble, and gives rise to salts which differ from those into which the ordinary acid enters. These papers obtained for him the Rumford medal from the Royal Society, and a prize from the Société de Pharmacie of Paris. He made elaborate researches on fermentation, the main results arrived at being that the process depends upon the action of microscopic organisms, and that each kind of fermentation, whether lactic, or vinous, or alcoholic, is due to certain species. Thus alcoholic fermentation is started by *Torula cerevisia*; lactic fermentation, by *Penicillium glaucum*, and so on. These researches led him to a careful investigation of the doctrine of spontaneous generation, or abiogenesis. By a series of admirably contrived experiments, he demonstrated that the organisms which give rise to fermentation are derived from germs in the air. He strained air through cotton-wool, and found, as others had before him, that no fermentation took place. He then examined the cotton-wool under the microscope: he found certain solid bodies, which he considered to be germs; and that they were germs he showed by placing them in the proper fluid, and thus developing fermentation. This idea was tested in many ways, the principal object being to prevent the access of germs by currents of air. It was further applied to explain the appearance of those organisms in fluids whose germs are invisible, owing, as is contended, to their minuteness. In 1853, and following years, a disease, called pébrine, broke out amongst silkworms, which resembled, in many points, cholera amongst men. The plague committed great ravages, and after many remedies had been suggested and tried, but with uniform failure, Pasteur was ordered by the French government to give the matter his attention. He found the disease to be due to the growth and multiplication of a plant which Lebert had named *Pankistophyton*. The disease, he said, was contagious, because the plant-corpuscles passed from the bodies of the diseased caterpillars to those of the healthy ones; it is hereditary, because the corpuscles gain access to the eggs while being formed, and this explains why the disease is inherited only from the mothers. The hypothesis explained all the phenomena. Pasteur accordingly proposed to eradicate the disease by preventing the distribution of the plant-corpuscles, and wherever his plan has been carried out it has been successful. By his researches on fermentation he has rendered the same service to the vine-grower and vinegar-maker as to the cultivator of silkworms. Besides a large number of papers, his principal works are, 'Études sur le Vin, ses Maladies, &c.,' 8vo, Paris, 1866; 'Études sur le Vinaigre, ses Maladies, &c.,' 8vo, 1868; 'Lettres sur la Sériciculture,' 8vo, 1869; and 'Études sur la Maladie des vers à soie, &c.,' 2 vols. 8vo, 1870.

PATINIR, JOACHIM DE, was born at Dinant, about 1490, learned painting at Antwerp, and was admitted into the guild of painters in that city in 1515. He at first painted small figure-pieces with landscape backgrounds, but eventually landscapes only; and he passed from a hard, dry, and minute style, to one of greater breadth and freedom. He is regarded as the founder of the Netherland school of landscape-painting, and was probably the first to give special study to that branch of art. When Albert Dürer visited Antwerp in 1520, he was so much delighted with the works of Patinir, that he painted his portrait as a mark of his esteem, and was present at his wedding. Patinir was a man of dissipated habits, and only painted when constrained. He died in 1548. His works are scarce, and much prized. Antwerp Museum has a well-painted 'Flight into Egypt'; and others are at Brussels and Vienna. The National Gallery contains three small pictures by him—No. 715, 'The Crucifixion,' valuable for the broad landscape background; No. 716, 'St. Christopher carrying the Infant Christ'; and No. 717, 'St. John at Patmos.'

PATTINSON, HUGH LEE, metallurgic chemist, was born at Alston, Cumberland, in 1798. He was engaged for some years at a soap factory in Newcastle-on-Tyne: and, returning to Alston in 1828, was, on the recommendation of Mr. John Taylor, the mining engineer, appointed assay-master at the lead mines belonging to the commissioners of Greenwich Hospital. While thus engaged, he made a discovery which has been of great practical importance in the metallurgy of lead. Until that time, the silver which is nearly always found in lead ore could only be

separated by converting the whole of the lead into oxide or litharge, isolating the silver, and reconverting the litharge into metallic lead. Mr. Pattinson found, after a long series of experiments, that he could gradually separate the silver from the lead, by a process of crystallisation or granulation, without the double operation of making and unmaking litharge [LEAD MANUFACTURE, E. C., Arts and Sci. Div., vol. v. col. 149]. He removed again to Newcastle, and became manager of Mr. Beaumont's lead-smelting and refining works. A patent which he obtained enabled him to bring his discovery into operation; and as it was now found profitable to de-silver lead which contained only three ounces of precious metal to the ton (the former minimum having been twenty ounces), the "Pattinson process" became generally adopted. In partnership with Messrs. Lee and Burnett, he established, in 1834, the Felling Chemical Works, near Newcastle, which grew to be so extensive as to employ a thousand hands; and, in 1843, he founded other works at Washington, another suburb of the same city. Observations made by him at a neighbouring colliery led him to the discovery that steam becomes electric when rushing forth from an orifice—a discovery that suggested Mr. (afterwards Sir W. G.) Armstrong's hydro-electric machine. As a chemical manufacturer, Mr. Pattinson introduced new modes of preparing magnesia and oxychloride of lead. At his residence at Scots House, near Gateshead, he maintained a small observatory, from which a fine $7\frac{1}{2}$ inch equatorial, made by Cooke, of York, was lent to Professor Piazzi Smyth for his Tenerife observations. Mr. Pattinson, who was F.R.S., F.R.A.S., F.G.S., and F.C.S., wrote papers on his discoveries in the 'Philosophical Magazine.' He died, November 11th, 1868.

PAUL, SAINT VINCENT DE [VINOENT DE PAUL, SAINT E. C. vol. vi. col. 396].

PAULDING, JAMES KIRKE. [E. C. vol. iv. col. 697.] This very pleasing writer died on the 9th of April, 1860. His last years were spent in cheerful retirement on the banks of the Hudson, but he made no addition to the works mentioned in the above memoir.

PAXTON, SIR JOSEPH [E. C. vol. iv. col. 703], the designer of the Exhibition building of 1851, and the Crystal Palace at Sydenham, died at Rock Hills, Sydenham, June 8th, 1865.

PEABODY, GEORGE, an American merchant, distinguished for the philanthropic bestowal of his wealth, was born at Danvers, Massachusetts, February 18, 1795. He was descended from a family who emigrated from Leicestershire to New England with the Pilgrim Fathers; and many of his relatives had been Congregational ministers. After receiving a plain education at the district school of Danvers, he served a four years' apprenticeship with a grocer; then spent one year with his grandfather in Vermont; and at the age of sixteen joined his brother David in a drapery or dry-goods trade at Newburyport. A fire having destroyed the store, George served for two years as assistant to his uncle, Mr. John Peabody, a merchant at Georgetown, near Washington. When the war with England broke out in 1812, he volunteered into the United States army. The war being over, he joined in partnership with Mr. Elisha Riggs in the dry-goods trade; Riggs provided the capital, while Peabody, as bagman or traveller, journeyed on horseback through Maryland and Virginia, and through the western wilds of New York and Pennsylvania, gaining a large amount of experience in business by such a mode of life. In 1815 the firm removed to Baltimore, with branches at Philadelphia and New York. The retirement of Mr. Riggs, in 1830, left Mr. Peabody at the head of a large and flourishing establishment. He steadily declined all invitations to take part in political or municipal affairs; but his opinions and advice were highly valued, and his personal character much respected. In 1843, Mr. Peabody, having withdrawn from the Baltimore firm, came to London, and joined with other merchants in establishing the firm known as George Peabody and Co., merchants and money-brokers, of Warmond Court. They held deposits for customers, discounted bills, negotiated loans, bought and sold stock. In 1848 he acted as one of three commissioners to aid the State of Maryland in getting out of financial difficulties; he succeeded, and declined to receive any payment for his services; whereupon the Maryland legislature passed a vote of thanks to him. His name was potent in monetary negotiations for more than one of the American States. In 1851 he supplied funds for fitting up the United States department at the Great Exhibition; in 1852 he aided Henry Grinnell in fitting out the expedition in search of Franklin; and in the same year presented a fund, afterwards increased to 100,000*l.*, for establishing a Free Library and Educational Institute at his native town of Danvers. In 1857 he visited the

United States, after many years' absence; and while there, presented 100,000*l.* (afterwards increased to 200,000*l.*), for founding a Free Library, and an Institute of Art and Science, at Baltimore. Returning to England, he resumed his commercial pursuits, which were eminently successful.

Mr. Peabody's first gift to the poor of London was made in March, 1862. He placed a sum of 150,000*l.* in the hands of trustees: viz., Mr. C. F. Adams, American Minister in London; Lord Stanley, afterwards Earl of Derby; Sir J. E. Tennant; Mr. (afterwards Sir Curtis M.) Lampson; and Mr. J. S. Morgan, one of his partners. The money was to be expended in building model dwelling-houses for working men and their families, and letting them at rentals that would pay a small interest on the capital sunk, after defraying current expenses. A second donation of 100,000*l.* was made in January, 1866, and a third of 100,000*l.* in December, 1868. The first 150,000*l.* was to be applied as soon as the arrangements could be completed; the remaining 200,000*l.* to be held intact until July, 1869. By the end of 1868, the trustees had erected four clusters of "Peabody Buildings," comprising 498 tenements, which were occupied by 1971 persons belonging to the families of working men. These clusters are situated at Spitalfields, Islington, Shadwell, and Westminster; in 1869 and 1870, others were commenced at Chelsea and Bermondsey, out of the same fund. The second fund is being laid out in Brixton, Blackfriars-road, and elsewhere. Mr. Peabody, in 1866, received the freedom of the city of London, and was presented by the Queen with her portrait in enamel; but he declined a baronetcy and an order of knighthood. He went to America again in that year, and remained there till 1869. During his sojourn he presented large sums of money for the founding of schools in the Southern States; for the establishment of museums of American relics at Yale and Harvard Colleges; for a free museum at Salem; for the improvement of Kenyon College; and to assist the coffers of the State of Maryland. Although unmarried, he devoted much of his wealth to his relations; he distributed 400,000*l.* (2,000,000 dollars) among them, and erected a Memorial church to his mother. In March, 1867, the Congress of the United States voted special thanks to him for his public benefactions. Early in 1869, his health began to fail; he returned to England, with the intention of spending the forthcoming winter in the south of France; but did not live to fulfil his intention. He died at the house of Sir Curtis Lampson, Eaton Square, November 4th, 1869. When his will was opened on the day of the funeral, it was found that he had directed his executors, Sir Curtis Lampson and Mr. Charles Reed, to apply a further sum of 150,000*l.* to the Peabody fund, to come into force in 1873. This makes a total of half a million sterling devoted to the provision of dwellings for the artisan families of London. Four months before his death, a bronze statue of Mr. Peabody, by Story, was unveiled by the Prince of Wales, near the Royal Exchange. Other merchants have amassed larger wealth than Mr. Peabody; but it was his distinction to apply by far the greater part of his fortune to important benevolent purposes during his life, instead of retaining the whole of it till his decease.

PEACOCK, GEORGE, DEAN OF ELY, an eminent mathematician, was born at Thornton Hall, Denton, near Darlington, April 9, 1781. He was the son of a schoolmaster, author of some books on arithmetic. After receiving his education at Richmond, Yorkshire, he entered Trinity College, Cambridge, in 1809, obtained a scholarship in 1812, was second wrangler in 1813 (the late Sir J. F. W. Herschel being senior); elected fellow in 1814, assistant tutor and college lecturer in 1815; took holy orders in 1817; became full tutor in 1823, and sole tutor, of the "Peacock side," in 1835. When a young collegian, he was one of four (the other three being Herschel, Babbage, and Maule, afterwards judge), who set themselves the task of introducing the continental method of the differential calculus at Cambridge, where the method of fluxions had till then prevailed. They formed an Analytical Society, which published some memoirs in 1813; they prepared a translation of Lacroix's 'Differential Calculus,' in 1816; and, in 1820, 'A Collection of Examples of the Application of the Differential and Integral Calculus,' mostly written by Peacock. About the same time, they had the satisfaction of seeing the calculus, which continental mathematicians generally adopted, authoritatively introduced at Cambridge. In 1826, Mr. Peacock wrote an admirable 'Arithmetic,' for the 'Encyclopædia Metropolitana.' In 1830, he published his 'Treatise on Algebra,' the second edition of which (2 vols., 1842, &c.) was greatly enlarged, and almost re-written. In 1833 he prepared, for the British Asso-

ciation for the Advancement of Science, a 'Report on the recent Progress and present State of certain Branches of Analysis.' In 1837 he became Lowndes Professor of Astronomy at Cambridge. He was a zealous promoter of the scheme for the establishment of an observatory by the university. He was one of the founders of the Cambridge University Philosophical Society; was admitted a fellow of the Royal, the Royal Astronomical, the Geological, and other scientific societies; and, in 1838, was appointed one of the Commissioners for Standards of Weights and Measures. In 1839 he took the degree of D.D.; and in the same year was appointed to the deanery of Ely. He zealously promoted the restoration of Ely Cathedral, which he found in a very bad condition; the enforcement of the Public Health Act, in the much-neglected city of Ely; and he was equally active in other matters. In 1840 he published 'Observations on Plans for Cathedral Reform'; in 1841, 'Observations on the Statutes of the University of Cambridge.' He was prolocutor of the lower house of Convocation for the province of Canterbury, 1840-47, and again, 1852-57. In 1843 he was appointed member of another standards commission; in 1850, and again in 1855, he was on the commission of inquiry into Cambridge University. In 1855, he published a 'Life of Dr. Thomas Young,' and edited his 'Miscellaneous Works.' He also published 'Observations on the Episcopal and Capitular Estates Bill,' and wrote a series of answers to questions put to him by the Commissioners on Decimal Coinage, a subject in which he took much interest. Dean Peacock (who married the sister of Bishop Selwyn in 1847) died November 8th, 1858.

PEARSON, REV. WILLIAM, LL.D., astronomer, was born at Whitbeck, Cumberland, April 20th, 1767; and educated at Hawkshead Grammar School. In early life he evinced much ingenuity in the construction of astronomical instruments, such as an orrery, a planetarium, and a (so-called) satellian, for illustrating the motions of Jupiter's satellites. He became proprietor of a large school at East Sheen, near Richmond, where he fitted up a private observatory, well supplied with good instruments. In 1817 he removed to South Kilworth, Leicestershire, the living of which was presented to him by Lord-Chancellor Eldon. There he built a second and better observatory, and devoted much of his time to astronomy. In 1824 appeared his 'Introduction to Practical Astronomy,' 2 vols. 4to, in which the use and management of instruments are largely dwelt upon. This work gained for the author the gold medal of the Royal Astronomical Society. He wrote largely on astronomical subjects, in 'Rees's Cyclopædia.' In various scientific journals he wrote papers on portable electrical machines, on models to explain the motions of satellites, on the philosophical uses of a common pocket watch, on ocular micrometers, on micrometrical eye-pieces, on rock-crystal micrometers, on Troughton's three-foot azimuth and altitude circle (made for Mr. Pearson, and placed in the observatory at South Kilworth), on the occultation of the pleiades by the moon, on Halley's comet, and on the obliquity of the plane of the ecliptic. But the most useful of his labours were, the preparation of a catalogue of moon-culminating stars, and a larger catalogue of 520 stars within 6° north and south of the ecliptic. Dr. Pearson, who was for many years vice-president of the Royal Astronomical Society, died September 6th, 1847.

PECOCK, or PEACOCK, REGINALD or REYNOLD, *Latin* PECOCCIUS or PECOKUS, an Anglican bishop and precursor of the Reformation, a native of North Wales, was born, probably in the diocese of St. David's, about the year 1390. After receiving his preparatory education in his own country, he was entered of Oriel College, Oxford, where he was elected to a fellowship on the 30th of October, 1417. He was made acolyte and sub-deacon by his diocesan, Dr. Flemmyng, Bishop of Lincoln, on the 21st of December, 1420; admitted to deacon's orders on the 15th of February, 1421, and priested on the 8th of March following, on the title of his college fellowship; and took his degree of B.D. about 1425. He was soon afterwards summoned to court, and through the influence of Humphrey, Duke of Gloucester, was appointed, in 1431, to the mastership of the College of St. Spirit and St. Mary, then recently founded by the celebrated Whittington, Lord Mayor of London. He obtained the see of St. Asaph by papal provision on the 22nd of April, 1444, and the temporalities were restored to him on the 8th of June following; on the 14th of which month he was consecrated at Croydon, and at the same time admitted to the degree of D.D., possibly by royal mandate. In 1447, in a sermon preached at St. Paul's Cross, he affirmed seven conclusions touching the duty and prerogative of bishops, which afterwards led to considerable discussion. He maintained that the peculiar function of the bishop was oversight and guidance, and not preaching; nor was

residence in his diocese imperative, if it happened that its interests could be better served by his occasional absence. It became necessary for him to defend himself before the Archbishop of Canterbury against the charge of having preached on a needless or unnecessary subject, indefensible in its treatment, and savouring more of curiosity than of usefulness. On the 23rd of March, 1450, he was translated by papal bull to the diocese of Chichester, and on the 31st of the same month made his profession of obedience at Leicester. About this time he published a book entitled 'The Repressing of over much witing the Clergie,' lately re-issued under the editorship of Professor Churchill Babington, in the 'Rerum Britannicarum Medii Ævi Scriptores,' &c., with the title of 'The Repressor of over much blaming of the Clergy,' &c., 2 vols., 8vo, London, 1860, to which is appended 'Abbreviatio Reginaldi Pecok,' being a vindication of his sermon at Paul's Cross. The 'Repressor' is in fact, *inter alia*, a development and extension of this sermon and vindication, being an apology for several of the practices and dogmas of the Church which the followers of Wycliffe attacked. Some modifications of Pecock's line of conduct presently appeared; and he accused the monkish preachers, whom he called "pulpit-bawlers," of error, heresy, and superstition. In his opposition to the Lollards he became more than ever temperate and indulgent, admitting them to private discussion, and affirming that the only way to reclaim them was to give them full liberty of propagating their opinions, which were to be combated by argument and persuasion, not by violence. In his concern for the education and enlightenment of the laity he wrote books in English, according to Gascoigne, for twenty years together. These proceedings made him obnoxious to the clergy; and on the 22nd of October, 1457, he was cited to undergo an examination, with his books, before the Archbishop of Canterbury. He accordingly appeared at Lambeth on the 11th of November, when nine of his works were submitted to a commission of twenty-four doctors appointed for their investigation. An unfair and prejudiced report charged Pecock with having sought to establish the following articles or conclusions:—(1.) That it is not necessary to salvation to believe that our Lord Jesus Christ after his death descended into hell; (2.) That it is not necessary to salvation to believe in the Holy Ghost; (3.) That it is not necessary to salvation to believe in the communion of saints; (4.) That the universal Church may err in those things which are of faith; and (5.) That it is not necessary to salvation to believe and hold that what a general council and the universal Church appoints, approves, or determines in favour of the faith, and for the salvation of souls, is to be approved of and holden by all the faithful members of Christ. Pecock was condemned, and when the archbishop placed before him the alternatives of the stake or recantation, he chose the latter; and having read his recantation before the archiepiscopal court at Lambeth, repeated it on the following day, Sunday, December 4th, at St. Paul's Cross, in the presence of twenty thousand people. A fire was kindled at the Cross; and Pecock with his own hands delivered three folios and eleven quartos of his own composition to the executioner, who threw them into the flames. His works were burned at Oxford a short time afterwards. His surprise and bewilderment, not to say cowardice, hurried him into a retraction of errors which he had never uttered, and of utterances which he believed to be true. He was deprived of his bishopric, and condemned, after a short sojourn at Canterbury and at Maidstone, to solitary confinement in Thorney Abbey, in Cambridgeshire, where he died in some unascertained year about 1460. A list of his works, extant, not known to be extant, English, Latin, and doubtful, is given in Babington's edition of the 'Repressor'; but one important treatise, besides the one already described, should be especially mentioned, written about 1450, but probably not published earlier than 1454, entitled a 'Treatise on Faith,' and edited by Henry Maurice, with a preface by Henry Wharton, as 'A Treatise proving Scripture to be the Rule of Faith,' 4to, London, 1688. A biography of Bishop Pecock was written by the Rev. John Lewis, and published with the title of 'The Life of the learned and Right Reverend Reynold Pecock, S.T.P., Lord Bishop of St. Asaph and Chichester, in the Reign of King Henry VI., faithfully collected from Records and MSS., being a Sequel of the Life of Dr. John Wiclif, in order to an Introduction to the History of the English Reformation,' &c., 8vo, London, 1744, new edition, 8vo, Oxford, 1820.

PELISSIER, AIMABLE-JEAN-JACQUES, MARÉCHAL, DUC DE MALAKOFF. [E. C. vol. iv. col. 719.] In April, 1858, the Duc de Malakoff superseded M. de Persigny as am-

bassador to the English Court, and retained the post till the outbreak of the war in Italy, when he was recalled and appointed to the command of the army of observation stationed at Nancy, but he had no opportunity of displaying his military prowess. In July 1859, he was nominated grand-chancellor of the Legion of Honour, and in November, 1860, governor-general of Algérie, which office he held at his death, May 22nd, 1864.

PENNETHORNE, SIR JAMES. [E. C. vol. iv., col. 730.] The Record Office, mentioned in the above memoir as being then in progress, has been gradually carried forward, the east wing having been completed in 1870; but the western portion which will have its principal frontage towards Chancery Lane, has not yet been commenced, though the designs have long been prepared. The alterations in Buckingham Palace and Marlborough House, the erection of a provincial post-office or two, and other works appertaining to his duties as surveyor of Land Revenues, besides numerous designs for new buildings and metropolitan improvements, of which only a few were carried out, provided Mr. Pennethorne with ample occupation. The only important new architectural work that devolved on him was the London University, a singularly chaste and graceful Italian edifice, the grand façade of which in Burlington Gardens, with its rich display of statuary, has met with very general admiration, while the convenience and appropriateness of the interior have been equally recognised. Before he had completed this, his latest and noblest work, Mr. Pennethorne's connection with the government had ceased; but the opening of the new building by the Queen afforded the opportunity of acknowledging the ability of the architect, and his merits as a public servant, by conferring on him the honour of knighthood. His professional brethren had already marked their esteem, by awarding him the gold medal for architecture, May 29th, 1865. Sir J. Pennethorne had but brief enjoyment of his title. He died at his residence, Worcester Park, near Malden, Surrey, September the 1st, 1871, aged 70.

PENNY, EDWARD, R.A., was born in 1714, at Knutsford, in Cheshire. His friends, fancying he showed a talent for painting, placed him with Hudson, the master of Reynolds, and he completed his studies at Rome, under Benefali. He chiefly painted small portraits, but he did not disdain to paint sign-boards, at a time when signs were universally hung out from London shops, and tradesmen who wished to distinguish themselves by a display of superior taste willingly paid a handsome sum for the work of painters of standing. Penny also painted subjects of a sentimental character, and occasionally historical pieces. His most noted work in this line was his 'Death of General Wolfe,' painted in avowed rivalry of West's more famous picture of the same subject. It was engraved by Sayer, and enjoyed considerable popularity. His Hogarthian pair, 'Virtue Rewarded' and 'Profligacy Punished,' also formed popular prints. Penny was one of the original members of the Royal Academy, and its first professor of painting, an office he held till 1783, when he resigned on account of failing health. He died November 15th, 1791. Penny was an indifferent painter, but he holds a position of some historical interest in the British school of painting.

PEPPERELL, SIR WILLIAM, BART., the captor of Louisburg, was sprung from a Cornish family who, holding strong Nonconformist principles, had settled with the Pilgrim Fathers in North America. He was born in 1696; became by his skill in ship-building, and good fortune in commerce and in the fisheries, the richest subject of the Crown in America, and one of the most influential of colonial magistrates. In 1745, when Louisburg was seized by the French, he invested the town with a force composed mainly of his own dependents, sailors, and militia; and having carried on the siege actively, on the strictest military and scientific principles, for three months, he forced the French general to surrender. The importance of this capture arose from the fact that Louisburg commanded the mouth of the river St. Lawrence. For this exploit, he was presented by King George II. with a commission as a major-general in the English army, and created a baronet, being the first American colonist on whom that honour was conferred. He died at his residence at Kittery, U.S., in 1759, when his title became extinct. The baronetcy, however, was revived in 1774, in favour of his son-in-law, William Sparhawk, who took the name of Pepperell, and who sacrificed his vast property in his adherence to the cause of royalty. Coming over to England, he acted for many years as the acknowledged head and representative of the American Loyalists, as they were called; but the title and name became again extinct at his decease, which hap-

pened at his residence in Portman-square, London, in December, 1816. (Smollett's *History of England*; Usher Parson's *Life of Sir W. Pepperell*.)

PERIGRINI, DA CESENA, a celebrated Italian engraver and worker in niello, who flourished in the early part of the sixteenth century. Nothing whatever is known of his life. He was an imitator, perhaps a scholar, of Francesco Francia, whose nielli of Hercules and of Orpheus he copied. From all the prints which have the monogram of Perigrini being of small size, and the figures being detached from a black ground as in nielli, Duchesne was led to conclude that they were really proofs of nielli; but, though some were, it is certain that many were not, as several copies often occur of the same print. Passavant ingeniously suggests that they were prints published for the use of goldsmiths—patterns, in short, to be copied by the workers in niello. Duchesne describes several nielli by Perigrini; Bartsch and Nayler give a catalogue of sixty-four prints by him, consisting chiefly of religious, mythological, and allegorical subjects; and the number has been increased by Passavant to seventy-two ('*Peintre-Graveur*,' vol. i., 248, &c., and vol. v., 205-220). The earliest date on a print by Perigrini is 1511.

PERKINS, JACOB, engineer and mechanical inventor, was born at Newburyport, Massachusetts, in 1766. He was early distinguished among his countrymen for his aptitude in devising new labour-saving contrivances and ingenious machines of various kinds. He stamped copper coins for the State of Massachusetts, under the old Confederacy. In 1790, he invented a machine for cutting and heading nails at one operation, with water-power as a substitute for hand labour; this led to the establishment of a factory which afterwards became one of the largest nail works in the United States. He invented a new mode of engraving the plates for bank notes, at a time when forgery was very prevalent: the engraving was effected on iron or soft steel, which was afterwards case-hardened, and used as a matrix for reproducing copies by intense pressure on soft steel, which was in its turn case-hardened. Mr. Perkins came to England with this invention in 1819. He did not succeed in obtaining the support he expected from the Bank of England; but his plans, improved by later inventions, were eventually carried out by the firm of Messrs. Perkins and Heath [BANK NOTE MANUFACTURE, E. C., Arts and Sc. Div. vol. i., col. 860; and E. C. S., col. 232]. In 1820 the Society of Arts awarded him medals for his inventions of a method of warming and ventilating rooms, and ventilating the holds of ships; a method of fastening the seams of hose for fire-engines, and of connecting two or more hose together; an improved ships' pump; and a method of drawing off waste water from water-wheels. In 1824 his steam-gun attracted great notice at the Adelaide Gallery; he made one of a similar kind for the French government; but the danger attending the use of steam so intensely high in pressure as that which he employed, deterred alike the English government from adopting his steam gun, and engineers from adopting a steam-engine which he devised on a similar principle. Between the years 1820 and 1837, papers by him were published on the compressibility of water; on an instrument called the "piezometer," for measuring this compressibility; on a new form of steam-engine; on the causes of the explosion of steam-boilers; and on the economy of using highly elastic steam expansively. They appeared in the '*Philosophical Transactions*,' the '*Edinburgh Philosophical Journal*,' the '*Journal of the Franklin Institute*,' and other scientific journals. He read a paper, in 1837, on the application of superheated steam to the locomotive, before the Institution of Civil Engineers, of which he was a member. His application of the high-pressure hot-water system of warming large buildings has come extensively into use. Mr. Perkins retired into private life in 1834; and died in London, in 1849.

PERON, FRANÇOIS, traveller and naturalist, was born at Cérilly, in the department of Allier, August 22, 1775. He attended the college at Cérilly, and in 1792 joined the army. He was wounded at the battle of Kaiserslautern, made prisoner, and confined at Magdeburg until released in 1794. Being incapacitated by the loss of his right eye from military employment, he went through a course of study in medicine and natural history at Paris, in order to qualify himself for the medical profession. When the great voyage of discovery was organised in 1800 by the French government, he urgently solicited that he might join the expedition. The proposed number of officers had already been appointed; but he drew up a paper on the importance of having a medical man and naturalist on the staff, which was submitted to the Institute, and the result was that he was appointed to the post as a supernumerary. Amongst the crew

was C. A. Lesueur, with whom he formed a lasting friendship, and under whose name in this Supplement will be found a brief account of Peron's work. During the long voyage Peron experienced much suffering and illness, and returned to France with his constitution much weakened. The exertions he made to carry out the wishes of the French government, in drawing up an account of the voyage, tended still further to enfeeble his system. Repose was ordered by his medical attendant; he wintered at Nice, and rallied somewhat; but the resumption of work brought on a renewed attack of illness, and he died at Cérilly, December 14, 1810.

* PERSIGNY, JEAN GILBERT VICTOR FIALIN, DUC DE, a French politician, was born on the 11th of January, 1808, at Saint-Germain-Lespinasse, Loire; and after receiving his earlier education at the college of Limoges, entered, on the 25th of July, 1826, the cavalry school of Saumur, which he left in 1828 to join the 4th Regiment of Hussars. He withdrew from active service in 1831, and repaired to Paris, where he found employment as a journalist. He now assumed the title of Vicomte de Persigny, which, formerly the style and dignity of his family, had been for generations allowed to continue in abeyance. In 1834 he commenced a review entitled '*L'Occident Français*,' in which he published an elaborate apology for the Imperial system; and from this time he began to be regarded as the completest representative of the '*Idées Napoléoniennes*.' Although the review did not proceed beyond the first number, it procured for its editor the favourable regards of Prince Louis Napoleon, then resident at Arenenberg. M. de Persigny was the principal instigator and contriver of the Strasburg Expedition in 1836; of the failure of which, after he had taken refuge in England, he wrote an account, entitled '*Relation de l'Enterprise du Prince Napoléon-Louis*,' &c., 8vo, London, 1837, and other editions, both in this country and America. For his share in the Boulogne Expedition in 1840, M. de Persigny was sentenced to twenty years' imprisonment, the circumstances of which were made so easy that he was able to elaborate a theory of the Pyramids, which he published in a volume entitled '*De la Destination et de l'Utilité permanente des Pyramides d'Egypte et de Nubie contre les Irruptions sablonieuses du Désert. Développement du Mémoire adressé à l'Académie, suivis d'une nouvelle Interprétation de la Fable d'Osiris et d'Isis*,' 8vo, Paris, 1845. The Revolution of February, 1848, put an end to his detention, and he hastened to Paris, where he laboured in every way in the interests of Louis Napoleon, who in December of the same year was triumphantly returned at the head of the candidates for the Presidency of the French Republic. He continued his active partisanship after his election to the Legislative Assembly in 1849; and on the 22nd of January, 1852, his services in general, and during the then recent *coup d'état* in particular, were recognised by his appointment to be Minister of the Interior, in which capacity he countersigned the decree confiscating the property of the Orleans family. On the 31st of December, 1852, four weeks after the proclamation of the Empire, he was promoted to the Senate; and, resigning his portfolio in 1854, on account of ill-health, was appointed ambassador to England in May, 1855, and continued in this function till the beginning of 1858. On the 16th of June, 1857, he was admitted Grand Cross of the Legion of Honour, having received his first decoration in 1849. He was again accredited to the Court of London on the 18th of May, 1859, from which he was recalled in November, 1860, to re-assume the office of Minister of the Interior. His policy was generally more Imperialist than that of the Emperor himself; and he resigned office, in the face of the comparatively adverse result of the elections in Paris and other large towns, on the 23rd of June, 1863; and, on the 13th of September following, was promoted to a dukedom. Latterly he showed a spirit of concession to the liberal measures which were forced upon the Emperor by the disposition of the times; but his progressive convictions wanted the frankness and thoroughness required before it could be reckoned expedient to entrust him with a share of the administration.

PESELLO, FRANCESCO DI, better known as PESELLINO, an early Italian painter, was born at Florence, in 1422. His father dying whilst Francesco was a child, he was brought up by his grandfather, Giuliano Pesello, and hence called Pesellino. He is said to have been the scholar of Filippo Lippi, whose manner he imitated. He died at Florence, on the 29th of July, 1467. His works are mostly at Florence; the Louvre possesses a predella by him, and there is another and very good one in the Liverpool Institution. In the National Gallery is a large '*Trinity*' (No. 727), ascribed to him, which was formerly in the

church of the Santissima Trinità, Pistoja; Waagen, however, attributes it to the grandfather, Giuliano Pesello.

PETERS, HUGH, a fanatical divine, son of a merchant at Fowey, in Cornwall, was born in 1599, and was a member of Trinity College, Cambridge, from which society he is said to have been expelled for irregular behaviour. This disgrace occurred to him after he had taken his degrees in arts—that of B.A. in 1618, and that of M.A. in 1622. "He afterwards betook himself to the stage, where he acquired that gesticulation and buffoonery which he so often practised in the pulpit." He was ordained by Dr. Mountaine, Bishop of London, and became lecturer of St. Sepulchre's in that city. Having been prosecuted for an offence against the laws which defend the sanctity of marriage, he fled to Holland, and became pastor of the English church at Rotterdam. It is only fair to Peters to state in this connection, that when at the extremity of life, and in the most testing circumstances, he very solemnly denied his criminality in this particular, in 'A Dying Father's Last Legacy to an only Child: or, Mr. Hugh Peters' Advice to his Daughter,' 8vo, London, 1660. At Rotterdam he was the colleague of Dr. William Ames, whose 'Lectiones ad Psalmos' Peters edited and published in London in 1647. From Holland, Peters repaired to America, and prolonged his stay there for seven years, returning to England when the troubles between the king and the parliament seemed to open up a way for employment and preferment to a man of his peculiar cast of character and politics. He became one of the most violent declaimers against Charles I., and promoted all the measures of the extreme Republican party. He was thus a valuable instrument in the hands of Cromwell wherewith to influence the army, and to sway the lower orders of the people. Sir William Warwick says that when Charles was brought to London, Hugh Peters "was truly and really his jailer." And Dr. Kennett avers that he bore a colonel's commission in the civil war; that he was vehement for the death of the king; and that it was strongly suspected that he was one of the masked executioners who put his majesty to death. After the Restoration, Peters was apprehended, and committed to prison in the Tower, where he wrote the 'Last Advice,' to which allusion has been made. At his trial, to the various charges which were sworn against him, imputing to him the "most horrid crimes that any man could be guilty of," he contented himself, for the most part, with a plea of innocence; calling witnesses to prove, however, that at the time when he was charged with a guilty presence and assistance at his late majesty's execution, he was in fact confined to his house and bed by an attack of illness. He was convicted, and sentence of death was recorded against him; and after three days' detention in Newgate, he was carried on a sledge to Charing Cross, and there executed, "exhibiting," it has been said, "the most cowardly demeanour." But this is a misapprehension; for Peters suffered with commendable intrepidity. To a person who upbraided him with the death of the king, and bade him now repent, he answered, "Friend, you do not well to trample on the feelings of a dying man. You are greatly mistaken. I had nothing to do in the death of the king." His last moments were those of a victor, and, with a smile on his countenance, he died, on the 16th of October, 1660, his head being afterwards exposed on a pole on London Bridge.

The most remarkable of the works of Hugh Peters are his occasional sermons, of which may be mentioned one which was published with the title of 'God's Doings and Man's Duty: opened in a Sermon preached before both Houses of Parliament, the Lord Mayor and Aldermen of the City of London, and the Assembly of Divines, at the last Thanksgiving Day, April 2, 1646,' which was delivered at Christ Church, and, upon its publication, was dedicated to the Lord Mayor and Aldermen; and another sermon preached before the House of Commons in their parish church of St. Margaret, on the occasion of the fast celebrated on the 20th of December, 1648. In the direct bearing which this sermon is reported to have had upon the fate of the unhappy Charles, it may be reckoned as amongst the most important and startling discourses ever delivered within the walls of an English church. One of the articles charged against Peters on his trial had special reference to this sermon, preached nearly twelve years before. The indictment set forth "that at St. Margaret's, Westminster, he preached upon these words, 'Not this man, but Barabbas;' comparing all along his majesty to Barabbas, and bloodily inciting his auditory to kill the king; intimating that God would bring every tyrant to justice, signifying that there was no exception for king, or prince, or any of that rabble."

PETERSEN, NIELS MATTHIAS. [E. C. vol. iv. col. 764.] The contribution to the History of Danish Literature, 'Bidrag til den Danske Litteraturs Historie,' on which Petersen was engaged at the date of the above memoir, he did not live to complete; but the sixth and final volume was published after his death. He died at Copenhagen on the 11th of May, 1862, in the 71st year of his age.

PETHER, ABRAHAM, landscape-painter, son of William Pether, the engraver, was born at Chichester, in 1756, and learned painting of George Smith, of that city. Abraham Pether, or Old Pether, as he is often called, to distinguish him from his son, is best known by his moonlight scenes, which are very clear, though often mannered and feeble. He was a man of considerable attainments, much ingenuity, and of the most unassuming habits. He was a good musician, having been brought up as a chorister in Chichester Cathedral, and intended for an organist; a clever mechanic, he made microscopes, telescopes, and other philosophical instruments; and an amateur astronomer, and lecturer on astronomy and electricity. Perhaps, partly from frittering away his time and energy in so many pursuits, he lived and died in poverty. After a long and lingering illness, he died, April 13th, 1812.

PETHER, SEBASTIAN, eldest son of the preceding, was born in 1790, learned painting from his father, imitated his manner, and, like him, became known as a painter of moonlight scenes. But he was of inferior skill, and having early fallen into the hands of the picture-dealers, was never able to extricate himself, and closed a long struggle with poverty and ill-health. March 18th, 1844.

PETHER, WILLIAM, a celebrated engraver, was born at Carlisle in 1731. He was a pupil of Thomas Frye, a mezzotint engraver of note in his day; but Pether soon outstripped his master, and ultimately took a foremost place among the practitioners in that branch of the art. He engraved some plates from his own designs, and portraits and subject-pieces after Wright, Penny, and other contemporary artists; but his best prints are those from Rembrandt. He died in 1795.

PÉTION DE VILLENEUVE, JÉRÔME, one of the leaders in the first French Revolution, was born at Chartres in 1753. He was practising as an advocate in that town when the States General were convened in 1789; and took his seat in the Tiers Etat as deputy for Chartres. He at once assumed a lead among those who demanded, not merely reforms, but the establishment of republican institutions. Though not a man of much ability, he gained power by facile oratory and daring opinions, and often combated the more moderate views of Mirabeau. In September, 1790, he was appointed member of the committee for the revision of the constitution; he inveighed frequently against the queen; joined Barnave and Lameth in demanding for the legislature the power of making war and peace; and became president of the National Assembly towards the close of the year. For a time he held friendly relations with Robespierre; and those Republicans who named Robespierre the "Incorruptible" gave to Pétion the designation "Vertueux." In June, 1791, when the royal family made their ill-starred attempt to escape from France, Pétion was one of the commissioners sent to bring them back; his unfeeling and unmanly conduct on this occasion, especially towards the queen, was among the worst trials which the captives had to endure. During the chief part of this year he was at the head of the Republicans; and when made Maire of Paris in November, he used his power in a way disastrous alike for monarchy and for regular government of any kind. During the terrors of the August and September massacres in 1792, he was still in office; he neglected taking the steps which might have lessened the bloodshed; and yet he lost influence with the mob by deprecating violence. When the National Convention was formed, he was elected deputy for Eure-et-Loire; he became soon afterwards president of the Convention; and his vanity tempted him to assume a kind of state which earned for him the sobriquet of "King Pétion." His influence in the Convention remained great until the spring of 1793, when Robespierre, who had begun to envy and to hate him, accused him of complicity with the defection of Dumouriez. His answer was so feeble that he fell into disfavour at once. He was proscribed on the 31st of May, fled on the 2nd of June, and remained in concealment for more than twelve months, well knowing that capture would speedily be followed by the guillotine. On the 17th of June, 1794, he quitted an asylum he had found at St. Emilion, near Bordeaux; and a few days afterwards the bodies of Pétion and a companion were found in a corn-field, half devoured by wolves. This is all that was ever known of his death.

PETRIE, GEORGE, LL.D., an eminent Irish archæologist, was born in Dublin in January, 1789. The son of a portrait-painter, his inclinations towards art were so decided that his father, who wished him to be a surgeon, gave way. Under his father's guidance he made such rapid progress that in his 14th year he obtained the silver medal of the Dublin Academy for a group of figures, and was soon competent to act as his father's assistant. A sketching excursion made in Wicklow stimulated an interest already excited in the ancient remains of Ireland, and he began to make careful notes as well as drawings of the various objects he met with. A journey in Wales in the following year strengthened this feeling, and determined his adoption of landscape-painting as his special branch of art. He visited London in 1813; examined the collections of art, and formed useful connections. His drawings and paintings found purchasers; and in 1816 two of his pictures, 'Glendalough' and 'Glenmalur,' gained admission to the Royal Academy exhibition. The taste for illustrated works having sprung up, Petrie's accurate pencil was soon in requisition for views of Irish scenery and antiquities. For Cromwell's 'Excursions through Ireland' he made nearly a hundred elaborate drawings; for 'Ireland Illustrated,' twenty-three; and many others for the 'Beauties of Ireland,' Fisher's 'Ancient and Modern Dublin,' Wright's 'Wicklow,' 'Killarney,' and 'The Northern Tourist.' The practice of making monochrome drawings for engraving has been supposed to have had an influence in producing a monotony of colour complained of in his paintings; but their fidelity, feeling, and the prominence he gave to scenes and objects illustrative of national antiquities raised them far above the rank of ordinary topographical landscapes; he was recognised as one of the best artists in Ireland; his pictures had a prominent place at the first exhibition of the Royal Hibernian Academy in 1826, as well as those of following years. In 1827 he was elected an academician, and in 1830 accepted the office of librarian.

For some years Petrie had been in the habit of contributing to journals occasional papers of a descriptive or antiquarian character; but the establishment of the 'Dublin Penny Journal,' in 1832, seemed to offer so fair an opportunity of interesting his countrymen in their national antiquities, that he at once joined its staff; was for a time joint editor with the Rev. Cesar Otway, and contributed to it a large number of valuable articles. The journal lasted about four years; but Petrie felt so strongly the value of such a work, that in 1840 he started one of a nearly similar character, and, during the year of its continuance, acted as its sole editor, besides contributing a paper to almost every number. But whilst thus engaged in popularising the knowledge of Irish antiquities, he was no less earnestly occupied in extending a more scientific study of them. In 1828 Petrie was elected a member of the Royal Irish Academy, and the following year a member of the council; and with characteristic zeal he threw all his energy into an effort to rouse it from the inert condition into which it had declined. One of his first objects was to increase the collection of Irish manuscripts, and the funds available being entrusted to him he was able to purchase a goodly number on easy terms, among them being the autograph copy of a portion of the first and the whole of the second part of the 'Annals of the Four Masters,' and others of scarcely inferior interest. He also laid the foundation, and very largely assisted in the formation, of the magnificent collection of antiquities now possessed by the Academy; and further contributed a series of papers on Irish antiquities and the condition of the arts during the earliest periods of Irish history, which are not untruly said to have for the first time placed the study of Irish archæology on a sound basis. When, under the direction of Captain (afterwards General) Larcom, it was decided to make the Ordnance Survey of Ireland embrace the investigation of its antiquities, economic state and social condition, as well as its physical and topographical features, Petrie's unrivalled knowledge and patient industry pointed him out as the fittest person to assist in the work. He was accordingly appointed, 1833, to conduct the antiquarian and orthographical investigations, and for six years devoted himself with untiring zeal to his duties, training at the same time an equally zealous band of young assistants, more than one of whom became subsequently eminent. In 1839 the survey was broken up, just as the system had come into full operation and the materials were being rapidly accumulated for a more thorough knowledge of the former and present condition of Ireland than it will now probably ever be possible to obtain. The 'Memoir of the County of Londonderry,' 1839, a large series of maps, drawings, and sketches, and "468 large volumes relating to the topography, language, history, and antiquities of

Ireland," are the evidence of what was aimed at and what was accomplished. Petrie was now constrained to return to the practice of his profession, of course with greatly diminished chances of success. It was, however, in this second period of his artistic career that he painted some of his best and most poetic pictures. But, whilst depending on his pencil, he spent much time with his pen: the first volume of his great work, the 'Inquiry into the Ecclesiastical Architecture of Ireland,' 1845, a work which grew out of his memoir on the Round Towers of Ireland, which gained the prize of the Royal Irish Academy, and excited very general attention when published in their Proceedings, modified and extended by the knowledge and experience acquired whilst engaged on the Ordnance Survey. This is in many respects the most important contribution that has been made to the archæological literature of Ireland. It obtained for its author the honorary distinction of LL.D. His promised essay on the Military Antiquities of Ireland, which would have completed the inquiry into the early architectural remains of Ireland, was never completed. His work on the 'Ancient Music of Ireland' was published by the Society for the Publication of the National Melodies of Ireland in 1835. Petrie's antiquarian labours, however valuable and appreciated, brought him little pecuniary gain, and the bestowal of a pension of 300*l.* from the civil list in 1849 furnished a welcome addition to his means, and enabled him to pursue his favourite studies in comparative comfort. He continued to work as long as his strength would permit, and then sank quietly to rest, January 17th, 1866, at the age of seventy-seven. (W. Stokes, M.D., D.C.L., *The Life and Labours in Art and Archæology of George Petrie, LL.D., M.R.I.A.*, 8vo, 1868.)

PETTIGREW, THOMAS JOSEPH, F.R.S. [E. C. vol. iv. col. 777.] Well advanced in years at the date of the memoir above cited, and retired from the practice of his profession, Mr. Pettigrew made no further independent contributions to general or professional literature, but he wrote occasional papers in the 'Archæological Journal,' and continued to take an active share in the proceedings of the Archæological Association, and attended its congresses at Ipswich, in 1864, and Durham, in 1865. He died November 23rd, 1865, at the age of 74.

PFEIFFER, MADAME IDA REYER [E. C. vol. iv. col. 779], traveller, died at Vienna, October 27, 1868.

* PFEIFFER, LUDWIG GEORG KARL, malacologist, was born at Cassel, July 4, 1805. After proceeding through a course of studies for the medical profession at Göttingen, Marbourg, Paris, and Berlin, he, in 1826, settled down in Cassel as a medical practitioner. In 1831 a revolution broke out in Poland, and he was called into active service with the army. This afforded him an opportunity of traversing many parts of Europe, and of following up his natural-history pursuits. At this time his attention was more especially given to Cactuses. In 1838 he visited Cuba, and made a careful examination of the molluscan fauna of the island. He has written some works on botany; but his attention has been chiefly given to the air-breathing gasteropoda, on which subject he is one of the principal authorities and most voluminous writers of the day. Thus, for example, he drew up the lists of the *Phaneropneumona*, *Auriculida*, *Truncatellida*, and allied families contained in the collections of the British Museum, forming two volumes of the official series of the Catalogue. He wrote a 'Monographia Heliceorum viventium,' 2 vols. 8vo, Lipsæ, 1847—48, to which additions have been added from time to time, the last being the third supplement to the sixth volume, which appeared in 1869. The work is the fullest record of the species published. Besides this, we have 'Monographia auriculaceorum viventium,' 8vo, Cassel, 1856; 'Monographia pneumonoporum viventium,' 8vo, 1852; and 'Novitates conchologicae,' which was commenced in 1854, and is still being continued. In this last work Pfeiffer has charge of the department relating to land mollusca, the marine species being taken by Dunker and others. He has also written upwards of 250 papers, which are mostly descriptive, and relative to mollusca; but the substance of them is for the most part incorporated in his larger and independent works. He is also editor of the 'Malakozologische Blätter,' which was first started in 1845, under the title of 'Zeitschrift der Malakozoologie.' His botanical works include some three or four volumes on Cactuses, and about as many giving an account of the flora of Heese Cassel. He has written a few medical books, and contributed to numerous publications by other persons, such as the last edition of the work on Mollusca, by Martini and Chemnitz, and Philippi's description of little-known shells.

PHILIP, JOHN, R.A., was born of humble parentage at Aberdeen, on the 19th of April, 1817. Apprenticed to a house-

painter and glazier, without having had any regular instruction, he early began to paint portraits. A visit to London, in 1834, gave him a long-desired opportunity of seeing the exhibition of the Royal Academy and other galleries of pictures, and he returned with clearer notions on art, and a firm resolve to be a painter. He worked hard, and found patrons, and in 1837 was enabled to come to London and enter as a student in the Royal Academy. In 1839 he returned to Aberdeen, and remained there a couple of years, gaining money and fame as a portrait-painter. He then settled in London, and after a few years began to attract attention at the Academy exhibitions by his pictures of homely Scottish life—'A Presbyterian Minister Catechising his Flock' (1847), 'A Scotch Fair' (1848), 'Baptism in Scotland' (1850), and the like. There was true native feeling in them, some humour, and a free dashing style of execution, and the painter was recognised as a rising man. But when the last named picture was exhibited, his strength seemed fast failing: he was told that he must not stay another winter in England, and was recommended to try Spain. Grievous as seemed this check to his career, it proved to be the making of his fortune as a painter. He stayed in Spain nearly seven years, and when he returned to England he was already famous. As his health improved he studied the pictures of Velasquez and Murillo, and quickly developed a new, more rapid, and more brilliant manner than that in which he had hitherto painted, and he found in the Spanish towns and Spanish people subjects, costumes, and colour exactly fitted for its exercise. 'Life among the Gipsies at Seville,' which he sent to the Royal Academy exhibition in 1853, and 'A Letter-Writer of Seville,' 1854, were thoroughly successful; the latter, as well as the next year's contribution, 'Il Pasco,' being purchased by the Queen. On his return to London in 1857, Mr. Philip was elected A.R.A., and at the earliest period allowed by the laws of the Academy, 1859, he became R.A. 'Spanish Contrabandistas' and 'A Daughter of the Alhambra,' 1858; 'A Huff,' 1859; 'Gossips at a Well,' 1861; 'Water-Drinkers,' 1862; 'A Spanish Wake,' 1864; 'The Early Career of Murillo,' 1865; and 'A Chat round the Braserio,' 1866, with numerous others of a like kind, showed the apparently inexhaustible resources of the field he had opened, while each year seemed to add to his appreciation of character, brilliancy of colour, and power and facility of execution. His style was marked, yet free from mannerism; and if the execution seemed at times verging on carelessness, it was excused by the brightness and sparkle of the effect; whilst he escaped the monotony to which the repetition, year after year, of Spanish life and costume would seem almost inevitably to lead, by frequently renewing his studies in Spain itself, instead of trusting to old and fading recollections. But, though Spanish pictures continued to form the staple of his productions, he did not confine his pencil to them. He painted a portrait of the Prince Consort, 1858, for his native city, and in the following year received the royal command to paint 'The Marriage of H.R.H. the Princess Royal,' in which he was considered to have been successful, far beyond what is customary with these royal ceremonials, and which had great success when engraved. In 1863 he exhibited 'The House of Commons, 1860,' and succeeding years saw several vigorously painted portraits from his pencil. But in mid-career he was seized with a low fever, paralysis followed, and he died, after about a month's illness, on the 27th of February, 1867, not having completed his 50th year. The pictures he left nearly finished, and which appeared at the Royal Academy in the May following his decease, 'Antonia,' 'A Highland Lassie Reading,' and 'O Nannie, wilt thou gang with me?' whilst they showed unabated powers, were further interesting as indications of a purpose to return to his earliest class of subjects.

PHILLPOTS HENRY, D.D., Bishop of Exeter. [E. C. vol. iv., col. 811.] Born at Bridgewater, Somersetshire, on the 6th of May, 1778, Bishop Phillpots had long passed the age when he could efficiently conduct the episcopal duties of his vast diocese. Suffering from partial loss of sight and enfeebled health, he had for many years performed most of his episcopal functions by proxy; the last time he appeared in public was on occasion of his triennial visitation in 1862. At length, on the passing of the Resignation of Bishops Act, August 1869, he notified to the Archbishop of Canterbury (September 9th) his desire to resign his see; but, before the necessary measures were completed for giving legal force to his resignation, he had ceased to live. He died at his marine villa, Bishopstowe, near Torquay, on the 18th of September, 1869, in his 91st year. He had been Bishop of Exeter 39 years, having been nominated to the see in October, 1830.

PHILPOT, JOHN, D.C.L., an English reforming divine and

martyr, son of Sir Peter Philpot, and member of an old Hampshire family, was born at Compton, in that county, about 1511, and was educated successively at Winchester and at New College, Oxford, where he was admitted, in 1534, to a law fellowship, which he forfeited, in 1541, "because of absence, being then on his travels." For several years he had been dissatisfied with the dogmas and the system of the Church of Rome, and he returned home from Italy, the country in which he principally travelled, and from Rome, the city in which he principally resided, with views strongly determined towards the Reformation. To these views he gave expression in the lectures on St. Paul's Epistle to the Romans which he read in the cathedral of Winchester, and which gave offence at once to the clergy and the citizens. At some unascertained date after the accession of Edward VI. he was made Archdeacon of Winchester. In the convocation of the clergy which assembled in October, 1553, the year of Queen Mary's accession, the catechism which had been published a short time before the late king's death was condemned as "pestiferous and full of heresies;" and for his determined refusal to subscribe this condemnation, Philpot was subjected to various examinations, of which he has left a vivid and interesting account; and, after a rigorous imprisonment of eighteen months, was condemned to the stake. In his defence he exhibited great courage and ability, and even an eagerness for disputation, provoked thereto by the cruelty of his inquisitors. He denied the assumed identity of the Church of Rome with the Catholic Church, the supremacy of the Pope, and the doctrine of transubstantiation. He met his fate triumphantly, being burned in Smithfield on the 18th of December, 1555.

Philpot was a man of extensive philological attainments, of which he gave evidence in his works, 'De Vero Christiani Sacrificio,' 'Epistolæ Hebraicæ,' 'De Proprietate Linguarum,' 'Translation of Calvin's Homilies,' and 'Translation of St. Chrysostom against Heresies.' None of the above works are extant; but an account of his Disputation in the Convocation House was printed in English at Basel, and in Latin at Rome, with the title of 'Vera Expositio Disputationis,' &c., 1554. Many of his works were preserved by Fox, who translated the narrative of his examinations into Latin; and these were reproduced in one of the volumes of the Parker Society, entitled 'The Examinations and Writings of John Philpot,' &c., 8vo, Cambridge, 1842, which contained (1) a 'Biographical Notice of Philpot;' (2) 'Examinations of John Philpot;' (3) 'Disputation in the Convocation House, October, 1553;' (4) 'Letters of Master John Philpot;' 'Apology for Spitting upon an Arian;' and (5) a 'Defence of the true and old Authority of Christ's Church, by Cælius Secundus Curio, translated by John Philpot.' Many years previous to this publication, the Rev. Legh Richmond had devoted part of the fourth volume of his 'Fathers of the English Church,' &c., 8 vols. 8vo, London, 1807—12, to 'The Life, Examinations, and Selections from the Writings of John Philpot,' &c., 1809.

PICHLER, JOSEPH ANTON, a gem-engraver, was born at Brixen, in the Tyrol, April 12th, 1697. He studied gem-engraving in Naples. From 1750 till his death, in 1779, he lived in Rome, holding a high position as an engraver both of intaglios and cameos. His subjects were chiefly mythological, but he engraved also numerous heads after the antique, and some of modern personages.

PICHLER, JOHANN VON, son and pupil of Joseph Anton Pichler, was born at Naples, January 1st, 1734. He was an earnest student of the antique, and was by many thought to have nearly approached his models in beauty of design and execution. He enjoyed a European reputation, and is still regarded as one of the best of modern gem-engravers; and he has the credit, almost alone among the gem-engravers of his time, of never fabricating antiques. He was greatly admired and patronised by the Emperor Joseph II., who named him court-engraver, and gave him titles of nobility. Johann von Pichler died at Rome, January 25th, 1791. Besides his cameos and intaglios, he painted in pastel, and executed several engravings on copper after Raffaele's paintings in the Vatican.

* PIERCE, FRANKLIN, 14th President of the United States of America, was born at Hillsborough, New Hampshire, November 23rd, 1804. His father, Brigadier-General Benjamin Pierce, had fought in the War of Independence, and had afterwards filled various municipal and state offices in New Hampshire. Franklin finished his education at Bowdoin College, Maine, where he was, in 1822, officer of a college military company, in which Nathaniel Hawthorne was one of the privates. He graduated in 1824; studied law under Judge Howe and

Senator Woodbury; and was admitted to the bar in 1827. He was elected representative for Hillsborough in the State Legislature in 1829, Speaker of the State House in 1831, and Member of Congress in 1833. He took sides with the Democrats, under General Jackson, supporting the South against the North. In 1837 he became a senator, remaining steady to his party, but not taking a prominent part in debate. He was successively offered the posts of Attorney-General and of Secretary of State from President Polk, and of nomination to the governorship of New Hampshire, but declined all these offers. Quitting the Senate in 1842, he established himself as an advocate at Concord, and became distinguished at the bar. On the breaking out of the Mexican war in 1846, he volunteered as a private in the army; rose to the rank of brigadier-general in 1847, under General Scott; and led his brigade against the enemy at the battles of Contreras and Churubusco. He acted as one of the Commissioners for negotiating a peace with Mexico; but this failing, the war proceeded, and he was engaged at Molino del Rey, Chapultepec, and the final conquest of the capital. Returning home, he resigned his military commission, and recommenced as an advocate. In 1850 he acted as President of the Convention intrusted with the revision of the Constitution of New Hampshire. In 1852 he was elected President of the United States, his nomination being the result of a compromise between conflicting sections of the Democratic party, to which all the States but four assented. In his Inaugural Message, 1853, he defended slavery, denounced anti-slavery agitation, and supported the Fugitive Slave Law. During his five years' term of office, he settled a fishery dispute with England; sent an expedition to explore a railway route over the Rocky Mountains; and brought about the repeal of the Missouri Compromise Act of 1820. By this act, slavery was not to be introduced into any new States of the Union; but, by its repeal, the troubles arose which distracted Kansas and Nebraska. Other measures connected with his presidency were the signing of commercial treaties with England and Japan; and the attempt, by means of the Ostend Conference, to compel Spain to sell Cuba to the United States—an intrigue which brought the American Government into bad odour with foreign powers. In 1855 Walker's filibustering expedition to Central America, and the angry remonstrances of the President against the alleged attempts of the English Government to raise recruits in the Union for the Crimea, created much irritation between the two countries. Mr. Pierce, although held in high personal esteem, was not popular as a president. When his term of office expired, in 1857, he visited Europe, and travelled for two or three years. During the civil war, he supported the Federals against the Confederates, but took no active part in the struggle. He was appointed a judge in 1863. Before Mr. Pierce's election as President, in 1852, his 'Life' was published by Nathaniel Hawthorne; also by Mr. Hermitage ('Life of General Franklin Pierce, the Granite Statesman,'); and by Mr. Bartlett. On the completion of his term of office, sketches of his administration and services were published by Carroll, Cooley, Robinson, and other writers.

PIERO DI COSIMO, an eminent Florentine painter, was the son of Lorenzo, a goldsmith of Florence, in which city he was born in 1462. He was a scholar and assistant of Cosimo Roselli; accompanied him to Rome, and from his connection with him was named Di Cosimo. In the early part of his career, Piero was regarded as the rival of Leonardo da Vinci, but he had neither the depth of feeling nor the comprehensive genius of that great master. He was, however, superior to most of the Florentine painters of his time. He is described as of a gloomy turn of mind, and something of his natural sombreness is reflected on his canvases. He was fonder than his predecessors of subjects from classical mythology, and these afford the most favourable examples of his pencil. His chief works are in Florence, but most of the great galleries of Europe possess specimens by him. The Berlin Museum has 'Venus playing with Love,' which is much admired; the Louvre, a 'Coronation of the Virgin;' and our own National Gallery, 'The Death of Procris,' which affords a good illustration of the general character of his style, and the kind of landscape background for which he was celebrated. He died at Florence in 1521.

* PILS, ISIDORE-ALEXANDRE-AUGUSTIN, French painter, was born at Paris, July 19th, 1813. He studied under M. Picot, and in the École des Beaux-Arts. In 1838 he carried off the grand prize of Rome by a picture of 'St. Peter at the Gate of the Temple;' and the pictures he painted at Rome, and for some time after his return to Paris, were chiefly of a religious character. In 1854 he visited the East and the Crimea, and has

BIOG. DIV.—SUP.

since painted several battle-pieces, which have won great applause in France. 'The Landing of the French Troops in the Crimea' was one of the chief attractions of the Exposition of 1857; 'The Battle of the Alma,' painted for the Government in 1861, and placed in the Museum of Versailles, was the most attractive of the many French battle-pieces in the International Exhibition of 1862, and the largest picture in the building. He was appointed professor of painting at the École des Beaux-Arts on its reorganisation in 1863. M. Pils received the medals of the second class in 1846 and 1855; of the first class in 1857; a grand medal of honour in 1861; and the Cross of the Legion of Honour in 1857.

PINAIGRIER, ROBERT, celebrated French painter on glass, was born in Touraine about 1490. It is thought that he learned his art in Italy. He acquired celebrity by an allegorical design in a window in the Church of St. Hilaire, Chartres, executed about 1520. He painted windows in other churches of the same city. At Paris he executed windows for the Abbeys of St. Victor, St. Jacques-de-la-Boucherie, and various churches. Little of his work remains uninjured. The windows, illustrative of the history of Joseph, in the Church of St. Merry, Paris, are perhaps the best. He died in or before 1530, at Tours, where his children long continued the glass-painting works with great credit.

PIRKHEIMER, WILIBALD, *Latine* PIRCKHEIMERUS, BILIBALDUS, a distinguished German scholar, was born at Eichstätt, on the 5th of December, 1470; and, after having received a careful education, and travelled with his father, a man of considerable reputation as a royal councillor and a patron of letters, was placed at the court of the Bishop of Eichstätt, where he cultivated all the arts, whether athletic or æsthetic, which then went to make up the character of a gallant gentleman. After a brief period of military service, he repaired, in 1490, to Padua for the study of law, which he further prosecuted three years afterwards at the University of Pisa. Returning to his native place in 1497, he became a member of the senate, by which assembly he was entrusted with several important affairs, and in particular in 1499, when he was appointed to the command of the troops sent to assist the Emperor Maximilian I. against the Swiss cantons. On the conclusion of the war, of which he wrote an account, 'Historia Belli Suitensis,' afterwards translated into German by Münch, and published with the title of 'W. Pirkheimers Schweizerkrieg,' &c., 8vo, Basel, 1826, he was honoured with the dignity of imperial councillor. After the performance of various important domestic and diplomatic services, he retired to private life in 1522, and devoted his leisure to scientific and literary pursuits, the advancement of education, and the society or the correspondence of his friends, amongst whom he numbered the foremost minds of the time. He wrote Latin versions of portions of the works of Plato, Xenophon, Plutarch, and others, and produced several volumes conversant about the history of Germany. One of his most popular works is a humorous production entitled 'Apologia seu Podagræ Laus,' 4to, Nürnberg, 1522, and often reprinted, German translation, 'Vertheidigung oder Lob des Padagra,' &c., 8vo, Nürnberg, 1831, English translation, 'The Praise of the Gout: or, the Gout's Apologie. A Paradox both pleasant and profitable,' 4to, London, 1617. Pirkheimer died on the 22nd of December, 1530; and eighty years after this event his works were collectively issued with the title of 'Opera politica, historica, philologica, et epistolica, adjectis Opusculis Pirkheimeri Auspicio concinnatis. Omnia nunc primum edita, collecta, recensita, ac digesta a Melch. Goldasto,' folio, Frankfurt, 1610.

PISTRUCCI, BENEDETTO, a celebrated Italian gem-engraver and medallist, was born at Rome in 1782, and worked there as an engraver of gems and cameos. A fabrication of a head of Flora, in a sard of three strata, which he imposed upon the noted collector Payne Knight (it is said at the suggestion of Mr. Hamilton, a rival collector) as a very fine antique cameo, brought him into note. He came to England in 1816, and was introduced to the Prince Regent (afterwards George IV.), who, thinking the cozening of a virtuoso at once a capital joke and a sure sign of merit, gave him a commission to engrave his portrait; and, approving of that, appointed him to engrave the dies for the new coinage. Although another held the title, Pistrucci was chief engraver to the Mint till about 1822, when he offended the king by declining to engrave Chantrey's more youthful profile, in place of his own. Pistrucci, however, retained his official connection with the Mint, with the title of medallist to the king; and the title was continued in the following reigns; but he was

not again employed on the coinage. His claims and position were the subject of a tedious controversy, which has long ceased to have any interest. Pistrucci was essentially a gem-engraver, and his coins and medals partake more of the character of gem-engraving than is desirable. It is said that to the last he cut his dies with the gem-engraver's lathe and diamond, instead of the customary steel tools. He obtained for his gems remarkably high prices. Mr. King, in his work on *Antique Gems*, says that he received for a cameo of the heads of Augustus and Livia the unprecedented sum of 800*l.*; forty years later (1859) this cameo, a blue chalcedony, was sold at the Herz sale for 30*l.*, a noteworthy illustration of the eccentricities of fashionable connoisseurship. Pistrucci's crown-pieces, with the St. George on the reverse, have been much admired; but the St. George, however prettily modelled, is too palpable an outrage on common sense. The coronation medal of George IV. is a fine work; but Pistrucci was accustomed to speak of his great Waterloo medal, on which he had been more or less engaged for above twenty years, as his masterpiece. The die proved, however, when completed, to be of too elaborate a character to admit of working successfully. Pistrucci died on the 16th of September, 1855, aged 73.

* PIUS IX., GIOVANNI MARIA MASTAI FERRETTI. [E. C. vol. iv. col. 862.] In June, 1859, an insurrection broke out in the Romagna, Bologna, and Ferrara, and initiated a series of movements, both political and military, the general tendency of which was unfavourable to the temporal power, and which culminated, in November, 1860, in a vote of annexation, the practical effect of which was to merge nearly all the "ancient patrimony of Saint Peter" into the Sardinian monarchy. Protests against the course of events were not wanting on the part of the Pope, who, in bestowing his benediction on the French army of occupation on the 1st of January, 1860, characterised the pamphlet '*Le Pape et le Congrès*,' then just issued under the inspiration of Napoleon III., as a "signal monument of hypocrisy, and an ignoble tissue of contradictions;" and who, on the 28th of September following, pronounced an allocution in severe condemnation of the Sardinian government.

On the 8th of December, 1864, being the tenth anniversary of the declaration of the dogma of the Immaculate Conception, the Pope issued an Encyclical Letter, accompanied by an Appendix consisting of eighty propositions directed against the principal religious and political vices and heresies of the age. These were scheduled as pantheism, naturalism, rationalism, religious indifference, errors and offences against the Church, errors in philosophy, errors with regard to the doctrine and practice of Christian marriage, the assertion of liberty and independence, and antagonism to the temporal sovereignty of the Pope. The operations of Bible Societies were censured, and the adherents of Socialism and the members of secret societies, as the Freemasons, were condemned; as also were those persons who held the possibility of salvation without the pale of the Church, or who believed that Protestantism was only another form of the true faith, and was equally pleasing to God. The public reading of this Encyclical—which was generally regarded as the expression of the pontifical wrath against the convention between Victor Emmanuel and Napoleon III., by which it had been stipulated, on the 15th of September previous, that the troops of the latter should evacuate Rome in two years from that date—was prohibited to the French clergy by an imperial decree of the 5th of January, 1865, which, however, the Archbishop of Besançon and some other prelates had the hardihood to disobey. In pursuance of the convention just mentioned, the last detachment of the French troops quitted Rome on the 11th of December, 1866, when General Montebello received a farewell benediction from the Pope, with the assurance of the pontifical intercession for the temporal and spiritual welfare of the Emperor. The patriotic impatience of Garibaldi and his followers, who had invaded what was left of the papal territory, and had repulsed the papal troops at Monte Rotondo, brought about a renewal of the French occupation on the 30th of October, 1867, and the utter discomfiture of the Italian invaders at Mentana on the 4th of November, on the 18th of which month the Pope celebrated a solemn service for the repose of the victims in the battle which had respite the temporal sovereignty. An allocution of the 20th of December expressed the pontifical gratitude that "while Satan and his satellites and sons ceased not to let loose, in the most horrible manner, their fury against our divine religion, the God of mercy and of goodness sent the valiant soldiers of the Emperor of the French, who rejoiced to come to our aid, and fought with the utmost zeal and ardour, especially at Mentana and Monte Rotondo, thus covering their names with

glory." In another allocution, written with reference to the religious affairs of Austria, and dated June 23rd, 1868, the Pope deplored and condemned as abominable the marriage and other laws depriving the Church of control over schools, and establishing the freedom of the press and liberty of conscience, declaring these laws null and void, censuring those concerned in their initiation, approval, or execution, praising the conduct of the Austrian bishops as defenders of the Concordat, and expressing a hope that the Hungarian prelates would follow in their footsteps. On the 29th of June, 1868, the supreme Pontiff issued a bull (*Æterni Patris*), fixing the opening of the Œcumenical Council, which had been announced on the 8th of December, 1867, for the 8th of December, 1869. On the 11th of April, 1869, the "jubilee of the priesthood of Pope Pius IX.," or the fiftieth anniversary of the celebration of his first mass, was observed with great fervour at Rome, and generally throughout Roman Catholic Christendom; and it is stated that the gifts of the faithful on this occasion, whether of the clergy or the laity, throughout Europe and America, reached the value of more than three-quarters of a million sterling.

The interest of the present incumbency of the Roman See groups itself around the efforts made by the Pope for the perpetuation and security of the temporal power, which finally fell as a sequel to the withdrawal of the French troops from Rome in 1870; and the efforts which he has made to compensate the probable loss of territorial sovereignty by the extension of his spiritual prerogative and domination. Of the last class of efforts the Œcumenical Council of 1869-70 was at once the most audacious, the most exhaustive, and the most disastrous; resulting, as has been already historically ascertained, in wide-spread dissatisfaction, in mingled contempt, horror, and amusement without the Church, and disaffection, defection, and probable disruption within. The whole Christian world was summoned to the Council. A special invitation was sent to the Patriarch of Constantinople, who refused it as not recognising the assumption of universal authority on the part of the Bishop of Rome; and Protestants were invited, as was elicited by Dr. Cumming, only on condition of silent acquiescence and submission. The invitation, given on such terms, was not accepted.

A Pre-Synodal Congregation assembled in the Sistine Chapel on the 2nd of December, 1869, when the Pope delivered an allocution, and received the oaths of the officers of the approaching Council, which was opened according to programme, on the 8th of December, being the anniversary of the declaration of the Immaculate Conception, with the ringing of bells and the salvoes of artillery. The inaugural ceremony took place in St. Peter's Church, whither the Pope marched in the rear of a procession composed of nearly eight hundred ecclesiastics—prince-archbishops, cardinals, patriarchs, archbishops and bishops, abbots, and generals of religious orders; to whom, after mass and an inaugural discourse, the Pope gave his blessing, and subsequently received the homage of the faithful. The appointed prayers followed, and the Pope three times invoked the aid and presence of the Holy Spirit at the deliberations of the Council. After a session extending over more than six months, during which between ninety and a hundred "General Congregations" and four "Public Sessions" were held, and in the course of which leave of absence was frequently refused to malcontents, and discussion and opposition were stifled, a majority of 451 out of the 601 members of the Council then present—many of whom were dependent upon the Pope for their maintenance during their stay at Rome—outvoting a minority of 150 dissentients, or *non placets*, and of those who gave a qualified assent (*placet juxta modum*) carried a measure, at the fourth public session, July 18th, 1870, affirming the infallibility of the Pope. The fourth chapter of the *Schema* incorporating this doctrine concluded as follows:—"With the approval of the Sacred Council, we inculcate and define as a dogma of faith, that, in virtue of the Divine assistance, the Roman Pontiff, of whom it was said in the person of St. Peter, by our Lord Jesus Christ, 'I have prayed for thee,' &c., cannot err when, fulfilling his mission as supreme teacher of all Christians, he defines by his Apostolic authority what the Universal Church must hold in matters of faith and morals, and that the prerogative of inerrancy, or infallibility, extends over the same matters to which the infallibility of the Church is applicable. But if any man shall presume—which may God forbid!—to controvert our present definition, let him know that he departs from the truth of the Catholic faith and the unity of the Church."

In a letter addressed by King Victor Emmanuel to the Pope, dated from Florence, September 8th, 1870, the former adverted

to the necessity, in the interests of his own crown and of the spiritual power of the supreme Pontiff, and in the face of the events then agitating Europe, that he should occupy Rome, and assume the protectorate of the Holy Father. The Pope, who had previously refused to recognise the kingdom of Italy, protested energetically against such an occupation as a "great sacrilege and an injustice of high enormity;" notwithstanding that it was undertaken to be effected without loss of the papal revenue or dignity, and without prejudice to the full jurisdiction and sovereignty of the Pope over the Leonine city. On the 20th of September, sixteen days after the downfall of the Emperor Napoleon III., and in spite of the famous "jamais" of M. Rouher, who, in a debate in the Legislative Assembly, December 5th, 1867, had, in the name of France, declared that "Italy should never seize upon Rome," the troops of Victor Emmanuel entered Rome, after a short resistance by the Pope's soldiers, who had received orders to yield to violence when violence should be offered. A slight breach in the walls of Rome, through which General Cadorna entered, was thus the signal for the cessation of the defence of the Holy City. A plébiscite of the Papal dominions was taken early in October, when an almost unanimous vote of 133,681 against a minority of 1,507, was recorded for the annexation of Rome and its dependencies to the kingdom of Italy. Perfect freedom of action was left to the Pope, either to remain at Rome or to leave it; and the Italian government undertook, for itself and on the part of the people, that, whatever might be the determination of the Holy Father, he should "never fail to be surrounded with all the honours and all the proofs of respect which were due to him."

Pius IX. belongs to a long-lived family; and he has the compensation, amongst all his troubles, of being the first occupant of the chair of St. Peter who, since the death of that apostle, has held office for the full term of twenty-five years. This term the present Pope has already, October, 1871, a little more than completed, his accession having taken place on the 16th of June, 1846; but it was only on the 23rd of August that his reign reached the duration which tradition ascribes to that of the Apostle—twenty-five years, two months, and seven days. So singular a falsification of the warning given at the coronation ceremony "Non videbis annos Petri" could scarcely pass without notice; and the event of the "Pope's Jubilee" was celebrated by sermons, masses, and religious ceremonies of imposing solemnity, from which the occurrence of political demonstrations, involving the death of one victim and the arrest of several rioters, somewhat detracted. The Pope was also the recipient of splendid gifts and offerings in honour of his protracted incumbency.

PLÜCKER, JULIUS, was born 16th July, 1801, at Elberfeld. He studied in the Gymnasium of Düsseldorf, and in the Universities of Bonn, Berlin, and Heidelberg; he also passed some years in Paris. In 1825 he became a privatdocent of mathematics in Bonn, and in 1828 professor extraordinarius in that university. In 1833 he went to Berlin in the same capacity. In 1834 he became professor of mathematics in the University of Halle; and in 1836 he obtained a similar professorship in the University of Bonn. His writings on analytical geometry placed him among the first mathematicians of his time. He became professor of physics in 1847, and made a series of brilliant discoveries in physics, such as that of magnecrystallic action and the action of powerful magnets on the luminous electric discharge in glass tubes containing highly rarefied gas. He also showed that certain elementary substances give each two totally different spectra at different temperatures. He was elected a foreign member of the Royal Society in 1855; and the Copley medal was awarded to him in 1866. He died at Bonn, 22nd May, 1868.

PLUMIER, CHARLES, botanist, was born at Marseille in 1646. He was a man of varied accomplishments, being well skilled in arts of so different a nature as painting, turning, and making philosophical instruments. It was owing to hearing some lectures by Tournefort, that he commenced to give particular attention to plants. He went on an expedition to the West India Islands for the purpose of introducing into France such plants as would be most useful; and he discharged his duties so well that he was appointed botanist to Louis XIV. He also collected, figured, described, and made copious notes respecting a very large number of species belonging to the animate world generally. Besides his published works, he left an immense quantity of unpublished material, and several thousand well-executed figures. Many of the genera which he founded were adopted by Linnæus, or have been established by more

recent observers. His principal works are, 'Description des Plantes de l'Amérique,' fol., Paris, 1693; 'Nova plantarum Americanarum,' 4to, Paris, 1703; 'Plantarum Americanarum, fasciculi X.,' edited by J. Burmann, folio, Paris, 1755—1760; 'Traité des Fougères de l'Amérique,' folio, Paris, 1705; and 'L'Art de Tourner,' folio, Lyon, 1701. The botanical works are illustrated by nearly 600 plates of capital figures, all engraved from his designs or paintings. He died at Puerto San Maria, near Cadiz, in 1704.

POERIO, BARON CARLO, an Italian lawyer and politician, was born at Naples, in 1803, and was early called upon to share in the successive sentences of exile passed upon his father, Baron Giuseppe Poerio, the leader of the Neapolitan bar, for his liberal opinions. The first six years of the administration of Ferdinand II., who succeeded to the throne of the Two Sicilies on the 8th of November, 1830, were tempered by the benign influence of his first wife, Maria Christina of Savoy; and the house of the elder Poerio during this period became one of the principal centres of liberal opinion and of literary and general culture at Naples. The second marriage of the king, in 1837, with the Archduchess Maria Theresa, brought him more completely under the domination of Austria, to which he had for some years been gravitating; and during the next ten years, Carlo Poerio, who was always ready to undertake the defence of political offenders, and whose name and reputation made him an object of extraordinary jealousy and suspicion, was more than four times arbitrarily arrested and immured in the royal dungeons. Early in the revolutionary year 1848, Poerio exchanged a state of intermittent captivity for office, first as Prefect of Police, and afterwards as Minister of Public Instruction. The hope of a permanently liberal régime was shaken, however, by the coup d'état of the 15th of May, 1848, and shattered by the dissolution of the Chambers on the 12th of March, 1849; after which Poerio, who refused to flee, was brought before a court and condemned, in June, 1850, to twenty-four years' imprisonment. The tortures he was now called upon to endure stirred up the eloquent indignation of Mr. Gladstone, who by his famous letter to Lord Aberdeen shocked Europe by the revelations of the atrocities of King Ferdinand's government. After a detention of nearly nine years, the sentence of a terminal imprisonment was commuted into one of perpetual exile; and Poerio and other political prisoners were forced to embark, in March, 1859, for South America, on board a vessel the captain of which they compelled to land them at Cork. Poerio's modesty, dignity, worth, and affability favourably interested many of the most influential people in England; and he left this country for Piedmont, where he refused the advances of King Francis, who had succeeded his father Ferdinand, and who wished him to return to Naples. He did not revisit his native country until after the flight of King Francis, in October, 1860, and just before the annexation of his kingdom to the Italian monarchy, during which short interval Poerio joined the Fanti cabinet as a minister without portfolio. He was promptly returned as a member of the House of Deputies; and in March, 1861, was elected Vice-President of this Assembly, an office which he retained until his death at Florence, on the 28th of April, 1867. He was buried at the public expense, and with uncommon expressions of respect and regret, at Naples, the syndic of which city immediately opened a subscription for the purpose of erecting a monument to his memory. An oration, in review and eulogy of his career, was published with the title of 'Della Vita e de' Tempi di Carlo Poerio: Discorso recitato dal Socio S. Baldacchini,' 4to, Naples, 1867.

Poerio left behind him the reputation of the purest and most elevated patriotism, caring nothing for party, but giving up all to his country. A record of the chief legal process instituted against him was edited by G. Tofano, and published with the title of 'Atti e Difesa della Causa di Carlo Poerio ed Altri,' 8vo, Naples, 1850; and two English volumes have been conversant about phases of the same event, 'Speech of Carlo Poerio, in his Defence before the Grand Court Extraordinary at Naples. Translated from the authentic Original,' 8vo, London, 1851; and 'Carlo Poerio and the Neapolitan Police. The Defence made by that Nobleman on his Trial before the Grand Court of Naples,' &c., 8vo, London, 1858.

* POGGENDORFF, JOHANN CHRISTIAN, a German physicist, was born at Hamburg, December 29th, 1796. The son of a merchant, he was educated first at the Johanneum in Hamburg, and then at Schiffbeck. Preferring science to commerce, he studied pharmacy, and removed in 1820 to Berlin, where he went through a regular course in physics and chemistry. In the following year appeared his first scientific paper in the

'Isis,' on the magnetism of the voltaic pile, especially relating to the galvanomultiplier. In 1824 he succeeded Gilbert as editor of the *Annalen der Physik und Chemie*, which had long been one of the leading scientific journals in Germany, and which became still more influential under his management. In 1826 he introduced a new magnetometer; in 1834 was appointed professor at the University of Berlin; and in 1838 was elected member of the Académie des Sciences. In 1853 appeared his *'Lebenslinien zur Geschichte der exacten Wissenschaften,'* Berlin, 8vo; which was followed ten years afterwards by a larger work in the dictionary form, *'Biographisch-literarisches Hand-Wörterbuch zur Geschichte der exacten Wissenschaften,'* Berlin, 2 vols. 8vo. He was also associated with Liebig and Wöhler in the compilation of the first volume of their *'Wörterbuch der Chemie,'* 1856. His labours have, however, been chiefly directed to the *'Annalen.'* For more than forty years this journal has been especially rich in papers relating to electricity and magnetism; Poggendorff himself has contributed nearly a hundred and fifty papers, mostly on these sciences. A few papers by him have also appeared in the Berlin Memoirs and in the Transactions of various societies.

POINSOT, LOUIS, French mathematician, was born at Paris, January 3rd, 1777. He studied in l'Ecole Polytechnique, which he left in 1795, to become an engineer in the corps of Ponts et Chaussées. Nearly all the subsequent changes in his career were due to his skill as a mathematical teacher and writer. He became professor of mathematics at the Lycée Bonaparte in 1804; inspector-general of the University of Paris in 1806; and professor of analysis at l'Ecole Polytechnique in 1809. In 1813 he succeeded Lagrange in the section of geometry at the Academy of Sciences; and in 1816 became examiner and member of the council at l'Ecole Polytechnique. In 1840 he was appointed a member of the Council of Superior Instruction; and, in 1843, Geometer to the Bureau des Longitudes. In 1846, he sat in the Chamber of Peers, and, in 1852, was made a senator. M. Poinot's scientific writings extended over a period of more than half a century. In 1803, appeared his *'Éléments de Statique,'* in which he developed the theory of statical couples. This work was highly praised by Fourier; it has passed through many editions, and an English translation by Sutton was published at Cambridge in 1847. In 1808 M. Poinot prepared the analysis placed at the beginning of Lagrange's *'Traité de la Résolution des Equations numériques.'* In 1825, appeared his *'Recherches sur l'analyse des Sections Angulaires,'* and, in 1835, *'Théorie Nouvelle de la Rotation des Corps.'* He published a great number of papers on mathematical and philosophical subjects, in the *'Journal de l'Ecole Polytechnique,'* the *'Mémoires des Savants Étrangers,'* the *'Mémoires de l'Institut,'* the *'Mémoires de l'Académie des Sciences,'* the *'Comptes Rendus,'* the *'Bulletin des Sciences Mathématiques,'* Liouville's *'Journal,'* and the *'Nouvelles Annales Mathématiques.'* These papers (many of which were read before the Institute, and some of them afterwards published in a separate form) relate, among other subjects, to circular arcs; the general theory of the equilibrium of systems; the composition of moments and areas; the theory of numbers; the fundamental principles of the differential calculus; the transformation of differential functions; the invariable plane of the solar system; the principle of virtual velocities; the theory of the rotation of bodies; Foucault's experiment to demonstrate the earth's diurnal rotation; and the theory of rolling circular cones. M. Poinot died at Paris, in his 83rd year, December 15th, 1859.

POLK, JAMES KNOX, eleventh President of the United States of America, was born in Mecklenburg county, North Carolina, November 2, 1795. He was the son of a farmer, who removed to Tennessee in 1806, and early placed him as a clerk in a store; but, in 1815, he entered the University of North Carolina, where he graduated in 1818 with high honours. In 1819 he commenced the study of the law, and in 1820 was admitted to the bar. His political career commenced in 1823, when he was elected a member of the State Legislature of Tennessee. He entered Congress in 1825, and joined the Democrats. He opposed federal appropriations of money for internal improvements, a protective tariff, and the establishment of a national bank; and he was a staunch adherent of President Jackson. In 1833 and 1834 he was chairman of the committee of ways and means; and Speaker of the House of Representatives from 1835 to 1839, greatly trusted by the House during his five years' occupancy of this post. On retiring from Congress in the last-named year, he was elected governor of the State of Tennessee. He failed in an election for Vice-President

of the Republic in 1840, in a re-election as governor of Tennessee in 1841, and again in 1843; but, in 1844, an unexpected complication in party tactics gave him the highest position in the United States. Dissensions among the Democrats respecting the nomination of Mr. Clay as an opponent of Van Buren, led to a compromise, by which Mr. Polk was elected President. He formed a strong government, with Buchanan, Bancroft, and Marcy among the ministers. In his four years of office, 1845 to 1849, the Oregon dispute with England was settled. He had headed the party which demanded a boundary line as far north as 54°40' N., so as to include the whole of the Oregon territory within the United States; but negotiations led to the adoption of 49° as the latitude of the boundary, with the assignment of Vancouver Island to England. This treaty lessened his popularity with his countrymen. On entering office, he had announced as part of his intended policy, the annexation of Texas; this annexation, effected in 1846, brought on a war with Mexico, which resulted in the treaty of 1849, by which a territory of 800,000 square miles, including California and New Mexico, was added to the United States. His advocacy of permissive slavery in newly formed or annexed territories, his preference of free trade as contrasted with protective duties, and his maintenance of State rights, caused him to lose favour with Congress. He established the independent Treasury system, whereby the revenue of the government was raised in specie, without the aid of banks; he founded the Department of the Interior, and, admitted the Wisconsin Territory to the rank of a State. His term of office ceased in March, 1849, and he died on June 15th, in the same year.

POLK, LEONIDAS, Bishop of Louisiana, and lieutenant-general in the American Confederate army, was one of the few modern examples of a bishop-militant. He was born at Raleigh, North Carolina, in 1806; graduated at West Point Military Academy in 1827; and entered the army as second lieutenant of artillery. Resigning his commission in the autumn of the same year, he took orders, and in 1830 became a deacon of the Protestant Episcopal Church. In 1838, as missionary-bishop, he took charge of a large region in the south-west of the United States; but in 1841 limited his functions to those of Bishop of Louisiana. When the civil war broke out in 1861, he vehemently sided with the South, being himself a slave-owner; his military ardour awakened after a slumber of thirty years; and, with the advice of General Lee, he accepted a commission in the Confederate Army offered to him by Jefferson Davis. As major-general, he headed a force in the valley of the Mississippi, where he constructed strong works at Fort Donelson and other places. In 1862 he joined Johnstone and Beauregard, and took part in the engagements at Corinth, Shiloh, Perryville, Murfreesboro, and Chicamunga. Having given dissatisfaction to General Bragg, he was suspended for a time; but was restored to a command in 1863, and was raised to the rank of lieutenant-general. In 1864 he was placed in command of the department of the Mississippi. He joined Johnstone in an attempt to check the advance of Sherman upon Atlanta. While reconnoitring on the Pine Mountains on the 14th of June, he was killed by a cannon ball. He had retained his bishopric, and had intended to resume episcopal functions if he survived the war.

PONCELET, NICOLAS, a distinguished French engraver, was born at Paris, March 12th, 1746. He studied engraving under Fessard and Delaunay. He was employed on the *'Galerie du Palais Royal,'* the *'Musée Laurent,'* and other important works of a similar character; the illustrations to the Bible by Mavillier; Cochin's designs in Dussieux's edition of Ariosto; editions of Voltaire, Rousseau, &c. His principal separate plates are the *'Battle of Marengo,'* after C. Vernet; *'Restoring the Blind Man to Sight,'* by Le Sueur; and the *'Marriage of the Virgin,'* by Vanloo. M. Ponce wrote and translated several artistic dissertations, which were collected under the title *'Mélanges sur les Beaux-Arts,'* 8vo, 1826; read several papers before artistic and literary societies, and published some political pamphlets. He died at Paris, March 27, 1831.

PONCELET, JEAN VICTOR, was born at Metz, July 1st, 1788. He studied mathematics at the Lycée Impérial of Metz, and was afterwards admitted at the École Polytechnique. He became sub-lieutenant of engineers at the École d'Application at Metz, and left it in March, 1812, in order to assist in constructing the defensive works of Ramekens, in the island of Walcheren. In June, 1812, he joined the Russian invading army, and in August took part in the battle of Smolensk. On the 19th he was employed in throwing bridges over the Dnieper under fire of the Russian batteries on the opposite bank. He deceived the

enemy by pretending to cross at a particular spot, while he constructed bridges at other points, better protected from the Russian fire. During the retreat from Moscow, he was taken prisoner, and after a painful march of four months through snow, and often with the mercury at the freezing point, he arrived at Saratof, on the Volga. After recovering from an illness brought on by the hardships he had endured, he resolved to occupy his leisure with the study of descriptive geometry; but he found that what he had learnt had been totally effaced by his privations and sufferings. Without the aid of books, he had to construct piecemeal the elementary propositions required for the line of research he had determined on. The results of his labours were afterwards published in Gergonne's 'Annales,' from 1817 to 1821, and the original manuscripts were published in 1862. At the conclusion of peace in 1814, he returned to France. From 1815 to 1825, as captain of engineers, he superintended the construction of machinery in the arsenal of Metz. From 1825 to 1835, he was professor of mechanics, and he not only instructed young officers in this branch of their profession, but, at the suggestion of Baron Dupin, delivered gratuitous evening lectures on geometry to the artisans of Metz, and thus contributed "to the establishment of those courses of public lectures that have brought the most fertile results of scientific research within the grasp of the whole nation." Poncelet published various works and memoirs on geometry and applied mechanics. His undershot water-wheel with curved buckets is known throughout Europe by the name of Poncelet's wheel, which nearly doubles the useful effects of a given water power. He became chef de bataillon in 1831, and member of the Institute in 1834. From 1835 to 1848, he was on the committee for constructing the fortifications of Paris. He also became professor of mechanics at the Sorbonne and at the Collège de France. He became general of brigade in 1848, and governor of the École Polytechnique. In June, 1848, he led his pupils through the barricades to the Luxembourg, where they formed a guard of honour for the protection of the provisional government; for which important service he was appointed to the command of the National Guards of the department of the Seine. He was also elected a member of the Constituent Assembly. As president of the Scientific Commission sent to the English Exhibition of 1851, he drew up a Report on the Progress of the Arts, involving the application of science during the last half-century. He wrote a large number of memoirs and scientific reports, and was a member of various learned societies. He died in Paris, 23rd December, 1867, after a long and painful illness.

PONTE, GIOVANNI DA, an eminent Venetian architect, was born at Venice in 1612. He built the Hall of the Great Council; the Store-house of the Arsenal, 900 feet long; the Church of S. Croce, and other important edifices; and rebuilt, among other things, the Collegio of the Ducal Palace. The Public Prison, completed in 1589, a spacious Doric building, with a single row of windows and a rusticated basement, was one of his best buildings, being remarkable for its appropriate air of stern, solid majesty. This building he united to the Ducal Palace by the famous Bridge of Sighs. But his most celebrated work was the Bridge of the Rialto over the Grand Canal, a single arch of 98 feet span, and a width of 66 feet, and which has always ranked among the chief architectural features of the city. Da Ponte is said to have died in penury in 1597.

* PÖPPIG, EDWARD, traveller and naturalist, was born at Plauen, in Saxony, in 1797. He was educated at Leipzig. In 1822 he went to Cuba, and spent two years in examining the island. He then rested for a short time in the United States, and in 1826 recommenced his explorations, which lasted until 1832, the new field of his exertions being South America. During this period he visited many parts of Chili, Peru, and Brazil; and formed valuable collections of the plants and animals which inhabit those countries. On returning to Germany he was appointed professor of zoology at the University of Leipzig. The results of his researches have appeared in articles contributed to German scientific periodicals, and to Ersch and Gruber's Encyclopædia, and in the following works:—'Reise in Chili, Peru, und auf dem Amazonenströme, während des Jahre 1827—1832,' 2 vols. 4to, Leipzig, 1835; and 'Nova Genera ac Species Plantarum quas in regno Chilensi, Peruviano, ac Terra Amazonica annis 1827—1832 legit,' 3 vols. 8vo, 1835—1845. In the last-mentioned work he was associated with M. H. Endlicher. A large number of new species are described in it.

PORPORA, NICOLO, musical composer, was born at Naples, probably in 1687. After studying under Scarlatti, at the Conservatorio di Santo Onofrio, he composed psalms and motetts

for the convents and chapels of Naples, became maestro at the Conservatorio, and afterwards filled a similar position in another establishment. He founded a new school of singing, which proved to be his chief passport to fame; his pupils including Farinelli, Caffarelli, Mingotti, and Gabrielli. Between 1724 and 1728, he resided alternately at Vienna, Rome, and Venice, composing much music for the church and the theatre, and, for a part of the time, directing the Conservatorio di Ospedaleto, at Venice. In 1728 he was at Dresden, as music-master to the Princess of Saxe, and director of the Chapel Royal and the theatre. His residence in England from 1729 to 1738, was marked by the celebrated rivalry between him and Handel; he, however, acquired more reputation in this country as a teacher of vocal music. The remaining thirty years of his life were marked with few incidents, save his meeting with Haydn at Vienna, in 1754, and his struggles against poverty in his advanced years, when he seems to have been ungratefully forgotten by pupils who had risen to fame and wealth. He died in 1766, according to Gazzaniga, in 1767 according to Villarosa. Among Porpora's compositions are more than 50 operas, beginning with 'Ariana e Teseo,' in 1717, and ending with the 'Trionfo di Camillo,' composed when he was nearly eighty years old, with his powers decayed. Among his many oratorios, the names of three are preserved—'Gedeone,' 'Il Verbo Incarnato,' and 'Davide.' His other works in church and chamber music were numerous and varied.

PORPORATI, CARLO ANTONIO, a celebrated Italian engraver, was born at Volterra, near Turin, in 1741. He studied engraving at Paris, under Beauvarlet, and J. G. Wille, but formed a style of his own—clear in line, pure in drawing, true and graceful in colour and expression, but deficient in strength and vigour. His 'Jupiter and Leda,' after Correggio, and 'Madonna with the Rabbit,' after Raffaele, are among his best prints. Porporati worked for some time in Paris, and was elected a member of the French Academy; but afterwards settled in Turin, where he was received into the Academy and nominated professor of engraving, and where he died, June 16th, 1816.

PORRETT, ROBERT, was born 22nd September, 1783. His father held the office of ordnance storekeeper in the Tower, and resided there. Robert became his father's assistant, succeeded him, and eventually rose to be chief of the department. He devoted his leisure to chemistry, before the introduction of the atomic theory, and was among the first to apply the new doctrine to the verification of chemical analysis. He discovered hydro-ferro-cyanic and hydro-sulpho-cyanic acids, and published accounts of them and of their salts, between 1809 and 1819, in the 'Philosophical Transactions' and elsewhere. He also examined, in 1813, the newly discovered formidable preparation of chloride of nitrogen. He also showed that a fluid, under the action of the electric current, is made to pass against gravity through a membrane when the connecting wires of a battery are connected with water placed at different levels on each side of the membrane. This is described by German writers as "das porrettsche Phänomen." After an interval of twenty-six years, namely, in 1846, he again published some original papers, on gun cotton. He retired from official duty in 1850, after a service of 55 years. He became fellow of the Royal Society in 1848, and died on the 25th November, 1868.

PORTA, GIACOMO DELLA, a distinguished Italian architect, was born at Milan in the early part of the 16th century. According to Milizia, he was a worker in stucco under Gobbo, and afterwards studied architecture under Vignola. The first building known to have been erected by him was the Church of Sta. Catarina de' Funari, in 1564. His most celebrated work was the dome of St. Peter's at Rome, the completion of the cathedral having been confided to him in conjunction with Fontana, on the death of Michelangelo. They altered the outline of the cupola, from that designed by their great predecessor, and it may be questioned whether judiciously; but, generally, carried out his intention. Porta also continued the buildings of the Campidoglio, after Michelangelo's designs. His other works in the capitol include the Collegio della Sapienza (1576); the churches of Sta. Maria, Madonna de' Monti, San Luigi, the Greek Church, &c.; the Palazzi Ercolani, Nicolini, Spada, Marescotti; and the Popolo, the Campidoglio, and other fountains. He commenced the Aldobrandini Palace at Frascati, but did not live to complete it. His death happened suddenly about 1598, from eating too much melon and ice on his return to Rome from Frascati with Cardinal Aldobrandini. The buildings of Della Porta, though not free from faults, display much grandeur of style, and are admirable for the employment and distribution of sculpture.

PORTA, GUGLIELMO DELLA, an eminent sculptor, the nephew of Giacomo della Porta, was born about 1512. He went to Rome, in 1537, and became the favourite pupil and assistant of Michelangelo, and the most successful of his imitators. His Mausoleum of Pope Paul III. is one of the very finest works of its kind extant; and the recumbent nude female figures of Justice and Prudence—since Guglielmo's time partly draped—have always been particularly admired. His figures of the Prophets in the first arch, and others on the altars of St. Peter's, are also excellent. Vasari mentions a series of fourteen reliefs, illustrative of the life of Christ, which would be surpassingly beautiful if finished and cast in bronze; but he adds that Fra Guglielmo has finished nothing since he received the office of Lead-seal to the Pope in 1547, to the present year 1567, "it being the peculiarity of this office that it renders him who fills it fat and lazy." Guglielmo seems to have done little afterwards. He died about 1577. His son, GIOVANNI BATTISTA DELLA PORTA (born at Polizza, 1542, died at Rome, 1597), also attained eminence as a sculptor. A colossal marble statue of S. Domenico, executed for the church of Sta. Maria Maggiore, at Rome, is reckoned his masterpiece.

* **PORTER, DAVID D.**, admiral in the United States navy, was born in Pennsylvania, in 1817; he was the youngest son of Commodore Porter, who had taken part in the war with England in 1812. As a boy, he made many voyages with his father, and then entered the United States navy as a midshipman in 1829. After varied service afloat, he became lieutenant of the ship 'Congress' in 1841; and was engaged in the Mexican war in 1846. For a time he quitted the service of the state, accepting the post of commander of one of the Pacific mail steamers; but returned to the navy, 1853, with the rank of captain. When the civil war broke out in 1861, Rear-Admiral Porter (his rank at that time) was placed in command of the Mississippi flotilla, under Admiral Farragut; he assisted in the capture of New Orleans in April, 1862, and then aided General Grant in achieving the victories at Vicksburg and Alexandria. All opposition on the part of the Confederates in that quarter being now nearly ended, Admiral Porter remained, with his flotilla, in undisturbed control over the Mississippi till October, 1864, when he was raised to the command of the North Atlantic squadron. He had to watch Wilmington, almost the only port at which the Confederates could succeed in breaking the blockade, to export cotton and bring in varied supplies. To watch James River, Albemarle Sound, and Pimlico Sound, to ward off the Confederate ironclads, and to bombard and capture Fort Fisher, were operations in which military and naval forces combined were needed. General Butler co-operated with Admiral Porter; but some difference of view between them led to a recall of the former. Fort Fisher, which was captured in January, 1865, was described by the admiral as stronger and more formidable than the Malakoff at Sebastopol, which he had visited during the Crimean war. During the remainder of the war he held his fleet in James River ready to facilitate the military operations at and near Richmond.

PORTLOCK, JOSEPH ELLISON [E. C. vol. iv. col. 947]. He was born in 1794, and was educated at the Royal Military Academy. Before he became connected with the Ordnance Survey of Ireland, he had seen some active service with the army in Canada. In the concluding portion of the preceding memoir, his connection with the Geological Society (not Geographical, as it has been misprinted) is mentioned. His presidency lasted through the years 1857 and 1858. In 1851 he was appointed inspector of studies at the Royal Military Academy at Woolwich; and in this capacity he made many improvements in the course of education at that establishment, especially by procuring increased attention to scientific subjects. In 1856, a sense of public duty induced him to resign this post; but the subject of military education still occupied much of his thoughts, and when the Council of Military Education was appointed, he was selected as one of the councillors. In 1862 a sudden illness caused him to retire to the neighbourhood of Dublin, and on February 14, 1864, he died.

POSTEL, GUILLAUME, *Latine*, **POSTELLUS GULIELMUS**, a French scholar and visionary, was born on the 26th of May, 1505, or, according to other authorities, five years later, at Dolerie, near Barenton. When very young, he lost both his parents by the plague; and, being extremely poor, sought to acquire the means of study by teaching others more ignorant than himself. He repaired to Paris, and presently entered the Collège Sainte-Barbe as a domestic, where he acquired, unassisted, the Hebrew and Greek languages. To these he added

the acquisition of Arabic, in the course of a visit to the East, from which he brought back many precious MSS.; and, after his return, was appointed by Francis I., in 1539, to be professor of mathematics and oriental languages at the Collège de France. His prospects were ruined in consequence of his attachment to Chancellor Poyet, in whose disgrace he was involved through the influence of the Queen of Navarre, deprived of his academical preferments, and banished from France. He now wandered eastward; and having stayed for some time at Vienna, where he found scope for his oriental learning, and having escaped from the trouble in which he found himself involved, on account of his accidental likeness to a Franciscan monk, who had murdered a brother of his order, he reached Rome in 1544. He was attracted to this city as offering the most promising scene for the fulfilment of a purpose for which he believed himself to have been divinely commissioned, of uniting all mankind, by the sword or by the pen, under the authority of the Pope and the King of France. The Society of Jesus seemed to present the best instrumentality for the accomplishment of his mission; and Postel accordingly applied for admission into the Order. After a novitiate of two years, however, he was definitively excluded from the Society, the members of which were forbidden to hold any communication with him. Having propounded his visionary ideas in certain writings, he was cast into prison; but he escaped, and repaired to Venice, where he was denounced to the Inquisition, the judges of which, after examination, contemptuously dismissed him as being less a heretic than a madman. Here he formed an attachment for an old maid, whom he had infected with his own folly, in whom he pretended that the redemption of women, hitherto incomplete, was now perfected, and that they were to have universal dominion over men. In this connection may be mentioned his singular work, the result of his visions, entitled, 'Très-merveilleuses Histoires des Femmes du Nouveau Monde,' 1553. The accounts of Postel's movements during the next four years diverge considerably; but, after various wanderings and a public retraction of his opinions, he was reinstated in his former professorship at the Collège de France, at Paris, whither he was recalled in 1562. He held this appointment for a short time only; and, after another outbreak of his madness, became, either by choice or by force, an inmate of the monastery of Saint-Martin des Champs, where he passed the last eighteen years of his life, attracting veneration with increasing age, and receiving the respectful visits of princes and nobles. He died on the 6th of September, 1581.

Notwithstanding the fitful extravagance and wildness of his conduct, Postel was a man of profound scholarship, and of wide and varied information. His principal works are, 'Linguarum duodecim Characteribus differentium Alphabetum, Introductio, ac legendi Modus,' otherwise entitled, 'De Originibus seu de Hebraicæ Linguae et Gentis Antiquitate, deque variarum Linguarum Affinitate Liber,' 4to, Paris, 1538; 'Syriacæ Descriptio,' 8vo, 1540; 'De Magistratibus Atheniensium Liber,' 4to, Paris, 1541; 'De Orbis Terræ Concordia Libri quatuor, cum Annotationibus,' folio; 'De Etruriæ Regionis Originibus, Institutis, Religione, et Moribus,' 4to, Florence, 1551; 'Signorum cælestium vera Configuratio,' 4to, Paris, 1553; 'Divinationis sive divinæ Summæque Veritatis Discussio,' 8vo, Paris, 1571; 'De Nativitate Mediatoris ultima, nunc futura,' 4to; and 'Des Histoires orientales, et principalement des Turchiques et Schitiques ou Tartaresques et aultres qui en sont descendues,' 8vo, Paris, 1575.

* **POTT, AUGUST FRIEDRICH**, a German scholar, and one of the founders of the science of comparative philology, was born at Nettelrede, Hanover, on the 14th of November, 1802, and, having received his school education at Hanover, repaired to the University of Göttingen for the prosecution of his theological and philological studies. In 1825 he became a teacher at the Gymnasium of Celle, which he left in 1827, in order to assume the functions of a tutor in the University of Berlin. In 1833 he was appointed professor of comparative philology at the University of Halle; and in the same year signalised his philosophical acquaintance with the leading languages of the world, by commencing the issue of his elaborate work entitled *Etymological Researches*, &c., 'Etymologische Forschungen auf dem Gebiete der Indo-Germanischen Sprachen, mit besondern Bezug auf die Lautumwandlung im Sanskrit, Griechischen, Lateinischen, Litauischen und Gothischen,' 2 vols. 8vo, Lemgo, 1833—36, second edition, enlarged and with modified title, 2 vols. 8vo, Lemgo, 1859—67. The events of the life of Professor Pott, who, on the 17th of December, 1869, was elected a corresponding member of the French Académie des Inscriptions et Belles-Lettres, are

chiefly to be found in his academical activity, and in the publication of his works. Amongst the latter, in addition to many articles which have been allowed to remain in the condition of contributions to various learned periodicals, may be mentioned two dissertations entitled, 'De Borusso-Lithuanice tam in Slavicis quam Letticis Linguis Principatu Commentatio i.,' 4to Halle, 1837, 'Commentatio ii.,' 1841; 'The Gypsies in Europe and in Asia,' 'Die Zigeuner in Europa und Asien. Ethnographisch-linguistische Untersuchung, vornnehmlich ihrer Herkunft und Sprache, nach gedruckten und ungedruckten Quellen,' 2 vols. 8vo, Halle, 1844-45, which received the prize of the French Institute; 'the Quinary and Vigesimal System all over the World,' 'Die quinare und vigesimale Zählmethode bei Völkern aller Welttheile. Nebst ausführlicheren Bemerkungen über die Zahlwörter Indo-germanischen Stammes und einem Anhang über Fingernamen,' 8vo, Halle, 1847; 'Origin of proper Names, and especially of Family Names,' 'Die Personennamen, insbesondere die Familiennamen und ihre Entstehungsarten, &c., Eine sprachliche Untersuchung,' 8vo, Leipzig, 1853 and 1859; 'Difference between the Races of Men, especially from a Philological Point of View,' 'Die Ungleichheit menschlichen Rassen, hauptsächlich vom sprachwissenschaftlichen Standpunkte,' &c., 8vo, Lemgo, 1856; 'Studies upon Greek Mythology,' 'Studien zur griechischen Mythologie,' 8vo, Leipzig, 1859, reprinted from the third 'Supplementbande der Jahrbücher für classische Philologie,' and 'Die Sprachverschiedenheit in Europa an den Zahlwörtern nachgewiesen sowie die quinare und vigesimale Zählmethode,' 8vo, Halle, 1868.

* **POUCHET, FÉLIX ARCHIMÈDE**, biologist, was born at Rouen, August 26, 1800. He studied at Rouen and Paris, taking his degree of M.D. in 1827. He then became the director of the Museum of Natural History at Rouen, one of the finest in France, and soon after professor of natural history. He has written several works and papers, the most noteworthy of which are those on ovulation in Mammalia, and on spontaneous generation. On the latter subject, Pouchet has been one of the most powerful opponents of the doctrines supported by Pasteur, one of the foremost of the party which maintains that all individuals have been derived from individuals previously existing. The particular form of heterogeny, or abiogenesis, supported by M. Pouchet, is that ovules may originate independently of a living being, by the application of the same forces upon organizable matter as concur to the formation of ovaries in organisms. This controversy has led to his publishing 'Hétérogénie, ou traité de la génération spontanée basé sur nouvelles expériences,' 8vo, Paris, 1859; 'Nouvelles expériences sur la génération spontanée et la résistance vitale,' 8vo, Paris, 1864, and numerous papers. Of his other publications, the more important are, 'Histoire des Sciences Naturelles au moyen âge,' 8vo, Paris, 1853; and 'Théorie positive de l'ovulation spontanée et de la fécondation des mammifères et de l'espèce humaine, basée sur l'observation de toute la série animale,' 8vo, with a 4to atlas, Paris, 1842. Besides the works mentioned, he has written others on fermentation, palæontology, botany, the physiology of mollusks, infusoria, and insects, and a volume entitled 'L'Univers,' intended to popularise science.

POWELL, THE REV. BADEN [E. C. vol. iv. col. 956], was the eldest son of the late Rev. Baden Powell, of Langton, in Kent, and was born at Stamford Hill, near London, August 22, 1796. In 1820 he entered into holy orders, and in the following year obtained the vicarage of Plumstead, in Kent. To the works enumerated in the memoir above cited, he added in 1859 a treatise entitled 'The Order of Nature considered with reference to the claims of Revelation,' and in the following year an essay 'On the Study and Evidences of Christianity,' which formed a part of the volume entitled 'Essays and Reviews.' The opinions expressed in these excited much criticism and some controversy. He died in London, 11th June, 1860.

POZZO, FATHER ANDREA, was born at Trent, in the Tyrol, November 30th, 1642; entered the Society of Jesus at the age of 23; became one of the most accomplished painters of his day; was regarded as a skilful architect, and especially celebrated for his knowledge of perspective. As a painter Pozzo was most noted for his extraordinary facility and fine colour, he being considered by contemporary critics to have united the qualities of Rubens with those of Titian and Correggio. His paintings are chiefly of a decorative character. The ceiling of S. Ignazio at Rome is his best-known painting, as the florid altarpiece in the same church is his best known architectural effort. Milizia describes this altar as the richest in Rome, perhaps in Europe, but still more extravagant than rich. Many of his frescoes

are at Turin, Genoa, Modena, and Arezzo. His celebrity for decorative work was so great that he was invited to Vienna by the Emperor of Austria. He had executed but a few works in Vienna, when his career was arrested by death, August 31st, 1709. Father Pozzo, who was an enthusiast in perspective, wrote a 'Trattato di Prospettiva de' Pittori ed Architetti,' 2 vols. folio, with many fine plates, Rome, 1693, which rapidly acquired celebrity as 'The Jesuit's Perspective,' and of which new and revised editions were issued in 1702 and 1764, and an English translation, 'Rules and Examples of Perspective, proper for Painters and Architects: in Latin and English. By John James,' with plates by Sturt, folio, London, 1693; new edition, 1707.

PREISLER, JOHANN MARTIN, a celebrated German engraver, was born at Nürnberg, March 14th, 1715. Of a family of engravers, he learned the rudiments of his art from his elder brother, George Martin Preissler (born 1700, died 1754), an engraver of considerable ability, but completed his studies under G. F. Schmidt. J. M. Preissler engraved with great neatness and precision the 'Madonna del Seggio' of Raffaele; 'Christ bearing the Cross,' by P. Veronese; and others, by Guido, Salvator Rosa, and other eminent masters; many plates of antique statues, and several contemporary portraits. He went to Copenhagen in 1744; was appointed professor of engraving, and engraver to the King of Denmark; was elected member of the Academy of Copenhagen; and died in that city, November 17th, 1794.

PRESCOTT, WILLIAM HICKLING [E. C. vol. iv. col. 963]. Mr. Prescott only lived to complete a third volume of his 'History of Philip the Second, King of Spain,' which appeared in 1859, and which brings the work down to the death of Philip's fourth wife, Anne of Austria, in 1580. He died suddenly at Boston, January 28, 1859; his unexpected death calling forth very general regret in England as well as in America, his writings being equally esteemed in both countries. A full and interesting 'Life of W. H. Prescott,' by his friend Mr. George Ticknor, was published in 1864.

PRESTEL, JOHANN GOTTLIEB, a German engraver, was born at Grünenbach, in Suabia, in 1739. He completed his studies at Vienna under Joseph Wagner. Prestel settled in Nürnberg, and there engraved above one hundred and forty prints, including several after Raffaele, Albert Dürer, and others of the great masters; but many of them are slight, being merely etchings finished in aquatint. Several of his engravings are from his own designs. He also painted some pictures. He died at Frankfurt in 1808. In many of his earlier plates he was assisted by his wife, **MARIA CATHARINE PRESTEL**; but in consequence of some disagreement they separated, and she came to England (1786), where she engraved landscapes in mingled etching and aquatint, after Gainsborough, Webber, and other English artists, as well as the old masters. She died in London in 1794. Her prints must not be confounded with those of her daughter Catherine, who engraved in a similar manner.

PREVITALI, ANDREA, an eminent Italian painter, was born at Bergamo in the last quarter of the 15th century. He was a scholar of Giovanni Bellini; painted many pictures for the churches of Bergamo, and was much esteemed as a portrait painter. An altar-piece at Borgo Sant' Antonio, dated 1506, is the earliest work known by him; one at San Spirito, of St. John the Baptist and other saints, is his most celebrated production. His works are not often met with in galleries. In the Berlin Museum is a picture of three female saints. The National Gallery possesses a 'Holy Family' (No. 695), which is marked by much quiet grace and nobleness of expression. Previtali died of the plague at Bergamo, November 7th, 1528.

PRÉVOST, LOUIS CONSTANT, geologist, was born at Paris, June 4, 1787. He was educated for the law; but his inclinations, stimulated by the teachings of Cuvier and Brongniart, led him to give his time and thought to geology and palæontology. He accounted for the association of freshwater shells with marine animal remains in the older tertiary beds of the Paris basin on the supposition that from time to time the swollen rivers carried down their charge of organic and inorganic matter far into a bay of the old ocean—a view which has been generally accepted in the cases where marine and freshwater species are intermingled in the same strata, or where there are frequent alternations of their beds containing some marine species only, and others freshwater or brackish-water species; but not in those where the changes are of greater magnitude, which changes are held to imply that the area was at one time submarine and another subaerial. He correlated the tertiary

of the Paris and Vienna basins, as also the secondary strata of the north of France, with those of Great Britain. He made a careful study of the extinct and active volcanic area of central France and Italy, as also of the temporary volcanoes of Graham's Island; and was led to advocate that, in all these cases, the cones were formed by the piling up of ejected matter, not by the protrusion of the solid ground. He demonstrated that, at every period of the world's history, volcanic action and the deposition of sediment have been proceeding contemporaneously; and drew up a chronological list of strata. He wrote a large number of papers; was a member of several societies, one of which, namely, the Geological Society of Paris, he helped to found; and was professor of geology at the Sorbonne from 1831 onwards. He died at Paris, August 16, 1856.

PRÉVOST-PARADOL, LUCIEN ANATOLE, a French journalist, politician, and historical writer, was born at Paris on the 8th of August, 1829, and was educated successively at the Collège Bourbon and the École Normale; at the former of which he carried off the first prize for French composition at the general competition of 1848, and the first prize for philosophy in 1849. He left the École Normale in 1851, and, devoting himself to literary pursuits, obtained the prize of eloquence offered by the Académie Française, for his 'Éloge de Bernardin de Saint-Pierre.' In August, 1855, he was admitted docteur-ès-lettres, on which occasion he exhibited a French essay, or *thèse*, afterwards published with the title of 'Elisabeth et Henri IV. (1585—1598). Ambassade du Hurlaut de Maisse en Angleterre, au Sujet de la Paix de Vervins,' 8vo, Paris, 1855, third edition, forming part of the 'Bibliothèque Contemporaine,' 12mo, Paris, 1863; and a Latin *thèse*, which he afterwards expanded and published as 'Jonathan Swift. Sa Vie et ses Œuvres,' 8vo, Paris, 1856. After holding for a year the appointment of professor at the Faculté des Lettres, Aix, M. Prévost-Paradol entered upon the more congenial duties of a journalist, by accepting, towards the end of 1856, the principal editorship of the 'Journal des Débats,' of which he continued almost to the last a faithful collaborateur—writing chiefly the leading articles, the premiers-Paris—with the exception of a few months in 1860, when he temporarily associated himself with the 'Presse.' In fact, his anti-imperial advocacy of a responsible ministry, and a proposal to confer the power of initiating laws on the Chamber, which had at once brought upon him a warning from M. de Persigny, had been systematically followed by other attacks and other warnings, until, in order to save the 'Débats' from suspension, the temporary secession, at least, of M. Prévost-Paradol became a necessity. The censorship, which seemed to discover treason against the system of personal government in everything he wrote, even in the discussion of topics of purely literary significance, kept a jealous watch over every organ of public opinion to which he contributed; and especially on the 'Courrier du Dimanche,' which, after a series of constant checks and annoyances, was suppressed on the 2nd of August, 1866, for an article more than usually obnoxious to the Imperial Government. Prévost-Paradol's manner of attack was allusive and collateral, rather than direct or violent. He was keen and brilliant in his irony, stabbing the imperial pretensions by reducing them to an absurdity, and treating them rather as matter for ridicule than as worthy of serious discussion. There was no subject, whether of ancient or modern times, which, in revolving through his mind, did not radiate a light, sparkling, and blighting condemnation. M. Prévost-Paradol was twice an unsuccessful candidate for a seat in the Chamber of Deputies—once, in 1863, for the sixth electoral circumscription of Paris, and again for the second circumscription of the Seine Inférieure in 1869. He was more fortunate with the Académie Française, of which he was elected a member on the 6th of April, 1865, in succession to M. Ampère, by a majority of three votes over his colleague of the 'Débats,' M. Jules Janin; and his public reception, by M. Guizot, took place on the 8th of March, 1866. Heartily but discriminatingly admiring the institutions of England, he had a singular command over the language of his country, in which language he delivered, in November, 1869, two lectures before the members of the Edinburgh Philosophical Institution, on the 'Social State of France,' immediately afterwards published as 'France,' &c., 8vo, Edinburgh, 1869; and in which for a considerable period he contributed to the 'Times' a weekly review of French politics, in the character of "A Parisian Correspondent." The time at length came when he believed that the Empire had separated itself from the past, and had frankly and fully adopted the principle of parliamentary government—of "an executive," as he defined it, "submitting in good faith

to a parliament elected by fair means"—of which, through many years of sore discouragement, he had been the persistent advocate. In the early days of January, 1870, he consented to serve the Emperor; and, although a single month was sufficient to modify his confidence in the hearty liberalism of the renovated Empire, and the feeling of misgiving was only strengthened by the course of events, he yet, in circumstances of peculiar difficulty and delicacy, and undeterred by the angry recriminations of former friends and political allies, elected to carry out the compact with Napoleon III., by which he had accepted the post of envoy to Washington. Early in July he sailed for the United States, and, on the very day on which he landed in America, war was declared against Prussia; and although, coinciding generally with M. Thiers, he held that a struggle for pre-eminence with Prussia was not only inevitable, but desirable, for France, he had always regarded an antecedent liberalism as a necessary condition of the undertaking, and now probably regarded the pretext and the time as ill chosen, and the enterprise as full of peril. It was his mortification to find himself, in the words of the "French Correspondent" who succeeded to his connection with the 'Times,' "far away, holding a post of empty honour, without real power, tongue-tied, pen-bound, the official servant and representative of Napoleon III. In an evil hour he had cast in his lot with the man who was about, perhaps, to bring defeat on France, or, if victory was hers, with the restorer of triumphant Cæsarism. He would either be buried under the ruins of that Empire which he had so long and so gloriously opposed, or he would go down to posterity as the accomplice of those who had used war as a means for defeating liberty. The thought must have been intolerable." The extreme heat of the weather affected his bodily health, and assisted in overturning the equilibrium of his mind; so that on the 20th of July, 1870, five days after his arrival in America, he committed suicide by shooting himself. His remains were embalmed, forwarded to New York, and placed on board the French steamer 'Lafayette'—which had carried him to America—for Brest, from which they were conveyed to Paris, and interred at the church of Notre Dame de la Lorette, on the 8th of August.

The works of M. Prévost-Paradol include, 'Revue de l'Histoire universelle,' 8vo, Paris, 1854, new edition, 2 vols. 18mo, Paris, 1865; 'De l'Impiété systématique,' 8vo, Paris, 1855; 'Du Rôle de la Famille dans l'Éducation,' 8vo, Paris, 1857, which obtained the prize of the Académie des Sciences Morales; 'De la Liberté des Cultes en France,' 8vo, Paris, 1858, first published in the 'Revue des Deux Mondes'; 'Essais de Politique et de Littérature,' 3 vols. 8vo, Paris, 1859—63, and 3 vols. 12mo, 1863, a collection of articles contributed to the 'Journal des Débats'; 'Les Anciens Partis,' 12mo, Paris, 1860, a brochure which was seized, and the author condemned to a month's imprisonment, and a fine of a thousand francs; 'Du Gouvernement parlementaire. Le Décret du 24 Novembre,' 8vo, Paris, 1861; 'Les Elections de 1863,' 8vo, Paris, 1863; 'Études sur les Moralistes français,' &c., 12mo, Paris, first two editions, 1865; 'Quelques Pages d'Histoire contemporaine. Lettres politiques,' 4 vols. 12mo, Paris, 1862—66, a collection of letters contributed to the 'Courrier du Dimanche'; and 'La France Nouvelle,' 8vo, Paris, 1868, a work which excited uncommon attention.

PRÉVOST, ZACHÉE, French engraver, was born at Paris, June 21st, 1797. He was a scholar of Regnaud and of Berwic, and published on his own account some vignettes, after various masters, in 1822. His first important picture was the 'Corinne' of Girard, which obtained a medal at the Exposition of 1827. M. Prévost engraved a large number of plates after the old masters and the principal modern French painters. His two great prints are 'Jesus in the House of Simon,' 1857, and the 'Wedding at Cana,' after the famous pictures in the Louvre by Paolo Veronese. M. Prévost's manner was peculiar, but effective. Except in his largest works, he made more use than usual of etching, reserving the graver for the heads and more important parts. In his slighter manner were executed the 'Improvisateur,' and other plates, after Leopold Robert, which were far more popular than his more elaborate productions. M. Prévost obtained a medal of the first class in 1839, and the cross of the Legion of Honour in 1852. He died March 27th, 1861.

PRICE, STERLING, general in the American Confederate army, was born in Prince Edward County, Virginia, in September, 1809. He settled as a young farmer in the State of Missouri; became a member of the State Legislature, and in 1844 entered Congress. When the Mexican war broke out, soon afterwards, he resigned his seat in Congress, raised a regiment of volunteer cavalry, put himself at the head of it, and joined the United

States army at Fort Leavenworth. On one occasion, with only 300 men, he besieged Taos, and compelled its garrison of 1300 men to surrender. For his services he was made brigadier-general, and military governor of Chihuahua. On the termination of the war in 1847, he returned home; engaged again in political life, and was in 1853 elected governor of Missouri by the Democratic party. In 1857 he was one of the Bank Commissioners for that State. When the civil war commenced in 1861, he was one of the delegates selected to meet in convention to decide whether the State of Missouri should throw in its lot with the North or the South; he became president of the convention, and his influence joined with that of others to adopt the latter course. As major-general of the Missouri forces, he concerted plans with other confederate leaders; and after retiring before the Federals at St. Louis, Booneville, and Carthage, he collected from various quarters a force of 10,000 men near the Arkansas. Joined by General McCulloch with another force of 5000 men, he advanced on August 7th against a Federal army under Generals Lyon and Sigel: Lyon was killed, and Sigel was defeated with great loss. A disagreement between Price and McCulloch interfered for a time with the proceedings of both; this was the means of allowing the Federals to gain a hold in the Missouri State, which they never afterwards lost. Price, it is true, advanced with his own force, and defeated the Federals at Lexington on the 16th of September; but the victory was barren of results. In a later phase of the war he was commander of a division at Corinth. In the latter part of 1864 he made another attempt to wrest Missouri from the Federals, but without success. On the conclusion of the war in 1865, he went to Mexico, and obtained a post in the Government Board of Immigration. He returned to the United States two years afterwards, with health and fortune shattered; and died at St. Louis, September 27th, 1867.

PRIM, JUAN, Marquis de los Castillejos, Count de Reuss, Viscount del Brueusch, a field-marshal and grandee of Spain, son of Pablo Prim, a colonel of infantry, was born at Reuss, in Catalonia, on the 6th of December, 1814. Very early in life he bore arms as a cadet in the Spanish service; and on the breaking out of the war of succession, which followed the death of Ferdinand VII. (September 29th, 1833), identified himself with the interests of the Queen Isabella, at that time not quite three years old. His skill and valour procured for him various military distinctions; and, having been promoted in his 22nd year to the command of a company, he attained, three years later, the rank of colonel. The peace of Bergara put an end to the civil war in 1839; and Prim, throwing himself into political life, displayed much zeal and capacity as a deputy in several parliaments, and as an organiser of political clubs. After the termination of the regency of Queen Christina, October 12th, 1840, and her retirement to France, Prim associated himself with the Progresistas in their opposition to Espartero, who, on the 8th of May, 1841, assumed the Regency. In 1842, Prim took refuge in France from the consequences of a suspected complicity with the insurrection at Saragoza; and, attaching himself to Queen Christina, participated in the measures concocted for her restoration. The amnesty of 1843 permitted his return to Spain; and he took his seat in the Cortes as deputy for Tarragona. He played a prominent part in the insurrectionary movements which resulted in the overthrow of Espartero; as a sequence to which event he was raised to the rank of brigadier-general, was made Governor of Madrid, and created Count de Reuss. In May, 1844, Narvaez was named President of the Council; and Prim, who had incurred disgrace with the Queen for the dilatoriness of his military measures against the revolt in Catalonia, was accused, November, 1844, of being a member of a conspiracy for the assassination of Narvaez, convicted, and sentenced to six years' seclusion in a fortress; but this sentence was revoked by the Queen. He was liberated on the 24th January, 1845, and he took up his residence at Madrid. Later in the year he proceeded to France, where, and in Spain, he passed several years of ostensible retirement from public life. In 1853, at the breaking out of the war with Russia, he joined the Turkish army on the Danube, and was present at the battles of Oltenitza and Silistria; and being named Spanish military commissioner to the camp of the Allies, took part in the earlier affairs of the Crimea. On his return from the East, of his experience in which he published an account, he passed through Paris, where, in 1856, he married a Mexican lady of large fortune, the Señora Echevarria. In 1856, he was rewarded for his support of the O'Donnell ministry by being promoted to the rank of lieutenant-general; and, in 1858, was raised to the Senate, having been,

BIOG. DIV.—SUP.

in 1857, the only member of the Progresista party returned to the Cortes. In October, 1859, war was declared by Spain against Morocco, and Prim was appointed to the command of the division of reserve. In this capacity he advanced his previous reputation by a variety of exploits, of which the most notable was his heroically courageous rallying of the fugitive regiment of Cordova, which had the effect of deciding favourably to the Spanish arms the Battle of Castillejos, January 1st, 1860. For his conduct in this critical position, Prim was rewarded with the title of Marquis de los Castillejos, and the rank of a grandee of Spain. The Moors were decisively defeated at Guadel-Ras, on the 23rd of March following, and a treaty of peace was soon afterwards concluded. In the following year, 1861, General Prim was appointed to the command of the Spanish contingent—being charged at the same time with the duties of a minister plenipotentiary—in the joint expedition undertaken against Mexico by France, England, and Spain, from which the troops of the last two powers presently retired. Having withdrawn his troops to the Island of Cuba, and personally paid a visit to New York, Prim returned to Spain in July, 1862. He now gave all his influence to advance the interests of the Progresistas, and accepted the presidency of many of their committees. In January, 1866, he placed himself at the head of several revolted regiments which made demonstrations against the government of O'Donnell; but the insurrection was suppressed, and Prim, having made good his retreat, with the bulk of his followers, into Portugal, afterwards repaired to London, where for several months he remained in comparative seclusion. The organisation of a counter-movement afforded him the opportunity of returning to Spain; and, after some fluctuations of fortune, he finally succeeded, September 29th, 1868, in driving Queen Isabella from the throne, for which, as minister of war, and the ruling spirit of the provisional government, he laboured for more than two years to find a suitable and willing candidate. The Spanish crown was at length definitely accepted by the Duke of Aosta, second son of the King of Italy, who landed at Carthagena on the 30th of December, 1870. On the evening of the same day, Marshal Prim died of wounds which he had received on the evening of the 28th, having been shot by six assassins as he was proceeding in his carriage along the Calle Alcalá, on his way from the Cortes to the Ministry of War. He lay in state in the Church of Atocha; and thither the youthful sovereign, Amadeus I., who had never seen him alive, proceeded immediately after his arrival at Madrid, January 2nd, 1871, to pay homage to the remains of the king-maker, with biographies of whom, a few months after his death, Madrid was said to be "inundated."

Prim was a man considerably below the middle height, with a small and slender, but apparently wiry and extremely active frame, a bright, lively, and intelligent countenance, with a very bad complexion, the visible result of a liver complaint from which he was known to suffer. His eyes were large and expressive, and his features tolerably regular, with no other marked peculiarity than the high cheek-bones. His manners were courteous and winning; he was fluent in discourse, and expressed himself forcibly, and not inelegantly, both in his native language and in French.

PROUDHON, PIERRE JOSEPH, a French socialist and political writer, was born on the 15th of July, 1809, at Besançon; and, as the eldest of the five children of a cooper in poor circumstances, was at first designed to follow the trade of his father. Being assisted, however, with the means of acquiring an elementary education, by friends who were attracted by his talents, he was able to commence his career as a compositor in a printing-office. Whilst employed in this printing-office, which he afterwards occupied on his own account, he recommended himself by his production of an 'Essai de Grammaire générale' to the Académie of Besançon, which awarded him (1838) the triennial prize of 1500 francs, founded by Madame Suard. He now repaired to Paris, where he spent some time, occupying himself in philosophical, philological, and theological studies, and contributing a number of articles to the 'Encyclopédie Catholique.' In 1839 he entered into competition for a prize offered by the Académie of Besançon on the keeping of the Lord's Day; but as his essay contained views on social matters which the Académie could not countenance, Proudhon himself undertook the responsibility of publishing it, with the title 'De la Célébration du Dimanche, considérée sous les Rapports de l'Hygiène publique, de la Morale, des Relations de Famille et de Cité,' 12mo, Besançon, 1840, fourth edition, 12mo, Paris, 1850. It was under the same conditions that he produced, in 1840, his famous memoir, entitled,

'Qu'est-ce que la Propriété? ou, Recherches sur le Principe du Droit et du Gouvernement,' 2 vols. 12mo, 1840—41, new editions, 1848, 1850, &c., in which he affirmed, as an answer to the interrogative title, the monstrous proposition that 'La Propriété, c'est le Vol,' a formula in which the various notions of the author may, for practical purposes, be regarded as epitomized. The impression produced by the treatise on Property was renewed from time to time by subsequent works, including a volume entitled 'De la Création de l'Ordre dans l'Humanité: ou, Principes d'Organisation politique,' 12mo, Paris, 1843, second edition, 1848; 'Système des Contradictions économiques: ou, Philosophie de la Misère,' 2 vols. 8vo. Paris, 1846, second edition, 2 vols. 12mo, 1849; and two *livraisons* of a work intended to be completed in about twenty, but the publication of which was interrupted by the Revolution of February, 1848, entitled 'Solution du Problème Social,' 8vo, Paris, 1848. A year of revolution would naturally favour the production of social and economical theories, and Proudhon published his 'Le Droit au Travail et le Droit de Propriété,' 12mo, Paris, 1848; 'Résumé de la Question Sociale, Banque d'Échange,' 12mo, Paris, 1848; 'Organisation du Crédit et de la Circulation, et Solution du Problème social, sans Impôt, sans Emprunt,' &c., 8vo, Paris, 1848, second edition, 1849; and a 'Proposition relative à l'Impôt sur le Revenu, présentée le 11 Juillet, 1848, par le Citoyen Proudhon; suivie du Discours qu'il a prononcé à l'Assemblée Nationale, le 31 Juillet, 1848,' 12mo, Paris, 1848, the latter of which was regarded as an odious attack on the principles of public morals. A little more than a month previous to the delivery of this speech he had been elected to the National Assembly as representative for the Department of the Seine; but his various eccentricities made his parliamentary life a failure, and he fell back for influence upon the pen. On the 1st of April, 1848, he had undertaken the editorship of a daily journal called 'Le Représentant du Peuple,' which was suspended in the following August; after which he edited 'La Peuple,' from the 23rd November, 1848, to April, 1849; 'Le Voix du Peuple,' from the 1st of October, 1849, to the 16th of May, 1850; and 'Le Peuple de 1850,' from the 15th of June to the 13th of October, 1850. All of these short-lived organs of obnoxious opinion were in turn condemned and suppressed; and his establishment of a "Banque du Peuple," in 1849, was not more successful. Upon his release, in 1852, from a lengthened term of imprisonment, to which he had been condemned three years before, he married, and retired into private life, devoting himself to the dissemination of his theories in books and pamphlets until his death on the 20th of January, 1865.

The most remarkable of his works, besides those already mentioned, are 'Les Confessions d'un Révolutionnaire, pour servir à l'Histoire de la Révolution de Février,' 12mo, Paris, 1849; 'La Révolution sociale, démontree par le Coup d'État du 2 Décembre,' first six editions, 1852; 'Manuel du Spéculateur à la Bourse,' 12mo, Paris, 1853, fifth edition, enlarged, 1857, German translation, 8vo, Zurich, 1857; 'De la Justice dans la Révolution, et dans l'Église. Nouveaux Principes de Philosophie pratique,' &c., 3 vols. 12mo, Paris, 1858, which was seized, and the author condemned to a fine and a short imprisonment; 'Théorie de l'Impôt,' 12mo, Paris, 1861; 'Les Majorats littéraires,' 12mo, Brussels, 1862; 'Les Démocrates assermentés et les Réfractaires,' 12mo, Paris, 1863; 'De la Capacité politique des Classes ouvrières,' 12mo, Paris; 'La Bible annotée. 1. Les Evangiles,' 12mo, Paris, 1865, which was seized as being hostile to religion, and the publishers condemned by a judgment. A number of Proudhon's works, published since his death, assume the form of instalments of a complete issue of his 'Œuvres Posthumes.'

PURKINJE, JAN EVANGELISTA, physiologist, was born at Libochowitz, near Leitmeritz, in Bohemia, December 17, 1787. He pursued his medical studies at Prague, and in 1819 he became the assistant professor of anatomy and physiology. He was professor of pathology and physiology at Breslau from 1823 to 1849, when he returned to Prague, where he resided till his death, July 28, 1860. Purkinje was one of the most eminent physiologists of his time. His most important researches were on embryology, physiological optics, and vibratile cilia, which he and Valentin discovered to be very general on the moist mucous

membrane of the vertebrate animals, the prevalent idea having been that they were almost restricted to the invertebrates. Purkinje also wrote somewhat extensively on the Slavic language and literature.

* PYAT, FELIX, a French journalist, dramatic author, and politician, was born on the 4th of October, 1810, at Vierzon, in the department of Cher; and, after having gone through his preliminary studies with distinction, proceeded to Paris, where he devoted himself to law, and was called to the bar in 1831. Although bred a royalist by his father, who was an advocate, Pyat, even whilst a law-student, had prominently signalled his republican sympathies; and he speedily vacated his hopes of professional advancement as a lawyer for the sake of the greater political liberty to be enjoyed as a journalist and dramatic writer. In 1833 he undertook the direction of the *feuilleton* department of the 'Siècle'; and from 1835 to 1841 shared in the editorial management of the 'National.' For an attack on M. Jules Janin, in 'La Reforme' of the 4th of January, 1844, he was sentenced to six months imprisonment; and after an interval, during which his most remarkable productions were of the dramatic order, he was brought into prominence by the events of February, 1848, as one of the *commissaires généraux* of his department of Cher, by which he was also returned as a representative to the Constituent Assembly, where he identified himself with the party known as the Mountain, and frequently spoke in advocacy of their opinions. After the abortive attempt at insurrection in Paris and elsewhere, and at establishing a Montagnard convention *en permanence* at the Conservatoire des Arts et Métiers in June, 1849, M. Félix Pyat, who had co-operated with Ledru Rollin in this movement, took refuge successively in Switzerland and Belgium, and during his exile produced his 'Loisirs d'un Proscrit,' 2 vols. 16mo, Paris, 1851. Afterwards he repaired to Jersey, which he was obliged to quit in 1855, in consequence of an insolent letter, signed by himself and M.M. Rouger and Jourdain, as the "Committee of the Revolutionary Commune," and addressed to Queen Victoria, who had just before returned the visit which the Emperor of the French had paid to England in the April of that year. Against his expulsion M. Victor Hugo and others protested in a declaration dated October 17th, 1855, an English translation of which, as well as of the offensive letter, was published as 'The Letter of the Jersey Exiles to the Queen of England. To which is added the Declaration of M. Victor Hugo and others,' 4to, London, 1855. In 1858, being then in England, he created some scandal and rendered himself obnoxious to legal proceedings before an English court—which resulted, however, in his dismissal—by the publication of a *brochure* which was charged with being an apology for the attempted assassination of the Emperor of the French on the 14th of January of that year; and the same *animus* betrayed him, about twelve years after, into the offer of a reward, to the extent of the whole of his "modest fortune" to any one who would summarily deliver France from the rule of Napoleon III. He spent several years in London, devoting himself to journalistic and other literature; and returned to France in virtue of the amnesty granted to political offenders in honour of the centenary of the birth of the Emperor Napoleon I. He soon transgressed so violently, however, in his writings in the 'Rappel' and elsewhere, that he again found it advisable to repair to London; from which he was summoned to Paris by the political movements which preceded the military disasters of France in the war against Prussia. On the 20th of September, 1870, he issued a wild manifesto in advocacy of a war of races, in which he proposed a coalition against the Teutonic race of the Latin peoples—French, Italians, and Spaniards. An ardent member of the Commune, M. Félix Pyat advocated in successive journals at once a war of extirpation against the enemies of France, and of opposition to the moderate Republic sanctioned by the Assembly at Versailles. During the time that the Commune held the fortunes of Paris in its hands, M. Pyat was a member of its government; but contrived to escape after the triumph of the Versailles troops, and is now, October, 1871, said, with considerable probability, to be in England.

PYNE, JAMES B., landscape-painter [E. C. vol. iv. col. 1022], died after a long and lingering illness on the 29th of July, 1870, in his 70th year.

Q

QUAIN, JONES, anatomist [E. C. vol. iv., col. 1034], died, January 31, 1865.

* QUATREFAGES DE BRÉAU, JEAN LOUIS ARMAND DE, zoologist, was born at Berthezene, near Valleraugue, in the department of Gard, February 10, 1810. From the college of Tournon he proceeded to Strasbourg, where he took the degree of doctor of mathematics in 1830, of medicine in 1832, and of natural science in 1840. His career as a naturalist, however, commenced long before he acquired his degrees, for very soon after he went to Strasbourg in 1827 he was appointed to assist the professor in physics and chemistry, and he also assisted Duvernoy in comparative anatomy, by preparing his diagrams. His first important papers were on the embryology of *Lymnaea*, *Planorbis*, and *Anodon*, written in 1834 and 1835. In 1835 he took a prominent share in the scientific congress held at Toulouse, and in 1838 was selected to lecture on zoology at the college of that town, but resigned in 1840, and went to Paris. Here he supported himself by writing for the 'Revue des Deux Mondes,' the proprietors of which paid the expenses incurred by him while travelling, in order to collect the materials for a series of papers entitled 'Souvenirs d'un Naturaliste,' afterwards collected into a book with the same title, forming 2 vols. 8vo, 1854, and which is one of his most popular productions. An English translation appeared in 1857. In 1850 he began a course of natural history at the Napoléon Lyceum, Paris, and in 1852 was appointed the professor; but in 1855 he resigned this post on becoming the professor of anthropology at the Museum of Natural History. He is a member of numerous societies both in France and other countries, and in August, 1863, was nominated an officer of the Legion of Honour. Although he takes high rank as a scientific observer, a large share of his writings has been devoted to the popularising of science. He has contributed largely to our knowledge of annelids, on which subject he is a leading authority, the diseases of silkworms, and embryology. Besides a great number of articles, and the works already mentioned, he has written, 'Unité de l'espèce humaine,' 12mo, Paris, 1861; 'Études sur les maladies actuelles des vers à soie,' 4to, 1859; 'Nouvelles recherches faites en 1859 sur les maladies actuelles du ver à soie,' 4to, 1860; 'Fertilité et culture de l'eau,' 8vo, 1862; 'Physiologie comparée. Métamorphoses de l'homme et des animaux,' 12mo, 1862; 'Histoire naturelle des annélés marins et d'eau douce,' 2 vols. 8vo, 1865; 'Les Polynésiens et leurs migrations,' 4to, 1866; 'Rapport sur les progrès de l'anthropologie,' 8vo, 1867; and 'Histoire naturelle générale,' 8vo, 1869.

QUATREMÈRE, ÉTIENNE MARC, a distinguished French Orientalist, was born on the 12th of July, 1782, at Paris, where his father, who was engaged in commercial pursuits, and who was elected to a municipal office in 1789, was guillotined in 1794. His earlier education was preparatory to the course of the École Polytechnique; but, being attracted to the study of the Oriental languages, he attended the Arabic lectures of Silvestre de Sacy, and also devoted himself, for the most part without assistance, to the acquisition of Hebrew, Chaldee, Coptic, Syriac, Persian, Turkish, and Armenian. In 1807 he was appointed to the charge of the MSS. at the Bibliothèque Impériale; and in the following year produced a work in demonstration of the fact that the modern Coptic is the direct descendant and representative of the language of the ancient Egyptians. This work, by which he at once became famous, and the discovery contained in which has been of great utility in the deciphering of hieroglyphic inscriptions, he entitled 'Recherches critiques et historiques sur la Langue et la Littérature de l'Égypte,' 8vo, Paris, 1808. This was speedily followed by two other works on the history and geography of Egypt, entitled respectively 'Mémoires géographiques et historiques sur l'Égypte et sur quelques Contrées voisines. Recueillis et extraits de Manuscrits Cophtes, Arabes, &c., de la Bibliothèque Royale,' 2 vols. 8vo, Paris, 1810; and 'Observations sur quelques Points de la Géographie de l'Égypte, pour servir de Supplément aux Mémoires historiques et géographiques sur l'Égypte,' &c., 8vo, Paris, 1812. In 1809 he became professor of Greek literature at the Académie de Rouen; was admitted, in 1815, to the membership of the Académie des Inscriptions et Belles-Lettres; in 1819 was ap-

pointed professor of the Hebrew, Chaldee, and Syriac languages and literature at the Collège de France, and in 1827 professor of Persian at the École des Langues orientales vivantes. He was made a member of the Société Asiatique in 1828; and in 1829 a member of the Legion of Honour. He died at Paris, on the 18th of September, 1857.

Many of the works of M. Quatremère, which are of great learning and value, and which the fulness of more recent investigation has not yet superseded, were at first furnished to periodical literature, and as contributions to the Transactions of learned societies. The principal of his substantive works, in addition to those which have been already mentioned, are, 'Chrestomathie en Turc oriental,' &c., 8vo, Paris, 1842; 'Histoire des Sultans mamlouchs de l'Égypte, écrite en arabe, par Takin Eddin Ahmed-Makrizi, traduite en français et accompagnée de Notes philologiques, historiques, géographiques,' &c., 2 vols. 4to, Paris, 1837—41; and 'Mélanges d'Histoire et de Philologie orientale,' 8vo, Paris, 1861.

QUEKETT, JOHN THOMAS, was born at Langport in Somersetshire in 1815. He was educated at Langport Grammar School, of which his father was head master. Being destined for the medical profession, he was apprenticed to his brother Edwin, then lecturer on botany at the London Hospital, where he pursued his medical studies. In June, 1840, he obtained by competition the appointment of student of human and comparative anatomy in the Museum of the College of Surgeons, where at the expiration of his term he became assistant curator. In this museum he had abundant opportunity of gratifying his taste for microscopical research; and here too he made that fine collection of specimens of the tissues of plants and animals and injections, which afterwards formed the illustrations of his lectures when in 1844 he was appointed by the council to explain the methods and resources of microscopical study. When Professor Owen retired in 1856, Quekett was appointed conservator of the Hunterian Museum and professor of histology. In 1848 he published his well-known treatise on the microscope. He was one of the founders of the Microscopical Society, and acted as its honorary secretary during nineteen years, until he became president in 1860. He contributed many papers to its Transactions. He also prepared the 'Descriptive and Illustrated Catalogue of the Histological Series contained in the Museum of the Royal College of Surgeons of England,' of which the first volume appeared in 1850, and the second in 1855. He also published, 1852—4, two volumes of 'Lectures on Histology.' He died 20th of August, 1861. He was a fellow of the Linnean Society, and was elected into the Royal Society the year before his death.

QUÉRARD, JOSEPH-MARIE, a celebrated French bibliographer, was born on the 25th of December, 1797, at Rennes, the capital of the department of Ile-et-Vilaine; and, after receiving a slender education in the school of his native town, was placed in 1807 in the book-trade, and thenceforward began to develop a liking for books which grew into a life-long passion. In 1812 he repaired to Paris; which he quitted in 1819 to enter upon a five years' connection with a firm in Vienna, where he devoted his spare time and energy to the preparation of a bibliographical work, for the publication of which he returned to Paris, and which bore the title of 'La France littéraire: ou, Dictionnaire bibliographique des Savants, Historiens, et Gens de Lettres de la France, ainsi que des Littérateurs étrangers qui ont écrit en français, plus particulièrement pendant les XVIII^e. et XIX^e. Siècles,' &c., 10 vols. 8vo, Paris, 1827—39. He resumed the main title of this work for two volumes which he published several years afterwards as 'La France littéraire. Corrections. Additions. Auteurs, pseudonymes et anonymes dévoilés,' with a second title of 'Les Écrivains pseudonymes et autres Mystificateurs de la Littérature française pendant les quatre derniers Siècles, restitués à leurs véritables Noms,' 2 vols. 8vo, Paris, 1854—64. A work which may be regarded as complementary to 'La France littéraire,' was entitled 'La Littérature française contemporaine au XIX^e. Siècle,' 6 vols. 8vo, Paris, 1842—57, in which, after conducting it to page 282 of the second volume, M. Quérard was adjudged by arbitration, June, 1844, to have forfeited his rights of authorship, on the ground, *inter alia*, that the length of the biographies would have enlarged the

work beyond the three volumes promised in the prospectus. Henceforth Quérard was constantly at feud with M. F. Daguin, the publisher, and MM. Charles Louandre, Maury, and Félix Bourquelot, the continuators of his work. The immediate result of the adverse judgment, however, was an imprisonment of some months' duration on account of pecuniary obligations which he had lost the power of meeting, and from which the annual allowance of a thousand francs which he received from the minister of public instruction, was insufficient to extricate him, even when supplemented by the subsidies of his "Mæcenas," M. Serge Poltoratzky of Moscow, the patron of the various publications in which he engaged up to the year 1854. It was in connection with this gentleman that he attempted to found a journal with the idea of elevating the literature of bibliography, of which only one number was published, entitled 'Le Bibliothécaire. Archives d'Histoire littéraire de Biographie, de Bibliologie, et de Bibliographie,' &c., 8vo, Paris, 1844. In the following year M. Quérard produced a small work entitled 'Les Auteurs déguisés de la Littérature française au XIX^e Siècle,' &c., 8vo, Paris, 1845, the merit or value of which was presently absorbed by a larger work, of which it was in fact a specimen, entitled 'Les Supercheries littéraires dévoilées. Galerie des Auteurs apocryphes, supposés, déguisés, plagiaires, et des Editeurs infidèles de la Littérature française pendant les quatre derniers Siècles,' &c., 5 vols. 8vo, Paris, 1845-60, a second edition of which, commenced by the author in the year of his death, was afterwards produced under the joint care of MM. G. Brunet and P. Jannet, in 8vo, Paris, 1869, &c. Having failed in 1850 to procure an adequate number of subscribers for a vast work of which he issued a prospectus, 'Encyclopédie du Bibliothécaire,' M. Quérard was more successful in founding a bibliographical journal, which he entitled, after his own name, 'Le Quérard. Archives d'Histoire littéraire de Biographie et de Bibliographie française. Complément périodique de la France littéraire,' 2 vols. 8vo, Paris, 1855-56, which, although handsomely subscribed by the literary public of Europe and America, collapsed before a conviction obtained against the editor in a suit instituted by M. de Saint-Albin. The publication of several works followed, as it had also preceded, this venture, many of which were extracts or adaptations from his larger productions, and the particular titles of which it would be of little interest to record; and he also produced brochures in bibliographical controversy, characterised by the bitterness of disappointment at the want of public patronage and of state recognition. He received the decoration of the Legion of Honour in August, 1865, and died at Paris on the 3rd of December following.

QUERCIA, JACOPO DELLA, one of the earliest of the great Italian sculptors of the Revival, was born near Siena about 1374. Till towards the close of his life, Della Quercia worked chiefly in Lucca, Bologna, and Florence. He studied more directly from nature than his predecessors, and was one of the first among modern sculptors who was really successful in rilievo. In Lucca he executed a mausoleum for the wife of Paolo Guinigi, in the church of San Martino, which was greatly admired, and of which some of the rilievi are now in the gallery of Florence; also a magnificent marble altar for the church of S. Friano. At Bologna his principal work was the great doorway of the church of S. Petronio. On this, which was in marble, and decorated with rilievi from the Old Testament, statues of the Virgin and Child, S. Petronio, &c., Della Quercia was engaged for twelve years, and it was thought to surpass any previous work of the kind. On its completion he went to Florence, where he carved the Assumption of the Virgin above the doorway of Sta. Maria del Fiore. Returning to his native place he was employed to erect the great fountain on the piazza of Siena, a magnificent work (now ruinous), in the centre of which he placed a figure of the Virgin surrounded by the Cardinal Virtues, and on the base rilievi of subjects from the Scriptures. Thenceforward the artist lived in honour in Siena, designated by his fellow-citizens *Jacopo Della Fonte*, in testimony of the great work with which he had adorned the city. He died at Siena in 1442.

QUESNOY, FRANÇOIS DU. [DUQUESNOY, FRANÇOIS, E. C. S. col. 492.]

* QUETELET, LAMBERT ADOLPHE JACQUES, was born at Ghent, 22nd February, 1796. He studied at the Lyceum of that place, to which, in 1814, he became professor of mathematics. He was the first who graduated as doctor of science

in the university then lately established at Ghent. In 1819 he was advanced to the chair of mathematics at the Athenæum of Brussels. Some time after this he was sent by King William I. to Paris for the purpose of studying astronomy, and on his return in 1826 he was appointed to superintend the construction of the Royal Observatory of Brussels, of which he became director in 1828, and he was appointed professor of astronomy in 1836.

Quetelet is known for the pleasant popular style in which he treats of a great variety of scientific subjects, such as astronomy, physics, meteorology, terrestrial magnetism, the theory of probabilities, various problems connected with social science, and biography; and he even indulges the taste of a cultivated mind in writing original poetry. He is member of various learned societies, including the Royal Society of London.

* QUINET, EDGAR, a French author, poet, and politician, was born at Bourg, the capital of the department of Ain, on the 17th of February, 1803. He completed his education at the University of Heidelberg; and after his return to his native country, published a translation, with an introduction, of Herder's work on the Philosophical History of Mankind, under the title of 'Idées sur la Philosophie de l'Histoire de l'Humanité,' 3 vols. 8vo, Paris, 1827. He was appointed a member of the scientific commission which proceeded to the Morea, in 1828; and whilst in Greece prepared the materials for his work entitled 'De la Grèce moderne et des Rapports avec l'Antiquité,' 8vo, Paris, 1830. He contributed largely to periodical literature, especially to the 'Revue des Deux Mondes,' to which he supplied numerous articles on questions of poetical, critical, philosophical, religious, and political interest, amongst the most remarkable of which was a poem afterwards issued separately with the title of 'Ahasverus,' 8vo, Paris, 1833, which promptly obtained a place in the Roman *index expurgatorius*. He was made a member of the Legion of Honour in 1838, and acted as professor of foreign literature to the faculty of letters at Lyons from 1839 to 1842; and in the latter year was appointed to the chair of the languages and literature of Southern Europe, then newly instituted in the Collège de France, and which he converted into a propaganda of revolutionary principles until his deprivation in 1846. He now made a tour in Spain, of which the literary result was a work in thirteen *livraisons*, entitled 'Mes Vacances en Espagne,' 8vo, Paris, 1846. Long identified with the extreme liberals, he was an active partisan of the Revolution of February, 1848, and actually assumed military command as colonel of the 11th Legion; and in the elections which followed, was returned as a member of the Assemblée Constituante, in which capacity, as well as the subsequent one of member of the Législative, he ranged himself along with the extreme Left. The freedom of his opinions and his audacity in expressing them, entailed upon him the penalty of exile from the French territory and from Algeria, by a decree dated January 9th, 1852. He retired successively to Brussels and to Vétoux, in Switzerland; and refused to avail himself of the amnesties within which he might have been comprehended. Returning to France, however, on the deposition of the Bonaparte dynasty, September, 1870, he was elected a member of the Assembly, where he has given proof of the retention of his former political and social opinions.

M. Quinet is the author of a multitude of dramatic, political, and other works, which have been variously published, periodically, separately, and collectively. Those which had been already issued in 1858 are sufficiently accounted for by naming his 'Œuvres Complètes, précédées de "Edgar Quinet. Sa Vie et son Œuvre," par Charles Louis Chassin,' 10 vols. 8vo and 12mo, Paris, 1857-58. His later works include a philosophical allegory entitled 'Merlin l'Enchanteur,' 2 vols. 8vo, Paris, 1860; 'Histoire de la Campagne de 1815,' 8vo, Paris, 1862; 'La Révolution,' 2 vols. 8vo, Paris, 1865, fifth edition, 1868, of which a defence followed with the title of 'Critique de la Révolution,' 8vo, Paris, 1867; and others.

QUOY, JEAN (RENÉ) CONSTANT, naturalist, was born November 10, 1790. He entered the navy in 1807, and, after filling various posts in the medical department, became inspector-general of the health of the navy in 1848; he retired from the service in 1858; and died at Rochefort, July, 1869. He is noticeable on account of the scientific work he performed in association with M. Gaimard, for details of which see GAIMARD, E. C. S. col. 564.

BIOGRAPHY.

SUPPLEMENT: PART III.

The abbreviations E.C. and E.C.S. signify the English Cyclopædia and the English Cyclopædia Supplement (Biographical Division).

The asterisk * prefixed to the name indicates that the subject of the memoir is still living.

1017

RACHEL, MADEMOISELLE.

RADCLIFFE, MRS. ANNE.

1018

R

RACHEL, MADEMOISELLE, a distinguished French tragédienne, whose true name was Elisabeth Rachel Félix, was born, according to different accounts, on the 28th of February or the 24th of March, and alternatively in the year 1820 or 1821, at the village of Münf, in the Swiss canton of Aarau, where her parents, who were Jew pedlars, halted for a while in the course of their wanderings. During a more lengthened stay at Lyons, where her mother established an old-clothes shop, she attended her elder sister Sarah, for the purpose of collecting the small sums which rewarded the vocal performances of the latter in the streets and cafés of the city. About 1830 the family removed to Paris, and the sisters resumed in the capital the street-life which they had commenced at Lyons; until at length they attracted the attention of M. Choron, one of the founders of the Conservatoire Royal de Musique, who received them into that institution. It was soon perceived, however, that the *forte* of the younger sister was less musical than declamatory; and she was transferred to the care of M. St. Aulaire, for the development of her dramatic abilities. The direction of her taste did not at first, and perhaps never did, completely coincide with that of her genius; and she made her début, as Mademoiselle Félix, on the 24th of April, 1837, at the Gymnase, in a two-act vaudeville, entitled 'La Vendéenne,' which had been written for her by M. Duport. She met with a substantial, though qualified, success; and after the withdrawal of 'La Vendéenne,' and after taking part in other pieces, which called forth the expression of great admiration from discerning criticism, she placed herself under the direction of M. Samson, who gave her the benefit of his instruction, and of his experience as a player and dramatic author. Her first appearance as Mademoiselle Rachel—a name by which she presently afterwards came to be acknowledged as the first tragédienne not only of France, but of the world—took place on the 12th of June, 1838, at the Théâtre Français, in the part of Camille in Corneille's 'Les Horaces.' The merit of the discovery of the surpassing dramatic genius of Rachel is generally referred to M. Jules Janin, who, in a *feuilleton* in the 'Journal des Débats' for September 10, 1838, laid the foundation of her subsequent fortune and triumph. Two or three years after, Rachel paid a visit to London, where she played at the Italian Opera House; and for a second time repaired to that city in July, 1846, for a short series of nights at the St. James's Theatre, where she was enthusiastically welcomed.

During the early stages of the Revolution of February, 1848, Rachel, who was an ardent republican, signalled her political creed by singing the Marseillaise at the close of the performance of Ponsard's tragedy of 'Lucrèce.' There was a terrible sublimity about her rendering of the Hymn; and, as she knelt and pressed the tricolour to her heart, the entire theatre broke out into a long,

loud, and uncontrollable burst of transport. Her manner was grand, but rather with the grandeur of hatred and revenge than of patriotism; yet it produced the effect desired by the artist herself, in the way of political propagandism, and also by the members of the provisional government, many of whom were present at the performance.

Mademoiselle Rachel's engagement at the Théâtre Français allowed a six months' annual congé, which she turned to account by frequent foreign tours; and the monetary result of her professional activity was the realisation of a large income, out of which she generously provided for her father, and a splendid fortune, which at her death fell to be divided among the different members of her family. In 1853 she undertook a very lucrative engagement at St. Petersburg; and in 1855 visited North America and the West India Islands, especially Cuba. She had always been of a fragile and delicate frame of body, but it was whilst engaged in this trans-Atlantic expedition that she first manifested grave symptoms of a pulmonary disease, which she sought to surmount by returning home, and by paying a subsequent visit to Egypt, in the course of which she made serious investigations into the evidences of Christianity. This circumstance gave rise to an unfounded rumour that she had embraced Catholicism, before her death at Cannet, near Toulon, on the 3rd of January, 1858.

Several critical estimates of her talent, and several biographical memoirs of her career, were published both before and after her death. Hers was the consummate art of simplicity and naturalness in the representation of passion, vengeance, and indignation; and her most wonderful results were attained by the slightest of means—a tone, gesture, or look, which, however, it was objected were so exactly reproduced in time, place, and manner, that frequent representations of the same piece caused a feeling of monotony and want of fresh interest on the part of the audience. Great as were the powers of Mademoiselle Rachel, the impartial critic could find grave defects in the tragédienne, as the exacting moralist could discover grave imperfections in her personal character. Her greatest success was achieved in the delineation of the sterner and darker passions; the perfect power over the softer, sweeter, and purer emotions was beyond one whose mind was wanting in the requisites of goodness and repose.

RADCLIFFE, MRS. ANNE, a celebrated romance writer, was born in London, July 9, 1764, the daughter of a respectable tradesman named Ward. In 1787 she married Mr. William Radcliffe, who afterwards became proprietor of the 'English Chronicle;' and about two years later she began publishing those exciting romances, which, for a time, so strongly riveted the attention of the reading public. They appeared in the following order: 'The Castles of Athlin and Dunbayne, a Highland

Story,' London, 12mo, 1789; 'A Sicilian Romance,' 2 vols. 12mo, 1790; 'The Romance of the Forest,' 3 vols. 12mo, 1791, and 'The Mysteries of Udolpho,' 4 vols. 12mo, 1794, the two most characteristic and popular of her stories; 'The Italian; or, the Confessional of the Black Penitents,' 3 vols. 12mo, 1797. It has seldom fallen to the lot of an English female novelist to have her writings, comprised within a period of eight years, commented on by so many distinguished men. Warton, Fox, Sheridan, Scott, Byron, Hazlitt, Prescott, Allan Cunningham, Leigh Hunt, and Talfourd, have criticised the Radcliffe romances either as a whole or separately. There has been a general admission of the authoress's power in dealing with the vaguely terrible, the picturesque, the exciting. In the words of a contemporary authoress, Mrs. Barbauld, "she seems to scorn to move those passions which form the interest of common novels; she alarms the soul with terror, agitates it with suspense, prolonged and wrought up to the most intense feeling by mysterious hints, and obscure intimations of unseen danger." The romances are now, however, seldom read. Mrs. Radcliffe travelled on the continent in 1794, and published the result in 'A Journey made, in 1794, through Holland, &c., with Observations during a Tour to the Lakes,' 4to, 1795, a work that exhibited as much imagination as any of her romances. She lived a quiet, domestic life, and died on the 7th of February, 1823. After her decease, appeared, in 1826, in four volumes, a patchwork of minor productions, comprising (1), 'Gaston de Blondville; or, the Court of Henri III. resting in Ardennes;' (2), 'St. Alban's Abbey,' a metrical tale; and (3), 'Poetical Pieces:' to these were prefixed a 'Life of the Authoress,' by Sir T. N. Talfourd. This work (afterwards subdivided and published separately) attracted but little public attention.

* RADDE, GUSTAV FERDINAND RICHARD, a well-known explorer of the geography and natural history of Eastern Siberia and the Caucasus, was born at Danzig, November 27, 1831. His travels commenced in 1852, when the Entomological Society of Stettin commissioned him to make an exploration of the Crimea, and the country along the shores of the Black Sea, for natural-history purposes. An account of this journey was given in the 'Bulletins' of the Imperial Society of Naturalists at Moscow, for 1854 and 1855. In 1855 the Imperial Russian Geographical Society of St. Petersburg organised and equipped, at its own cost, an expedition to explore Eastern Siberia. Herr Radde was one of the principal members, and was charged with the biological department, special instructions having been given to him by Professor Brandt. Radde reached Irkutsk, May 30, 1855, and the following summer was spent in preparations for a long journey, and in exploring Lake Baikal. The winter was passed at Irkutsk. On March 1, 1856, he and others left Irkutsk, crossed the Appel range, proceeded along the frontiers of Mongolia, and returned to Irkutsk on January 8, 1857. In the following April he went down the Amur to its junction with the Ussuri, and wintered at the foot of the Bureja mountains, in a hut built for the purpose; the object being to have the advantage of examining the district as soon as spring commenced. This event occurred at the end of March, and the rest of the year was spent in examining the Bureja mountains. Irkutsk was again reached, January 17, 1859. He then visited the high mountains to the west of Lake Baikal, ascended to the summit of Munku Sardik, and made observations on Kossogol, one of the largest lakes in Mongolia. His expedition ended by his return to St. Petersburg, in January, 1860. A full account of his researches appeared in the 'Reisen im Süden von Ost Sibirien in den Jahren 1855—59.' Bd. I. 'Die Säugethier-Fauna,' 4to, St. Petersburg, 1862; Bd. II. 'Die Festlands-Ornis des südöstlichen Sibirien,' 1863. The other departments have been treated by Schrenck and others. In the volume on mammalia, particulars are given respecting 94 species; in that on birds, 368 species are noticed, whereas the number previously known from the same area, comprising the larger portion of the basin of the Amur, was only 190. These volumes are especially valuable on account of the full details they give of the geographical distribution of the fauna, both from a general and a specific point of view. Radde also collected copious notes respecting the plants, insects, and fishes. Since 1863 he has lived at Tiflis, as keeper of the natural history museum at that place. He has made several excursions into the Caucasus range, and has published the results in Petermann's 'Mittheilungen,' and in 'Berichte über die biologisch-geographischen Untersuchungen in der Kaukasus-länder,' 4to, Tiflis, 1866.

RADETSKY DE RADETZ, FIELD-MARSHAL COUNT JOSEPH. [E. C. vol. v. col. 6.] Count Radetzky enjoyed but a

short time his hard-earned retirement. He died, after a brief illness, at his residence, the Villa Reale, Milan, January 5, 1858, in his 92nd year.

RAFN, CARL CHRISTIAN. [E. C. vol. v. col. 12.] This great Icelandic scholar died at Copenhagen, on the 20th of October, 1864, aged 70.

RAIBOLINI, FRANCESCO. [FRANCIA, FRANCESCO, E. C. vol. ii. col. 988.]

* RAMMELSBERG, KARL FRIEDRICH, mineralogist and chemist, was born at Berlin, April 1, 1813, and was educated at the same place from 1833 to 1837, his most influential teachers being Professors Rose and Weiss. In 1837 he took his degree of doctor. In 1845 he became professor of mineralogy and chemistry in the University of Berlin. He founded an analytical laboratory, which has been attended by many who have since followed successful careers, including Englishmen, Americans, and others not of German nationality. His most important labours have been in the chemistry of minerals, on which subject he has contributed a large number of papers to Poggendorff's 'Annalen der Physik und Chemie,' and numerous independent works. His greatest production is the 'Handbuch der Mineralchemie,' 8vo, Leipzig, 1860, which is the best work of its kind. It is the last edition of his 'Handwörterbuch des chemischen Theils der Mineralogie,' 8vo, Berlin, 1841, to which supplements were added in 1843, 1845, 1847, 1849, and 1853; when it was remodelled. His other works comprise an edition of the 'Neues chemisches Mineralsystem,' by Berzelius, 8vo, Stuttgart, 1847; 'Anfangsgründe der quantitativen mineralogisch und metallurgisch analytischen Chemie durch Beispiele erläutert,' 8vo, Berlin, 1845; 'Handbuch der Krystallophischen Chemie,' 8vo, Berlin, 1845; 'Lehrbuch der chemischen Metallurgie,' 8vo, 1850; 'Lehrbuch der Krystallkunde,' 8vo, 1852; and 'Grundriss der anorganischen Chemie gemäss den neueren Ansichten,' 8vo, Berlin, 1867.

* RAMSAY, ANDREW CROMBIE, geologist, was born in 1814, and educated at Glasgow. In 1841 he became connected with the Geological Survey of Great Britain, of which he was soon afterwards appointed the local director; and a few years ago, when Mr. A. Geikie was nominated the special director, he retained the post of director of the English branch of the Survey. In 1851 he accepted the office of professor of geology at the Royal School of Mines in Jermyn Street. He has received several honorary distinctions for his researches. In 1862 and 1863 he was president of the Geological Society; and in 1866 and 1868 he presided over the geological section of the British Association. In his official capacity he has taken an active share in surveying the geology of Great Britain, and in the preparation of the maps and memoirs resulting from that survey. His most important work has been effected in North Wales, of which he has written an elaborate account in his 'Geology of North Wales,' forming vol. iii. of the 'Geological Survey Memoirs,' 1866. As superintendent he has had a considerable share in the surveying of various other parts of England and Scotland. He is the author of 'The Physical Geology and Geography of Great Britain,' 8vo, 1863; second edition, 1864, a small volume containing his lectures to working men; and he is a joint author of 'A Descriptive Catalogue of the Rock Specimens in the Museum of Practical Geology,' 8vo, 1859. The arrangement of these specimens was to a large extent his work. The catalogue has passed through several editions. Besides some other books, he has written numerous articles and scientific papers. The subjects which have been most advanced by him are the formation of lake basins, the occurrence of the old glaciers of this country, denudation, and the time represented by the principal known gaps in the succession of strata. We believe he was the first to show that the uniform gradients represented by the tops of the highest hills of many mountainous areas are approximately planes of ancient marine denudation. He is one of the principal advocates of the subaerial theory of denudation, a theory which mainly attributes the orographic features of the land to other denuding agents than the sea.

* RANKINE, PROFESSOR WILLIAM JOHN MAC-QUORN, F.R.S., civil and mechanical engineer, was born in 1805, and was educated at the University of Edinburgh. He adopted the profession of engineering, receiving part of his instruction from Sir John McNeill. As professor of mechanics and civil engineering at the University of Glasgow, member (and some time president) of the Institution of Engineers of Scotland, in several different years president of the mechanical section of the British Association for the Advancement of Science, and consulting en-

gineer to the Highland Agricultural Society, Professor Rankine has made valuable contributions to the theory and practice of engineering, especially in connection with mechanism. His papers in scientific journals are numerous, relating to thermodynamics; the science of energetics; the elasticity of solids; the strength of iron; the stability of earth and masonry; the motion of waves; the construction of sea defences; the resistance on railways; the theory of the steam engine; &c. With Mr. J. R. Napier he has made important researches in steam navigation, especially relating to the resistance of ships.

Among his separately published works are the following:—*'Mechanical Laws, Formulæ, and Tables,'* 4to, Glasgow, 1850; *'Letters to the Provost of Glasgow, on the means of improving the water-supply of that city,'* 8vo, 1852, in which he proposed to obtain the supply from Loch Katrine, which has since been practically and successfully achieved; *'Introductory Lecture on the Harmony of Theory and Practice in Mechanics,'* 8vo, Glasgow, 1856; *'Manual of Machinery and Millwork,'* 8vo, London and Glasgow, 1859; *'Manual of Civil Engineering,'* 8vo, ibid., 1862, fifth edition, 1867; *'The Mechanical Properties of Steam,'* 8vo, Edinburgh, 1865; *'Useful Rules and Tables relating to Mensuration, Engineering, Structures, and Machinery,'* 8vo, London and Glasgow, 1866, second edition, 1867; *'Applied Mechanics,'* 4to, Edinburgh, 1866; *'Cyclopædia of Machine and Hand Tools,'* folio, London and Glasgow, 1868-69. He has also edited, and contributed portions of, *'Shipbuilding, Theoretical and Practical,'* folio, ibid., 1866. Professor Rankine, who is a fellow of the Royal Society, and received the degree of LL.D. from the University of Dublin, was awarded the Keith Medal in 1852 by the Royal Society of Edinburgh. In 1859 he raised the Glasgow University Corps of Volunteer Rifles, of which he was for some years captain and major.

RANSOME, ROBERT, member of a family connected for nearly a century with mechanical engineering at Ipswich, was born in that town on the 27th of February, 1795. His father's iron foundry was gradually enlarged by the addition of agricultural instrument making to the other operations carried on. Robert Ransome learned all the details of mechanical engineering under his father, his elder brother, and Mr. (afterwards Sir William) Cubitt, who was at that period engaged at the Ipswich works. He was admitted into partnership in 1818, and during twenty years was principally instrumental in developing a very extensive manufacture of agricultural implements. About the year 1838 Mr. Charles May joined the firm, which thereafter entered largely into railway work—especially in manufacturing Mr. James Ransome's patent railway chairs, and Mr. May's patent compressed wood fastenings. The iron-work for some large observatory telescopes, requiring great nicety of construction, was executed by the firm. Among examples of this kind were the dome for Dr. Lee's observatory at Hartwell, another for Mr. Barclay's observatory at Bury Hill, the equatorial mounting for Ross's large object-glass (exhibited in Hyde Park in 1851), and the fine transit circle and altazimuth at Greenwich, planned by the astronomer royal. Before Mr. Ransome withdrew from active participation in the business, the establishment at Ipswich had so extended as to employ more than a thousand workmen. He was struck with an apopleptic fit while on the Rhine in 1864, and died November 6th of that year.

RAPER, LIEUTENANT HENRY, R.N., the eldest son of Admiral Raper (who fought under Lord Howe in 1794), was born in 1799, and was educated at the Charterhouse. He made a cruise with his father in 1811 in the *'Mars.'* In the following year he entered as a student at the Royal Naval College, Portsmouth; where he obtained the silver medal for mathematics in 1814. He entered the Royal Navy in 1815 as a midshipman; and during the course of nine years served in succession, in various parts of the world, in the *'Nymph,'* *'Alceste,'* *'Tyne,'* *'Seringapatam,'* *'Adventurer,'* *'Euryalus,'* and *'Despatch.'* In the course of this service he was shipwrecked in the China Seas in 1817; and was entrusted by Captain (afterwards Admiral) W. H. Smyth with the management of the chronometric department, in a survey of the Mediterranean in 1822. In 1829 he was elected fellow of the Royal Astronomical Society, of which he was in later years secretary. His first publication appeared in 1831, *'Rules for finding Distances and Heights at Sea.'* In 1832 the Admiralty appointed him a member of the committee for determining a new plan for measuring the tonnage of ships. His most important work was *'The Practice of Navigation and Nautical Astronomy,'* 1840, for the Table of Maritime Positions in which work Lieutenant Raper was

awarded the gold medal of the Royal Geographical Society in 1841; the book itself was officially adopted, in 1843, for the ships in the Royal Navy and in the East India Company's Service; a tenth edition was published in 1870. In 1849 appeared *'Sailing Directions for the West Coast of Africa,'* an Italian translation of the third edition of this work, by F. Leva, was published at Trieste in 1866. In 1858 Lieutenant Raper contributed to the Royal Astronomical Society a paper on *'Lunar Distances.'* He died January 6th, 1859.

* RATTAZZI, URBANO, an Italian lawyer and statesman, was born at Alessandria on the 29th of June, 1808; and, having chosen his father's profession of law, commenced practice at the bar of Turin, from which he removed, in 1838, to the then newly constituted Court of Appeal at Casale. He was returned as deputy for Alessandria in the parliament which assembled at Turin on the 6th of May, 1848; and became a member of the eight days' ministry appointed by King Carlo Alberto after his defeat at Custoza, in July of the same year. An ardent liberal, Rattazzi went into opposition to the administration which succeeded; and when his party triumphed, a few months afterwards, he assumed the Ministry of the Interior, and subsequently that of Grace and Justice, in the cabinet formed by Gioberti on the 15th of December. Deprived of power in consequence of the abdication of Carlo Alberto in March, 1849, Rattazzi at first identified himself with the democratic opposition; but gradually assimilating his views to those of the more moderate reformers, he was appointed, in 1852, first to the vice-presidency and afterwards to the presidency of the Chamber of Deputies. In 1854 he accepted the Ministry of Justice under Count Cavour, to whom he had formerly been opposed, but of whose plans and policy he became for the future so sympathetic and cordial an exponent, that it is said that Cavour in his last moments, June 6th, 1861, spoke emphatically of Rattazzi as his only possible successor in the conduct of the administration. But this declaration was not immediately acted upon, and the premiership of Ricasoli intervened before the promotion of Rattazzi to be the head of the Government, in March, 1862. His policy may be epitomized as an attempt after the peaceful development of Italian liberty and unity; but failed to ensure the confidence of parliament, and he resigned office in December of the same year. After an interval of some years, during which several short-lived administrations had been initiated and broken up, Rattazzi again succeeded Ricasoli as premier in April, 1867, but held office only until the following October.

In a letter written by Count Cavour to one of his friends, Rattazzi is described as being the most conservative member of his cabinet, the most decided partisan of the principle of authority, and one of the most sincere and devoted adherents of the king, the monarchy, and the cause of order. His career has given rise to several works of greater or less importance, which, so far as they are biographical or political, may be represented by a Life forming the 27th number of *'I Contemporanei Italiani,'* 18mo, Turin, 1861, &c.; a sketch, by Hippolyte Castille, occupying the 30th number of the 2nd series of *'Portraits Historiques au dix-neuvième Siècle,'* 18mo, Paris, 1862; *'Vita di Urbano Rattazzi,'* 8vo, Naples, 1867, by Cesare Perocco; and Alphonse de Calonne's *'M. Rattazzi et la Crise Italienne,'* 8vo, Paris, 1862.

RAUCH, CHRISTIAN. [E. C. vol. v. col. 34.] This distinguished sculptor died at Dresden on the 3rd of December, 1857, within a month of the completion of his 80th year.

* RAUMER, FRIEDRICH LUDWIG GEORG VON, a German historian, was born at Wörlitz, in Anhalt, on the 14th of May, 1781; and, after receiving his earlier education at the Joachimsthal at Berlin, repaired successively to the Universities of Halle and Göttingen for the prosecution of his legal and financial studies. He commenced his official life in 1801, passing through various stages of promotion until, in 1810, he was appointed a counsellor in the bureau of the state-chancellor Hardenberg. The reputation acquired by the publication of several works of research and erudition procured for him, in 1811, a professorship in the University of Breslau; from which, after having gained experience in travels undertaken, partly at the expense of the government, in Germany, Switzerland, and Italy, he migrated in 1819 to the University of Berlin, on his appointment to the chair of political economy and history in that institution. For a series of years he combined various offices of a scientific, municipal, parliamentary, or diplomatic character, with his professorial duties, and with intervals of travel in England, France, and America; after which he retired from active life in 1853, with the title of professor-emeritus.

Amongst the many works of Professor von Raumer, besides those devoted to the department of philology, may be mentioned an *Autumn Journey to Venice*, 'Die Herbstreise nach Venedig,' 2 parts, 8vo, Berlin, 1816; *Lectures on Ancient History*, 'Vorlesungen über die alte Geschichte,' 2 parts, 8vo, Leipzig, 1821, third edition, 1861; *History of the House of Hohenstaufen*, &c., 'Geschichte der Hohenstaufen und ihrer Zeit,' 6 vols. 8vo, Leipzig, 1823—25, fourth edition, 1857—58; *On the Historical Development of the Ideas of Law*, &c., 'Ueber die geschichtliche Entwicklung der Begriffe von Recht, Staat und Politik,' 8vo, Leipzig, 1826, third edition, 1861; 'England im Jahre 1835,' 2 parts, 12mo, Leipzig, 1836, second edition, with a third part, or volume, 'England im Jahre 1841,' 3 parts, 12mo, Leipzig, 1842; *History of Europe*, &c., 'Geschichte Europas seit dem Ende des funfzehnten Jahrhunderts,' 6 vols, 8vo, Leipzig, 1832—38, and other editions; *Contributions towards a Knowledge of Italy*, 'Italien. Beiträge zur Kenntniss dieses Landes,' 2 parts, 12mo, Leipzig, 1840; 'Die vereinigten Staaten von Nordamerika,' 2 parts, 12mo, Leipzig, 1845, English translation, 'America and the American People,' 8vo, New York, 1846, translated by W. W. Turner; *Miscellaneous Writings*, 'Vermischte Schriften,' 8vo, Leipzig, first three volumes, 1852—54; *Politics of the Day*, 'Zur Politik des Tages,' 8vo, Leipzig, first two editions, 1859; *Letters on the Social Relations of Mankind*, 'Historisch-politische Briefe über die geselligen Verhältnisse der Menschen,' 8vo, Leipzig, 1860; *History of Literature*, 'Handbuch zur Geschichte der Litteratur,' 2 vols. 8vo, Leipzig, 1864; and a *Discourse on the Past and Present*, 'Sonst und jetzt. Vortrag,' &c., 8vo, Berlin, 1867.

RAUMER, KARL GEORG VON, geologist and geographer, younger brother of the historian, was born at Wörlitz, April 9, 1783. In 1797 he went to the Joachimsthal Gymnasium at Berlin, and from thence in succession, 1801—8, to the Universities of Göttingen, Halle, and Freiberg. At Göttingen he attended Blumenbach's lectures; but it was at Halle that his bent towards geology was first developed; while Werner's lectures at Freiberg induced him to make a special study of mineralogy. The battle of Jena, which was followed by the downfall of the Prussian monarchy, seems to have been a turning point in his life. It was to a certain extent the cause of his undertaking geological explorations in the mountainous districts on the right bank of the Rhine and in the neighbourhood of Paris; as also of the resolve which he made to benefit his country by improving the education. Having been much struck with the work written by Pestalozzi, he enlisted himself as a teacher in his establishment, but his stay was short, as he soon found that Pestalozzi's teaching had no method in it. In the leisure which followed he was induced to give an account of his explorations, which appeared under the title of 'Geognostische Fragmente,' 8vo, Nürnberg, 1811, and led to his appointment as professor of mineralogy and councillor of the mining establishment at Breslau. The object of the work was to show that Werner's succession of rocks, which was based upon their mode of occurrence in the Erzgebirge, was not of general application. This led Werner and his school to quarrel with him, but the estrangement was only temporary. In 1813 the King of Prussia appealed to his subjects to arm against France, to which Raumer willingly responded. For his services at Leipzig and other places he received the Order of the Iron Cross in 1814. He then returned to his post at Breslau, but, owing to his being suspected of liberal tendencies, he was made to resign it soon after. In 1819 he received the professorship at Halle, which he retained till 1823, when he was obliged to give it up from much the same cause as led to his leaving Breslau. He then took the management of a private school at Nürnberg, but this being broken up in 1826 he was again out of employment. In 1827 he was appointed to the chair of natural history and mineralogy at Erlangen, which he filled until his death, June 2, 1865. He wrote numerous works, some purely educational and others scientific. The most important are his 'Lehrbuch der allgemeinen Geographie,' third edition, 8vo, Leipzig, 1848, which was highly valued by Humboldt; 'Palaestina,' 8vo, 1835, third edition, 1850; 'Das Gebirge Niederschlesiens,' 8vo, Berlin, 1819, which was his principal geological work; and 'Geschichte der Paedagogik,' 4 vols. 8vo, Stuttgart, 1846—1857, the work with which his name is usually associated.

RAVENET, SIMON FRANÇOIS, a celebrated engraver, was born at Paris about 1706, according to some, but Milizia says in 1710, Zani in 1721. He studied with J. P. Le Bas; practised his art in Paris till 1750; and then came to England in order to assist Hogarth in engraving the series of plates of *Marriage-a-la*

Mode. He was afterwards much employed by Alderman Boydell, and engraved many portraits of eminent men of the day, and some plates after the great masters. Ravenet drew well, and engraved in a neat firm manner. He was elected associate-engraver of the Royal Academy in 1770, and died in London in April, 1774. His son, SIMON FRANCIS RAVENET, born in London in 1755, studied engraving under his father, and painting in Paris under T. Boucher. He then went to Parma, where he undertook to engrave Correggio's paintings in the cathedral and churches of that city. These he completed in a slight manner, about 1785, and afterwards some prints from Rubens, N. Poussin, &c. He died about 1813.

RAVENNA, MARCO DENTE DA, Italian engraver, was born at Ravenna in 1496. He was a pupil of Marcantonio Raimondi, and imitated the manner of his master, but was less refined in style. He was, however, an able engraver, spirited in execution, and painter-like in feeling, and his prints are much esteemed. The best are those after Raffaele and Giulio Romano. His Raffaele engravings include the Transfiguration, the Bible subjects, and a series of thirteen from the history of Christ. Another noted print by him is the group of the Laocoon. Marco Dente da Ravenna was killed at the sack of Rome in 1527.

* READE, CHARLES, D.C.L., a novelist and dramatic author, youngest son of the late Charles Reade, Esq., of Ipsden House, Oxfordshire, was born in the year 1814, and was educated at Magdalen Hall, Oxford, where he graduated as B.A. in 1836. In 1842 he was elected to one of the Vinerian fellowships, and on the 26th of January, 1843, was called to the bar by the Society of Lincoln's Inn. He became a frequent contributor to periodical literature; and produced various dramatic pieces, including a five-act drama in prose, entitled 'Gold,' 12mo, London, 1850, &c.; and, in association with Mr. Tom Taylor, a drama entitled 'Two Loves and a Life,' 8vo, London, 1854; 'The King's Rivals,' 8vo, London, 1854; and a comedy entitled 'Masks and Faces,' 8vo, London, 1854, which, before its literary publication, had served as the basis of a story called 'Peg Woffington,' 12mo, London, 1853, new edition, 8vo, London, 1868, American edition, 16mo, Boston, 1855, &c., by which Mr. Reade at once achieved popularity as a novelist. Works of fiction were now produced in rapid succession: 'Christie Johnstone. A Novel,' 12mo, London, 1853; 'It is Never too Late to Mend. A matter-of-fact Romance,' 3 vols. 8vo, London, 1856, which was dramatised in four acts, by C. Hazlewood, as 'Never too Late to Mend,' 12mo, London, 1860; 'White Lies. A Story,' 3 vols. 12mo, London, 1857, new edition, 'Double Marriage: or, White Lies,' 8vo, London, 1868; 'The Course of True Love Never did Run Smooth,' 8vo, London, 1857; 'Love me Little, Love me Long,' 2 vols. 8vo, London, 1859; a "tale of the Middle Ages," reprinted from 'Once a Week,' entitled 'The Cloister and the Hearth,' 4 vols. 8vo, London, a work, the chief characters of which are Gerard and Margaret, the parents of Erasmus; 'Hard Cash. A matter-of-fact Romance,' 3 vols. 8vo.; 'Griffith Gaunt: or, Jealousy,' 3 vols. 8vo, London, 1866. This work was censured for indecency and immorality in the New York 'Round Table,' from the editor of which, in an action brought by Mr. Reade, in March, 1866, the latter was successful in recovering three cents damages. 'Griffith Gaunt' was dramatised by Augustine Daly, of New York, and successfully represented in that city in November, 1866; it was also travestied in a production entitled 'Liffith Lank,' 16mo, New York, first seven editions, 1867. A "Household Edition" of Mr. Reade's novels was published in 8 vols. 16mo, Boston, U. S., 1869; and his later productions include 'Foul Play. A Novel,' 3 vols. 8vo, London, 1868, new edition, 1869, of which Mr. Dion Boucicault is joint author; 'Put Yourself in His Place,' 3 vols. 8vo, London, 1870; and 'A Terrible Temptation,' 3 vols. 8vo, London, 1871, which was reprobated by the 'Times,' of August 24th, for the prominence which it gave to the doings of a certain Rhoda Somerset, whose character and profession ought not to have been even suggested before the eyes of youthful virtue, and to which Mr. Reade replied, in a defensive letter which appeared in the 'Times' of August 31st. The greater number of Mr. Reade's novels have passed into second editions; most of them have been reprinted in America, and several have been reproduced in Germany, in the 'Tauchnitz Collection of British Authors.' A large proportion, as will have been observed, have had their first publication in the pages of magazines, and their tendency, presumably in the interests of benevolence and morality, has been to make the reader acquainted with what is abnormal, criminal, or disreputable in either sex, as shown in the discussion of strikes, rattening, theft,

prisons, lunatic asylums, and the proceedings of "Anonymas." Mr. Reade writes habitually of disease; he claims to do so with the pen of a physician.

REBOUL, JEAN, a French poet, son of a locksmith at Nîmes, the capital of the department of Gard, was born in that town on the 23rd of January, 1798; and, having received such education as the humble fortunes of his parents admitted, became at thirteen years old a copyist in a lawyer's office. The death of his father, about two years after, left the care of four children upon his mother, and, in order more effectually to assist her, he chose to follow the business of a baker. He married early, and having been twice left a widower, solaced himself by a close application to study, which in some measure atoned for the slenderness of his earlier education. In 1820 he became a member of a society, or club, at whose meetings he first developed the poetical gifts by which he acquired a reputation. After several tentatives of a gay, light, and anacreontic character, he produced a cantata on the Spanish war, at the request of his friends; and soon afterwards wrote a more solemn piece entitled 'Hymne à la Vierge.' In 1828 he contributed to 'La Quotidienne' his charming and pathetic poem entitled 'L'Ange et l'Enfant,' dedicated to a lady who had just lost her infant. This elegy achieved an immense popularity, and attracted to its author the interest and patronage of Lamartine, who addressed to him one of his 'Harmonies,' entitled 'Le Génie dans l'Obscurité.' In 1835 he received a visit from Alexandre Dumas, by whose advice and encouragement, jointly with those of Lamartine, to whom he dedicated the volume, he published his 'Poésies. Précédées d'une Préface par Alexandre Dumas, et une Lettre à l'Éditeur par Lamartine,' 8vo, Paris, 1836, of which five editions were exhausted in as many years. In April, 1839, he visited Paris for the purpose of publishing his poem entitled 'Le Dernier Jour. Poème en dix Chants,' 8vo, Paris, 1839, 18mo, 1841, 1842, &c., and was received with enthusiastic hospitality in the capital; to which he again repaired in 1848 to take his seat as representative of the department of Gard in the Constituent Assembly, where his votes were given with the legitimist minority. He contributed verses to various periodicals, and produced three tragedies, one of which, 'Le Martyre de Vivian. Mystère en trois Actes et en Vers,' 12mo, Paris, 1850, was brought out at the Odéon. He died at Nîmes, May 29, 1864.

The works of Jean Reboul, besides those already mentioned, include 'Poésies Nouvelles,' 12mo, Paris, 1846; 'Les Traditionnelles. Nouvelles Poésies,' 12mo, Paris and Nîmes, 1857; and 'Dernières Poésies. Précédées d'une Notice biographique par l'Abbé de Cabrières,' 12mo, Avignon, 1865. Several letters of Reboul are preserved in 'Souvenirs, Études, Mélanges littéraires, par le Baron Gaston de Flotte. Précédées de la Correspondance de Jean Reboul avec l'Auteur,' 8vo, Paris and Nîmes, 1865; and M. R. Valladier has produced a small work in illustration of his career, entitled 'Jean Reboul. Étude biographique et littéraire,' 8vo, Toulouse, 1864.

REDSCHID PASHA [E. C. vol. v. col. 43] lived but a few months after the publication of the above memoir; he died at Constantinople on the 6th of January, 1858.

REED, ANDREW, D.D., was born in London, November 27th, 1787. He studied for the ministry in the Independent connection at Hackney College, and was ordained in 1811. In 1812 he was chosen minister of the New Road Chapel, St. George's-in-the-East. His career as a pastor was marked by few changes. He visited America in 1833-4, with Dr. Mather, as a deputation from the Congregational Union of England and Wales, and published an account of his mission after his return. He refused all invitations to part from his original charge, but removed with his congregation to a new and much larger building, Wycliffe Chapel, Stepney; and it was only when he had completed a jubilee period of fifty years, and felt the infirmities of extreme age, that he, in 1862, resigned his pastorate.

Dr. Reed published many sermons, charges, memorial notices, devotional tracts, and religious manuals, but acquired no celebrity as a theologian, and wrote nothing that is likely to be of permanent value or interest. His worth was that of a devoted pastor; but beyond that he has claims to general remembrance as an earnest, persevering, and successful philanthropist. In 1813 he first conceived the idea of a home for orphans, and succeeded in establishing the East London Orphan Asylum and Working School, which began with two orphan girls at a house near the Cannon-street Road. In 1816 he changed the name to the London Orphan Asylum, obtained subscriptions by indefatigable application, and bought a piece of ground at Clapton. On this site, as funds accrued, a spacious building was constructed, and was

opened by the Duke of Cambridge in 1825. Meanwhile his thoughts had been directed to the need for a separate home for infant orphans; he kept the idea to himself for a time, lest he should exhaust the flow of benevolence by too frequent appeals; but in 1827 he made his scheme public. One of his first subscribers was the Duchess of Kent, who stated that the asylum should have her aid, "and that of her fatherless daughter Victoria" (the present Queen). He began in 1828, with a small establishment at Hackney; but, having obtained land near Wanstead, he gradually collected funds for a large and handsome structure, the Infant Orphan Asylum, of which the first stone was laid in 1841, by the Prince Consort. Dr. Reed's next charitable scheme was for a Home for Fatherless Children, he having become dissatisfied with the working of the Wanstead Asylum. He began in a small house at Richmond, then removed to another at Hackney; and at length, in 1856, obtained funds sufficient to buy an estate at Coulsdon, three miles from Croydon. Here he erected a spacious building, which the trustees afterwards called Reedham, in compliment to him. The idea of a fourth good work of the kind, for the succour of poor idiots, had occupied his mind occasionally since 1837; he visited, as time and opportunity offered, asylums for idiots in various parts of Europe, and gradually framed a plan. In 1848 he took an old mansion on Highgate Hill; then another at Colchester, in 1850; and, in 1852, bought the estate of Earlswood, near Redhill, Surrey. Here an extensive asylum for idiots was built, and opened by the Prince Consort in 1855. It has increased in magnitude and usefulness ever since, and is now, probably, the most important and best managed institution of the kind extant. A fifth asylum was the Hospital for Incurables, which he commenced in a small way in 1845, and removed to a new building in 1854. In 1859 he succeeded in establishing another asylum in Essex—the Eastern Counties Asylum for Idiots. In earlier years he had been instrumental in founding the Hackney Proprietary Grammar School. Although in good circumstances, Dr. Reed never possessed a fortune; his untiring exertions, and the respect in which he was universally held, were the means which enabled him to achieve such great results. He died February 25th, 1862. (*Memoirs of the Life and Philanthropic Labours of Andrew Reed, D.D., with Selections from his Journal.* Edited by his sons, Andrew Reed, B.A., and Charles Reed, F.S.A., 8vo, London, 1863.)

* REED, EDWARD JAMES, naval architect, was born at Sheerness, in September, 1830. After serving an apprenticeship of four years in Sheerness Dockyard, he was selected by Canon Moseley, Government examiner, for special training in the School of Mathematics and Naval Construction at Portsmouth. Here, under the tuition of Dr. Woolley, he made great progress, and was recommended to the attention of the Admiralty in 1852. After serving for about a year as draughtsman at Sheerness Dockyard, he became one of the editors of the 'Mechanics' Magazine.' The articles on ship-construction which he contributed to this work attracted attention, and were quoted in Parliament as being authoritative; and a paper read by him before the Society of Arts, 'On the Modifications which the Ships of the Royal Navy have undergone during the present century, in respect to dimensions, forms, means of propulsion, and power of attack and defence,' elicited notice in high quarters. In 1856 the Admiralty placed in Mr. Reed's hands some official papers relating to the French navy, in order that he might institute a searching comparison between the strength of the navies of England and France. About the same time he became secretary to the newly formed Institution of Naval Architects. In 1857 he submitted to the Admiralty plans for reducing the size and cost of ships of war, and expediting the processes of building. These plans were so well received by the Duke of Somerset as First Lord of the Admiralty, and Sir Spencer Robinson as Controller of the Navy, that the Admiralty entrusted him with the conversion of the 'Enterprise,' 'Research,' and 'Favourite' into ironclads. He next designed the new ironclads 'Bellerophon,' 'Lord Warden,' 'Lord Clyde,' and 'Pallas,' and his success led to his appointment as Chief Constructor of the Navy. His leading idea was to combine thick armour with high speed; and he introduced many new features in carrying his plans into effect. The 'Hercules,' a broadside ironclad with very thick armour; the 'Monarch,' a turret-ship with the largest guns (25-ton) till that time used in any navy; the 'Inconstant,' the swiftest war-ship afloat; and the 'Volage,' were among the vessels planned and constructed by him. In 1868 he published 'Ship-building in Iron and Steel; a Practical Treatise giving full details of construction,' &c.: this work has become a textbook in naval schools. In the following year appeared 'Our

Iron-clad Ships; their qualities, performances, and cost; with chapters on Turret Ships, Ironclad Rams, &c.' In 1868, Mr. Reed proposed to resign, in order that he might have a chance of election to Parliament, where he much wished to meet in debate naval critics who had found fault with his plans; but the Admiralty dissuaded him from this course. A dispute between him and the First Lord, led, in 1870, to the resignation of Mr. Reed, who has since become connected as managing director with a large iron ship-building company. Nevertheless he keeps his name constantly before the public, as an unsparing critic on matters affecting ship-construction and stability and Admiralty management—such as the loss of the war-steamer, 'Captain,' in 1870, the plan and construction of which had always been opposed by him, and that of the 'Mégara,' in 1871.

REGNAULT, HENRI VICTOR, a distinguished chemist, was born at Aix la Chapelle, July 21st, 1810. After studying at the École Polytechnique in 1830–32, he entered the Government department of Mines. He became professor of chemistry at the École Polytechnique in 1840; professor of physics at the College of France in 1841; engineer in chief of mines in 1847; and director of the Imperial Manufactory of Porcelain at Sèvres in 1854. His first important memoir, 'Sur l'Action du Chlore sur l'Éther chlorhydrique,' appeared in vol. 71 of the 'Annales de Physique et de Chimie.' He confirmed an opinion held by Laurent, that chlorine may be substituted for hydrogen, atom for atom, in organic compounds; and examined with great care the chloride compounds obtainable from hydrochloric or muriatic ether. Mariotte and Charles, early in the century, had endeavoured to determine the relations which exist between the volumes of gases and vapours under varying degrees of pressure and temperature; Dulong, Pétit, Arago, and Gay-Lussac, by better experiments, arrived at more accurate results; while Despretz showed that the law of compressibility is not the same for all gases. Regnault made a searching examination into the whole matter; defined the various circumstances which disturb the law; and ascertained the numerical constants which must enter into any calculations of the effects of heat and pressure. He wrote numerous articles on the dilatation of elastic fluids; the density of gases; the measure of temperature; the density and absolute dilatation of mercury; the compressibility of elastic fluids and liquids; the elastic force of steam at different temperatures; the latent heat of saturated steam under different pressures; the specific heat of water under different pressures; the respiration of animals; hygrometry; and various other physico-chemical subjects. The chief of them were, in 1847, collected to form vol. 21 of the 'Mémoires de l'Académie des Sciences,' comprising 748 4to pp., under the title 'Relation des Expériences entreprises par ordre de M. le Ministre des Travaux Publics, and sur la proposition de la Commission Centrale des Machines à Vapeur.' Abstracts of most of these papers were given in the 'Comptes Rendus,' and he subsequently published others on allied subjects. Among his separate works are 'Cours Élémentaire de Chimie,' Paris, 4 vols. 12mo, 2nd edition 1849–50, German translation by Strecker, with alterations and additions, Brunswick, 1857; 'Premières Notions de Chimie,' 12mo, 1850, an abridgment of the preceding; an American translation, Philadelphia, 1852. Regnault succeeded Robiquet as a member of the Académie des Sciences in 1840; he was elected foreign member of the Royal Society in 1852; corresponding member of the Academies of Berlin, St. Petersburg, &c.; and was made commander of the Legion of Honour in 1863.

REGNAULT, BARON JEAN BAPTISTE, an eminent French painter, was born at Paris, October 19th, 1754. His father, whose name was Renaud, sent him to sea when ten years old, and he served on shipboard for five years, when on the death of his father he returned to Paris. By the kindness of a friend he was enabled to enter the atelier of Bardin, whom he accompanied to Rome. In 1775 he won the second, and in 1776 the first prize of the Academy. This entitled him to study at Rome. His pictures soon secured him fame and position. He was elected a member of the Academy in 1783 and the picture he presented on his reception, 'The Education of Achilles,' well known by Bervie's fine engraving, is now in the Louvre, where are also his 'Pygmalion imploring Venus to animate his Statue,' 'The Origin of Painting,' and a 'Descent from the Cross.' These may be taken as fair examples of his manner and range of subjects. He painted ecclesiastical and mythological pictures with equal facility, and both in what was then regarded as the purest classical style. M. Regnault was looked on as the great rival of David, in competition with whom he opened an atelier from which several good artists proceeded. He was appointed professor

at the École des Beaux-Arts in 1795, and at the École Polytechnique in 1816. He was a chevalier of the Legion of Honour, and of the order of St. Michel, and was created a baron in 1819. He died at Paris on the 12th of November, 1829.

RÉGNIER, MATHURIN, a French poet, chiefly known as a satirist, was born at Chartres on the 21st of December, 1573; and, being destined by his parents for the church, in order that he might succeed to the preferments of a well-beneficed uncle, received his first tonsure at eleven years of age, when he had already exhibited a tendency to satire. The gaiety and wildness of his youth gave rise to scandal, and he found it expedient to leave France in attendance on the Cardinal de Joyeuse, whom he accompanied, in 1593, to Rome. Here he stayed eight years, and finding on his return to France that the patronage of the Cardinal did not conduce to preferment, returned to Rome in 1601, as a retainer of the Duc de Béthune, who proceeded to that city as the ambassador of Henry IV. At the death of his uncle, Desportes, in 1608, Régnier received, out of all the benefices of that ecclesiastic, only a pension of 2000 livres, which was charged upon the Abbey des Vaux-de-Cernai; and on the 30th of July, 1609, was appointed to a canonry in the cathedral church of Chartres, the entire benefit of which, as not being in full orders, he was not in a position to enjoy. His income was, however, sufficient to enable him to devote himself to poetry and pleasure; and he varied his residence at his will, sometimes living at Paris, but oftener at Chartres or Royaumont. He died whilst on a visit to Rouen, at the hotel called 'l'Escu d'Orléans,' on the 22nd of October, 1613.

The works of Régnier, which comprise satires, epistles, elegies, epigrams, sonnets, and poems of miscellaneous form, display a wonderful amount of vigour, nerve, and naturalness, as well as a consummate knowledge of human character and manners. They have gone through a vast number of editions, and have been reproduced in France, Holland, and England. The principal editions are 'Œuvres de Régnier,' &c., 12mo, Paris, 1608, &c., 8vo, Rouen, 1613, 1614, &c., 12mo, Leyden, 1652, 12mo, Amsterdam, 1712; a series published with the Commentary of Brossette, 12mo, Amsterdam, 1729, 4to, London, 1730, and 2 vols. 12mo, London, 1730, stereotyped, 18mo, Paris, 1808, &c. Still more modern and critical editions are 'Œuvres Complètes. Avec les Commentaires revus, corrigés, et augmentés: précédées de l'Histoire de la Satire en France, pour servir de Discours préliminaire. Par M. Viollet le Duc,' 8vo, Paris, 1823, and, as part of the 'Bibliothèque Elzévirienne,' 16mo, Paris, 1853; 'Œuvres Complètes de Régnier. Nouvelle édition. Avec le Commentaire de Brossette, publié en 1729, des Notes littéraires, un Index des Mots vieilliss ou hors d'usage, et une Étude biographique et littéraire par M. Prosper Poitevin,' 12mo, Paris, 1860, and, as part of the 'Bibliothèque Gauloise,' 16mo, Paris, 1860, "augmentées de trente-deux Pièces inédites, avec des Notes et une Introduction par M. Edouard de Barthélemy," 12mo, Paris, 1862; and 'Œuvres Complètes de Régnier. Revues sur les Éditions originales, avec Préfaces, Notes, et Glossaire par M. Jannet,' 8vo, Paris, 1867. Amongst the critical and other notices conversant about the works of Régnier, may be mentioned the Baron James de Rothschild's 'Essai sur les Satires de Mathurin Régnier (1573–1613),' 8vo, Paris, 1863.

* REICHENBACH, BARON KARL VON, was born at Stuttgart, February 12th, 1788. He studied at the Stuttgart Gymnasium, and then at Tübingen University. In 1807 he began to devote his attention to technology, or the application of science to the industrial arts; visited various mining and smelting works in Germany and France; and gradually formed works of his own at Villingen and Hausach. A partnership with Count Hugues de Salm in 1821 led to the establishment of other works, including a beet-sugar factory at Blankenau in Moravia. Reichenbach realised a large fortune; and the King of Wurtemberg raised him to the rank of baron. During a course of chemical experiments, he discovered paraffin in 1831, creosote in 1833, and afterwards eupion and capnomor. In 1834 he published a memoir on the geology of Moravia, 'Geologische Mittheilungen aus Mähren.' Reichenbach is chiefly known, however, by his publications relating to nerve-power, or psychical biology. He claims to have discovered a new agent, called the Od force, as universally diffused as electricity or magnetism; he explains by it the mutual preferences and antipathies of mankind; and asserts that sensitive persons have the power of rendering the Od force faintly luminous and visible. These views have been developed in numerous publications, of which the following are the chief:—'Physikalisch-physiologische Untersuchungen über die Dynamide des Magnetismus,' 3 vols. 8vo,

Brunswick, 1845, 2nd edition, 1849, abridged English translations by J. Ashburner and W. Gregory; 'Odisch-Magnetische Briefe,' Stuttgart, 1852, French translation, 1854; 'Der sensitive Mensch und sein Verhalten zum Ode,' 2 vols. 8vo, 1854; 'Wer ist Sensitiv, wer nicht? oder kurze Anleitung sensitiv: Menschen mit Leichtigkeit zu finden,' 8vo, Vienna, 1856; 'Odische Erwiederungen an die Herren Professoren Fortlage, Schleiden, Fechner, und Hofrath Carus,' 8vo, 1856; 'Die Pflanzenwelt, in ihren Beziehungen zur Sensitivität und zum Ode,' 8vo, 1858; 'Aphorismen über Sensitivität und Od,' 8vo, 1866; 'Die odische Lohe und einige Bewegungserscheinungen,' 8vo, 1867.

REID, MAJOR-GENERAL SIR WILLIAM, K.C.B., F.R.S. [E. C. vol. v. col. 49]. General Reid retained the governorship of Malta till 1858. He died shortly after his return to England, in October, 1858, aged 67.

REINDEL, ALBERT CHRISTOPH, German engraver, was born at Nürnberg in 1784. In 1798 he became a pupil of H. Guttenberg, and in 1803 went to Paris in order to study anatomy and design. Whilst there he engraved several plates for Visconti's 'Iconographie,' the 'Musée Français,' &c. Returning to Nürnberg, he was appointed professor of the Malerakademie, and afterwards director of the Kunstschule, an office he retained till his death, February 23rd, 1853. Reinidel was one of the ablest of recent German engravers. Besides the prints already named, he engraved Poussin's 'Arcadian Shepherds,' A. Carracci's 'Silence,' the sculpture by Peter Vischer on St. Sebald's shrine, Nürnberg; Rauch's statue of Albert Dürer, &c. He translated, for the use of his pupils, Thibaut's 'Perspective linéaire,' 4to, Nürnberg, 1834. A catalogue of his engravings was published by Andersen, Leipzig, 1867.

* RÉMUSAT, CHARLES FRANÇOIS MARIE, COMTE DE, a French philosopher and politician, was born at Paris on the 14th of March, 1797; and received under the roof of his father, Comte de Rémusat, chamberlain of the Emperor Napoleon I., and under the care of his mother, a lady of extensive cultivation, and a friend of the Empress Josephine, a more profound training than ordinarily fell to his youthful contemporaries. After the completion of his classical and professional studies, he was called to the bar, and devoted himself to the prosecution of politics and legislation, varying these pursuits with philosophy and poetry, in the latter of which he had from an early age produced several pieces of happy augury. The Restoration of 1814 is said to have precipitated his liberalism; and, formed by the teaching and influence of M. Guizot, he produced several brochures on political, constitutional, and juridical subjects, contributing also to various journals and other periodicals during the decade 1820—1830. To this epoch belongs the production of a treatise, 'De la Procédure par Juges en Matière criminelle,' 8vo, Paris, 1820, Spanish translation, 'Del Modo,' &c., 2 vols., 18mo, Paris, 1827; and of a translation, with a preface, of Cicero's 'De Legibus.' In 1824, M. de Rémusat became connected with the 'Globe,' in which he wrote the remarkable protest against the press ordinances, July 25th, 1830, which resulted in the downfall of the Government of Charles X. In October following he entered the Chamber of Deputies as the representative of Toulouse. He took office in September, 1836, as under-secretary of state to the Ministry of the Interior, but resigned this post on the modification of the Cabinet, in April, 1837; and on the 1st March, 1840, received the portfolio of the Interior in the Thiers cabinet, which was succeeded, in the following October, by the Guizot administration. M. de Rémusat, who on the 27th of April, 1840, had been made a knight of the Legion of Honour, took advantage of his vacation from office to bring out his 'Essais de Philosophie,' 2 vols., 8vo, Paris, 1842, the critical power of which procured for him the membership of the Académie des Sciences, in succession to M. Théodore Jouffroy; 'Abélard,' 2 vols., 8vo, Paris, 1845, a work which comprises at once a valuable life of that philosopher and a lucid exposition of his doctrines; 'De la Philosophie allemande. Rapport à l'Académie des Sciences morales et politiques, précédé d'une Introduction sur les Doctrines de Kant, de Fichte, de Schelling, et de Hegel,' 8vo, Paris, 1845; and 'Passé et Présent. Mélanges,' 2 vols., 12mo, Paris, 1847, second (enlarged) edition, with the modified title of 'Critiques et Études littéraires: ou, Passé et Présent,' 2 vols., 12mo, Paris, 1857. M. de Rémusat was elected a member of the Académie Française in 1846, in succession to M. Royer-Collard; and in his *discours de réception*, which was delivered on the 7th of January, 1847, insisted finally upon the necessity of the alliance between politics and philosophy. He was one of the ministry selected by Louis Philippe on the night 23-24th of February, 1848, about an hour

before the abdication of the king, in the futile hope that certain concessions in the direction of liberalism might prolong the monarchy; and after the accomplishment of the Revolution, he was returned by the Haute-Garonne as a member of the Assemblée Constituante, and was appointed a member of the Committee on the Constitution, and vice-president of the War Committee. In 1849 he became a member of the Legislative Assembly; where he upheld the moderate party as opposed at once to socialism and absolutism. After the coup d'état, he suffered a temporary exile; but was soon recalled to France, where he led a quiet life, devoting himself to study and literary production. Since the election of M. Thiers as president of the Republic, he has given a cordial support to that statesman, in whose cabinet he is minister for foreign affairs.

The works of M. de Rémusat, besides those which have been already mentioned, include, 'Du Paupérisme et de la Charité légale,' 18mo, Paris, 1840; 'Saint Anselme de Cantorbéry. Tableau de la Vie monastique et de la Lutte du Pouvoir spirituel au XI^e Siècle,' 8vo and 12mo, Paris, 1853, Italian translation, 8vo, Milan, 1853; 'L'Angleterre au XVIII^e Siècle. Études et Portraits pour servir à l'Histoire du Gouvernement anglais depuis la Fin du Règne de Guillaume III.,' 2 vols. 8vo, Paris, 1856, second edition, 2 vols., 12mo, Paris, 1856, a collection of articles which were originally contributed to the 'Revue des Deux Mondes'; 'Bacon. Sa Vie, son Temps, sa Philosophie et son Influence jusqu'à nos Jours,' 8vo, Paris, 1857, second edition, 12mo, Paris, 1858; 'Preface' to 'Channing. Sa Vie et ses Œuvres,' 8vo, Paris, 1857, &c.; 'Politique libérale: ou, Fragments pour servir à la Défense de la Révolution française,' 8vo, Paris, 1860; and 'Philosophie religieuse. De la Théologie naturelle en France et en Angleterre,' 12mo, Paris, 1864. M. de Rémusat, amongst numerous contributions to periodical literature, and especially to the 'Revue des Deux Mondes,' brought out in various numbers of that review an interesting series of articles, which recorded his memories of a tour in Italy in 1857.

* RENAN, JOSEPH ERNEST, a French philologist and biblical critic, was born on the 27th of February, 1823, at Tréguir, Côtes-du-Nord, where he received his earlier education. Being destined for the priesthood, he studied successively at one of the primary theological schools of Paris, at the Seminary of Issy, where he devoted himself to science and metaphysics, and finally at the Seminary of Saint-Sulpice, where he developed that singular aptitude for Oriental learning for which he afterwards became distinguished. The independence of his judgment, and his tendency to original critical investigation, led him into a condition of much mental perplexity, which resulted in his abandonment of an ecclesiastical career. Accordingly, he left Saint-Sulpice, and, through the influence of M. Dupanloup, Bishop of Orleans, at that time president of the Seminary, who sympathised with his difficulties, obtained an appointment as tutor in the Collège Stanislas. He vacated this post soon afterwards, and divided his time between private teaching and the studies necessary to qualify him for admission as a university professor of philosophy. In 1847 he received from M. de Tocqueville, as representing the Académie des Inscriptions et Belles Lettres, the *pria Volney*, for a memoir which was afterwards expanded and published as 'Histoire générale et Système comparé des Langues sémitiques,' 8vo, Paris, 1855, &c., fourth edition, 1863, &c. In 1849, having in the previous year published an essay, which was subsequently elaborated into a considerable volume, 'De l'Origine du Langage,' 8vo, Paris, fourth edition, 1863, he was sent on a literary mission to Italy, during which he prepared the materials of his historical essay on Averroes the philosopher; which, having been issued in a more fugitive form, was afterwards published, at the request of M. Victor Cousin, as 'Averroès et Averroïsme. Essai historique,' 8vo, Paris, 1852, second edition, 1860. In April, 1851, M. Renan was appointed librarian in charge of the Oriental MSS. in the Bibliothèque Nationale, and signalled the independence of circumstances which he thus enjoyed by a yet more ardent prosecution of his various studies. In 1852 he took his doctor's degree, with a thesis entitled 'De Philosophia peripatetica apud Syros. Commentatio historica,' 8vo, Paris, 1852; in 1856 was admitted to the Académie, in succession to M. Augustin Thierry; and in December, 1860, was made a member of the Legion of Honour, and commissioned by the Emperor to proceed to Syria for the purpose of exploring the reputed sites of the Phœnician cities. His sister, who accompanied him on this expedition, died suddenly at Byblos, on the 24th of September, 1861; and it is to her spirit—"à l'Âme pure de ma sœur Henriette"—which in this life had been so perfectly sympathetic with his

own, that he afterwards dedicated the "livre premier" of his great work, which owes to the author's Eastern experience so much of its vividness of colour and precision of detail. The more direct literary result of the journey, however, was a volume entitled 'Mission de Phénicie dirigée par M. E. Renan,' 4to, with 'Planches,' fol., Paris, 1864. The death of his sister had the effect of curtailing his stay in the East; and on his return to France, he was appointed by the Emperor to the professorship of the Hebrew, Chaldee, and Syriac languages and literature in the Collège de France, for which he had been proposed in his absence, and which had remained vacant since the death, September 18th, 1857, of the distinguished orientalist, M. E. M. Quatremère. The inaugural address of M. Renan, which was delivered in February, 1862, and published with the title 'De la Part des Peuples Sémitiques dans l'Histoire de la Civilisation,' &c., 8vo, Paris, first four editions, 1862, and others, was so offensive to the clerical party, whom it was the policy of the Emperor to conciliate, that the lectures were indefinitely suspended by a decree in the 'Moniteur' of the following day; and M. Renan, having protested energetically against an appointment to the Bibliothèque Impériale, under which M. Duruy, the Minister of Public Instruction, sought to veil the real nature of the professor's suspension, was driven to depend on the press for the promulgation of his opinions.

The work by which M. Renan is most widely known, and one which has caused an immense commotion throughout Christendom, is his 'Vie de Jésus,' 8vo, Paris, 1863, thirteenth edition, 1867, of which, it is said, 40,000 copies were sold in six weeks, and which has been translated into Italian, German, Dutch, English, Spanish, Russian, Polish, and other languages, in nearly all of which it has been discussed, attacked, confuted, answered, and defended. The exegetical opinions of M. Renan, as stated in the 'Vie de Jésus,' are to the effect that we have neither of the original Gospels which bear the names of Matthew and Mark, whilst the books at present ascribed to them are only subsequent arrangements which were completed one by the other. A judicious criticism may succeed in restoring what belonged to each originally, with sufficient certainty to fix the exact historical worth of these compositions. Thus Matthew is to be trusted, in preference, for the discourses, whilst Mark is to be prized for his superior freedom from credulity, and his greater precision. The Gospel of Luke, again, is entirely derived from that of Matthew and of Mark; and that of St. John, in spite of the fierce contentions to which it has given rise in modern rationalistic criticism, is the Gospel selected by M. Renan as the general basis of his narrative, as being worthy of the first place of all, regard being had to its assertions in biography and history. M. Renan meets the assertion of the miraculous or supernatural with a general denial; and the position he had long before laid down, in 1849, in a periodical entitled 'La Liberté de Penser,' demanded that marvellous recitals were not to be accepted literally, whatever might be their origin or antiquity, inasmuch as the essence of criticism is the negation of supernatural agencies. The 'Vie de Jésus' is, however, something more than a biography of Christ; it is also the "livre premier"—where "livre" is coincident with "volume"—of a larger work entitled 'Histoire des Origines du Christianisme,' of which the "livre deuxième," or second volume, was published with the title of 'Les Apôtres,' 8vo, Paris, 1866, English translation, 8vo, London and Bungay, 1869, and the "livre troisième," entitled 'Saint Paul,' 8vo, Paris, 1869. Two other "livres," or volumes, are announced as necessary to complete the work, the titles of which will be respectively 'L'Antéchrist' and 'Les Derniers Hommes apostoliques.'

Amongst the other works of M. Renan, hitherto unmentioned, may be named 'Études d'Histoire religieuse,' 8vo, Paris, 1857, seventh edition, 1864, of which an American edition, incorporating the famous inaugural lecture at the Collège de France, and an article from the 'Revue des Deux Mondes,' for October 15th, 1860, was published by "O. B. Frothingham, pastor of the third Unitarian Church in New York," with the title of 'Studies of Religious History and Criticism. With a biographical Introduction,' 8vo, New York, 1864; 'Essais de Morale et de Critique,' 8vo, Paris, 1859, second edition, 1860, consisting chiefly of articles reprinted from the 'Revue des Deux Mondes' and the 'Journal des Débats'; 'Le Livre de Job, traduit d'Hébreu. Étude sur l'Âge et le Caractère du Poème,' 8vo, Paris, 1858, third edition, 1865; 'Nouvelles Considérations sur le Caractère général des Peuples sémitiques, et en particulier sur leur Tendance au Monothéisme,' 8vo, Paris, 1859; 'Le Cantique des Cantiques, traduit de l'Hébreu, avec une Étude

sur le Plan, l'Âge, et le Caractère du Poème,' 8vo, Paris, 1860, &c.; 'Questions contemporaines,' 8vo, Paris, 1868; 'La Part de la Famille et de l'État dans l'Éducation,' 12mo, Paris, 1869; and 'La Monarchie constitutionnelle en France,' 12mo, Paris, 1870.

RENDEL, JAMES MEADOWS [E. C. vol. vi. col. 1016].

RENNIE, GEORGE, F.R.S. [E. C. vol. v. col. 60], died: on the 30th of March, 1866, at his house, 39, Wilton-crescent, London, aged 75.

RESTOUT, JEAN, French painter, was born at Rouen, March 26th, 1692. His father, Jean Restout, and his mother were both artists; and he was nephew of the celebrated Jean Jouvenet, whose pupil he became, and whose manner he imitated. Restout designed well, and painted with facility on a large scale; but he was wanting in style, and was a poor colourist. Among his principal works were 'Ananias laying hands on St. Paul,' painted for the church of St. Martin des Champs, and 'Christ curing the Paralytic,' for Saint-Germain-des-Prés, which are now in the Louvre; the ceiling of the library of Ste. Gèneviève; and the 'Presentation of the Virgin,' painted for the city of Rouen. Restout was in 1730 a member, in 1733 professor, in 1752 rector, in 1760 director, and in 1762 chancellor of the Academy. He died at his apartments in the Louvre, January 1st, 1768.

RETHEL, ALFRED, an eminent German painter, was born at Aix-la-Chapelle, on the 15th of May, 1816, and studied under W. Schadow at the Düsseldorf Academy with brilliant success. His early works excited much admiration, but Schadow and the heads of the Düsseldorf school censured him for showing a tendency to abandon the abstract conventionalisms of the school for a more naturalistic manner, and Rethel left Düsseldorf in 1836 for Frankfurt, where he connected himself with Ph. Veit. Here he produced the works which made his name famous in Germany; notably the cartoons for the series of frescoes illustrative of the Life of Charlemagne in the grand salle of the Town Hall; his great picture of the 'Reconciliation of the Emperor Otho I. with his brother Henry,' and a series of portraits of the German emperors. He also prepared a large number of designs which were widely diffused by engravings. Among the most popular were his 'Dance of Death,' in six plates; and his two plates of 'Death as a Friend and an Enemy'—works of great ability. Other well-known series of designs are his 'Rheinischen Sagenkries,' twenty-one plates, folio, 1835; illustrations to Rotteck's History, and the 'Lebensbilder für deutsche Volk,' six plates, fol., Frankfurt, 1850. Failing health led him to make a second visit to Italy, where, during a prolonged stay, he drew several large cartoons of the Passage of the Alps, as a part of a series commemorative of the Life of Hannibal. Returning to Germany, he lingered on in feeble health till released by death at Düsseldorf, December 18th, 1859. Rethel was among the best recent German designers. All that he did was marked by loftiness and purity of purpose, a strong imagination, good drawing, and skilful composition, learning, and intelligence. As a painter he was less successful, being deficient in vigour and facility of handling, and truth and brilliancy of colour.

RETZSCH, MORITZ [E. C. vol. v. col. 63]. This excellent artist died at Dresden, June 11, 1857, in his 78th year.

RETZIUS, ANDERS OLOF, anatomist, was born at Lund, October 3, 1796. After conducting a veterinary school for some time, he, in 1823, commenced teaching anatomy at the Caroline Institute in Stockholm, and continued the occupation till his death, April 18, 1860. He has written numerous papers on biological subjects in the scientific periodicals of Sweden and in Müller's 'Archiv'; but he is chiefly known on account of his classification of skulls according to their relative breadths, which has been very largely employed. Hence he has been regarded by some as one of the founders of human cranio-logy. His knowledge of human skulls was very extensive, and the collection which he formed at Stockholm is exceedingly rich, especially in the crania of the races of Northern Europe.

* REUTER, PAUL JULIUS, founder of the press telegram system, was born at Cassel, July 21st, 1821. While engaged at a banking-house, he gave some attention to science, especially electro-magnetism. In 1847 he removed to Berlin, and engaged in the book trade. The political events of 1848 suggested to him the idea of improving the transmission of intelligence to the newspapers; and when the electric telegraph from Berlin to Aix-le-Chapelle was made available for commercial purposes by the Prussian Government in 1849, he

organised a new system of press telegraphing, employing carrier-pigeons to fill up the gap between Aix-la-Chapelle and Brussels, and supplied newspapers and bankers with news several hours in advance of the regular post. In 1850 he in a like degree organised and accelerated the telegraphic communication from Berlin to Paris. In 1851 Mr. Reuter removed to London, where he established a central office. He contracted with merchants and bankers to supply them with news from almost every capital in Europe; and in order to accomplish this, he spared no expense in laying down short lines of wire and chartering steamers where gaps in the line of communication occurred. For some years the newspaper proprietors were unwilling to avail themselves of his aid; nevertheless he frequently sent them telegrams of foreign news to show what celerity and accuracy he had attained. At length one striking achievement gave a new turn to the whole enterprise. On the 9th of February, 1859, the Emperor of the French made a speech which denoted approaching war between France, Italy, and Austria; the words were spoken about 1 P.M.; within two hours a third edition of the 'Times,' containing the news, was in circulation in the city. From this period the principal journals, one by one, availed themselves of Mr. Reuter's brief telegrams from foreign parts. During the Austro-Italian war, and again during the American civil war, numerous minor arrangements were made by him to supplement the telegraphy of wires in various countries and cables in various seas; and in Lombardy, in 1860, he had three special correspondents at three distinct camps to transmit telegrams direct to his central office in London, whence they were forwarded to several of the newspapers. Mr. Reuter, who obtained a concession for a submarine cable from Hanover to England, and joined Baron Erlangen in starting the French Atlantic Cable, has extended his operations by means of a joint-stock company, which entered into arrangements with the English Government in 1869, in connection with the new system of postal telegraphy. Mr. Reuter has become a naturalised British subject, and resides in London.

REVETT, NICHOLAS. [STUART JAMES, E. C. vol. v. col. 795.]

REYNOLDS, SAMUEL WILLIAM, an eminent engraver in mezzotint, was born in 1774, and was a pupil of Hodges. His plates are exceedingly numerous, and necessarily of unequal merit, many having been produced hastily to meet the requirements of the publishers. He is best known by his engravings of the 'Works of Sir Joshua Reynolds,' a series of over 300 plates issued in three folio volumes; 'The Lion and Snake,' and 'The Falconer,' after Northcote; 'The Fisherman's Dog,' after Morland; Owen's portraits of Bishop Heber, and Rubens's 'Chapeau de Paille,' now in the National Gallery. In 1826 he went to Paris, and whilst there executed mezzotints of 'Napoleon crossing the Alps,' after H. Vernet; and Géricault's 'Wreck of the Medusa,' which had an immense popularity. He died in 1835. Samuel Cousin, R.A., was his pupil, and one of his assistants.

RIBADENEIRA, PEDRO DE, a Spanish Jesuit and hagiographer, was born at Toledo, on the 1st of November, 1527; and, having been sent to Rome at an early age for the purposes of education, was received, in 1540, as one of the earliest disciples of Ignatius Loyola, at a period when his society had not yet attained the confirmation of the Holy See. In 1542 he repaired to Paris for the study of philosophy and theology; and migrated to Padua in 1545, for the completion of his education. In 1549 he was appointed to teach rhetoric at Palermo; and was called upon to pronounce a formal eulogium of his order before the magnates of the city. In 1555 he commenced his travels into various countries of Europe as a Jesuit apologist and propagandist; and in 1558 accompanied the Duke of Feria to England, and devoted much attention to the ecclesiastical affairs of this country, upon which he afterwards produced a work entitled, 'Historia ecclesiastica del Scisma del Reyno de Inglaterra, en la qual se tratan las Cosas mas notables q han sucedido en aquel Reyno, tocantes a nuestra Santa Religion, desde que comengo hasta la Muerte de la Reyna de Escocia,' 8vo, Madrid, 1588, of which a second part was published as 'Segunda Parte de la Historia,' &c., 16mo, Lisbon, 1594, new edition, 2 parts, quarto, Madrid, 1781. He obtained permission, in 1574, to establish himself at Madrid, where, after zealously devoting his pen to the defence of the Romish faith, and to the glorification of the Society of Jesus, and especially of its founder and his immediately succeeding generals, he died on the 1st of October, 1611.

The principal works of Ribadeneira are his 'Vida de San Ignacio de Loyola,' 8vo, Madrid, 1570, new edition, 8vo, Barcelona, 1863, Latin versions, by the author, 8vo, Naples, 1572, 8vo,

Antwerp, 1588, French translation, by Mlle. Evelina de Tressan, "précédée d'une Introduction par M. de B***," 12mo, Toulouse, 1844, a work which has gone through numerous editions, with one of which, folio, Madrid, 1598, was incorporated 'Vidas de Diego Lainez, Alfonso Salmeron, y Francisco de Borja,' 8vo, Madrid, 1592, Latin version, by André Schott, 8vo, Antwerp, 1598, 16mo, Cologne, 1604, &c., and translated in whole or in part into French and Italian; 'Vida de Christo y de su Madre Santissima,' folio, Madrid, 1604, and other editions both before and after, Italian translation, with additions, 4to, Venice, 1682, English (partial) translation, 'The Life and Death of the Virgin Mary,' 12mo, Limerick, 1814—19, French translation, with additions, 'Vie de N. S. Jésus-Christ, de la très-sainte Vierge, de Saint Joseph, et des Fêtes de l'Eglise,' &c., 8vo, Tournay, 1862; 'De la Tribulacion particular y publica,' 8vo, Barcelona, 1691, &c., from a Latin version of which a French translation was made by M. l'Abbé B***, entitled, 'Manuel des Ames affligées: ou, Traité des Tribulations,' &c., 8vo, Nancy, 1855; a work on Government, in opposition to the 'Prince' of Machiavelli, 'Tratado de la Religion y Virtudes que deve tener el Principe Christiano, para gobernar y conservar sus Estados,' &c., 4to, Madrid, 1595, &c., Latin version, 8vo, 1603, &c., and translations into French, English, and Italian; 'Tratado en el qual se da Razon del Instituto de la Religion de la Compañia de Jesus,' &c., 4to, Madrid, 1605; and 'Illustrium Scriptorum Religionis Societatis Jesu Catalogus,' 8vo, Antwerp, 1608, &c., afterwards much enlarged, especially as 'Bibliotheca Scriptorum Societatis Jesu. Opus inchoatum a R. P. Petro Ribadeneira ejusdem Societatis Theologo, anno Salutis 1602: continuatum a R. P. Philippo Alegambe ex eadem Societate, usque ad Annum 1642 recognitum, et productum ad Annum Jubilæi MDCLXXV. a Nathanaele Sotvello ejusdem Societatis Presbytero,' &c., folio, Rome, 1676. But the chief work of Ribadeneira, and which incorporates some of the biographical material already mentioned, is his 'Flos Sanctorum: o, Libro de las Vidas de los Santos,' 2 vols. folio, Madrid, 1590—1610, which, growing in bulk under the hands of successive editors, who were at once critics and biographers, has gone through a great number of editions, amongst which may be mentioned one in 6 parts, 8vo, Madrid, 1716—18, and another, more recent, and still incomplete, entitled 'Flos Sanctorum. Nuevo Año Cristiano. Vidas de los Santos,' &c., 8vo, Cadiz, 1863, &c., Latin versions, 'Vitæ Sanctorum ex orthodoxis Patribus,' &c. Studio et Labore C. Gradii, &c., 4 vols. 8vo, Cologne, 1616, and 'Flos Sanctorum: seu, Vitæ et Res gestæ Sanctorum ex probatis Scriptoribus selectæ,' &c. Additis Annotationibus et Sanctorum Vitis recentioribus a J. Canisio, 2 vols. folio, Cologne, 1700, another edition, 3 vols. folio, Cologne, 1741, often translated into French, 'Les Vies des Saints,' &c., folio, Paris, 1719, 8vo, Bar-le-Duc, 1858—60, and more elaborately as 'Les Vies des Saints et Fêtes de toute l'Année. Traduction française, revue et augmentée des Fêtes nouvelles, des vies des Saints et bienheureux nouveaux, par M. l'Abbé E. Daras,' &c., fourth edition, 13 vols. 8vo, Paris, 1864, the first of which appeared in 1855—58. An eighth edition of an Italian translation of the 'Vidas,' appeared in 2 parts, 4to, Venice, 1680; and amongst the English translations, or partial translations, may be mentioned Mrs. Hope's 'Acts of the Early Martyrs,' 12mo, Dublin, 1855, 8vo, New York, 1857, and an antecedent one, "translated into English by W. P., Esq.," and entitled 'The Lives of the Saints: with other Fastes of the Year according to the Roman Calendar,' second edition, 2 parts, folio, London, 1730.

* RICASOLI, BARON BETTINO, an Italian statesman and scientific agriculturist, the representative of an old baronial family of Lombardy, was born at Florence, on the 9th of March, 1809, and was educated in his native city and at Pisa. Early in life he adopted the principles of liberalism, which, in accordance with his bias towards aristocracy, he believed must be initiated from above, and not by the people. His first prominent political act was the presentation of a memorial to the Grand Duke, in 1847, in which he pointed out the grievances and the critical position of the country, the ignorance, laxity, and inefficiency of the clergy, and the necessity of administrative and municipal reforms. He held aloof from the Republican government of 1848, and, trusting to the promises of the Grand Duke, he interested himself for the return of that prince to Tuscany, in April, 1849, under such conditions as were calculated to ensure the preservation of constitutional privileges. But the expectations thus formed were short and illusory; and when Ricasoli saw that the Grand Duke was upheld by an Austrian garrison, he withdrew from political life, and for ten years devoted himself to his intermitted agricultural pursuits. He enlarged the sphere of his

operations by the reclamation of waste lands, and especially by the draining—under his personal supervision, and with machinery imported from England and elsewhere—of a portion of the Tuscan Maremma, or marshes, which had been long given up to malaria and pestilence. After the expulsion of the Grand Duke in April, 1859, Baron Ricasoli emerged from his retirement to undertake, May 8th, the Ministry of the Interior, in an administration ostensibly formed in the interests of peninsular unity, as represented by the sovereignty of Victor Emmanuel over an Italian kingdom. Subsequently to the realisation of this project, and the merging of Tuscany in the new kingdom of Italy, which was proclaimed on the 14th of March, 1861, Ricasoli was returned by three electoral colleges to the Parliament at Turin, in which he took his seat as representative of Florence, and became Minister of the Interior in the administration of Count Cavour, after whose death on the 6th of June, 1861, he succeeded to the post of President of the Council. During his tenure of office, which continued until the 2nd of March, 1862, he endeavoured to carry out and consolidate the policy of his predecessor; but, although his loyalty and patriotism were undoubted, he did not succeed in attracting the affection of the people or the implicit confidence of parliament. His manners lacked pliancy, and his powers of administration were superior to his gifts of diplomacy—a fact of which he showed his own consciousness when he declined the offered presidency of the Chamber, on the ground of his want of the requisite suppleness and adaptability. He was again appointed to the Ministry of the Interior in 1866; and, on the 20th of June, once more became prime minister, in succession to General Alphonso de la Marmora, whom it became necessary to set free for the military operations of the war against Austria, the declaration of which was announced to the Italian parliament, coincidentally with the announcement of the constitution of the Ricasoli cabinet. On the 11th of February, 1867, Baron Ricasoli, whose policy with regard to the property of the church did not command the confidence of parliament, tendered his resignation to the king, who pressed him to continue in office. The Chamber was dissolved, and the ministry somewhat modified; but, although the government gained by the elections, the increase of strength was not sufficient to encourage Ricasoli to persevere in the conduct of the administration. Accordingly he definitively resigned on the 5th of April, 1867, and was succeeded by Rattazzi.

The political career and character of Baron Ricasoli have given rise to abundant discussion; and among the works which he has either produced himself, or of which he has caused the production by others, may be mentioned, 'Discorso pronunziato da S. E. il Barone Bettino Ricasoli, Presidente del Consiglio e Ministro degli Affari esteri, per l'Inaugurazione del Monumento a S. M. il Re Carlo Alberto il Magnanimo, 21 Luglio, 1861,' 4to, Turin, 1861; 'Le Baron Ricasoli et la Question Romaine,' 8vo, Paris, 1861; 'Speeches delivered in the Italian Chamber of Deputies, on the 18th, 19th, and 20th of April, 1861, on Baron Ricasoli's Interpellation upon the Subject of the Southern Army, lately under the command of General Garibaldi,' 8vo, London, 1861; 'Il Ministerio Ricasoli e le Relazioni della Chiesa collo Stato. Discussione alla Camera dei Deputati sull' Interpellanza Ferrari intorno la Missione Tonello a Roma, con Documenti e Note 9—15 Luglio, 1867,' 8vo, Florence, 1867. A biography of Baron Ricasoli, by F. dall' Ongaro, formed No. V. of 'I Contemporanei Italiani,' 16mo, Turin, 1861, &c., of which an English translation appeared as 'Baron Ricasoli, Prime Minister of Italy,' &c., 8vo, London, 1861.

RICCI, MATTEO, a Jesuit missionary and Chinese scholar, was born on the 6th of October, 1552, at Macerata, in the March of Ancona, where he received his earlier education. He studied law at Rome, and acquired considerable skill in mathematics under the celebrated Christopher Clavius. He was admitted a member of the Society of Jesus on the 15th of August, 1571; and in 1578, having devoted himself to the Eastern mission, proceeded to Goa, where he completed his course of theology, and taught rhetoric, and applied himself assiduously to the language of China, to which country he was destined, in order to open it up as a field of Christian propaganda. After a series of difficulties and failures, he was permitted, in 1583, to establish himself, with two other Italian fathers, Roger and Pasio, at Tchao-King-fou, in the province of Canton; and won the admiration of the Chinese by his mathematical learning, and the art with which he adapted a map of the world to Chinese prejudices. In a similar spirit of compliance he drew up a Chinese catechism, which, keeping in the background the dogmatic features of Christianity, gave

especial prominence to the precepts of morality and natural religion. In 1589 he was left in sole charge of the mission at Tchao-King; and, after undergoing various difficulties and dangers, more or less formidable, in the course of which he had to leave his establishment at Tchao-King, succeeded, in 1600, in procuring access to the Emperor at Pekin, in the hope of obtaining the influence of the court in favour of his operations. He presented himself in the double character of a scholar and an ambassador commissioned by the Portuguese with the presentation of scientific and other novelties to the Emperor. He was well received by the latter, and was allowed to settle in the capital, where his learning and talents rendered him acceptable to the court and to the men of letters. The cares of the mission, and the anxieties of the multiform duties, religious and secular, which devolved upon him, added to the hardships of the earlier stages of his career in China, accelerated his death, which took place at Pekin on the 11th of May, 1610. He was buried with much distinction, and with the open observance of Catholic ceremonial.

Father Ricci produced fifteen works in the Chinese language, for the information of that people upon philosophical, moral, religious, mathematical, astronomical, and geographical subjects. His *Memoirs or Commentaries on China* formed the basis of Father Trigault's work entitled 'De Christiana Expeditione apud Sinas suscepta ab Societate Jesu, ex Matthæi Ricci Commentariis, Libri quinque,' 4to, Leyden, 1616, 8vo, Cologne, 1617, French translation, by T. C. D. A., 'Histoire de l'Expédition Chrestienne en la Chine,' &c., 8vo, Paris, 1618; and his 'Chinese Letters' form part of a volume entitled 'Litteræ Japonicæ Anni MDCVI. Chineses Anni MDCVI. et MDCVII. Illæ à R. P. Joanne Rodriguez: hæ à R. P. Matthæo Ricci, Societatis Jesu Sacerdotibus,' &c., 12mo, Antwerp, 1611.

RICHARD OF ARMAGH, *Latine* RICHARDUS ARMACHANUS, whose real name was Fitz-Ralph or Fitz-Raufe, Archbishop of Armagh in the 14th century, is variously stated to have been born in Devonshire, and at Dundalk, in the county of Louth, in Ireland. He was educated at Oxford, successively at University College and Balliol College; and took the degrees in arts and divinity. In 1333 he was commissary-general of the university; on the 10th of July in the following year was collated to the chancellorship of the cathedral church of Lincoln; became Archdeacon of Chester in 1336; on the 20th of April, 1337, was installed in person as Dean of Lichfield; and in 1347 was promoted to the archbishopric of Armagh. Whilst at Oxford he distinguished himself by his opposition to the Mendicant friars, whose affectation of poverty and other superstitions and irregularities he exposed in his lectures, his object being their reform, rather than their abolition. He also preached against them in London; and the incensed friars procured him to be cited, in consequence, before Pope Innocent VI., at Avignon, where he exhibited much firmness in the defence of his opinions, and where he died in 1360, not without suspicion of poison. The discourse which he made before the pope and cardinals at Avignon, and which was a defence of the parish priests against the Mendicants, was published with the title of 'Defensorium Curatorum contra eos qui Privilegiatos se dicunt,' 4to, about 1475, another edition, 4to, about 1480, folio, Lyons, 1490, 8vo, Paris, 1625. He also produced, amongst other polemical works, a treatise entitled 'De Audientia Confessionum,' and 'Sermones quatuor, ad Crucem Londinensem.' Fox, the martyrologist, asserts that Archbishop Fitz-Ralph translated the whole of the Bible into Irish, and that it was preserved in the 16th century; and Archbishop Usher says that in his time several fragments of this translation were extant in Ireland.

RICHARDSON, DR. CHARLES [E. C. vol. v. col. 92]. This distinguished philologist died October 6, 1865, at the ripe age of 90.

RICHARDSON, SIR JOHN, M.D. [E. C. vol. v. col. 92]. The situation of Director-General of the Medical Department of the Navy having become vacant by the retirement of Sir William Burnett, 1855, Sir John Richardson applied for it in the usual terms to the First Lord of the Admiralty, but was informed that his age was considered to disqualify him for promotion. He thereupon resigned his post as chief medical officer at Haslar Hospital, and was placed on the retired list of medical inspectors, having spent forty-eight years in the public service. From this time he resided at Lancrigg, a pleasant villa near Ambleside, Westmoreland, but continued to attend the annual gatherings of the British Association, and occasionally to make distant journeys. In December, 1856, he received one of the royal medals of the Royal Society, for his Arctic researches and general scientific

labours. Nor did he allow his pen to remain idle. He wrote, 1857, for the 'Encyclopædia Britannica,' a short memoir of Sir John Franklin, and the articles 'Polar Regions' and 'Ichthyology.' He also edited, 1859—62, a new edition of Yarrell's 'British Fishes,' and contributed many papers to the 'Museum of Natural History,' and, up to within an hour or two of his death, he was occupied in reading and noting Wycliffe's Bible for the Dictionary of the Philological Society. He died very suddenly on the 5th of June, 1865, and was buried in Grasmere churchyard, near the grave of Wordsworth. (Rev. John Mellraith, *Life of Sir John Richardson*, C.B., 12mo, London, 1868.)

RICHARDSON, THOMAS, chemical technologist, was born at Newcastle-upon-Tyne, in 1817. He studied chemistry at Glasgow University, in the laboratory of Dr. Thomas Thomson; then under Liebig, at Giessen; and afterwards under Pérouze, at Paris. On returning to Newcastle, he became connected with chemical manufactories; introduced new processes and apparatus in some of the lead works in the neighbourhood, and established the manufacture of new artificial manures. He was appointed professor of chemistry in the Medical College at Newcastle, and in 1859 reader in chemistry at Durham University. On the invitation of the North-Country Steam Coal Association, he undertook, in conjunction with Sir W. E. Armstrong and Mr. Langridge, an elaborate investigation into the economic combustion of coal under steam boilers, and the relative merits of North-Country coal and Welsh coal. In 1866, in conjunction with Mr. Fletcher, he made a similar examination of Lancashire and Cheshire coal. Dr. Richardson and Dr. Edmund Ronalds edited an English translation of Knapp's 'Chemical Technology,' 2 vols. 8vo, 1848; but this has since been almost wholly re-written, and greatly extended, by Dr. Richardson and Mr. Henry Watts; five volumes of the new edition had appeared by 1871, and others were in progress. Dr. Richardson held the degrees and honours of Ph.D., A.M., F.R.S., and M.R.I.A. He died July 10th, 1867.

* RICHMOND, GEORGE, R.A., was born March 28, 1809; became a student of the Royal Academy in 1824; and early commenced practice in painting portraits in water-colours. By these and his chalk drawings he acquired celebrity, but eventually devoted himself to painting in oil. Mr. Richmond has probably painted the portraits of a larger number of distinguished persons than any of his contemporaries, his sitters including such men as Macaulay, Ruskin, E. M. Ward, R.A., and the like; the Prince of Wales, the Earl of Shaftesbury, and a large proportion of the higher nobility; the Archbishop of Canterbury, Bishop Wilberforce, John Keble, and a considerable portion of the episcopal bench, and other dignitaries and leading members of the clerical profession; Lord Cranworth, Stephen Lushington, and other eminent lawyers, and a vast number of ladies of high position, as well as many presentation and memorial portraits of municipal and other official personages. As may be supposed from the amount and character of the patronage he has enjoyed, Mr. Richmond possesses great facility in catching a favourable likeness. He seldom fails, indeed, to smooth away some of the ruggedness of his male sitters, while his female portraits are always graceful and usually elegant, and both classes are marked by clear and careful execution. Besides his portraits, Mr. Richmond has painted several scriptural subjects, such as 'The Agony in the Garden,' 1858; poetical pieces, as 'Comus,' 1864; and one or two landscapes, as a 'Sunset seen from Hyde Park,' 1861. Mr. Richmond was elected A.R.A. in 1859, and R.A. in June, 1866.

RIEMANN, GEORG FRIEDRICH BERNHARD, was born 17th September, 1826, at the village of Breselenz, near Dannenberg, in Hanover, of which his father was pastor. While yet a child, he exhibited great powers of arithmetical calculation, and it is said that an able tutor had to make unusual exertions in order to follow the short and original solutions of the problems submitted to his pupil. In 1840 he entered the Lyceum in Hanover, and after two years the Gymnasium of Lüneburg, under Director Schmalfuss, who soon discovered Riemann's mathematical talent, and lent him works on the higher mathematical subjects. In 1846 he entered the University of Göttingen as a student of theology, but the lectures of Gauss made him so fond of exact science, that he obtained his father's permission to devote himself to science. He studied two years under Jacobi at Berlin, and returned to Göttingen, where he graduated. In 1854 he qualified for the post of teacher, and in 1857 became professor extraordinarius. He published several mathematical and physico-mathematical papers in Poggendorff's 'Annalen,' Crell's 'Journal,' and the 'Abhandlungen' of the Academy of Sciences of Göttingen, of which he became a member in 1860. He married

in 1862, and in July of the same year was attacked with pleurisy. Through the good offices of some of the professors of Göttingen, he was enabled to travel in Italy for the benefit of his health. After some months' residence his health was partly restored, but he suffered a relapse in crossing the Splügen, so that he had to return to Italy, and he passed two winters in Pisa. In the autumn of 1865 he returned to Göttingen, and commenced a paper on the mechanism of the ear, which was published after his death. A paper on the surface of least area having a given boundary, is printed in vol. xiii. of the 'Abhandlungen.' He again visited Italy, with the intention of completing his unfinished works, but he died on the 16th June, 1866, at Selasca, near Intra, on the Lago Maggiore. His memoirs on the propagation of plane waves of finite amplitude in air, and on the motion of a fluid homogeneous ellipsoid, are in the 8th and 9th vols. of the 'Abhandlungen.'

RIENZO, or RIENZI, COLA DI, and, more precisely, NICCOLO GABRINO DI RIENZO, distinguished in one of the most popular of modern romances as the 'Last of the Tribunes,' was born at Rome about the year 1310. Although he claimed through his father an illegitimate descent from the Emperor Henry VII., his parents were of mean condition; but, triumphing over all obstacles in the way of education, he became an accomplished scholar, well versed in the literary, artistic, and monumental antiquities, as well as in the history of the past political glories of his country, from the ancient magnificence of which he drew the augury of future liberty and splendour. He was a notary by profession, and an orator of rare and persuasive eloquence. His life and career form an episode of that seventy years' period during which the Papal court was held at Avignon, where it was first established in 1306, by Clement V., who was a Frenchman. The absence of the popes left Rome and its dependencies a prey to the unchecked fury and factions of disorderly nobles, whose houses were fortified castles, and whose ceaseless turbulence and tyranny robbed, oppressed, and demoralised the people. Such excesses revolted the mind of Rienzo, whose brother had been slain without retribution made for his death, and who, after long pondering on the anarchy of the State, strove to awaken in the citizens the resolve of freedom. When, in 1341, Petrarch was crowned at the capitol, it seemed to Rienzo a revival of Rome's ancient glories, and he contracted a friendship with the poet, which continued, with slight interruption, to the last, and which was strengthened and consolidated in 1342, at Avignon, whither Rienzo had been commissioned as one of the members of a deputation to supplicate Clement VI. to remove the Holy See from Avignon to Rome. The pope was charmed with the extraordinary eloquence of Rienzo, to whom he listened with pleasure and frequency, and whom, although he did not accede to his prayer, he sent back to Rome invested with the dignity of high and responsible office. He fulfilled the duties of vicar-apostolical with zeal, justice, and integrity; and when on the 20th of May, 1347, in response to his passionate and patriotic eloquence, he was elected by popular acclamation to the Government of Rome, with the title of Tribune, the dignity was recognised by the Bishop of Orvieto, the pope's legate and Rienzo's colleague, and confirmed by the Pontiff himself. He sought to restore the Roman Republic to its ancient form, and acquired, according to the testimony of Machiavelli, "so great a reputation for justice and virtue, that not only the places adjacent, but the whole of Italy, sent ambassadors to him. The ancient provinces, seeing Rome arise to new life, again raised their heads, and some induced by hope, others by fear, honoured him as their sovereign." Several kings appealed to his tribunal, as had been customary in the times of the ancient republic; and Louis of Hungary, especially, referred to his decision the quarrel between himself and Queen Joanna of Naples, whom he accused of having murdered her husband, his brother. Trade, commerce, justice, and security were fostered and ensured. Constitutionally inclined to mysticism and enthusiasm, Rienzo thought to fortify his rule by much symbolism and pageantry—a practice which naturally led him into the commission of many acts which, if only because they were generally unintelligible, were judged to be wanton, fanatical, or arrogant. A confederacy, headed by the great families whose authority and immunities he had abridged, was formed against him in December, 1347, and he retired, after various wanderings in Italy, to seek refuge from Charles, King of Bohemia, who, by the influence of the pope, and in contempt of Ludwig of Bavaria, had been elected Emperor, and who, it is said, in order to ingratiate himself with the Pontiff, sent Rienzo as a prisoner to Avignon, where he remained for some years the occupant of a

dungeon. At length, in 1353, Innocent VI., who had succeeded Clement in the Papacy, having at heart the amelioration of the state of misrule and anarchy to which Rome had again fallen a victim, released Rienzo, and sent him to Rome as the colleague of his legate, Cardinal Gil Albornoz, who, a warrior as well as a prince of the church, defeated on his way various enemies of the Papal power, and restored various revolted states to their allegiance to the Holy See. The Romans received Rienzo with enthusiasm; but when they found him hampered with restrictions and with the necessity of raising supplies, which he endeavoured to accomplish by means of a tax on wine and salt, their loyalty and affection turned to hatred and contempt. On the 8th of October, 1354, only seven weeks after his arrival in Rome, a furious insurrection took place; and Rienzo, having hastily adopted a mean disguise, sought to escape from his residence, the capitol, which had already been fired by the people. Having been detected, however, and having in vain endeavoured by his eloquence to change the purpose of his enemies, he was stabbed to death, after which his body was subjected to the vilest indignities.

RIEPENHAUSEN, FRANZ, German painter and engraver, was born at Göttingen in 1786, and was the eldest son of Ernst Ludwig Riepenhausen (born 1763, died 1840), an engraver of some note in that city. Franz learned engraving of his father, then became a pupil of Wilhelm Tischbein; in 1804 passed into the Cassel art-academy, and thence, 1805, into that of Dresden. He had attracted notice by some illustrations of Tieck's 'Genoviva,' 1806, and other etchings, when in 1807 he and his brother Johannes were enabled by the liberality of the Westphalian government to continue their studies at Rome, whither they went in company with Tieck. Here the brothers devoted themselves to the study of the works of Raffaele and his predecessors; and produced numerous designs in chalk illustrative of the poems of Goethe, Schiller, &c., and some scriptural subjects. They also painted, alone or in conjunction, several altar-pieces and other pictures in oil, including some for the Hall of the Guelphic Order at Hanover. They likewise published, 1820—24, three parts of a 'History of Painting in Italy,' with outline engravings from the works of the chief painters prior to Perugino; also 'The Paintings of Polygnotus in the Lesche at Delphi, designed and engraved from the Descriptions of Pausanias,' 16 plates, Rome, 1826—29. Franz Riepenhausen died at Rome, January 3rd, 1831.

RIEPENHAUSEN, JOHANNES, younger brother of the preceding, was born at Göttingen in 1788. The brothers, as indicated above, studied together, went together to Rome, and worked in common till the death of Franz in 1831. Johannes then set about completing the engravings, and arranging the materials of the life of Raffaele already commenced, in continuation of the History of Painting in Italy. The Italian edition, 'Vita di Raffaello,' appeared at Rome in 1834, the German at Göttingen in 1835. He subsequently painted the 'Death of Raffaele,' 1836; 'The Emperor Maximilian and the Duke of Brunswick;' 'The Cenci,' and other large oil pictures. He died at Rome in September, 1860.

RIETSCHEL, ERNST FRIEDRICH AUGUST, an eminent German sculptor, was born at Pulsnitz, in Saxony, December 15th, 1804. He studied in the Dresden art-academy, and afterwards at Berlin under Rauch. In 1827 he went to Rome as academy student, and remained there about a year. On his return he was commissioned to execute a colossal statue of Friedrich Augustus of Saxony. Henceforward his position was assured. He was nominated member, and in 1832 professor, in the Dresden Academy; was elected member of several foreign academies, including that of France; decorated with numerous orders, and actively employed by his own and other German governments. His works consist of classical, poetical, and religious groups, statues, and reliefs, and portrait busts and statues. Among the chief may be named a 'Pieta,' life size, executed for the King of Prussia, which takes high rank among modern works of that class for beauty of design and religious sentiment; 'The Christ-Angel,' a work of wide popularity; a series of reliefs representing Morning, Noon, Twilight, Night; colossal statues of Goethe and Schiller for Weimar; Lessing for the city of Brunswick; Weber for Dresden, and several more; besides busts of Rauch, Luther, &c., for the Walhalla; and a large number of other public and private commissions. He had also completed the design for the Worms memorial statue of Luther, but its execution was left for another hand. Rietschel died at Dresden, February 21st, 1861. (Appermann's *Ernst Rietschel*, Leipzig, 1863.)

RIGAUD, STEPHEN JORDAN, Bishop of Antigua [E. C. vol. vi. col. 1019], died on the 23rd of June, 1859.

***RIGAUD, STEPHEN PETER, M.A., F.R.S.**, Savilian professor of astronomy at Oxford [E. C. vol. vi. col. 1018].

RITCHIE, LEITCH [E. C. vol. v. col. 104], died on the 16th of January, 1865.

* **RITTER, AUGUST HEINRICH**, but generally known as Heinrich, a German philosopher, was born at Zerbst, in the year 1791, and received his earlier education under the roof of his father, who was an eminent legist, and at the Gymnasium of his native town. In 1811 he commenced at the University of Halle the study of theology, which he afterwards prosecuted successively at the Universities of Göttingen and Berlin. His studies, which had from an early period determined towards philosophy, were interrupted by a campaign as a volunteer in the German army against France; but in 1815, at the suggestion of his father, by whose advice he had been directed and encouraged in all his studies, he became a successful competitor for the prize offered by the Berlin Academy of Sciences on the subject of the Influence of the Cartesian Philosophy on that of Spinoza, &c. This essay was published together with a treatise, embodying a doctrine upon which Ritter afterwards proceeded in his teaching, on the Formation of the Philosopher by the History of Philosophy, 'Ueber die Bildung des Philosophen durch die Geschichte der Philosophie,' 8vo, Leipzig, 1817, in which he showed that, as the present state of the science is the result of all previous states, an intimate acquaintance with its history is indispensable to its further advancement. The successful essayist now devoted himself entirely to philosophy, in which he took his doctor's degree; and, having become a tutor in that faculty at Berlin in 1817, was appointed extraordinary professor in the same university in 1824. In 1832 he was elected a member of the Royal Academy of Sciences; but, having been disappointed in the hopes he had reasonably entertained of succeeding to the chair left vacant by the death of Hegel, on the 14th of November, 1831, he accepted, in 1833, a chair in the University of Kiel, from which he migrated in the early part of 1838, to undertake the professorship of philosophy at Göttingen.

Ritter occupies an independent position in the field of speculative philosophy; and, without attaching himself to any school, favours the principles of eclecticism. Several of his works, which, especially his minor treatises, are very numerous, have been translated into French, English, and other languages of Europe. They include an Examination of the Philosophical Doctrine of Empedocles, 'Ueber die philosophische Lehre des Empedokles,' contributed to Wolf's 'Literarischen Analekten,' 1820; History of the Ionian Philosophy, 'Geschichte der Ionischen Philosophie,' 8vo, Berlin, 1821; Introduction to Logic, 'Vorlesungen zur Einleitung in die Logik,' 8vo, Berlin, 1823; Epitome of Logic, 'Abriss der philosophischen Logik,' 8vo, Berlin, 1824, second edition, 1829; History of the Pythagorean Philosophy, 'Geschichte der Pythagorischen Philosophie,' 8vo, Hamburg, 1826; The Semi-Kantians and Pantheism, 'Die Halb-Kantianer und der Pantheismus,' &c., 8vo, Berlin, 1827; History of Philosophy, 'Geschichte der Philosophie,' 12 vols. 8vo, Hamburg, 1829—53, second edition, 8vo, 1836, &c., which devotes four volumes to the History of Ancient Philosophy, 'Geschichte der Philosophie alter Zeit,' 1829—34, second edition, 1836—38, French translation, by Dr. Tissot, 4 vols. 8vo, Paris, 1836—37, English translation, by Alexander J. W. Morrison, B.A., 4 vols. 8vo, Oxford, 1838—1846, four other volumes to the History of Christian Philosophy, 'Geschichte der Christlichen Philosophie,' 1841—45, French (partial) translation, by M. Trullard, 2 vols. 8vo, Paris, 1843—1844, and the remaining four volumes to the History of Modern Philosophy, 'Geschichte der neuern Philosophie,' 1850—53, French translation, "précédée d'une Introduction par M. Challemeil-Lacour," 3 vols. 8vo, Paris, 1861; On the Recognition of God in the World, 'Ueber die Erkenntniss Gottes in der Welt,' 8vo, Hamburg, 1836; Philosophical Miscellanies, 'Kleine philosophische Schriften,' 3 vols. 8vo, Kiel, 1830—40; 'Historia Philosophiæ Græco-Romanæ ex Fontium Locis contexta,' &c., 8vo, Hamburg, 1838, second edition, with slightly modified title, 8vo, Göttingen, 1857, third edition, 1864, a work produced in association with L. Preller; a paper read before the Göttingen Royal Scientific Society, on Our Knowledge of Arabic Philosophy, &c., 4to, Göttingen, 1844; Essay on the post-Kantian Philosophy of Germany, 8vo, Brunswick, 1853, reprinted from the 'Allgemeine Monatsschrift für Wissenschaft und Literatur'; System of Logic and Metaphysics, 'System der Logik und der Metaphysik,' 2 vols. 8vo, Göttingen, 1856; On the Development

of Christian Philosophy, 'Die Christliche Philosophie nach ihrem Begriff, ihren äussern Verhältnissen, und in ihrer Geschichte bis auf die neuesten Zeiten,' 2 vols. 8vo, Göttingen, 1858-59; 'Encyclopädie der philosophischen Wissenschaften,' vols. 1 and 2, 8vo, Göttingen, 1862-63.

RITTER, KARL [E. C. vol. v. col. 106]. Being endowed with unusual health and strength, Ritter carried on his great scheme of a universal geography as far as his professional duties would allow. In addition to the volumes of his 'Erdkunde,' already mentioned, he wrote a second on Arabia, forming the 13th of the whole work; the next four were devoted to the peninsula of Sinai; and the last published contains the first part of Asia Minor. After Asia was finished he contemplated treating Europe in the same manner, for which object he had collected a large quantity of material; but his life, although it spanned upwards of eighty years, was too short for the task. He died September 28, 1859.

ROBBIA, LUCA DELLA, Italian sculptor and inventor of the potter's ware which bears his name, was born at Florence, about 1400, and learned to design and model in wax of a celebrated goldsmith, Leonardo di San Giovanni. His spare time, however, was given to sculpture; and while still a youth he was employed by Sigismond di Malatesti, lord of Rimini, to carve the marble ornaments in a monumental chapel he was building. Recalled to Florence, Luca was commissioned by the wardens of Santa Maria del Fiore to execute some bassi-relievi for the campanile of Giotto, which excited great admiration; and afterwards to carve the marble ornaments on the organ screen, in which were some admirable figures of singing boys, designed in rivalry with the screen of Donatello on the opposite side of the cathedral: both are now in the Florence Gallery. So well satisfied were the wardens with this work, that they gave Luca the commission for the great bronze door of the sacristy. On this door, which he divided into ten compartments filled with reliefs, he was employed several years. It was greatly admired; but, according to Vasari, he found that from the time expended on them these works produced so little profit that he, about 1438, determined to abandon bronze and marble, and work in terra-cotta. Succeeding in this, he became anxious to discover a means of securing it from the effects of the atmosphere, and eventually invented an opaque glaze, or enamel, which perfectly answered the purpose, and produced a novel and pleasing effect. The first important work of this kind was, according to Vasari, a bas-relief placed over the door of the sacristy of S. Maria del Fiore. The early specimens were white, but he now determined if possible to add colour to them, and after many failures succeeded. The ware became exceedingly popular, and Robbia received numerous commissions. Cosmo de' Medici employed him to decorate the ceiling and pavement of a study with this coloured ware, and afterwards the central chapel and that of S. Jacopo, in the church of St. Miniato-al-Monte. The fame of these and other works in the same material soon brought Luca commissions, not only for other churches and palaces in Florence, but from Fiesole, Naples, and even from Spain. Indeed, says Vasari, so widely was their celebrity spread through Europe, that the Florentine merchants began to find them a profitable article of commerce, and kept Luca so fully employed at this kind of work, to his great profit, that he was fain to call in his relatives, Andrea, Ottaviano, and Agostino, to assist him. He continued his labours till about 1471. He died at Florence in 1481.

Luca made over the works to his nephew ANDREA DELLA ROBBIA (born 1437, died 1528), to whom he confided his secret, and who continued the manufacture with scarcely inferior ability. Andrea bequeathed the manufactory to his sons, in whose hands the ware began to deteriorate. It afterwards passed by marriage to the Buglioni, and, still declining, was finally abandoned in the latter part of the 16th century. In our own day, Della Robbia ware has again come into fashion. Original examples command very high prices, and it has been successfully imitated on the Continent, and by Minton in this country. Many of the enamelled terra-cottas of Luca remain in perfect preservation in their original positions; others have been removed uninjured to museums. The Louvre possesses a fine 'Madonna adoring the Infant Jesus,' by him. In the South Kensington Museum are more than fifty good specimens of this work, including several fine medallions by Luca, and an altar-piece, 'The Adoration of the Magi,' and others by Andrea della Robbia. The most remarkable example is a massive medallion eleven feet in diameter, one of the largest works of its kind ever made. It was taken from the exterior of

BIOG. DIV.—SUP.

the Villa Pontificia-Ximenes, near Florence; and though exposed there for nearly 400 years, is still almost uninjured.

(Barbet de Jouy, *Les Della Robbia*; *Étude suivie du Catalogue de leurs Œuvres*; Vasari, Baldinucci, Cicognari, &c.).

* ROBERT-FLEURY, JOSEPH NICOLAS, a celebrated French painter, was born August 8th, 1797, at Cologne, then in the department of the Roër. He studied in Paris, and obtained a medal of the second class in 1824. Robert-Fleury early distinguished himself as a partisan of what is known in France as the neo-romantic school. His subjects are mostly incidents from the bye-paths of history, or the biography of eminent men, but he is classed by his countrymen among the painters of genre. Among his most characteristic pictures are—'Le Colonne de Poissy,' now in the Luxembourg; 'Une Scène d'Inquisition,' 'Benvenuto Cellini,' 'Charles-quin au Monastère de Saint Just,' and 'Louis XIV.' the last two of which were in the International Exhibition of 1862. M. Robert-Fleury's works are characterised by sobriety of style, careful drawing and execution, a warm tone of colour, and refinement of expression. In 1836 M. Robert-Fleury was created a knight, and in 1849 officer of the Legion of Honour. In 1850 he was elected member of the Institute, and professor in the École des Beaux-Arts, of which he was appointed director on its reorganisation in 1863.

ROBERTS, DAVID, R.A. [E. C. vol. v. col. 114]. This celebrated artist and kind-hearted man died on the 27th of November, 1864. In 1866 appeared the 'Life of David Roberts, R.A., compiled from his Journals and other sources, by James Ballantine. With Etchings and Fac-similes of Pen-and-Ink Sketches by the Artist.'

ROBERTSON, REV. FREDERICK WILLIAM, eldest of the four sons and seven children of Captain Robertson, R.A., was born in London, at the house of his grandfather, Colonel Robertson, on the 3rd of February, 1816. The first five years of his life were spent at Leith Fort, at that period the station of his father, who, with the view of educating his children more efficiently, retired from the service and settled at Beverley, where he previously instructed his son for four years, and then sent him to the grammar-school of that town. In 1820 the family removed to Tours; but returned to England in consequence of the Revolution of July, 1830. Young Robertson now became a pupil of the Edinburgh Academy; and afterwards conjoined the private tuition of Mr., afterwards Bishop, Terrot, with attendance upon various classes in the University. In 1833 he was articled to a solicitor at Bury St. Edmunds, and passed a year in his office; although at this time, as indeed throughout his life, his heart was with the army, to which his earliest associations attracted him, and in which two of his brothers became officers, while the third held a commission in a regiment of militia. He himself received the promise of a commission; but, in disappointment at its late arrival, and acting upon the wish of his father, and the advice of Dr. Daly, Bishop of Cashel, he decided to enter the Church, and with this view matriculated on the 4th of May, 1837, at Brasenose College, Oxford, where he went into residence in the following October. Four days after his matriculation, the coveted commission was granted; but as Captain Robertson recognised the hand of Providence in the fact of the matriculation having been then completed, the career thus begun was not interrupted, and the commission was reluctantly declined. He took his B.A. degree in due course, and proceeded M.A. in 1844. On the 12th of July, 1840, he was ordained by Dr. Sumner, Bishop of Winchester, and entered upon a curacy in that city on the 19th of the same month, which he occupied for a year; and then, after having passed his examination for priests' orders, sought to recover his health, which had considerably suffered, by a tour on the continent, in the course of which he stayed for some time at Geneva, where he married a daughter of Sir George William Denys, then equerry to the Duke of Sussex. Returning to England, he became curate to Dr. Boyd, Dean of Exeter, at that time incumbent of Christ Church, Cheltenham; and, entering upon his duties in the summer of 1842, remained there for above four years, during which his views underwent considerable change and enlargement. On leaving Cheltenham, he again repaired to the continent; and in the course of his travels, which extended to the Tyrol, spent some weeks at Heidelberg, where he devoted himself to the examination of German theology and metaphysics. He received from Bishop Wilberforce the charge of the parish of St. Ebbe's, Oxford; and shortly afterwards left it in order to enter upon the incumbency of Trinity Chapel, Brighton, in which he preached his first sermon on the 15th of August, 1847. The

3 X

fearless liberality of his opinions presently alienated many members of the old congregation; but their places were more than supplied by the crowds who flocked to listen to the singular, yet restrained, fervour of his eloquence. The young, the eager, and the thoughtful regarded him with reverence and affection; and he brought Christianity as a power to bear upon the daily life and the social state of all classes. His sympathy with the poor was so ardent, and his activity in their behalf was so constant and multiform, that he became obnoxious to the charge of being a democrat and revolutionist. He assisted in establishing a Working Man's Institute; and in an Address which he delivered on the 23rd of October, 1848, convinced the working classes that "at last a clergyman had entered into their aspirations and their wrongs." This 'Address,' which was afterwards published, 8vo, Brighton, 1849, "attracted," Mr. Robertson wrote in a letter to a friend, "more notice than it deserved, and than I expected, vituperative and laudatory. It has been read by her Majesty; distributed by nobles and Quakers; sneered at by Conservatives; praised by Tories; slanged by Radicals; and swallowed, with wry faces, by Chartists." It was followed up by lectures, speeches, and addresses, having for their object the intellectual, moral, and spiritual elevation of the working men; in whose behalf, especially in a sermon preached at St. John's Church, in Charlotte Street, Fitzroy Square, London, in June, 1851, he incurred from the 'Record' the charge of preaching democracy and socialism, notwithstanding that the latter was distinctly opposed in his discourse. The only sermon published in the life-time of Mr. Robertson was one which he delivered on the day of the public mourning for the late Queen Dowager, and which bore the title of 'The Israelite's Grave in a Foreign Land.' Two sermons which, according to his custom of discussing the subjects of the day, he preached upon the Gorham controversy, gave displeasure to both parties; but it is claimed for them that "they reconciled to the Church many who had despaired of ever accepting the teaching of her baptismal services." Within six months, it was said, Mr. Robertson had put himself into opposition with the whole accredited theological world of Brighton on the questions of the Sabbath, the Atonement, Inspiration, and Baptism. "His words were garbled; passages from his sermons, divorced from their context, were quoted against him; persons who could not understand him came to hear him and look at him as a strange phenomenon; he became the common talk of all the theological tea-tables of the town. People were solemnly warned against him; those who knew little of his doctrines, and less of himself, attacked him openly, with an apparently motiveless bitterness. He had dared to be different from the rest of the world, and that in itself was revolutionary. He was called neologian, socialist, sceptic; all the cruel armoury of fanaticism, and especially the weapon of blind terror, was used against him." The manifold antagonism which Mr. Robertson had to encounter acted disastrously upon a constitution which had always been delicate; and his death, accelerated by the almost reckless abandonment to the fervid and continuing energy of his devotion to the duties—especially to preaching, which he "hated"—of a profession which he did not choose, took place on the 15th of August, 1853. He was interred in the New Cemetery, Brighton; and the procession upon the occasion partook of the dimensions of a public rather than a private funeral. More than two thousand persons assisted at the ceremony, and comprised the members of various incorporated societies; whilst a number of the clergy of Brighton met the hearse upon its arrival at the cemetery.

Mr. Robertson's continual effort was to bring into clear light the living spirit of dogmas, forms, and even of errors; which of itself marks the positive character of his teaching. He insisted imperatively on the historical reality of the life of Christ, holding that Christianity itself would be lost with the loss of the facts of the incarnation, the childhood, the temptation, the daily life, the miracles, the death, and the resurrection of Jesus. He rested on a life, rather than on a system. He did not deny the necessity of a system of theology; but what he did deny was the necessary permanence of any system. Christianity was founded on a life, the spirit of which was infinite and capable of infinite expansion. It would, therefore, be necessarily born again and again under new forms, conditioned by the character and thought of the several countries and ages in which it existed.

Mr. Robertson's works include 'Two Lectures on the Influence of Poetry on the Working Classes,' 12mo, Brighton, 1852, second edition, 8vo, 1853; 'Lectures and Addresses on Literary and Social Topics,' 8vo, London, 1858; 'Analysis of

Mr. Tennyson's "In Memoriam," 16mo, London, 1862; 'Sermons preached at Trinity Chapel, Brighton,' 8vo, London and Edinburgh, 1855, eleventh edition, 1863, American edition 12mo, Boston, 1857, new edition, 1866; 'Sermons,' &c., second series, 8vo, London, 1855, tenth edition, 1864, and others, American edition, 12mo, Boston, 1858, new edition, 1866; 'Sermons,' &c., third series, 8vo, London, 1857, tenth edition, 1864, new edition, 1868, American edition, 12mo, Boston, 1858, new edition, 1866; 'Sermons,' &c., fourth series, 8vo, London, 1863, new edition, 1868, American edition, published as "fifth series," 12mo, Boston, 1864, new edition, 1866; 'Sermons,' &c., "new popular edition, with memoir and portrait," 2 vols. 12mo, Boston, U. S., 1870; and 'Expository Lectures on St. Paul's Epistles to the Corinthians: delivered at Trinity Chapel, Brighton,' 8vo, London, 1859, new edition, 1868, American edition, in which it is reckoned as the "fourth series" of the 'Sermons,' &c., 12mo, Boston, 1860, new edition, 1866. Robertson's 'Life and Letters,' 2 vols. 8vo, London, 1865, new (fifth) edition, one volume, 8vo, London, 1868, has attained a large amount of favour and circulation. It was published under the care of the Rev. Stopford A. Brooke, who combined the duties of author and editor.

* ROBIN, CHARLES PHILIPPE, French physician and histologist, was born at Jasseron, Ain department, June 4, 1821. He passed through the regular course of medical study and in 1844 he received a prize from the 'École pratique de Médecine.' In 1845 Orfila the eminent toxicologist sent Robin and Lebert to Normandy and Jersey to collect specimens of marine life, for the purpose of making additions to the museum which he had founded in connection with the school of practical medicine, of which he was one of the professors. In 1846, Robin received his degree of doctor of medicine, and in 1847, that of doctor of science, as also a professorship in the Parisian medical faculty. In 1862 a chair of histology was formed in the same faculty, and he was the first to fill it. He is a member of the Academy of Sciences of France, as also of many other societies in France and other European countries. He has written much on anatomy and more especially on those branches in which the microscope is requisite as an instrument of investigation. His special study, one in which he is the principal pioneer, has been the determining the normal and abnormal conditions, development, and structure of animal tissues and humours, more especially as revealed by the application of chemical re-agents. As a teacher he has had signal success. His researches on the vegetable parasites of animals are published in his 'Histoire naturelle des végétaux parasites qui croissent sur l'homme et les animaux vivants,' 8vo, Paris, 1853; and a general outline of them is given under ENTOPHYTA, E. C. NAT. HIST. Div. vol. ii. col. 564. Of his other works, the more noteworthy are his thesis on fermentation; 'Traité de chimie anatomique et physiologique, normale ou pathologique, ou des principes immédiats normaux ou morbides qui constituent le corps de l'homme et des mammifères,' 3 vols. 4to, 1852, in which Verdel was his coadjutor; 'Leçons sur les substances amorphes et les blastèmes,' 18mo, 1866; 'Leçons sur les substances organisées et leurs altérations,' 18mo, 1866; 'Leçons sur les humeurs normales et morbides du corps de l'homme,' 8vo, 1867; 'Leçons sur les vaisseaux capillaires et l'inflammation,' 18mo, 1867; 'Anatomie microscopique,' 8vo, 1868; and 'Programme du Cours d'Histologie professé à la Faculté de Médecine de Paris,' second edition, 1870. He has also edited, in conjunction with M. Littré, the later editions of Nysten's 'Dictionnaire de Médecine.'

ROBINSON, JOHN HENRY, R.A. [E. C. vol. v. col. 123]. Under the altered constitution of the Royal Academy, this eminent line engraver was elected an academician in 1867. But before this he had ceased to employ his burin, he having, in 1862, published his latest plate of importance, a fine rendering of Vandyck's famous portrait of the 'Countess of Bedford.' Mr. Robinson's last years were spent at Petworth in Sussex, where he died on the 21st of October, 1871, at the age of seventy-five.

* ROCHEFORT, VICTOR HENRI, generally known as HENRI, MARQUIS DE ROCHEFORT-LUCAY, a French journalist, vaudevilliste, and politician, son of the lately deceased Marquis Claude Louis Marie de Rochefort-Lucay, also known as a dramatic author, was born at Paris, on the 30th of January, 1830, and was educated at the Collège Saint-Louis, where he was early distinguished for his gifts in poetical composition, and especially for a hymn which he wrote in honour of the Virgin. On the 1st of January, 1851, he became a clerk (expéditionnaire) in the bureaux of the Hôtel de Ville; and having gained considerable reputation by the literary results of his leisure, and parti-

cularly by his contributions to the 'Charivari,' received the appointment of sub-inspector to the fine arts for the city of Paris, which he resigned in 1861. Devoting himself entirely to literature, he became connected, more or less closely, with different journals, and became at length the editor of the daily 'Figaro,' the character of which changed in his hands from non-political satire to the bitterest irony against the Imperial régime. His contributions to 'Figaro,' the audacity of which made the severance of his connection with that journal necessary, were collectively published as 'Les Français de la Décadence,' in three series, 18mo, Paris, 1866-68, the second and third series of which bore respectively the titles of 'La Grande Bohème' and 'Les Signes du Temps,' and the earlier series of which had in 1868 reached a fifth edition. Separated from the 'Figaro,' M. Rochefort at once founded a weekly journal called 'La Lanterne,' the first number of which, June 1st, 1868, attained on the day of its issue a circulation of eighty thousand copies, a figure which was maintained by its successors, besides a continual demand for back numbers. The articles of 'La Lanterne,' the wonderful success of which called forth a crowd of journals with analogous titles, were written exclusively, or all but exclusively, by Rochefort himself, and were conceived in a spirit of extreme and bitter hostility to the Imperial government. The eleventh number was seized, and its author summoned before the tribunals, and sentenced, August 13, 1868, to a twelvemonth's imprisonment, to a fine of 10,000 francs, and to the deprivation of all civil and political rights; and the like penalties were decreed to follow any subsequent issue. For an assault on a printer who had published an alleged libel against him, M. Rochefort was about the same time sentenced to four months' imprisonment; and in order to evade the effects of these two convictions, an account of which was published with the title of 'Rochefort devant les Tribunaux,' &c., 8vo, Paris, 1868, he escaped to Brussels, where he continued the publication of 'La Lanterne,' which obtained a surreptitious circulation in France, and was scattered nearly all over Europe, both in the original French, and in English, German, Spanish, and Italian translations. Rochefort dropped the publication of 'La Lanterne' after he had produced about fifty numbers; and, presuming on the amnesty granted to political offenders in honour of the centenary of the birth of the Emperor Napoleon I., August 15, 1869, returned in November to France, where he had been named as a candidate in two of the electoral circumscriptions of the capital, for one of which he was returned. On his way to Paris, however, he was arrested and detained for a short time at the frontier, but was allowed to proceed under a safe-conduct granted by the Emperor. Professing himself the delegate and mouth-piece of his constituents, he took their votes for the selection of a manager and staff of a journal which he established with the title of 'La Marseillaise,' of which he became chief editor, counting among his collaborateurs MM. Flourens and Victor Noir. The death of the latter at the hands of Prince Pierre Bonaparte on the 10th of January, 1870, at Autenil, caused an extreme agitation, in which M. Rochefort was a prominent figure; and on Wednesday, January 12, the day of Noir's funeral, when about a hundred thousand persons marched to Neuilly to swell the procession to the grave, and when M. Flourens wished to have the hearse driven, at all hazards of murder and insurrection, into Paris, Rochefort—whose courage had been proved by the four duels in which the amenities of journalism had involved him—lacking the will or the nerve to take advantage of a promising opportunity of revolution, recommended to the excited multitudes the preservation of peace and order. Yet for an incendiary article which appeared in 'La Marseillaise' of the same day, he became obnoxious to a government prosecution authorised by the Chamber of which he was a member; and, having been cited before the Correctional Tribunal on the 22nd of January, was condemned by default to pay a fine of 3000 francs, and to undergo a term of imprisonment. He was arrested on the evening of the 7th of February, when on his way to preside over one of the popular meetings which he had organised, and was committed to Ste. Pélagie; from which, on the 4th of September following, the day of the overthrow of the Empire, he was "carried by the crowd" to the Hôtel de Ville, to become a member of the Government of Defence, of which General Trochu assumed the presidency. According to the testimony of the latter, Rochefort was for eight weeks "very actively engaged in the defence, without any apparent personal ambition, more moderate than his notoriety had given cause to expect, and a supporter of several measures of a conservative character" initiated by the General. Rochefort resigned office

on the 1st of November, stating that, in consequence of the events that had occurred, he could not follow the Government in the course upon which it had entered; that course being, according to General Trochu, "a struggle with the democracy the arrest of whose leaders had been determined upon." The chief circumstances in the later career of M. Rochefort may be most conveniently examined in the light of the proceedings of the third Conseil de Guerre, commissioned at Versailles for the trial of the Communist prisoners; and which on the evening of the 21st of September, 1871, after two days' trial, sentenced him to *déportation dans une enceinte fortifiée*, being the maximum of punishment demanded by the prosecution. The main charges against him were for incitement, not for participation; and his pen, as wielded in the 'Mot d'Ordre,' was held more or less responsible for nearly all the misdeeds of the Commune, from the destruction of M. Thiers' house to the assassination of the hostages. His defence consisted chiefly in pleading good character and past services. In order to prevent agitation or discord calculated to weaken the defence of Paris, he claimed to have voluntarily suppressed, just before the siege, 'La Marseillaise,' in which, without his knowledge, an attack had appeared on General Trochu, although that journal was bringing him in from 18,000 to 20,000 francs a month, and he had no other private means of support. He had given many other proofs of patriotic disinterestedness; in spite of which, on account of a single article—too strongly worded, perhaps, but substantially harmless—the Government suppressed his paper, the 'Mot d'Ordre,' which had succeeded 'La Marseillaise,' and thus deprived him of his livelihood. A few days after came the March insurrection, for which, as for nearly all the other misfortunes of France, the prosecution held him responsible, although when it occurred he was lying dangerously ill; and when, on his recovery, he came to Paris, he found a Government *de facto* existing there, with the creation of which he had had nothing to do, and which he merely recognised as a journalist—a public writer, professionally criticising and often blaming its acts. He was simply, he pleaded, a journalist under the Commune, not a politician or man of action in the Commune. So far was he, even as a journalist, from being its uncompromising supporter, that its avowed organs fiercely denounced him as "reactionary," and in the end he was obliged to save himself from prosecution at the hands of the Commune by flight. But various passages taken almost at random from numbers of the 'Mot d'Ordre,' the responsibility of which he could not evade, were fatal to his defence; and after a deliberation of between two and three hours, the Court, whilst acquitting him of inciting to the destruction of the Colonne Vendôme, and to the pillage of the Church Notre Dame des Victoires, found him guilty of inciting to civil war; of inciting to the destruction of M. Thiers' house; of inciting to the damage of the Chapelle Expiatoire; of publishing a journal suppressed by the Government; of publishing false news with deliberate intent to disturb the public peace; and of offences against the Chief of the Government and against the National Assembly. The sentence pronounced upon M. Rochefort has been already mentioned; it remains to be seen to what extent, if any, it may be modified, in answer to applications already (December, 1871) made, or to be made, for that purpose. He is said to have made some progress, since his incarceration, in a work on the life and career of the Emperor Napoleon III.

ROCHETTE, DESIRÉ RAOUL, called RAOUL-ROCHETTE, French archæologist, was born March the 9th, 1790, at Saint Amand in the department of Cher. He received his education at Bourges; in 1811 went to Paris and was appointed professor of history at the Lycée Impérial; in 1813 received the prize of the Académie des Inscriptions for a 'Histoire critique des Colonies grecques,' and in 1815 became suppléant to M. Guizot in the chair of modern history in the Faculté des Lettres. On the restoration M. Rochette was named by royal ordonnance member of the Académie des Inscriptions, and his polished and courtier-like manners, strong royalist opinions, reputation for learning, and pleasing elocution smoothed the way to great social success despite the hard criticisms of several of the leading scholars of France and Germany. He was appointed in 1816 editor of the 'Journal des Savants,' in 1818 keeper of medals and of the antiquities at the Bibliothèque; in 1820 censeur royal, an office he retained till the abolition of the censorship in 1824; in 1826 suppléant and in 1828 titular professor of archæology, when he delivered several courses of lectures which drew crowds of fashionable auditors; the 'Lectures on Ancient Art,' published at Paris in 1828, &c., were translated into English by Mr. H. M. Westrop, 8vo, 1854. In 1826-27 he was sent

on a mission to Italy and Sicily; and he published the results of his archaeological investigations, in 'Monuments inédits d'Antiquité figurée, grecque, étrusque et romaine, recueillis pendant un voyage en Italie et en Sicile, dans les années 1826 et 1827,' large folio, Paris, 1833, &c.; 'Choix de Peintures de Pompéi, la plupart de sujets historiques, publiées avec l'explication et une introduction sur l'histoire de la peinture chez les Grecs et les Romains,' large folio, Paris, 1838—44; and 'Peintures antiques inédites, précédées de recherches sur l'emploi de la peinture dans la décoration des édifices sacrés et publics chez les Grecs et chez les Romains,' 4to, Paris, 1836, which was commented on by M. Letronne in 'Lettres d'un Antiquaire à un Artiste sur l'emploi de la peinture historique murale dans la décoration des temples et des autres édifices publics ou particuliers chez les Grecs et chez les Romains. Ouvrage pouvant servir de suite et de supplément à tous ceux qui traitent de l'histoire de l'art dans l'antiquité,' 8vo, Paris, 1836; 'Appendice,' 1837. In 1836, M. Raoul-Rochette was elected perpetual secretary of the Académie des Beaux-Arts. Honours continued to shower on him. He was elected a member of almost every academy in Europe, and received numerous orders—indeed, so loaded was his button hole with decorations that his colleagues at the Institute named him Raoul-Brochette, and even the provisional government of 1848 did not go further than to take away one of his offices, that of keeper of the medals. He died at Paris, July 3rd, 1854. Besides the works named above he published many other books, of which the most important are 'Tableau des Catacombes de Rome,' 12mo, Paris, 1837; 'Sur les Antiquités chrétiennes des Catacombes,' 4to, Paris, 1839; 'Lettres archéologiques sur la Peinture des Grecs,' 8vo, Paris, 1840; 'Mémoires de Numismatique et d'Antiquité,' 4to, Paris, 1840; 'Mémoires d'Archéologie comparée, asiatique, grecque et étrusque,' part i., 1848. He also contributed numerous papers to the Academy and other learned bodies; and it was his intention to remodel much of what he had written and embody therewith the results of his various studies and travels in Greece and Italy into an exhaustive 'History of Ancient Art,' but his purpose was never accomplished. M. Rochette's erudition was wide but superficial, but his works contain much valuable matter, and are written in a clear and readable style.

ROCK, DANIEL, D.D., a Roman Catholic divine and archaeologist, was born at Liverpool in the year 1798, and was educated successively at Old Hall, Hertfordshire, and at the English College at Rome. After serving the mission in London for two years, he was appointed domestic chaplain to the Earl of Shrewsbury in 1827, and in 1840 assumed the charge of the Roman Catholic congregation at Buckland, near Faringdon, Berkshire, which he resigned in 1854, in order the more effectively to fulfil the duties of a canon of Southwark, to which office he was preferred after the re-establishment of the Romish hierarchy in England, in 1852.

Dr. Rock's reputation rests mainly upon his 'Hierurgia,' &c., 2 vols. 8vo, London, 1833, the more extended title of the second edition of which, 8vo, London, 1851, will sufficiently explain its scope and purpose:—'Hierurgia: or, Transubstantiation, Invocation of Saints, Relics, and Purgatory, besides those other Articles of Doctrine set forth in the Holy Sacrifice of the Mass, expounded; and the Use of Holy Water, Incense, and Images, the Ceremonies, Vestments, and Ritual employed in its Celebration among the Latins, Greeks, and Orientals. Illustrated from Paintings, Sculptures, and Inscriptions found in the Roman Catacombs, or belonging to the earliest Ages of the Faith.' He has also written a polemical brochure entitled 'Did the early Church in Ireland acknowledge the Pope's Supremacy? Answered in a Letter to Lord John Manners,' 8vo, London, 1844, which gave rise to a slight controversy and one or two Protestant disclaimers; 'The Church of our Fathers, as seen in St. Osmund's Rite for the Cathedral of Salisbury: with Dissertations on the Belief and Ritual in England before and after the Coming of the Normans,' 3 vols. 8vo, London, 1849—53; a poetical production, entitled 'The Mystic Crown of Mary, the Holy Maiden Mother of God, born free from the Stain of Original Sin,' 8vo, London, 1857; 'The Action of the Church upon Art and Civilisation, shown in the high Altar in the Church of St. Ambrose at Milan,' &c., an article contributed to the volume produced by various writers, and edited by Dr. Manning, with the title of 'Essays on Religion and Literature,' 8vo, London, 1865; and 'Textile Fabrics: a descriptive Catalogue of the Collection of Church Vestments, Dresses, Silk Stuffs, Needlework, and Tapestries, forming that Section of the [South Kensington] Museum,' 8vo, London, 1870, a production which followed as a

natural sequence to the functions performed by Dr. Rock, in 1862, as a member of the Committee appointed to carry out the objects of the South Kensington "Special Exhibition of Works of Art on Loan, chiefly of the Mediæval Period." He died at his residence, Kensington, on the 28th of November, 1871, aged 73.

RODE, CHRISTIAN BERNARD, German painter, was born July 18th, 1725, at Berlin, and studied there under A. Pesne, and at Paris under C. Vanloo and J. Restout. After visiting Italy, he returned to Berlin, and became the favourite painter of Frederick the Great, who employed him to paint the palaces of Sans Souci and Potsdam, and various altar pieces for churches. Rode was in his day extremely popular as a painter of historical and religious subjects, but his manner was slight and superficial, and out of Berlin he is now held in little estimation. He executed about one hundred and fifty etchings. Nagler gives a list of his pictures and prints. He was director of the Berlin Academy and died in that city, June 24th, 1797.

ROGERS, HENRY DARWIN, geologist, and one of four brothers, all of whom acquired more or less distinction in science. He was born at Philadelphia in 1809, but belonged to a family of Scotch origin. When only twenty-one he was professor of chemistry and natural philosophy in Dickinson College, Pennsylvania, and continued to be so for some years. After a visit to Europe he returned to the United States as State geologist for Pennsylvania and New Jersey. From 1836 to 1841 he, in a series of annual reports, gave an outline of the progress of the survey, but in 1858 appeared his final report, which was the great work of his life, and to which he had devoted twenty-two years. This final report occupies three thick quarto volumes profusely illustrated. It deals with a very large area of country, and explains the peculiar features of the great Appalachian chain of mountains. The minute details and many of the broader views enunciated in this work are exceedingly valuable, but unfortunately its usefulness has been sensibly impaired by a fanciful stratigraphical nomenclature which has not passed into the ordinary currency of geological literature. In 1857 he accepted the professorship of natural history and geology at Glasgow, and he still held the post when he died, May 29, 1866. Professor Rogers was an enthusiastic scientific enquirer, and a very eloquent speaker. He wrote a large number of papers, chiefly geological, in the scientific periodicals of England and America.

ROGERS, JOHN, an English divine, and the first Marian martyr, son of John Rogers, of Deritend, Birmingham, was born at that place about the year 1509; and was educated at Pembroke Hall, Cambridge, where he took his B.A. degree in 1526. Having been admitted to holy orders, he was appointed chaplain to the Company of English Merchant Adventurers at Antwerp; where, as the result of an intimacy which he contracted with Tyndal and Coverdale, he embraced their Protestant opinions. Under the assumed name of Thomas Matthew, he published, in July, 1537, an English translation of 'The Byble, which is all the Holy Scripture: in which are contained the Olde and Newe Testament truly and purely translated into English by Tho. Matthew,' folio, 1537, the place of the issue of which has not been ascertained. Rogers was the superintendent and corrector of the press; and for the most part adopted Tyndal's translation of the Old Testament as far as the end of the Second of Chronicles, and the whole of the New Testament, with an occasional variation only in the orthography. With regard to the rest of the Old Testament, it seems to have been founded upon a critical reading and examination of Coverdale's version, whilst the translation of the Apocrypha, in whole or in part, was the work of Rogers himself. In the same year, 1537, Rogers married, and soon afterwards left Antwerp for Wittenberg, where he became pastor of a church or congregation. Here he continued until the accession of Edward VI., after which he returned to England, where he acquired the reputation of great ability and eloquence as a preacher, and was appointed to the Rectory of St. Margaret Moyses, in London, and to the vicarage of St. Sepulchre's in the same city on the 10th of May, 1550. He resigned the former of these preferments about the time when he was collated, August 24, 1551, to the prebend of St. Pancras in St. Paul's Cathedral, in which church he was appointed by the dean and chapter to be a reader in divinity. He had to defend himself before the Privy Council for his denunciation of the sacrilegious designs and proceedings of some of the young king's courtiers in a sermon which he preached at St. Paul's Cross; at which place he had the hardihood to deliver a discourse on Sunday, August 6, 1553, three days after the triumphal entry of Queen Mary into London, in which he exhorted the people to abide by the doctrine taught

in the time of King Edward, and to beware of popery in all its forms and superstitions. For this offence he was immediately summoned before the Privy Council, in which were many of the restored Romish bishops; but he defended himself with such wit and wisdom that he was for that time dismissed unhurt. His security, however, was of short duration; for on the 16th of the same month, two days before the issue of the Queen's proclamation against preaching the Reformed doctrines, he was again cited before the Privy Council, who ordered him to confine himself as a prisoner in his own house at St. Paul's, without communication with any one but the members of his household. He was committed to Newgate on the 27th of January, 1554; and having been detained there until January, 1555, was called upon to undergo three examinations before Gardiner, Bishop of Winchester, of which Fox the martyrologist has furnished an interesting account. The trial resulted in the conviction of the accused for the crimes of heretical pravity and execrable doctrine; for his persistence in which he was degraded from his ministerial orders by the hands of Bishop Bonner, in Newgate, and was afterwards delivered over to the secular power. On the 4th of February, 1555, he suffered death at the stake, in Smithfield, whither he proceeded, chanting the fifty-first psalm, through an immense and sympathising crowd, amongst whom he had the agony of seeing his wife and his eleven children, one of whom was an infant at the breast, and whose visits had been forbidden to him whilst he was in prison. But nothing sufficed to shake the constancy and determination of his soul, and he refused at the last moment to purchase his life by recantation; thus worthily sustaining the honour of being the proto-martyr of the Marian persecution, from whom several families in England and America are proud to claim descent, and to celebrate the day of his passion in devout commemoration. 'The Story, Life, Admonition, and Martyrdom of John Rogers, Prebendary of St. Paul's, and the first Martyr in the Reign of Queen Mary, A.D. 1555,' forms part of a volume entitled 'Writings of Rogers, Saunders, Taylor, and Careless, Confessors and Martyrs, A.D. 1555—1556,' 8vo, London, forming one of a series published by the Religious Tract Society.

Besides the translation of the Bible already mentioned, several works have been referred to Mr. Rogers as their author. These include 'Historia a condito Mundo,' 'Indices Bibliorum,' 'Conciones per Annum,' 'In Evangelium Johannis,' 'Lectiones in Paulum. Libri IV.,' 'Letters,' 'Examinations before Stephen Gardiner,' and English translations of Melancthon's 'Homilies,' 'Common Places,' and 'Commentary on the Book of Daniel,' as well as of the same author's 'Waying and Considering of the *Interim*,' 8vo, London, 1548.

ROGET, PETER MARK, M.D. [E. C. vol. v. col. 133]. In his later years Dr. Roget gave considerable attention to a classified arrangement of words and phrases in the English language, with a view to facilitate composition. The idea was first conceived somewhere about the beginning of the present century, and was carried out, partially, from time to time, but it was not until 1852 that the work appeared as a 'Thesaurus of English Words and Phrases,' since which it has passed through numerous editions. He died September 12, 1869.

* ROGIER, CHARLES, a Belgian statesman of French origin, was born at Saint-Quentin, on the 12th of August, 1800, and was educated at Liège; where, after the prosecution of the requisite study of law, he took a doctorate in that faculty. He became editor and co-proprietor of the 'Politique,' a journal to which he contributed a remarkable and popular series of letters entitled 'Lettres d'un Bourgeois de Saint-Martin.' Always a warm advocate of Belgian independence as opposed to the domination of Holland, he took a prominent part, at once enterprising and moderate, in the Revolution of 1830, which ended in October of that year in the proclamation of the independence of the Belgian provinces by the provisional government of which he was a member. In June, 1831, he was appointed Governor of Antwerp, and held this position till July, 1832, in which year he became Minister of the Interior, and signalled his term of office, which continued until 1835, by the activity with which he endeavoured to develop and extend the commerce and industry of the country. In 1835 he entered upon a five years' incumbency of the governorship of the province of Antwerp, in which office he continued his efforts for the advancement of commerce and agriculture; and in 1840, after the dissolution of the retrograde Theux cabinet, took office in the Liberal administration of his friend M. Lebeau, as Minister of Public Works. He resigned in 1841, and for a period of six years acted as one of the leaders of the opposition against the successive administrations of M.

Nothomb, 1841—1846, and M. Theux, 1846—1847, whose policy it was to encourage the supremacy of the clerical party. M. Rogier was again summoned to office in August, 1847, and, after having successfully administered the departments of the Interior and of War through all the difficulties and dangers of the revolutionary year 1848, resigned office on the 31st of October, 1852; and, after a vacation of eight years, assumed in 1861 the Presidency of the Council and the Ministry of Foreign Affairs, from which he retired in 1868.

M. Rogier has distinguished at once his liberalism and his literary culture by the production of '*Mémoires de Don Juan van Halen, écrits sous les Yeux de l'Auteur*,' 2 vols. 8vo, Brussels, 1827.

* ROHLFS, GERHARD, traveller in Africa, was born at Vegesack near Bremen, April 14, 1834. In 1848 he was compelled to enter the army, and he served in the Schleswig-Holstein campaign with so much distinction that he was made an officer. In 1849 he commenced his collegiate studies, which were pursued at Heidelberg, Würzburg, and Göttingen; afterwards travelled in various parts of Europe; and then entered into the French army in Algiers. His residence here enabled him to acquire the Arabic language and to adapt himself to Arabian customs. In 1861 he disguised himself as a Mussulman, and commenced his travels in North Africa. He crossed the Atlas Mountains, worked his way through Morocco, and penetrated into the desert of Sahara as far as Toccat and Tidikelt. His return was effected by way of Ghadamis and Tripoli. This journey carried him through a wide tract of country not previously visited by Europeans; and it was effected at considerable risk, since no Christian would have been knowingly allowed to pass, while he was not only alone amongst the natives, but his means were so slender as to compel him to use the utmost economy. During eighteen months he kept his travelling expenses down to 80*l*. He published an account of this journey under the title of '*Reise durch Marokko . . . und . . . durch die grosse Wüste über Rhadames nach Tripoli*,' 8vo, Bremen, 1868. In 1865 he again essayed to penetrate into Central Africa, with the object of visiting the kingdom of Wadai for the purpose of recovering the lost papers of Vogel. On this occasion a considerable sum was subscribed for him, both in England and Germany. He reached Murzuk in November, 1865. In 1866 he was detained at Schimmedru, and occupied his forced leisure in mapping from native information the mountainous country about Tibesti, of which scarcely anything was known. In August he reached Kuka, on the shores of Lake Tchad. From here he vainly attempted to get access into Wadai, so was obliged to make his way south-westward to Lagos in the Bight of Benin. This journey, though more extensive than the previous one did not add so much to geographical science, as it was mostly along caravan routes which had been followed by Denham, Clapperton and several other Europeans. The scientific results of his journeys have been published in Petermann's '*Mittheilungen*.' In 1868 the patron's medal of the Royal Geographical Society was awarded him. He has also written '*Neueste Nachrichten aus den Inneren Afrikas*,' 4to, Gotha, 1867; '*Im Auftrage Sr. Majestät des Königs von Preussen mit dem Englischen Expeditionscorps in Abessinien*,' 8vo, Bremen, 1869; '*Land und Volk in Afrika*,' 8vo, Bremen, 1870.

* ROLLESTON, GEORGE, biologist, was educated at Pembroke College, Oxford, where he graduated first-class in Literis Humanioribus in 1850, and subsequently took the degree of M.D. He was elected Fellow of Pembroke in 1850, and in 1860 became the Linacre professor of anatomy and physiology in the University, a post which he still holds. He is an excellent teacher and he has obtained the reputation of being one of the foremost of the anatomists of this country, a reputation based upon an unusually wide range of knowledge of biological literature, high classical attainments, remarkable terseness of language, and an independence of character which urges him to oppose all dogmas supported by mere authority or popular ignorance. Although very few individuals surpass him in personal knowledge of anatomical and physiological structure, he has written few works of importance. His contributions to literature have consisted almost entirely of isolated papers, many of which are valuable. Some of these have an antiquarian character, such as those on the animals domesticated by the ancients, and called cats, which in several instances belonged to other species than *Felis domestica*; on ancient modes of burial, and other subjects. His principal separate work is entitled '*Forms of Life*,' 8vo, Oxford, 1870. It is essentially a book for students at Oxford. It consists of an introduction forming nearly half the volume,

which is noticeable mainly on account of the summaries given of the principal characteristics of each class of animals. The summaries are confined to the class groups and only incidentally relate to the larger sub-divisions into which each class may be separated. The body of the book is for the most part a descriptive catalogue of the anatomical specimens in the Oxford Museum, the species selected being those which are most readily obtainable. Each class is illustrated by one or two species only. The book is full of matter, although its plan is very condensed. It is possibly the forerunner of works of a wider scope, which will afford a better opportunity of exhibiting the real depth and extent of Professor Rolleston's knowledge. He was the president of the biological section of the British Association at its meeting in Edinburgh in 1871. He is a fellow of the Royal Society, and a member of many other societies.

ROMANI, GIROLAMO, called **IL ROMANINO**, was born at Brescia, about 1480. He was a pupil of Stefano Rizzi; but moulded his style on that of Giorgione and Titian, and became known as the rival of Moretto, to whom he was preferred by many, though Moretto was undoubtedly the better portrait painter. Romanino's pictures exhibit a lively imagination, deep feeling, and much technical skill. One of his finest extant works is a 'Dead Christ with Mourning Disciples,' in the Manfrini Palace, Venice. The National Gallery contains a large and excellent example (No. 297), 'The Nativity,' painted in 1525 for the high altar of the church of Sant' Alessandro at Brescia. Romanino's earliest known picture was painted in 1502, the latest in 1541. He died about 1560.

RONDELET, JEAN, French architect, was born at Lyons, June 4th, 1734. After completing his general education in the college of the Jesuits, he became the scholar and afterwards assistant to the court architect Soufflot. He was superintending the erection of the Church of St. Gèneviève, named afterwards the Pantheon, for Soufflot, at the death of the latter in 1781, and he was entrusted with its completion. The dome is attributed entirely to Rondelet, who published a memoir on its construction; but its weight caused a sinking in the building, and Rondelet had to alter materially the internal arrangements of the church. In 1783, during a suspension of the works, Rondelet visited Italy under the auspices of his government. He stayed there two years, and digested his studies and investigations into a 'Traité Théorique et Pratique de l'Art de Bâtir,' 5 vols. 4to, Paris, 1802—17—a work which was speedily accepted as an authority, and of which a seventh edition was called for in 1834. In 1794 Rondelet was appointed superintendent of the royal buildings, and in that capacity directed most of the public works executed during the next two years. He was engaged in the formation of the Ecole Polytechnique, and organised the arrangements for the study of civil engineering and the schools of applied sciences. Rondelet was one of the members of the Ecole des Beaux-Arts, nominated at the remodelling of the Institute in 1816. He became quite blind some years before his death, which occurred on the 25th of September, 1829. Besides the works above mentioned, Rondelet contributed many articles on architecture to the 'Encyclopédie Méthodique,' and wrote a 'Mémoire sur la reconstruction de la Halle au Blé de Paris,' 4to, 1803; and other professional memoirs.

* **ROON, ALBRECHT THEODOR EMIL, GRAF VON**, a Prussian soldier and military administrator, was born in Pomerania, on the 30th of April, 1803; and, after having passed five years as a cadet, received his first commission in the army in January, 1821. He devoted himself from 1824 to 1827 to the study of the higher branches of his profession; and in 1828 was appointed governor of the cadet-institution at Berlin, where he also gave instruction in military science. His tutorial avocations did not prevent him from taking his share in the more active duties of his profession. He served in the field during the Belgian campaign of observation in 1832, and on the occasion of the siege of Antwerp was a member of the topographic service; and, having received a staff appointment, became captain in 1836, and major in 1842. In 1844 he was entrusted with the scientific and military education of Prince Frederick Charles, whom he attended at the University of Bonn, and afterwards accompanied in his travels in Switzerland, Italy, France, and Belgium. After filling various intermediate grades, he was promoted to be lieutenant-general in May, 1859; and it fell to him to undertake the mobilisation of the Prussian army, when that step became necessary on account of the war of Italian independence which was abruptly concluded by the peace of Villafranca. On the 16th of April, 1861, General von Roon was appointed to the Ministry of Marine, to which office was added,

on the 5th of December following, that of Minister of War. In spite of the budget contest into which King William I. had entered with the Chambers in 1862, and the necessity of dissolving the latter on account of their refusal to sanction the extraordinary amount asked for the re-organisation of the army, General von Roon, with the king's sanction, determined that the army should be put into a state of efficiency, at whatever cost. This resolution he carried out so thoroughly that when, in 1866, his preparations were seconded by the admirable strategical arrangements of Von Moltke, and the political foresight and promptness of Von Bismarck, the war against Austria was limited to a short campaign, which commenced in June and virtually terminated on the 3rd of July, with the splendid victory of Sadowa. Von Roon had remained in the capital until the 30th of June, when he left for the seat of war, in the suite of the king, with whom, and with the generals who had directed the campaign, he made a triumphant entry into Berlin, on the 20th of September, and was entertained at a grand dinner given jointly in his honour and in honour of Bismarck and Moltke. The same unity of purpose and the same unanimity of sentiment led to a still more splendid, if less rapid, result in the war which broke out between France and Germany in July, 1870. Setting out with the king for the seat of war on the 31st of the last-named month, General von Roon shared the dangers and the successes of various battle-fields; and finally, on the 17th of June, 1871, on which day his services were rewarded with promotion to the rank of Graf, or count, once more rode in triumph through the streets of Berlin, with his colleagues and comrades, and with his sovereign, who in the previous January had added to his dignities the style and title of Emperor of Germany.

ROSA DA TIVOLI. [ROOS, PHILIP PETER, E. C. vol. v. col. 155.]

ROSCOE, THOMAS [E. C. vol. v. col. 158], died at his house, St. John's-wood, London, September 24, 1871, aged 81.

ROSE, HEINRICH [E. C. vol. v. col. 159]. The sixth edition of Rose's 'Handbuch' was published in French at Paris in 1861, and may be regarded as a new work, so thoroughly was it revised, re-written, and enlarged. An enormous amount of labour was expended in the preparation of this volume. He also prepared an 'Elementary Treatise on Analytical Chemistry,' about thirty sheets of which were printed during his lifetime, and which entailed a large amount of laboratory work. His activity and industry increased with advancing age, and for some years his only recreation was a long walk taken late in the evening in all weathers. He was the first in Germany to establish a class of working pupils. He continued to lecture to within eight days of his death, and he was confined to his bed only a week. On the 27th January, 1864, he asked for writing materials to correct some proof sheets, but he died on the afternoon of that day of inflammation of the lungs.

* **ROSECRANS, WILLIAM STARKE**, an American general, was born at Kingston, in the State of Ohio, September 6th, 1819. He entered West Point Military Academy in 1838, graduated in 1842, and in the same year received a commission as brevet second lieutenant of engineers. In the academy he afterwards occupied the posts of assistant professor of engineering and professor of natural philosophy. Resigning his commission in 1854, he established himself at Cincinnati as an architect and civil engineer, and also engaged in the manufacture of kerosene oil. When the civil war broke out in 1861 he entered the Federal army as aide-de-camp and chief engineer to General McClellan, and was soon afterwards placed in command of a force in Western Virginia, with the title of brigadier-general. In 1862 he was promoted to the rank of major-general, and succeeded General Pope in the command of one wing of General Grant's army, occupying the border regions of Alabama and Mississippi. He defeated the Confederates under General Price at Juka, in September, and in the following month fought the severe battle of Corinth, in which the Confederates lost 9000 men in killed, wounded, and prisoners. In 1863 Rosecrans commanded an army in Tennessee. The Confederates in that State were believed to have been weakened by dividing their forces, and the Government at Washington urged him to take advantage of the opportunity to drive General Bragg out of Tennessee. This was effected in July sufficiently to recover a portion of the State and to protect Kentucky; but in September and October, Bragg, with augmented forces, gained advantages at Chattanooga and Chickamauga, which led to the temporary supersession of the Federal commander. In 1864 General Rosecrans commanded an army in Missouri, but was not again concerned in the more active operations of the war.

In 1868—9 he filled the post of United States Minister at Mexico.

* ROSNY, LÉON DE, a distinguished French orientalist, son of the archaeologist, M. Lucien de Rosny, was born at Loos (Nord) on the 5th of August, 1837; and, having early begun to manifest a determination to the study of Eastern literature, became, in 1852, a pupil at the *École des Langues orientales*. He was subsequently appointed professor of Japanese at the *Bibliothèque Impériale*; and in May, 1863, was commissioned by the Minister of Foreign Affairs to officiate as interpreter to the Japanese ambassadors then on a visit to Paris, and whom he accompanied to Holland, England, and Russia. He served as a member of the scientific commission of the *Exposition Universelle* in 1867, and in 1868 was appointed to fill the newly-instituted chair of Japanese literature in the *École spéciale des Langues orientales*. M. de Rosny is a member of various learned societies, to the *Transactions* of which several of his smaller works have been in the first instance contributed; and he is especially to be mentioned as the founder and perpetual secretary of the *Société d'Ethnographie*. The principal of the serials to which his articles have been supplied are—'*Actes de la Société d'Ethnographie*,' '*Revue orientale et américaine*,' '*Journal asiatique*,' '*Bulletin du Grand-Orient de France*,' '*Annales de Philosophie chrétienne*,' '*Revue de l'Orient*,' '*Bulletin de l'Académie impériale des Sciences de Saint-Petersbourg*,' &c. The most important of M. Rosny's works, which have been either re-issued or originally published in a substantive form, comprise an '*Introduction à l'Étude de la Langue japonaise*,' 4to, Paris, 1857; '*Dictionnaire de la Langue japonaise (japonais-français-anglais), précédé d'une Introduction à la Langue japonaise*,' 4to, Paris, first *livraison*, 1857, of which no other instalment has yet been issued; '*Aperçu général des Langues sémitiques et de leur Histoire*,' 8vo, Paris, 1858; '*Mémoire sur la Chronologie japonaise, précédé d'un Aperçu des Temps antéhistoriques*,' 8vo, Paris, 1858; '*Les Écritures figuratives et hiéroglyphiques des différents Peuples anciens et modernes*,' 4to, Paris, 1860; '*Notice ethnographique de l'Encyclopédie japonaise Wa-kan-san-sai-dzou-yé*,' 8vo, Paris, 1861; '*Aperçu de la Langue coréenne*,' 8vo, Paris, 1864; '*Dictionnaire des Signes idéographiques de la Chine, avec leur Prononciation usitée en Chine et au Japon, et leur Explication en français, accompagné d'un Vocabulaire des Caractères difficiles à trouver, rangés d'après le Nombre de Traits*,' &c., 3 parts, 8vo, Paris, 1864; and '*Grammaire japonaise, accompagnée d'une Notice sur les différentes Écritures japonaises, d'Exercices de Lecture, et d'un Aperçu du Style sinico-japonais*,' 4to, Paris, second edition, 1865.

ROSS, SIR JAMES CLARK [E. C. vol. v. col. 165], the eminent navigator, and the discoverer of one of the north magnetic poles, died at Aston Abbots House, near Aylesbury, April 3rd, 1862.

ROSS, SIR WILLIAM CHARLES, R.A. [E. C. vol. v. col. 165]. This celebrated miniature painter, after about three years' suffering from paralysis, died on the 20th of January, 1860, in the 66th year of his age.

ROSSE, WILLIAM PARSONS, THIRD EARL OF [E. C. vol. v. col. 166]. During the later years of his life Lord Rosse was prevented by a lingering and painful malady from paying much attention to astronomy. His great telescope continues to be the largest in existence, but adapted only for observations of a special character, for which the humid climate of Ireland is scarcely suited. From 1861 till his death he was chancellor of Trinity College, Dublin. He died at Birr Castle, October 31st, 1867, and was buried in the Church of St. Brandon, Parsonstown.

ROSSELLINO, ANTONIO (but whose family name was GAMBARELLI), an eminent Italian sculptor, was born at Florence about 1427. He was possessed of great ability, was of a devotional turn of mind, and of rare mental and moral qualities. His chisel was in constant employment, especially for monumental sculpture. Among the more celebrated of his works are the monuments to Francesco Nori, in the chapel of Santa Croce; the Cardinal of Portugal, in the monastery of San Miniato—a work which excited great admiration when erected, and which was praised by Michelangelo; several statues of the Madonna; a '*Nativity*,' in the church of Sta. Maria di Monte, Naples; rilievi, fountains, portrait-busts, &c. He died, according to the Florentine editors of Vasari, in 1490.

ROSSELLINO, BERNARDO, elder brother of Antonio, born about 1409, practised architecture with eminent success. He was especially patronised by Pope Nicolas V., who employed him on

many important works. Among other things, he built several costly buildings at Civita Vecchia and Civita Castellana; the fortresses of Orvieto and Narni; rebuilt or restored the Piazza, church, &c., in Fabriano; San Benedetto, in Gualdo; the baths of Viterbo; and built and restored several churches within and outside the walls of Rome. The pontiff designed to carry out far more important and extensive works in connection with the Vatican: the reconstruction of the papal palace on a scale of unequalled magnificence; some new churches within the city; and to rebuild the forty churches of the stations of Pope Gregory I.; and for all these the genius of Bernardo was to be called into requisition. But Nicolas died before his great projects could be even begun, and they were neglected by his successor. Bernardo is, however, said to have been employed by Pius II., for whom he executed various works at Pienza. He also executed several monuments, among others that of Leonardo Bruni, in the church of Santa Croce.

ROSSETTI, DANTE GABRIEL, an English painter, was born in London about 1828. His father was the late G. Rossetti, LL.D., professor of Italian in King's College, London, and known as a commentator on Dante; and under his care young Rossetti received an excellent literary education. His leaning being towards art, he was in due time entered as a student at the Royal Academy, and whilst there originated, in conjunction with his fellow-students, Hunt and Millais, that effort to revive what they considered to be the purer, more earnest, and more devotional practice of art of the early Italian painters, which became so well known as pre-Raphaelism. [HUNT, WILLIAM HOLMAN, and MILLAIS, JOHN EVERET, E. C.] Mr. Rossetti was the leader in this movement, and supported it with his pen in the '*Germ*,' as well as with his pencil; but, from not sending his pictures to the exhibitions, he remained comparatively unknown to the public, though highly esteemed by a circle of warm admirers. On the whole, he appears to have remained most faithful to the original creed. He delights in the symbolical treatment of religious subjects, and retains the dry, quaint forms, intense expression, strong positive colours, and minute finish which characterised his first works. His earliest picture in this manner was '*The Girlhood of the Virgin*,' 1849. He has since painted other subjects from the life of the Madonna, from Scripture, and from the legends of the Saints; a series in water-colours from Dante, others from Spenser, Shakspeare, and Tennyson; in all of which a vein of poetry and refined feeling pervades and underlies the quaint, hard envelope. His more important works include a triptych, painted as a reredos for the high altar of Llandaff cathedral; and the series of Arthurian legends at the Union, Oxford. Mr. Rossetti has also made a few drawings on wood for an illustrated edition of Tennyson's poems, for a volume of verse written by his sister, &c. He has also appeared with distinguished success as an author:—'*The Early Italian Poets*, from Ciuillo d'Alcamo to Dante Alighieri (1100—1200—1300) in the original metres, together with Dante's *Vita Nuova*,' 8vo, 1862, is a work of learning, research, and poetic feeling; and shows a remarkable command of forms of metre unfamiliar to the English language; while '*Poems*,' 8vo, 1870, consists of short original pieces and sonnets, full of striking imagery, fervid, passionate, sensuous, and pictorial; sometimes wilful in structure, and strange in rhythm and rhyme, but often very beautiful.

* ROSSI, GIOVANNI BATTISTA DE, an Italian archaeologist, was born at Rome about the year 1822, and early distinguished himself by his determination to the study of antiquity, which he has in the course of his life pursued with much zeal, intelligence, and success. He is known as a prominent member of the *Commissione Pontificale per la Pubblicazione dei Monumenti Cristiani*, and as an important contributor to the archaeological serials of Rome and Naples. The discoveries of the *Cavaliere de Rossi* have been instrumental in the solution of many difficulties in the earlier ages of Christian Rome, upon the chronology and archives of which they have thrown considerable light; and it is through them that a more orderly and lucid understanding of the catacombs has become attainable. The results of his labours underground, the most remarkable of which has been the discovery of the famous cemetery of St. Callistus, with the tombs of the Bishops of Rome from the time of Alexander Severus to that of Constantine, have been set forth in various works of his production. These include '*Inscriptiones Christianæ Urbis Romæ septimo Sæculo antiquiores*,' folio, Rome, 1867, &c.; '*Buletino di Archeologia Cristiana del Cavaliere Giovanni Battista de Rossi*,' 4to, Rome, 1863, &c.; '*La Roma Sotterranea Cristiana descritta ed illus-*

trata,' 8vo, Rome, 1864, &c., with 'Tavale,' 4to, Rome, 1864, &c., English version, 'Roma Sotterranea: or, Some Account of the Roman Catacombs, especially of the Cemetery of San Callisto. Compiled from the Works of Commendatore de Rossi, by J. S. Northcote and W. R. Brownlow,' &c., 8vo, London and Edinburgh, 1869.

ROSSINI, GIOACCHINO ANTONIO [E. C. vol. v. col. 167]. This famous composer adhered pretty closely to a resolution, made in the prime of life, to publish little more music. He is understood to have assigned, as the reasons for this determination, that he had made a sufficient fortune by his compositions (40 operas between his 20th and 38th years); that he was not likely to rise higher than he had done in 'Il Barbiere' and 'Guillaume Tell'; that it would be unwise to run the risk of failure; and that he thought himself now entitled to pursue music as a source of pleasure rather than of profit and fame. In 1832 appeared his 'Stabat Mater,' in recent years performed more frequently throughout Europe than any other 'Stabat.' 'La Carità,' and a few other sacred trios and choruses, were published some years afterwards. In 1864 he finished a 'Messe Solennelle,' which was heard in London for the first time in 1869. Rossini lived at Bologna from 1836 to 1847, occupying himself chiefly in agriculture and painting; then at Florence till 1855. The remaining thirteen years of his life were spent in Paris, where his music, cheerfulness, and kindness of disposition rendered him a general favourite in social and artistic circles. He died at Paris on the 13th of November, 1868. The funeral at the Cemetery of Père la Chaise, and the preceding service at the Church of the Trinity, were attended by the most distinguished persons in Paris in music, the drama, art, and literature. He left by will an endowment of 3000 francs a year, to be administered by the Institute of France, one-half as an annual prize for the best libretto for an opera, and one-half for the best score of a new opera—melody (in which Rossini himself had always excelled) to be regarded as a *sine quâ non*. Shortly after his death a claim was put forth by the small town of Luge, near Ravenna, as having been his birthplace, instead of Pesaro. Memoirs of Rossini have been published by Edwards, Montazio, Mirecourt, Roqueplan, Rovani, and other writers.

* **ROTHSCHILD, BARON LIONEL NATHAN DE**, M.P. [E. C. vol. v. col. 172], was enabled to take his seat and vote in the House of Commons, July, 1858, by the passing of the Act for Removing the Disabilities of the Jews. He retained his seat as member for the City of London till the general election of December, 1868, when he was not returned; but on the death of one of the members, Mr. Charles Bell, he was re-elected, February, 1869. Baron Lionel Nathan de Rothschild was born November 22nd, 1808. His eldest son, **NATHANIEL MAYER DE ROTHSCHILD**, born in 1840, was elected M.P. for Aylesbury in July, 1865, and has since continued to represent that borough.

ROTTMANN, KARL, a distinguished German landscape painter, was born at Handschuchsheim, near Heidelberg, in 1798. He began with water-colour painting, and copying the Dutch masters. But in 1822 he removed to Munich, and, under the influence of the eminent masters there, turned his attention to a more elevated style, and to the study of the grander features of nature; spending his summers among the Bavarian mountains, and working in his painting-room in the winter. In 1826 he went to Italy and Sicily, painted a large view of Palermo for king Ludwig of Bavaria, and made a great number of careful drawings. On his return to Munich in 1829 he was commissioned by king Ludwig to paint in fresco a portion of the arcades of the Hofgarten, with views of famous scenes in Italy and Sicily. For each of these landscapes, twenty-eight in number, the king wrote an inscription in verse. On the completion of this commission (1835), Ludwig sent Rottmann to Greece, to make a corresponding series of representations of the famous historical scenes of that country. Several of these were in due course painted in the northern arcades of the Hofgarten, but as the Italian frescoes had become greatly injured, these were painted in encaustic. He also painted the ceiling of the upper storey of the royal palace at Munich, and prepared several Grecian landscapes for the new Pinacothek, besides many private commissions. Rottmann, who was a great favourite with the king, was appointed court-painter in 1841, and created knight of the order of St. Michel in 1843. He died at Munich, July 7th, 1850.

* **ROUHER, EUGÈNE**, a French lawyer and politician, was born at Riom, in the department of Puy-de-Dôme, on the 30th of November, 1814, and was educated successively at the Collèges of Riom and Clermont, with a short interval in 1838, when

he was a pupil of the naval school of Angoulême. He studied law at Paris, and commenced his career as an advocate before the Cour Royale at Riom, and in a few years became one of the leading members of the bar of his native place, for the representation of which he was an unsuccessful candidate in 1846. After the Revolution of February, 1848, he was returned on republican principles for the department of Puy-de-Dôme; and in the Constituent and Legislative Assemblies, to the latter of which he was deputed by the same electoral body in May, 1849, identified himself with the Right or Moderate party. On the 31st of October following he was appointed to the Ministry of Justice in the cabinet selected by the President of the Republic. M. Rouher retained office, with two or three short intermissions consequent upon as many reconstructions of the cabinet, until the 26th of October, 1851, and resumed the Ministry of Justice on the morning of the 2nd of December, the day of the *coup d'état*, being at the same time appointed a member of a new Consultative Commission, composed of "men deservedly enjoying the confidence and esteem of the country," who should act as assessors or advisers of the President until the re-organisation of the Legislative Body and a permanent Council of State. In common with the other ministers who refused to concur in the decree by which the Prince President confiscated the property of the Orleans family, M. Rouher tendered his resignation on the 22nd of January, 1852; and three or four days afterwards was appointed a member of the Council of State, which replaced the temporary Consultative Commission, and in which he assumed the presidency of the department of legislation, justice, and foreign affairs. On the 3rd of February, 1855, he received the appointment of minister of agriculture, commerce, and public works, his administration of which was signalised by the successful holding of the Universal Cattle Show and Agricultural Exhibition at the Palais de l'Industrie, in June, 1856, and other exhibitions in which he took a lively and enlightened interest. He fostered in divers ways the development of scientific agriculture, and both in the capital and in the departments initiated various works for the material benefit of the country; but performed the most important service of all by negotiating with Mr. Cobden the commercial treaty of January, 1860, in the preparation of which they had laboured in concert for the preceding twelve months, and in acknowledgment of which M. Rouher was promoted to the grand cross of the Legion of Honour. He was also chosen in January, 1861, to act as plenipotentiary in negotiating a commercial treaty between France and Belgium; and this treaty, which was concluded on the 1st of May following, was accompanied by a maritime, as well as by a literary, convention between the two countries. M. Rouher, who had been raised to the rank of senator on the 18th of June, 1856, acted, in the place of the Prince Napoleon, as president of the French commission for the London Exhibition of 1862; and on the 16th of July of that year was entertained at a banquet given in Willis's Rooms, under the chairmanship of Mr. Milner Gibson, President of the Board of Trade. M. Rouher negotiated a treaty of commerce between France and Italy, which was signed in January, 1863, and for his services in this business received from Victor Emmanuel the grand cordon of the order of SS. Maurizio e Lazzaro. Quitting the portfolio of agriculture on the 23rd of June, 1863, he was again appointed to the Ministry, and became on the same day President of the Council of State; and, after a temporary occupation of the Ministry of the Interior, succeeded M. Billault as Minister of State on the 18th of October, in which capacity it fell to him to defend and explain the political measures of the Government as they were placed before the Senate and the Legislative Assembly. His powers in this direction were fully taxed in the hopeless endeavour to conciliate the confidence and goodwill of a small, but keen-eyed, eloquent, and influential minority. During the debate upon the affairs of Italy in the Legislative Assembly on the 5th of December, 1867, M. Rouher said, "We declare that Italy shall never seize upon Rome," a declaration which was affirmed by a majority of 238 votes against 17, but the emphatic and reiterated "jamais" of which was reduced to an absurdity by the entry of the soldiers of Victor Emmanuel into the Eternal City on the 20th of September, 1870. On the 20th of July, 1869, M. Rouher was appointed to the presidency of the Senate; and one of his last public acts, at the commencement of the war, which in its very early stages swept away the whole Imperial system, was as spokesman of the members of the Senate whom the Emperor received at St. Cloud on the 16th of July, 1870. "Your Majesty draws the sword," he said, addressing the Emperor, "and the country is with you, trembling with indignation at the

excesses that an ambition over-excited by one day's good fortune was sure, sooner or later, to produce. Your Majesty was able to wait, but has occupied the last four years in perfecting the armament and the organisation of the army."

ROUSSEAU, THÉODORE, a distinguished French landscape painter, was born at Paris in 1812. Having passed through the usual training in the schools of Paris, he devoted himself to landscape painting, and formed his style in a wide course of travel and sketching from nature. He made a successful début at the Salon of 1834, and in a short time came to be the recognised head of the "realistic school" of French landscape, the outgrowth of the reaction from the classic and conventional styles which had long prevailed. Year-by-year M. Rousseau increased in facility of handling and mastery over his materials; he was an able and learned designer, and a pleasing and skilful colourist, and his works achieved considerable popularity in this country as well as in France. But, however realistic, he was still eminently Parisian in his way of looking at nature; his composition and colour, though amazingly clever and fascinating, are decidedly conventional, and his works have often the appearance of sketches rather than finished pictures. His subjects are such as the 'Marais des Landes,' 'Sunset in Fontainebleau,' 'Avenue de l'Île Adam,' 'Borders of the Loire in Spring,' 'Stormy Morning,' 'Forest Scene,' 'A Village,' &c. M. Rousseau received first-class medals in 1849 and 1855, and the decoration of the Legion of Honour in 1852. He died in December, 1867.

ROWLANDSON, THOMAS, a celebrated caricaturist, was born in Old Jewry, London, in July, 1756; entered the École des Beaux-Arts, Paris, in 1772, and in 1774 became a student in the Royal Academy, where he distinguished himself by his talent and versatility. He began his artistic career by making designs for the booksellers, but having received a bequest of 7000*l.* from an aunt, he gave way to dissipation. His means being exhausted, he took to making satirical drawings and etchings, which being coarse, virulent, and unrestrained, but full of life, vigour, and dash, became exceedingly popular, and found purchasers as fast as he could produce them. His first political caricature, 'The Champion of the People,' appeared in 1784, and was followed by a long succession of effective prints, chiefly in the interest of the Opposition. But he executed a still larger number of social burlesques, both as tinted drawings outlined with the reed pen, and etchings, which were even freer and coarser, verging often on obscenity, than his political caricatures. Several series of etchings, and especially the 'Dance of Death,' the 'Dance of Life,' and 'The Travels of Dr. Syntax in Search of the Picturesque,' as elucidated by the pen of the equally unscrupulous Dr. Combe, met with an almost unparalleled success. Of his various designs Rowlandson produced, it is said, some thousands, so that, however dissipated, he could not have led an idle life; but the signs of haste and mannerism became more and more marked as he advanced in life. He died on the 22nd of April, 1827.

ROYER-COLLARD, PIERRE PAUL, a French philosopher and statesman, was born on the 21st of June, 1763, at Sompuis, near Vitry-le-François, in the department of Marne, where his childhood was passed under the careful superintendence of his mother, a lady of strong Jansenist principles. He was afterwards educated successively at the College of Chaumont and the College of Saint Omer, the latter of which was under the direction of one of his uncles, the Abbé Collard. Devoting himself to a legal career, he had already formed the basis of a practice as an *avocat au parlement*, when, on the breaking out of the Revolution, he was elected one of the representatives of the Commune of Paris, by the quarter of the Île Saint Louis. Assuming the duties of assistant-registrar of the municipality in 1790, he continued to discharge these until the 10th of August, 1792, the day of the King's committal as a prisoner to the Temple, when he retired before the excesses which were obnoxious to his moderation, and during the Reign of Terror led a life of studious and philosophical seclusion at Sompuis. In 1797 he was elected representative of the department of Marne, in the Council of Five Hundred, in the labours of which assembly he took an active part in the interests of constitutional monarchy. In 1811, on the organisation of the Université de France, he accepted with some reluctance the chair of philosophy in that institution, becoming also dean of the faculty of letters; and, during an incumbency of two years, increased his already extended reputation by his exposition of the philosophy of Reid, and his successful opposition of the sensual system, which, up to the time when he began his lectures in 1811, was the ruling philosophy. The task he undertook required eminent personal qualities,

which were happily combined in him. His mind was singularly vigorous, profound, and clear; his language was easy, forcible, and precise; and he was rich in the gifts of imagination and eloquence. He exerted a prodigious influence on the philosophy of France. It was in accordance with his principles that the minds of Cousin, Guizot, and Jouffroy were formed and developed; and the fragments of his lectures—his only philosophical remains—were published by the last, with explanations, in connection with his translation of the 'Works of Reid,' 6 vols., Paris, 1836. The powerful influence exerted by Royer-Collard as a teacher of philosophy is chiefly to be recognised in his disciples and successors. He founded a school of ardent and elevated young minds, to whom he imparted his zeal, his spirit, his method, and his principles, and in whose labours the activity and mind of their master, even under all modifications and extensions, are to be readily traced. In 1814, almost coincidently with the restoration of the Bourbons, he returned to political life, and in August, 1815, took office as President of the Council of Public Instruction, the duties of which post he fulfilled until July, 1820, when he resigned, still preserving as an honorary rank the title of Councillor of State. In 1815 he had been sent by the electors of Marne to represent them in the famous Chamber called *introuvable*, in which he played a prominent part at once loyal and constitutional; and maintained the same course in the succeeding and more liberal Chamber, of which he was also a member. As a member of the Opposition he contributed in no small degree to the securing of the Constitutional Régime and to the propagation of sound liberal doctrines; and at length came to be the head of the political party known as Doctrinaires, who opposed the movements both of the ultra-liberal and the royalist parties. It was thus he gained great hold on the opinion and esteem of his country, and attained such popularity that, in 1827, he was returned as a representative by no fewer than seven electoral colleges. To this honour succeeded, a few weeks after, his election as a member of the Académie Française; and in 1828, he became, as a natural sequence, President of the Chamber of Deputies, in which capacity it fell to him, March, 1830, to present to Charles X. the famous address of the 221 deputies, which met with so little regard from the King that he prorogued the Chamber on the following day. The Revolution of July brought about the downfall of Charles; after which M. Royer-Collard continued to sit as a Deputy, and took a conscientious oath to the new dynasty and to the revolution of which the address of the 221 had formed the standard. The advance of age, with its attendant infirmities, for some years before his death, seldom allowed of his appearance in the tribune; and he retired altogether from political activity in 1842, after which he lived in the most complete privacy and seclusion. He died on the 4th of September, 1845, at his residence of Châteauneuf, near Saint Aignan (Loir-et-Cher); and ten years after, the town of Vitry-le-François raised a statue in his honour. Of the biographies which have been produced in illustration of his life and career, the most remarkable are M. de Barante's 'Vie Politique de M. Royer-Collard, ses Discours et ses Ecrits,' 2 vols. 8vo, Paris, 1861; and M. de Lacombe's 'Vie de Royer-Collard,' 8vo, Paris, 1862.

ROYLE, JOHN FORBES, M.D. [E. C. vol. v. col. 183], died at Acton, near London, January 2, 1858, in the 59th year of his age.

RÜCKERT, FRIEDRICH, a distinguished German poet and Orientalist, was born at Schweinfurt, Bavaria, May 16th, 1788. He received his education in the gymnasium of his native town, and at the University of Jena, in which he became lecturer in 1811. In 1815 he left Jena to become one of the editors of the Stuttgart 'Morgenblatt,' and remained thus employed for two years. After a year's residence at Rome, during which he studied the national songs of Italy, he returned to Germany, settled at Coburg, married, and wrote and published largely. He studied Arabic, Persian, Sanscrit, and other oriental languages, of which he acquired so extensive a knowledge, that, in 1826, he was appointed professor of oriental literature at the University of Erlangen. In 1841 he was invited by the King of Prussia to Berlin, where he filled various university offices. In 1849 he retired into private life, settled at Neuses, near Coburg, and resided there till his death, which took place January 31st, 1866.

Rückert was one of the most voluminous and ablest German poets of his time. His temperament and sympathies were such as to throw a poetical halo around everything he wrote; he had studied all the best marked styles of the ancient Greek and early German poets; while his knowledge of the eastern

languages enabled him to produce almost unrivalled translations of oriental poetry. Indeed his own poems partook much of the oriental style, the rich imagery of which was congenial to his taste and feeling. His published writings—epics, lyrics, dramas, didactic pieces, and metrical translations—are very numerous. His early poems were collected in 1814, with the title 'Deutschen Gedichten,' which he published at Heidelberg, under the assumed name of Freimund Raimar. A Call to Arms, the 'Geharnischten Sonette,' aroused attention by the fierce hostility it breathed against Napoleon. 'Napoleon, eine polit. Komödie,' Stuttgart, 1816. This was followed by 'Kranz der Zeit,' celebrating the downfall of Napoleon, Stuttgart, 1817; 'Oestliche Rosen,' Leipsic, 1822, imitated from the Persian; 'Amarylis, ein ländliches Gedicht,' 1825; 'Die Makamen des Hariri,' an oriental translation, Stutt., 1826—forming part of a collection, in 2 vols., entitled 'Die Verwandlungen des Abu-Seid,' 'Nal und Demajanti, ein indisches Gedicht,' Frankfurt, 1828; 'Schi-King, chinesisches Liederbuch,' 1833. All his poems down to this date were collected in 'Gesammelte Gedichte,' 6 vols., Erlangen, 1834—38; 'Erbauliches und Beschauliches, aus dem Morgenland,' 2 vols., Berlin, 1836—8; 'Sieben Bücher Morgenländische Sagen und Geschichten,' 2 vols., Stutt., 1837; 'Die Weisheit des Brahmanen, ein Lehrgedicht in Bruchstücken,' 6 vols., 1836—9; 'Rostem und Suhrab, eine Heldengeschichte,' Erl., 1838; 'Brahmanische Erzählungen,' Leip., 1839; 'Amralkais der Dichter und König,' a translation, 1843; 'Saul und David, ein Drama der heiligen Geschichte,' Erl., 1843; 'Herodes der Grosse,' 2 vols., Stutt., 1844; 'Kaiser Heinrich IV.,' 2 vols. Frank., 1845; 'Christoforo Colombo, Geschichtes-Drama,' Frank., 1845; 'Hammāsa, oder die ältesten Arabischen Volkslieder übersetzt und erläutert,' 2 vols., Stutt., 1846; 'Ein Dutzend Kampflieder für Schleswig-Holstein.' The latest poem published in his lifetime was 'Sawitri,' 1866. There appeared posthumously, 'Lieder und Sprüche,' edited by F. Rückert, 1866. In 1867 was commenced a collected edition of his whole works, 15 vols., Frankfurt. Notices of the life and writings of Rückert, by Stein, Kinkel, Beyer, and Fortlage, have been published.

RUDOLPHI, KARL ASMUND, Swedish naturalist and entozoologist, was born at Stockholm, July 14, 1771. His academical education was begun and ended at Greifswald, but the intermediate portion was received at several of the German universities. The thesis which he sustained on acquiring his degree of doctor of medicine was 'Sur les vers intestinaux,' a subject which he studied with remarkable success. For a few years he was engaged in teaching medical science and veterinary surgery at Greifswald, but in 1810 he acquired the professorship of anatomy and physiology at Berlin, and there taught till his death, November 29, 1832. His principal writings are 'Observationes circa vermes intestinales,' 4to, Greifswald, 1793—1795; 'Entozoorum historia naturalis,' 2 vols., 8vo, Amsterdam, 1808—1810; 'Entozoorum Synopsis,' 8vo, Berlin, 1819; 'Bemerkungen aus dem Gebiet der Naturgeschichte, Medicin und Thier-arzeneykunde, auf seiner Reise durch einen Theil von Deutschland, Holland und Frankreich gesammelt, von K. A. R.,' 8vo, Berlin, 1804-5; and 'Grundriss der Physiologie,' 3 vols., 8vo, 1821—1828. Rudolphi was the first to group together all the anneloid parasites into one class, which he named *Entozoa*, from which the class *Scolecida*, as now adopted, only differs by including, in addition, certain forms which live free in water. He divided the group into five orders, all of which have long been adopted, but latterly one has been suppressed. Rudolphi may be regarded as the first systematist of these animals. He was a pupil of Linnæus, a teacher of Johannes Müller, and has been styled the "princeps helminthologorum."

RÜMCKER, CARL LUDWIG CHRISTIAN, German astronomer, was born at Neubrandenburg, Mecklenburg-Strelitz, May 28th, 1788. After receiving his education at the Graue Kloster and the Engineering Academy at Berlin, he passed an examination in 1807 as engineer and architect. The French occupation of North Germany greatly interfered with peaceful employment about that time; and Rümker came to England in 1808 to seek an opening for his abilities. He served for a time as a midshipman in the East India Company's navy; then in a merchant-ship belonging to a private firm. In 1811 he entered the Royal Navy, and served in the 'Benbow,' and afterwards in the 'Montague,' as naval instructor. In the 'Albion' he made a voyage to the Mediterranean, met Baron Zach at Genoa, and contributed some astronomical papers to Zach's 'Correspondenz.' In 1817 he quitted the English navy, removed to Hamburg, became principal of the School of

Navigation, and extended his knowledge of astronomy under Schumacher at Altona Observatory. In 1821 he returned to England, and accompanied Sir Thomas Brisbane to New South Wales, where he took charge of the newly-founded observatory at Paramatta. In 1822 he anticipated the astronomers of Europe by obtaining the first view of the return of Encke's comet. His observations on comets, solstitial latitudes, the pendulum, the dip and declination of the needle, and other subjects, were so numerous and important as to fill a volume of the 'Philosophical Transactions;' a collection especially notable for his 'Catalogue of Stars in the Southern Hemisphere.' In 1829 [he changed his abode again to Hamburg, where he obtained the appointment of principal of the School of Navigation and director of the Observatory. He became renowned throughout Germany as the leading teacher in the sciences bearing upon navigation. His 'Handbook of Navigation,' 1843, became a standard work, and has gone through many editions. His 'Catalogue of the places of 12,000 Fixed Stars visible at Hamburg,' 4to, 1843, gained for him the Royal Society's medal. In 1861 he presented to the Royal Astronomical Society the MSS. of his Observations of Southern Stars, made at Paramatta in 1826—7. Rümker, who was a fellow or member of most of the great scientific societies in Europe, went to Lisbon with the hope of recruiting his declining health, and died there on the 21st of December, 1862.

RUNGE, OTTO PHILIPP, a celebrated German painter, was born at Wolgast in 1776. He studied at Hamburg, whence he proceeded in 1798 to Copenhagen, where he particularly distinguished himself. In 1801 he went to Dresden, where he executed numerous designs—among others several from the poems of Goethe, which were greatly admired by Tieck and by the poet himself. One of his best oil paintings, 'The Triumph of Love,' was painted at the suggestion of Tieck. Runge returned to Hamburg in 1804, and there, among other things, produced designs illustrative of the Bible; of Ossian; and a series of the Seasons, which attracted considerable attention, and, on account of their obscurity, called forth some witticisms—amongst others from Goethe. He died December 2nd, 1810. He wrote a treatise on the relations of colours, 'Farbenkugel,' &c., Hamburg, 1810. His 'Writings and Letters' were published at Hamburg in 2 vols. 8vo, 1841.

* RÜPPELL, WILHELM PETER EDUARD SIMON, traveller and zoologist, was born at Frankfurt-am-Main, November 20, 1794. The son of a wealthy merchant, he early indulged his taste for travelling by visiting Italy and Egypt. After spending three years in making the preliminary preparations, he in 1822 commenced the exploration of Africa, and, from that year till 1827, his time was spent in Nubia, Sennaar, Kordofan, and Arabia. From 1830 to February, 1833, he devoted to an investigation of Abyssinia. During these journeys he made extensive collections of animals, plants, antiquities, and Abyssinian manuscripts, the large proportion of which he presented to the museum and library at Frankfurt. His works abound in information of a varied and trustworthy kind respecting the countries visited by him. They include 'Reisen in Nubien, Kordofan und dem Petrischen Arabien, vorzüglich in Geographischen-Statistischen-Hinsicht,' 8vo, Frankfurt, 1829; 'Reise in Abyssinien,' 2 vols., 8vo., 1838—1840; 'Neue Wirbelthiere zur Fauna Abyssinien,' 8vo, 1835—1840; 'Systematische Uebersicht der Vögel Nord-ost Afrikas,' 8vo, 1845; and numerous papers. In 1838 he received the patron's medal of the Royal Geographical Society of London. He is a member of numerous societies.

* RUSKIN, JOHN [E. C. vol. v. col. 204.] Mr. Ruskin was born on the 8th of February, 1819. He completed his great work 'Modern Painters,' by the publication of the fifth volume in 1860. He has since published many volumes, but mostly small in size and occasional in character. Several of them have been more or less directly concerned with social and political economy, in which his views diverge widely from those of the leading authorities on the subject. He had touched on political questions in some of his larger works, but he treated it more specifically in 'The Political Economy of Art: being the substance, with additions, of two Lectures,' 16mo, 1857; "'Unto this Last,'" four Essays on the First Principles of Political Economy, 8vo, 1862, a work which called forth much adverse criticism, and 'The Crown of Wild Olive. Three Lectures on Work, Traffic, &c.,' 8vo, 1866. He further developed his views in letters which appeared in the newspapers, and in 'Time and Tide, by Wear and Tyne. Twenty-five Letters to a Working Man of Sunderland, on the Laws of Work,' and he is at present engaged in writing a series of letters to working men, in one of

which he stated his intention, if he found it practicable, to establish on a suitable estate a colony of working men, in which it should be a fundamental law that no steam-engine or railway should be admitted. In his more generally recognised position as a teacher of art, he published in 1858 'An Inaugural Address, delivered at the Cambridge School of Art, October 20th, 1858,' and 'The Two Paths : being Lectures on Art and its application to Decoration and Manufacture,' 8vo, 1859. In 1861 a 'Selection from the Writings of J. Ruskin' appeared in one volume 8vo. In 1862 he issued a new edition of his 'Pre-Raphaelitism.' Of a different class, but equally characteristic, were his 'Ethics of the Dust : ten Lectures to little Housewives on the Elements of Crystallization,' 8vo, 1866 ; and 'The Queen of the Air : being a study of the Greek Myths of Cloud and Storm,' 8vo, 1869. In 1867, Mr. Ruskin was appointed Sir Robert Rede's Lecturer in the University of Oxford ; and on the foundation of the Slade Professorship of Fine Art at the University, Mr. Ruskin was elected the first professor. On the duties of this office he entered with characteristic zeal ; his lectures were largely attended, and he supplemented them by personal instruction ; he set about forming a collection of drawings and engravings chiefly from his own sources for the use of the students ; he drew up and published a 'Catalogue of Examples arranged for elementary study in the University Galleries,' 8vo, Oxford, 1870, and passed through the press his early lectures, 'Lectures on Art delivered before the University of Oxford in Hilary Term, 1870,' Oxford, 8vo, 1870 ; and he made what the University authorities justly term "a munificent offer" of 5000*l.* for the endowment of a Master of Drawing, which was accepted by a Convocation, November 22nd, 1871. On the 23rd November, Mr. Ruskin was elected Lord Rector of the University of St. Andrew's. He had shortly before been proposed for the rectorship of Glasgow University, but the choice fell on Mr. Disraeli.

* **RUSSELL, RIGHT HONOURABLE JOHN RUSSELL, EARL**, formerly known as Lord John Russell [E. C. vol. v. col. 207]. On the return of Lord Palmerston to power in June, 1859, Lord John Russell resumed office in his administration as Minister for Foreign Affairs ; and in this capacity assisted in concluding the commercial treaty with France in January, 1860. On the 1st of March following, he introduced a scheme of Parliamentary Reform ; which, after a series of languid debates, was finally withdrawn on the 11th of June. On the 31st of July he addressed a note to the Sardinian Government, dissuading it from attacking Austria or Naples ; but when, by the unauthorised expedition of Garibaldi, the territory of Naples had been virtually won for Victor Emmanuel, he encouraged the latter in its appropriation as a part of his dominions. "Her Majesty's Government," he said, in a despatch to the British minister at Turin, dated October 27, 1860, "could see no sufficient ground for the severe censure with which Austria, France, Prussia, and Russia, have visited the acts of the King of Sardinia. Her Majesty's Government will turn their eyes rather to the gratifying prospect of a people building up the edifice of their liberties, and consolidating the work of their independence, amid the sympathies and good wishes of Europe." The position of the British Government in relation to Italy, about the epoch referred to in the foregoing extract, was illustrated at the time by the publication of 'Italy. Corrected Report of the Speeches of Lord John Russell, delivered in the House of Commons, February 5 and 6, 1861,' 8vo, London, 1861. On the 24th of July, 1861, Lord John Russell issued his farewell address to the electors of the City of London, whose representative he had been for twenty years ; and six days afterwards, July 30, took his seat in the House of Lords as Earl Russell, of Kingston-Russell, in Dorsetshire, and Viscount Amberley, of Amberley, in Gloucestershire, and of Ardsalla, co. Meath. Earl Russell was made a Knight of the Garter on the 21st of May, 1862 ; and, in 1863, was elected Lord Rector of the University of Aberdeen, of which city he had been made a burgess in September, 1859 ; on the 9th of August, 1863, received the freedom of Dundee ; and made, a few days after, at a banquet given in his honour at Blairgowrie, a speech in which occurred the phrase, afterwards so amusingly canvassed, that, so far as Reform was concerned, the nation might "rest and be thankful."

On the 2nd of March, 1863, Earl Russell addressed remonstrances to Russia on behalf of Poland ; and on the 17th of June, concurrently with France and Austria, followed up this step with a note, in which the grievances of the Poles were exhibited under six different heads, and redress demanded. In November of the same year he declined to accept the invitation of the Emperor of the French to take part in a congress proposed

to be assembled at Paris for the settlement of the affairs of Europe ; on the ground that, where good-will was wanting, such a congress would lack authority peacefully to enforce its decisions. Earl Russell displayed skill and firmness in the manner in which he consistently maintained and defended the neutrality of Great Britain during the civil war in America ; a course which he had to pursue against the appeals of the one party to the contest, and the remonstrances of the other. In May, 1865, he made a concise and logical statement of the dilemma in which President Lincoln's proclamation of March, 1861, declaring the ports of the Confederate States to be under blockade, had placed the British Government. The latter, Lord Russell explained, had two alternatives : either to acknowledge the belligerent rights of the North, and by consequence of the South, or else to refuse to acknowledge the blockade. The former course was adopted as a necessary consequence to the acknowledgment of the rights of blockade claimed by the United States.

In the earlier stages of the quarrel between Denmark and the German powers in 1863, Lord Russell sought to mediate between the two parties ; and even when he found that the Danish Government obstinately refused to give any pledge that the grievances to which the Germans of the Duchies were subjected should be redressed, he still was reluctant not to carry out the engagements which were common to the five powers who had signed the treaty of London. Of these signatories, Austria and Prussia were hostile to the integrity of Denmark ; France and Russia were indifferent ; whilst "England alone," as Earl Russell claims in his pamphlet, 'The Foreign Policy of England from the Year 1570 to the Year 1870,' 8vo, 1871, "sincerely endeavoured to fulfil her promise. . . . It became a great question for Lord Palmerston's Cabinet whether, if they could obtain a binding stipulation from Denmark in favour of her German subjects, they should advise the Queen to offer to the King of Denmark naval and military aid for his defence. The Cabinet, after much deliberation, decided that in the case supposed they should offer to assist Denmark by force only in case France would join in an alliance for that purpose. . . . Had England and France guaranteed the performance by Denmark of her own solemn engagements, Prussia and Austria would have had no case for war ; had they entered upon it, the military forces of France and England, the naval forces of England and France, would have been a powerful assistance to Denmark. The Emperor of the French twice rejected this proposal. . . . A further attempt at pacification was made at the Conference of London. But Denmark, with a small army, and guns which could not reach the Prussian army, was confident in her own power of resistance to the end. She declined the good offices of the neutral powers, and fell a victim to her blindness. Lord Palmerston, by a happy suggestion, saved her from the probable destruction of her capital."

Viscount Palmerston died on the 18th of October, 1865, and Earl Russell succeeded to the premiership. On the 12th of March, 1866, Mr. Gladstone, at that time Chancellor of the Exchequer, and leader of the House of Commons, introduced a Franchise Bill, which, after considerable discussion, was read a second time on the 28th of April. With this bill, a second for the redistribution of seats was incorporated on the 7th of May ; and on the 18th of June, the Government was defeated, by a majority of 315 to 304, on Lord Dunkellin's amendment in favour of a borough franchise based on rating instead of "clear yearly value," or rental. The defeat was taken as decisive ; and led to the dissolution of the administration on the 26th of June ; since which time Earl Russell has pursued a career of independent and unofficial liberalism in the House of Lords, in which he introduced a bill, April 9, 1869, empowering the Crown to confer a limited number of life peerages. The bill passed through committee on the 3rd of June, but on the 8th of July, was rejected, on the motion for a third reading, by a majority of 106 votes against 77. On the 20th of June, 1870, he introduced a motion for a commission to inquire into the relation between the mother country and the colonies, especially with reference to the defence of the latter ; which motion, after a debate, was withdrawn.

During the agitation of the question of the disestablishment and disendowment of the Irish Church, Earl Russell freely, and in various ways, ventilated his opinions. Thus he published a 'Speech on the Irish Church. With a Preface,' 8vo, London, 1867, as well as three letters which were largely conversant about the same, and were severally entitled, 'Letter to the Right Honourable Chichester Fortescue on the State of

Ireland,' 8vo, London, 1868, second 'Letter,' 8vo, 1868, third 'Letter,' 8vo, 1869; and at a meeting over which he presided at St. James's Hall, on the 16th of April, 1868, he expressed his opinion that the great point to be secured was equality, which might result either from the endowment of all the different communions in Ireland, or from a general disendowment. On the whole, looking at public opinion, and discarding any preferences of his own, he sought for general disendowment.

Lord Russell has at all times taken deep interest in educational questions, and in societies intended for the moral and material well-being of the people. He was president of the National Association for the Promotion of Social Science, at its second annual meeting at Liverpool, in 1858; and, on the 12th of October, delivered an address which was published with the title of 'The Improvement of the Law, Health, Education, and Morals of the People. The Inaugural Address,' &c., 12mo, London, 1858. Of more local interest was his 'Inaugural Address delivered at Tavistock . . . at the fifth Annual Meeting of the Devon Association for the Advancement of Literature, Science, and Art,' 8vo, London, 1866. Of his more distinctively literary productions may be mentioned a new edition of his 'Essay on the History of the English Government and Constitution,' &c., 8vo, London, 1865, French translation, by C. B. Derosne, 8vo, Paris, 1865; 'The Life and Times of Charles James Fox,' 3 vols., 8vo, London, 1859-66; and 'Selections from Speeches of Earl Russell, 1817 to 1841; and from Despatches, 1859 to 1865. With Introductions,' 2 vols. 8vo, London, 1870. Earl Russell enjoys several honours and offices which are incidental to his talent and position; being one of the Lords of the Privy Council; G. C. M. G.; F.R.S.; a Governor of the Charterhouse; an Elder Brother of the Trinity House; a Commissioner of Chelsea Hospital; and a Trustee of the British and Hunterian Museums.

RUSSELL, JOHN SCOTT, F.R.S. [E. C. vol. vi. col. 1019].

* RUSSELL, WILLIAM HOWARD, LL.D. [E. C. vol. v. col. 213.] As soon as the importance and extent of the Sepoy Mutiny were understood, Mr. Russell was requested by the proprietors of the 'Times' to proceed to India as their Special Correspondent. He reached India in the latter part of 1857; was attached to the head-quarters of Lord Clyde, and, till the entire suppression of the mutiny in 1858, continued with the army, sharing its perils and regularly chronicling its prowess, notwithstanding considerable physical suffering from the effects of the climate, which resulted in a serious illness. After his return he published 'My Diary in India in the year 1858-9,' 2 vols. 8vo, 1860, of which the seventh thousand was published in the same year. In 1858 he established the 'Army and Navy Gazette,' of which he took the chief editorship. The same year he published a revised edition of 'The British Expedition to the Crimea,' and in 1859 a work entitled 'Rifle Clubs and Volunteer Corps.' The outbreak of the civil war in America, 1861, led to his visiting that country in his old vocation of special correspondent to the 'Times,' and his graphic narratives of the early engagements which appeared in that journal excited intense interest. But his description of the encounters at Bull Run offended the susceptibilities of the North, and he was refused permission to accompany the Federal army in the following campaign. He, in consequence, returned to England in 1862 and published 'My Diary North and South,' 2 vols. 8vo, 1863, to which he added a third volume in 1865, especially devoted to Canada. The narrative of the reception of the Princess Alexandra, and of the incidents connected with the marriage of the Prince of Wales, which he wrote for the 'Times,' was reprinted in America with the title 'The Marriage of the Prince of Wales and Princess Alexandra of Denmark. Collected from the description in the London 'Times' by W. H. Russell,' 8vo, Boston, U. S., Cambridge, U. S., 1863; and he himself, in the following year, published a distinct account in a richly illustrated volume, 'A Memorial of the Marriage of H. R. H. Albert Edward Prince of Wales and H. R. H. Alexandra Princess of Denmark, &c.,' folio, 1864. His next important expedition was in the 'Great Eastern,' 1865, in the unsuccessful attempt to lay the Atlantic Telegraph, relating to which he published 'The Atlantic Telegraph (Dedicated to the Prince of Wales),' 4to, 1866. In the war of 1866, he was with the Austrian army. In 1868 he appeared in the novel characters, first, of a novelist by the publication of 'The Adventures of Dr. Brady;' and, secondly, of a candidate for the representation of Chelsea in parliament in the Conservative interest; but in neither was he successful. At the beginning of 1869 he left England in order to accompany the Prince and Princess of Wales in their long Eastern tour, of which,

besides the letters in the 'Times,' he published a separate account in 'A Diary in the East during the Tour of the Prince and Princess of Wales,' 8vo, 1869. The declaration of war between France and Germany, July, 1870, again led him to the battle-field. During the whole campaign he was with the headquarters of the German army, and he sent ample reports of the events he witnessed to the 'Times,' but hitherto he has not published any separate work on the Franco-German war. He was treated with great distinction in the German camp, and the Emperor of Germany marked his approval of Mr. Russell's record of German prowess by conferring on him the iron cross of the Order of Merit.

RUSTICI, GIOVANNI FRANCESCO, an eminent Italian sculptor, was born at Florence of a noble family, about 1470. Whilst studying and modelling in the garden of the Medici, which had been opened as a sort of academy, Rustici was singled out by Lorenzo the Magnificent, and placed as a pupil with Andrea del Verrochio, and when he left Florence, with Leonardo da Vinci. One of Rustici's earliest works was a bronze Mercury for a fountain in the Medici palace, and which was made to turn round by the falling water. He also executed reliefs of the Annunciation in bronze and in marble, a Leda, and other classical figures; and for the guild of merchants three colossal bronze statues, St. John, a Pharisee, and a Levite, for the Baptistery of Florence. These were regarded as the finest modern works produced in bronze up to that time; but Rustici was very inadequately remunerated, and became so disgusted that for some time he seems to have neglected his profession. He was generous and devout, but of somewhat eccentric manners. One of his whims was to keep a number of animals about his house and gardens, and among the rest he had a room full of different kinds of serpents, whose habits he delighted to watch. He modelled horses with great spirit, and these and other things he used to present to his friends. He also modelled in terra-cotta, and gave to the convent of Santa Lucia a rilievo of 'Christ appearing to Mary Magdalene in the Garden,' which was afterwards vitrified by G. Della Robbia. On the expulsion of the Medici from Florence, Rustici accepted an invitation from Francis I. of France, who assigned him a residence, and bestowed on him a handsome pension. Rustici executed some minor works, and prepared the design of a colossal equestrian statue of Francis. But he always worked slowly, and Francis died before the model was ready; and his successor not only refused to have it completed, but deprived the sculptor of his house and pension. Rustici found shelter for his old age in a French abbey, where he died in 1550.

RUTHERFORD, SAMUEL, a Scottish scholar and divine, "a gentleman by extraction," but of whose earliest years little is known, was born about 1600, in the parish of Nisbet, now annexed to Crailing, in Roxburghshire. In 1617 he became a student at the University of Edinburgh, where he took the degree of M.A. in 1621, and where he was occupied from 1623 to 1625 at once as a regent in philosophy and a student in divinity. In 1627 he was ordained minister of the parish of Anwoth, in the stewartry of Kirkcudbright, to which he was appointed "by means of the then Viscount Kenmure, and without any acknowledgment or engagement to the Bishop." Here he distinguished himself by his devotion to study and the conscientious performance of his pastoral duties, until the publication of his work against Arminianism, entitled 'Exercitationes apologetice pro divina Gratia, adversus Jacobum Arminium ejusque Assecclas,' 8vo, Amsterdam, 1636, of which an earlier edition had already been issued in 1630. In June of the latter year, he was summoned, on account of this work, before the High Commission Court at Edinburgh; and although a concurrence of fortunate accidents stayed the proceedings for that time, they were some years afterwards resumed at the instance of the Bishop of Galloway. Rutherford was charged with non-conformity, with preaching against the five Articles of Perth, and with the production of the 'Exercitationes;' but when he came before the Court of High Commission, he "altogether declined it as a lawful judicatory, and would not give the chancellor (being a clergyman) and the bishops their titles." Notwithstanding that he was befriended by Lord Lorne, afterwards Marquis of Argyle, and others, he was sentenced on the 27th of July, 1638, to deposition from his ministerial functions, and was ordered to repair within six months to Aberdeen, and there to confine himself during the king's pleasure. He continued at Aberdeen for upwards of a year and a half; and whilst in that city wrote to various correspondents a series of letters which form the bulk of a volume afterwards posthumously

published with the title of 'Joshua Redivivus: or, Mr. Rutherford's Letters,' &c., 2 parts, second edition, 8vo, London, 1671, third edition, in which the omissions and inaccuracies of the second were corrected by reference to the first, and which contained sixty-eight additional letters, 3 parts, 8vo, 1675, &c., lately reprinted at Bonmahon, co. Waterford, under the editorial care of the Rev. D. A. Doudney, as 'Letters. By the eminently godly and learned Rev. Samuel Rutherford, Professor of Divinity, St. Andrew's,' 8vo, London, 1857. Political circumstances at length favoured his enlargement, and he returned to Anwoth in February, 1638, and resumed his ministerial functions in that place with such ardour and success that the whole of the neighbouring district is said to have formed his particular flock. He was appointed a delegate for the presbytery of Kirkcudbright to the memorable General Assembly which met at Glasgow in November, 1638; before the members of which he rehearsed the particulars of his previous career, of his confinement, and the causes which occasioned it. By this Assembly he was appointed to the professorship of divinity in the University of St. Andrew's, whither he proceeded in October, 1639, and where he was associated with Mr. Blair in the pastorate of the parish church. In 1643 he was deputed as one of the Scots Commissioners to the Assembly of Divines at Westminster, from which he finally returned in November, 1647. During his stay in London, in the course of which he occasionally preached before both Houses of Parliament, he produced various works, amongst which may be mentioned his 'Divine Right of Presbytery: or, a peaceable Plea for the Government of the Church of Scotland,' 4to, London, 1644; 'The Trial and Triumph of Faith,' London, 1645; 'The Divine Right of Church Government, in opposition to the Erastians,' 4to, London, 1646; 'Christ dying, and drawing Sinners,' London, 1647; 'A Survey of the Spiritual Antichrist,' &c., 2 parts, 4to, London, 1648; and 'Lex Rex,' a reply to a piece of exaggerated loyalty by John Maxwell, the excommunicated Bishop of Ross, of which King Charles is reported to have said that "it would scarcely ever get an answer," and on account of which, several years subsequently, he was deprived of his academical preferments, his stipend confiscated, and himself confined to his house, and cited to appear before the ensuing parliament on a charge of high treason, whilst already lying on his death-bed. The 'Lex Rex' was burned by the hangman

at the cross at Edinburgh in 1661, and also at the gates of the New College of St. Andrew's, of which Rutherford had been appointed principal in January, 1649, and, shortly after, rector of the University. He refused more than one offer of academical employment and distinction abroad; and died at St. Andrew's on the 20th of March, 1661, having nearly a month before, and in full view of his death, published a remarkably clear and particular 'Testimony' to the Reformation in Great Britain and Ireland.

Rutherford was one of the most able, learned, and consistent of the Presbyterians of the 17th century; and it has been observed by Wodrow, that those who knew him best "were at a loss which to admire, his sublime genius in the school, or his familiar condescension in the pulpit, where he was one of the most moving and affectionate preachers of his time, or perhaps in any age of the Church." Yet it must be said that Rutherford, in spite of his exemplary and laborious zeal as a scholar, pastor, and professor, was himself scarcely in advance of the most bigoted party of his age in the matter of toleration, as indeed he exemplified in several of his controversial works, and in particular in his 'Free Disputation against pretended Liberty of Conscience,' London, 1649, a work principally directed against the Independents.

RYCKAERT, DAVID, a celebrated Flemish painter, the third of that name of a family of painters, born at Antwerp in 1612, was the son and scholar of the second David Ryckaert, a painter of some note, born 1590, died 1642. David Ryckaert painted somewhat in the manner of Teniers. His subjects are commonly interiors, with peasants regaling; occasionally fairs and other rustic gatherings; chemists' laboratories, &c.; and he has also left, like Teniers, some representations of the Temptations of St. Anthony. Ryckaert's pictures are much admired for their lively, spirited composition, the expression of the heads, and clear golden colour. The Antwerp Museum possesses a 'Village Festival' by him (No. 559). He was appointed dean of the fraternity of St. Luke in 1652, and died in that city between September 18, 1661, and February 18, 1662. Bryan's biography of David Ryckaert is full of errors, which were pointed out and the correct dates for the first time supplied by Van Lerius in the 'Supplément au Catalogue du Musée d'Anvers,' 1863, pp. 60-68.

S

* SABINE, GENERAL SIR EDWARD, R.A., K.C.B. [E. C. vol. vi. col. 1081.] In 1865 Major-General Sabine was promoted to be lieutenant-general; in 1869 he was made general, knighted, and created K.C.B. In 1871 "the increasing weight of years" led him to resign the presidency of the Royal Society, which he had held for eleven years, to the general satisfaction of the fellows and benefit to the society; and on the anniversary meeting, November 30, 1871, he relinquished the chair to his successor, Professor Airy, the Astronomer Royal. His observations 'On the Cosmical Features of Terrestrial Magnetism' appeared in 1862.

SADELER, the name of a family of Flemish engravers, of whom the following are the most eminent:—JEAN SADELER, born at Brussels about 1550, was brought up to his father's business of damascening, or engraving iron and steel in patterns, and inlaying it with gold or silver; but having studied drawing the figure, he, when about 20, began to engrave on copper. His early plates, chiefly after German designers, were hard and meagre in manner; but he went to Italy, and there acquired a freer and better style. In all, he engraved nearly 200 plates. His best are scriptural subjects, after Bassano, Caravaggio, Van Orley, &c., in which there are peculiar effects of light and shadow. He also engraved many portraits, and some landscapes. He died at Venice about 1600.—RAPHAEL SADELER, younger brother and scholar of Jean Sadeler, was born at Brussels about 1555. He assisted his brother in many of his plates; but about 150 bear his own signature. Several of these are from his own designs, but the best are those after Jan van Achen and Martin de Vos. He engraved with spirit and freedom, and his best prints are much

esteemed. He is said by some authorities to have died at Venice in 1617, while others say he removed to Munich, and died there in 1628.—GILLES or EGIDIUS SADELER, brother, or nephew, and scholar of Jean and Raphael Sadeler, was born at Antwerp in 1570. He was by far the best engraver of the family. He designed and drew with spirit and facility; engraved with firmness, clearness, and precision; and was free from stiffness in manner. His prints embrace almost every variety of subject. Some, including scriptural and classical subjects, and a series of 52 views of Roman antiquities, are from his own designs; others are after Raffaele and other great Italian masters, or Albert Dürer and other German and Netherlandish artists, and many are portraits. In all, there are 231 plates by him. Gilles Sadeler went to Prague at the invitation of the Emperor Rudolph II., and continued to be patronised by his two successors. He died at Prague in 1629. There was a succeeding generation of Sadelers, engravers, but their works are of little value.

SAFARIK, PAL JOZSEF [E. C. vol. v. col. 237], died on the 26th of June, 1861.

SAGRA, RAMON DE LA, a Spanish economist and naturalist, was born at Coruña in 1798. After receiving his education at Madrid, he was appointed director of the botanical gardens at Havana, in the island of Cuba, and professor of agricultural botany, in 1820. In 1835 he returned to Paris, at which city and at Madrid his subsequent time was chiefly spent. From 1854 to 1856 he sat in the Spanish Cortes; but on the forcible dissolution of the General Assembly by General O'Donnell and the restoration of the form of government of

1845, he retired into private life. He wrote a large number of works, many of them pamphlets, on natural history, political economy, and social matters. The most important of these are the following:—'*Licções di Economia Social*,' 12mo, Madrid, 1840; and his works on Cuba. The latter are essentially different editions of the same work. It first took form in 1831 as '*Historia economica politica, y estadística de la Isla de Cuba*,' 4to, Havana. It appeared in a much enlarged form under a somewhat different title, in two folio volumes in 1837—42; and a still larger work was commenced in 1861, having for title, '*Historia física economica, etc., de la Isla de Cuba*,' which he proposed to complete in ten folio volumes. He also published '*Icones plantarum in flora Cubena descriptorum*,' folio, 1863, with 133 plates. He died in the early part of 1871.

SAINT-HILAIRE, AUGUSTE. [E. C. vol. v. col. 242.] Though known as Auguste Saint-Hilaire, his full name was Augustin François César Prouvensal de Saint-Hilaire. He died at Orleans, September 30, 1853.

SAINT-HILAIRE, ISIDORE GEOFFROY, zoologist, was born at Paris, December 16, 1805. He was the son of Geoffroy Étienne Saint-Hilaire, whose work he continued, and in whose footsteps he closely followed. His education was received in Paris, and he commenced writing, as also performing official duties, in his 19th year; for in 1824 he acted as assistant naturalist at the Jardin des Plantes. In 1829 he became assistant professor of zoology to his father in the Museum of Natural History, and in 1837 his assistant at the Faculty of Sciences. In 1838 he went to Bordeaux as dean of the Faculty of Sciences there, for the purpose of organising that faculty; but as soon as the task was performed he returned to Paris. In 1840 he acted as inspector-general of the University of Paris, and, his father becoming blind in 1841, he succeeded to the professorship of zoology at the Museum of Natural History. In 1850 he succeeded M. de Blainville in the similar professorship at the Faculty of Sciences. In 1854 he was appointed the first president of the Société d'Acclimatation, in the founding and organising of which he had the principal share. He died November 10, 1861. Like his father, he wrote numerous works and papers, and, like him, he belonged to the school of philosophical naturalists. The one great aim which he constantly pursued was the construction of a general system of zoology. The germs of the ideas which he developed more fully in later life were enunciated by him in writings published before his 30th year, such as the articles on the *Mammalia*, in the '*Dictionnaire Classique d'Histoire Naturelle*.' The articles were subsequently collected into a volume, which is remarkable for the strong generalising tendency which was one of his chief characteristics. He carried on the investigations into monstrosities commenced by his father, and showed that abnormal developments were as much amenable to law as normal structures, and that they afforded considerable aid to the zoological systematist. He objected to the system of linear classifications generally adopted by naturalists, and showed how essential it was that collateral should be indicated alongside with the direct affinities, which object he sought to effect by means of his system of parallel classification. The great work of his life was his '*Histoire naturelle générale des règnes organiques, principalement étudiée chez l'homme et les animaux*,' 8vo, Paris, 1854—62. The work is only a fragment, and was in progress when he died. The published portion comprises the first two volumes and nineteen chapters of the third. The ground covered extends over two only of the six sections in which he proposed to develop his subject. The programme of the work prefixed to the first volume indicates that several more volumes would have been required to complete it. Two other works of high value were written by him. The first is entitled '*Histoire générale et particulière des anomalies de l'organisation chez l'homme et les animaux, ou traité de Tératologie*,' 3 vols. 8vo, Paris, 1832—37; and the second, '*Acclimatation et domestication des Animaux utiles*,' 4^e ed. 8vo, Paris, 1861. He was popularly known as one of the principal advocates of the use of horse-flesh for human consumption. A memoir of him is given by M. de Quatrefages in the '*Bulletin de la Société d'Acclimatation*' for 1862, of which an English translation appears in the '*Smithsonian Report*' for the same year.

SAINT-JUST, LOUIS ANTOINE, one of the most prominent actors in the first French revolution, was born at Decize, in the Nivernais, August 25th, 1767. He received a good education at Soissons, studied law at Rheims, and went to Paris in 1789 to find a publisher for a satirical poem, '*Organt*,' which appeared in two volumes in that year. The revolution was just becoming of serious import; he threw himself into it with eager-

ness, and soon acquired influence by his ability, eloquence, and knowledge. He could not enter the National Assembly because he had not attained the age of 25; but he formed intimacies with some of the leading spirits of the time, and in 1791 published his '*Esprit de la Révolution et de la Constitution de la France*,' in which he breathed forth the most enthusiastic yearnings for liberty, equality, and the other watchwords of the day. In 1792 he entered the National Convention as deputy for Aisne, just after the September massacres; and in his first speech, on the 13th of November, drew attention by the intensity with which he advocated the death of the king. The Girondists wished him to join their party, but he refused to adopt their comparatively moderate views. After the execution of the king, Saint-Just introduced many measures for improving the army and encountering the enemy, who were threatening the frontiers. He became at the same time president of the Convention, a member of the Committee of Public Safety, and (in spite of his education and high moral character) one of the most merciless organisers of the Reign of Terror. Any one suspected of royalism, or even of timid republicanism, was by him at once consigned to the guillotine, with no more hesitation than was exhibited by Robespierre and Couthon, with whom he maintained a close alliance. In the winter of 1793—4 he spent much time on the frontier, exercising almost despotic power over the generals in command of the armies of the Rhine and of the North, and greatly contributing towards their success by his energy and ability in obtaining supplies for the troops. In Paris, after he had joined them in revolutionary movements, he voted for the condemnation of the Hébertists, and then of the Dantonists, but remained in unbroken amity with Robespierre. It is believed by some French historians that Saint-Just had great influence over Robespierre, although current views represent the latter as a master and the former as his disciple. During one of his visits to the army of the north in 1794 a plot was formed against him by Collot d'Herbois, Fouché, Tallien, and others, who resented the destruction of Danton. Saint-Just shared with Robespierre, Couthon, and Le Bas the accusation, trial, and condemnation which brought them to the guillotine on the 28th of July, 1794. He met death with sullen silence. None of the leaders of the revolution presented a more remarkable study than Saint-Just; for his dignified private character and cultivated mind never for an instant stood in the way of his remorseless slaughter of all whom he believed to be unfaithful to the republic. Six years after his death appeared '*Fragments d'Institutions Républicaines*,' 1800; a collection of "ideas" picked out from his speeches and reports, with a preface by Nodier.

(Hamel, *Histoire de Saint-Just*, Paris, 1859.)

SAINT-PIERRE, J. H. BERNARDIN. [PIERRE, BERNARDIN DE ST., E. C. vol. iv. col. 827.]

SAINTE-BEUVE, CHARLES AUGUSTIN, a French poet and critic, was born on the 23rd of December, 1804, at Boulogne-sur-Mer, where his father, who died two months before his birth, was a principal comptroller in the revenue department. His early training consequently fell on his mother, who was an English lady, and who executed her task with care and discretion. He was educated until his 14th year at a school at Boulogne, after which he was sent to Paris, where he studied successively at the Institution Landry, the Collège Charlemagne, and the Collège Bourbon. Choosing medicine as a profession, and especially devoting himself to anatomy, he distinguished himself as a student of the Hôpital Saint-Louis. He became possessed, however, with an ambition for literary distinction; and in 1824 began to contribute to '*Le Globe*,' in which he wrote, in January, 1827—the same year in which he severed his connection with the Hôpital Saint-Louis—a critique of the '*Odes et Ballades*' of Victor Hugo. His first published work was entitled '*Tableau historique et critique de la Poésie française et du Théâtre français du seizième Siècle*,' 12mo, Paris, 1828, "édition revue et très-augmentée, suivie de Portraits particuliers des principaux Poètes," 12mo, Paris, 1843, which was received by the '*Revue Française*' as a model of criticism, and which was followed by a volume of great power and realism, entitled '*Vie, Poésies, et Pensées de Joseph Delorme*,' 16mo, Paris, 1829, 8vo, 1830, and reissued, with '*Les Consolations*' and other poems, or groups of poems, which had also been severally published, in '*Poésies Complètes*,' 12mo, Paris, 1840, and in a more perfect edition, entitled '*Poésies Complètes*. 1^{re} Partie: Vie, Poésies, et Pensées de Joseph Delorme. 2^e Partie: Les Consolations. Pensées d'Août. Notes et Souvenirs. Un dernier Rêve,' 2 vols. 8vo, Paris, 1863. In 1829 he commenced, in the '*Revue de Paris*,' a series of '*Portraits littéraires*,' of which the first was devoted to

Boileau, and which, from the year 1831, he continued in the 'Revue des Deux Mondes.' They were afterwards published in 2 vols. 12mo, Paris, 1844, "nouvelle édition, revue et corrigée," 3 vols. 12mo, Paris, 1864. After the Revolution of July, 1830, M. Sainte-Beuve endeavoured to turn the 'Globe,' at that time under the direction of M. Leroux, into an organ of Saint-Simonianism; and about 1831 became a contributor to the 'National.' In 1832 he made the acquaintance of Lamennais, and signalised the influence of that eccentric man upon his character by the production of a romance devoted to the illustration of the strife between flesh and spirit, entitled 'Volupté,' 12mo, Paris, 1834, fifth edition, 12mo, Paris, 1861. In 1837 he made a tour in Switzerland, during which he delivered an academical course of lectures at Lausanne on the history of Port-Royal; a subject which he afterwards treated in a remarkable work, entitled 'Port-Royal,' 3 vols. 8vo, Paris, 1840—48, second edition, 5 vols. 8vo, Paris, 1860. It was in 1837 that he first published the 'Pensées d'Août,' 18mo, Paris, which have been already mentioned. In 1840 he was made librarian of the Bibliothèque Mazarine; and on the 27th of February, 1845, was received as a member of the Académie Française, in succession to M. Casimir Delavigne, on which occasion the reply to the speech of the new member was pronounced by M. Victor Hugo. In October, 1848, M. Sainte-Beuve absented himself temporarily from France, and delivered at the University of Liège a course of lectures on French literature, afterwards published with the title of 'Chateaubriand et son Groupe littéraire sous l'Empire. Cours professé à Liège en 1848—1849,' 2 vols. 8vo, Paris, 1860, second edition, 2 vols. 12mo, Paris, 1861. In 1850 he became connected with the 'Constitutionnel,' to which, and to the 'Moniteur Universel,' which he joined in 1852, he contributed those remarkable literary and biographical articles afterwards published with the title of 'Causeries du Lundi,' 15 vols. 12mo, Paris, 1857—62, and parts of which were reissued as 'Galerie des Femmes célèbres, tirée des Causeries du Lundi,' 8vo, Paris, 1859, and 'Galerie nouvelle,' &c., 8vo, Paris, 1864. The 'Causeries' were remarkable for the fineness and lightness of the author's manipulation, for his knowledge of human nature, for his wide sympathies and minute curiosity, and for his good taste and good sense. In 1852 M. Sainte-Beuve was appointed professor of Latin poetry in the Collège de France; but as his lectures were interrupted by a noisy and adverse party of the students, he gave them publicity in another form, with the title of 'Étude sur Virgile, suivie d'une Étude sur Quintus de Smyrne,' 12mo, Paris, 1857. About the end of the last-named year he accepted the post of master of conferences at the École Normale, which he resigned in 1861, on the occasion of his resumption of his intermitted connection with the 'Constitutionnel.' He was promoted on the 28th of April, 1865, to be a member of the Senate, in which he distinguished himself for his love of the principles of free thought. He defended the reputation of M. Ernest Renan; and the last work on which he was engaged was a defence of Proudhon. During his latter years M. Sainte-Beuve suffered from the stone, against which he struggled with great constancy and cheerfulness, but of which he at length died on the 13th of October, 1869. To the list of works of M. Sainte-Beuve, which have been already mentioned, may be added, 'Portraits contemporains et divers,' 2 vols. 12mo, Paris, 1846, new edition, 3 vols. 12mo, 1855; 'Portraits des Femmes,' 12mo, Paris, 1844, new edition, 1855; and 'Nouveaux Lundis,' vols. i.—x. 12mo, Paris, 1863—68.

* SAINTE-CLAIRE DEVILLE, CHARLES, geologist and physical geographer, was born at the island of St. Thomas, in the West Indies, in 1814. His education was received at Paris, and as soon as it was completed he undertook a scientific journey, 1839—43, through the group of islands of which St. Thomas formed one. On his voyage out he stopped for a time, first at the island of Tenerife, and then at the Cape de Verd Islands. A whole year was devoted to Guadalupe, during which it was subjected to a violent earthquake. He then returned to Paris, and devoted a portion of his time to publishing an account of his researches. In 1855 he went to Italy, and was an attentive observer of the volcanic phenomena afforded by Vesuvius. This volcano was again visited by him in 1861. More recently he has made a careful study of the volcanic eruptions at Santorin. Latterly his attention has been given largely to meteorological questions. He has for many years supplemented Elie de Beaumont's geological lectures at the Collège de France, Paris. His writings are somewhat voluminous. Almost his first important publication was his 'Voyage géologique aux Antilles et aux îles de Tenerife et de Fogo, &c.,' folio, Paris, 1847—48; and

another edition appeared in quarto in 1856—64. Most of his papers have been contributed to the 'Comptes Rendus.' Those on volcanoes, meteorology, and on the modifications of sulphur by heat and solvents are of special value. He is a member of the Academy of Sciences, as also of numerous other learned bodies in France and elsewhere, and is an officer of the Legion of Honour.

* SAINTE-CLAIRE DEVILLE, HENRI ÉTIENNE, French chemist, younger brother of the geologist, was born on the island of St. Thomas, March 11th, 1818. On completing his literary education in France, he instructed himself in the rudiments of science. Making chemistry his special study, he fitted up for himself a laboratory, engaged for several years in experimental research, and obtained the doctorate of science and of medicine. In 1844, when a faculty of science was established at Besançon, he was charged with its organisation, and in the following year became dean and professor of chemistry. In 1851 he was appointed to the chair of chemistry at the École Normale; in 1853 he became adjunct, and in 1859 successor, to M. Dumas in the chair of chemistry at the Faculty of Sciences. He was decorated with the Legion of Honour in 1855, and in 1861 was admitted into the Académie des Sciences, succeeding Berthier in the section of mineralogy. Many of the earlier experiments of M. H. E. Sainte-Claire Deville were on essences and resins, and were described in 'Recherches théoriques sur les Essences et les Résins,' as one of the 'Collection des Thèses,' published by the École de Médecine, 1843. In 1849 his experiments on nitric acid settled some disputed points concerning its constitution and atomic relations. In 1853 he introduced a new method of mineral analysis by the employment of gaseous and vaporic reagents, thereby getting rid of errors attendant on the filtering of liquids. In the same year he, by desire of the Emperor, commenced his important researches into the possible modes of obtaining aluminium, associating himself in the work with Debray, in the manufactory at Javel. Wöhler's discovery of aluminium as an independent metal had shown chemists how to isolate it for experimental and special purposes; but the cost was too great to permit of the use of the metal in general manufactures. Sainte-Claire Deville pursued his investigations to a great length, and with marked success [ALUMINIUM, E. C. vol. i. col. 262; and ALUMINIUM; ALUMINIUM BRONZE, E. C. S. col. 110]. The results were published in the French scientific journals from time to time, especially in the 'Annales de Chimie et de Physique,' vols. xliii. and xlv., and afterwards collected in a treatise, 'De l'Aluminium; ses propriétés, sa fabrication, et ses applications,' 1859. Other important papers by him are on metallic carbonates and their combinations; on the three molecular states of silica; on a general method of eliminating simple substances from volatile compounds; on the variations in chemical affinity by changes of temperature; on the metallurgy of platinum; on the permeability of iron to gases at high temperatures; on the measurement of high temperatures, &c. Published in a separate form are 'Des lois des Nombres en Chimie, et de la Variation de leurs Constants,' 1861; Notes and Appendix to a French translation of Faraday's 'History of a Candle,' relating to lamps, stearine, gas-lighting, &c., 1865; 'Leçons sur la Dissociation,' published by the Société Chimique de France, 1866; 'Leçons de Chimie, professées en 1865 and 1867,' published by the same society, 1869; 'Propriétés physiques et Pouvoir calorifique des Pétroles et les Huiles minérales,' 1869.

SAISSET, ÉMILE EDMOND, a French philosopher, was born on the 16th of September, 1814, at Montpellier, where his father practised as a physician. In 1833 he entered the École Normale, which he quitted with the title of agrégé de philosophie, and to which, after giving instruction in various colleges in the provinces, and in Paris at the Collège Henri IV., he returned in 1842 to occupy the post of assistant professor of the history of philosophy. He subsequently filled other academical offices, and from 1849 to 1852 lectured at the Sorbonne on the history of philosophy, as assistant professor to M. Damiron, whom, after his death, on the 11th of January, 1862, he succeeded in his chair as professor, as well as in that which he occupied as a member of the Académie des Sciences Morales et Politiques, to the latter of which distinctions M. Saisset was received on the 7th of February, 1863. M. Saisset was decreed a knight of the Legion of Honour on the 28th of March, 1851; and he died at Paris on the 17th of December, 1863.

His works include a thesis, entitled 'Ænésidème,' 8vo, Paris, 1840, which was afterwards incorporated, with other articles, in a volume, entitled 'Le Scepticisme. Ænésidème. Pascal. Kant. Études pour servir à l'Histoire critique du Scepticisme ancien et

moderne,' 8vo, Paris, 1865, new edition, 12mo, 1865; 'Essais sur la Philosophie et la Religion au XIX^e Siècle,' 12mo, Paris, 1845, a collection of articles from the 'Revue des Deux Mondes,' the sections entitled 'Morale' and 'Théodicée,' forming half the volume called 'Manuel de Philosophie, à l'Usage des Collèges,' 8vo, Paris, 1845, fourth edition, 8vo, 1863, to which M. Amadée Jacques contributed the 'Introduction' and 'Psychologie,' and M. Jules Simon the sections on 'Logique' and 'Histoire de la Philosophie'; 'Mélanges d'Histoire, de Morale et de Critique,' 12mo, Paris, 1859; 'Essai de Philosophie religieuse,' 2 vols. 12mo, Paris, 1859, third edition, "revue et augmentée d'éclaircissements," 2 vols. 12mo, Paris, 1862, English translation, bearing the double titles of 'Modern Pantheism' and 'Essay on Religious Philosophy,' 2 vols. 8vo, Edinburgh, London, and Dublin, 1863; 'Précurseurs et Disciples de Descartes,' &c., 8vo and 12mo, Paris, 1862; and two volumes of posthumous publication, each of which formed part of the 'Bibliothèque de Philosophie contemporaine,' entitled respectively 'L'Âme et la Vie. Étude sur la Renaissance de l'Animisme, suivie d'un Examen critique de l'Esthétique française,' 12mo, Paris, 1864, and 'Critique et Histoire de la Philosophie. Fragment et Discours,' 12mo, Paris, 1865. M. Saisset likewise produced an annotated translation of St. Augustine's 'City of God,' entitled 'La Cité de Dieu. Traduction nouvelle, avec une Introduction et des Notes,' &c., 4 vols. 12mo, Paris, 1855; an amended translation of the 'Letters' of Leonhard Euler, 'Lettres à une Princesse d'Allemagne sur divers Sujets de Physique et de Philosophie, précédées de l'Éloge d'Euler, par Condorcet,' 12mo, Paris, 1843, illustrated edition, 2 vols. 12mo, Paris, 1859, new edition, 1866; and a critical translation, the first which had been made into French, of the 'Works' of Spinoza, 'Œuvres. Traduites, &c., avec une Introduction critique,' 2 vols. 12mo, Paris, 1843, new edition, "revue et augmentée," 3 vols. 12mo, Paris, 1861.

* SALA, GEORGE AUGUSTUS, a journalist, novelist, and miscellaneous author, whose father was an Italian, and whose mother was a popular English vocalist of West Indian extraction, was born in London in 1828. He was educated as an artist, but soon abandoned his profession in favour of a literary career. He was amongst the earliest contributors to 'Household Words,' and wrote many of the articles and sketches of modern life, and especially of London life, which conduced to the popularity of that publication. He was an extensive and regular contributor to the 'Welcome Guest,' and the founder and first editor of 'Temple Bar,' and wrote, for the 'Cornhill Magazine,' a series of papers on Hogarth. He has been connected, more or less intimately, with various other periodicals; and he wrote for several years in the 'Illustrated London News.' Of late he has been most prominently known as a correspondent of the 'Daily Telegraph,' which he has represented in various parts of Europe, as well as in Algeria and the United States of America. During a professional sojourn at Paris, in the earlier stages of the late war between France and Germany, he became, on one occasion, a victim to the popular suspicion, and was subjected to a short imprisonment, in the course of which he encountered several indignities. On the 17th of February, 1871, he appeared as plaintiff in an action in the Court of Queen's Bench, against Messrs. Hodder and Stoughton, as the publishers of a work by Mr. Hain Friswell, entitled 'Modern Men of Letters honestly Criticised,' and which was charged with embodying libellous matter. On the second day of trial the jury returned a verdict in favour of the plaintiff, with 500*l.* damages against the defendants.

Mr. Sala is one of the most prolific writers of the day, and enjoys a high reputation for his powers of description, which he, however, too frequently overlays with excessive ornamentation, and impairs with wordiness and diffuseness. His numerous works, which are generally re-issues of his contributions to magazines and newspapers, comprise 'A Journey due North: being Notes of a Residence in Russia in the Summer of 1856,' 8vo, London, 1858, and other editions, English and American, a series of articles which had appeared in 'Household Words,' 'How I tamed Mrs. Cruiser,' &c., 12mo, 1858; 'Twice Round the Clock: or, the Hours of the Day and Night in London,' 8vo, 1859, and other editions; 'Gaslight and Daylight: with some London Scenes they shine upon,' 8vo, 1859, second edition, 1860; 'The Baddington Peerage,' 3 vols., 8vo, 1860, &c.; 'Lady Chesterfield's Letters to her Daughters,' 18mo, 1860; 'Looking at Life,' 8vo, 1860; 'Make your Game,' &c., 8vo, 1860, &c.; 'Dutch Pictures, with some Sketches in the Flemish Manner,' 8vo, 1861; 'The Seven Sons of Mammon,' 3 vols., 8vo, 1861, and other English and American editions; 'Strange

Adventures of Captain Dangerous,' 3 vols. 8vo, 1863, &c., American edition, 8vo, Boston, 1863; 'Quite Alone,' 3 vols., 8vo, 1864, and 8vo, New York, 1865, the completion of which, as it first appeared in a serial form, was rendered necessary by another pen; 'My Diary in America in the Midst of War,' 2 vols. 8vo, first two editions, 1865; 'Trip to Barbary by a Roundabout Route,' 8vo, 1865; 'From Waterloo to the Peninsula,' 2 vols. 8vo, 1866; 'William Hogarth: Essays on the Man, the Work, and the Times,' 8vo, London, 1866; 'Rome and Venice, with other Wanderings, 1866—67,' 8vo, London, 1869; and an edition, still incomplete, of Charles Lamb's works, entitled 'The Complete Correspondence and Works of Charles Lamb, with an Essay on his Life and Genius,' 8vo, vol. i. 1868.

* SALDANHA OLIVEIRA E DAUN, JOÃO CARLOS, DUQUE DE, a Portuguese soldier and politician, was born on the 17th of November, 1791; and, as descending from two of the greatest families of his native country, received his earlier education at the College for Nobles at Lisbon. From this institution he proceeded to the University of Coimbra, which he left in order to embrace a military career. He spent some years in Brazil, in the affairs of which he played an important part; and, having returned to Portugal after the re-establishment of the constitutional government, was appointed in February, 1825, to the Ministry of Foreign Affairs. In the following year he became military governor of Oporto, and whilst holding this office distinguished himself for the bold and successful liberalism of his proceedings in proclaiming the constitution of Dom Pedro, and for the vigour with which he upheld the cause of the regent, Isabella Maria, against the attempts of the partisans of Dom Miguel. He fulfilled for a short time the duties of Minister of War, but was driven from office by the predominant influence of the court party, and took refuge in England. He returned to Portugal in May, 1828, and made an attempt to rally and re-organise the constitutional army. When this attempt proved abortive, he resumed his position of exile; and, successively in England and France, planned measures, in concert with his political friends, in favour of Doña Maria, of whose government he became, upon his landing at Oporto in 1833, the moving and sustaining power, and whose authority he upheld in a series of victorious movements which had the effect of crushing the fortunes of Dom Miguel, who by the capitulation of Evora, in 1834, renounced all his pretensions. For his important services Saldanha was rewarded with a marquisate, and promoted to the rank of marshal; yet either from a certain inconstancy, or from the promptings of ambition, he now placed himself at the head of the opposition in the Cortes opened by Dom Pedro on the 5th of August, 1834, and by this means forced himself into office, May 27th, 1835, as President of the Council of Ministers and Minister of War, but was compelled to resign in November following. A liberal by reputation and by the majority of his antecedents, Saldanha, nevertheless, upon the breaking out of the revolution of September, 1836, became the champion of the Queen in her tendency to reactionary measures, and joined a number of peers in protesting against the abolition of their exceptional privileges. But, when this policy failed, he joined the Duque de Terceira, in July, 1837, in an abortive attempt to raise an insurrection in defence of the outraged constitution of Dom Pedro, and took refuge from the consequences of his defeat in an exile which he divided chiefly between France and England. He was summoned, in 1846, to the counsels of Doña Maria, by whom he was appointed in October of that year to be President of the Council and Minister of War, and was afterwards elevated to a dukedom in recognition of the services he performed against various formidable insurrectionary movements. He held office until the 22nd of August, 1847; and, after having varied his political life by fulfilling for a short time the duties of ambassador at the court of Madrid, returned to power in December, 1847. He was once more appointed, January, 1849, to the Presidency of the Council; which, having lost office by his refusal to associate himself with the reactionary measures of Costa Cabral, he once more gained by a successful insurrection in the liberal interest, in which he was seconded by Sylva Cabral, the brother of the dictator. His final term of office extended from May, 1851, to June, 1856, in the course of which period he had to encounter the difficulties consequent upon a regency, which compelled him to measures fatal to his popularity. In 1860 he succeeded the Duque de Terceira as president of the Supreme Council of Military Justice; and in the following year suffered from so severe an attack of illness that his death was reported, and accredited to so great an extent that the majority of his biographers to this day still continue to repeat the falsehood.

Only a year or two ago, in spite of his advanced age, he was busied with diplomatic functions, and engaged in political movements, which necessitated several journeys between Lisbon and Paris; since which time he has passed into the repose and retirement that befit his years.

The Duque de Saldanha is a member of many of the most distinguished of the scientific societies of Europe, as well as vice-president of the Academy of Sciences at Lisbon, of which the sovereign is *ex officio* president. He has produced a few works of interest, including a concordance of the natural sciences, 'Concordancia das Sciencias Naturas, e principalmente da Geologia com o Genesis,' &c., 8vo., Vienna, 1845; and 'Estado da Medicina em 1858,' 8vo., Lisbon, 1858, second edition, 1859.

SALE, MAJOR-GENERAL SIR ROBERT HENRY, a distinguished Anglo-Indian officer, was born in 1782. His father, a colonel in the East India Company's service, after having had him educated in a private school at Ealing, procured for him an ensigncy in the 36th foot at the early age of thirteen; and the youth was a lieutenant before he reached his sixteenth year. Young Sale was engaged at Malavelly and Seringapatam, and in various other actions before the close of the century. He rose to the rank of captain in 1806, led a company at the storming of the lines of Trevancore in 1809, was promoted to major in 1813, served in the Mauritius, and bore an active part in the Burmese war, receiving a severe wound at the capture of Rangoon in 1824. His services in the Burmese war were rewarded with a lieutenant-colonelcy and the companionship of the Bath. As colonel, he took command of the first Bengal brigade in the Afghan war of 1838; he was severely wounded at the capture of Ghuznee on the 23rd of July, when he headed the storming party. His reputation was so much enhanced by his participation in this war that he was promoted to the rank of major-general, and received the decorations of K.C.B. and the Dourannee Order. In 1840 he commanded the force sent to subdue the Kohistan country, defeated Dost Mohammed Khan, and compelled him to surrender as prisoner to Sir W. M'Naghten. In 1841 and 1842 occurred the events which brought Sir Robert Sale prominently into notice. When the British had secured military possession of the city of Cabul, it was essential to keep open communication with Peshawur and the Indus. The Ghilzees and other Afghan tribes commanded the rugged mountain passes at and near the frontier, especially the Khoord Cabul Pass and the Khyber Pass. Sale was sent with a column to force these passes, and keep the route open. He fought and defeated the Ghilzees at Teezen, Jugdulluck, and Mamoo Kail, but could not penetrate farther east than Jellallabad, where he intrenched himself, and kept a numerous enemy at bay for several months—himself cut off from all communication with Cabul on the one hand and Peshawur on the other. It was not until Sir George Pollock, marching with a column from Peshawur, forced the Khyber Pass by a series of brilliant operations that Sale could be relieved. Sir Robert took part in the recapture of Cabul, and at the conclusion of the war received the thanks of parliament and the decoration of G.C.B. He came to England for a time, but returned to India to take part in the Sikh war of 1845. He was appointed quartermaster-general to the army of the Sutlej, under Sir Hugh Gough. Quite early in the campaign, his left thigh was shattered by grape-shot at the battle of Moodkee, and he died on the 18th of December. Sir Robert Peel afterwards paid a graceful compliment to Sir Robert Sale, in a speech in the House of Commons relating to the war.

LADY SALE calls for a brief notice as one who worthily filled the position of a soldier's wife at a critical period. Her maiden name was Florentine Wynch, and she was married to Sir Robert (then Captain) Sale in 1809. When the British were at Cabul in 1841, in an ill-planned and ill-provisioned cantonment outside the city, Sir Robert was one of the officers, and his wife one among a small number of English ladies quartered with their husbands. Sale (as above stated) was engaged in his eventful operations during the winter. During his absence, the terrible disasters occurred to the British at Cabul and in the Khoord Cabul Pass, by which almost every man in the British force was destroyed. Lady Sale, Lady M'Naghten, Mrs. Trevor, and five other ladies, were kept as hostages by Akhbar Khan, the Afghan chief. Sale knew of these deplorable events, but was helplessly shut up in Jellallabad. Akhbar Khan sent him, promising to give up the ladies, if Sale would consent to a treaty humiliating to the British; but Lady Sale contrived to send a private message, entreating him not to think of her, but to maintain the honour of the flag. She was in captivity from January to September, 1842, when the victorious advance of Sir George

Pollock compelled Akhbar Khan to surrender the ladies—who, it ought to be recorded, had been treated with unvarying respect and decorum by the Afghans. The events of these two years are treated in Lady Sale's 'Journal of the Disasters in Afghanistan,' 12mo., London, 1843; Gleig's 'Sale's Brigade in Afghanistan,' 1846; Sale's 'Defence of Jellallabad,' and Lady Sale's 'Narrative of her Prison and Fellow-Prisoners,' with folio lithographic plates, 1846; and Kaye's 'History of the War in Afghanistan,' 1851.

SALT, HENRY, was born at Lichfield in 1785, and was educated at the grammar school of that city. Appointed secretary to Lord Valentia in 1802, he accompanied that nobleman in his extensive travels in India, and in 1805 was sent on a separate mission into Abyssinia. Having rejoined Lord Valentia, they returned to England together in 1808. Mr. Salt greatly assisted in the preparation of Lord Valentia's narratives of his travels, and the reputation he thus acquired induced the government to send him on an independent mission to Abyssinia. Although unsuccessful in his principal object, he was able to acquire considerable acquaintance with the country, then little known to Europeans, and his 'Account of a Voyage to Abyssinia, and Travels in the Interior Part of that Country in 1809 and 1810,' 4to., London, 1814, French translation by P. F. Henry, 2 vols. 8vo., with atlas, Paris, 1816, was warmly welcomed, and procured his election as corresponding member of the French Académie des Inscriptions, 1816. In 1815 he was appointed consul-general at Cairo, and henceforth devoted all his leisure to the study of the history and language of the ancient Egyptians. He formed an extensive collection of Egyptian antiquities, deciphered various inscriptions, and rendered valuable assistance to Belzoni and other travellers and investigators. He published 'Egypt, a Descriptive Poem,' 8vo., Alexandria, 1824; and 'An Essay on Young's and Champollion's Phonetic System of Hieroglyphics,' 8vo., 1825, French translation by L. Devère, 8vo., Paris, 1827. He died on his way from Cairo to Alexandria, October 30th, 1827. (J. J. Hall, *Life and Correspondence of Henry Salt*, 2 vols., 8vo., London, 1854.)

* SALT, SIR TITUS, founder of one of the largest manufacturing establishments in England, was born at Morley, West Riding of Yorkshire, in 1803, and was educated at Wakefield. He established himself as a manufacturer of stuffs or worsted goods at Bradford, in the same county, and was the chief means of introducing the alpaca manufacture. He possessed factories in Bradford for these products; but in 1853 he built a magnificent establishment near Shipley, about three miles from Bradford. Having a frontage on one side to the river Aire, the owner compounded his own name with that of the river, and called the place *Saltaire*. The entire buildings of the factory comprise or enclose an area of six acres. The chief structure, the "mill," is a stone edifice 550 feet long, 6 stories in height, architectural in character, and the windows glazed with large sheets of plate glass. Hollow-brick floors give lightness and facilitate ventilation; while cast-iron beams and columns are employed with a view to rendering the structure fireproof. Running northward from the main centre are two wings, each 330 feet long, of less height. Various large but low buildings are appropriated to the preparatory processes in the treatment of wool and alpaca; others contain the vast ranges of weaving-machines; while the main edifice is chiefly devoted to the spinning-machines. Quays and wharfs by the side of the Leeds and Liverpool Canal, stations and steam hoists by the side of the Leeds and Skipton Railway, bridges and roads over the river, the canal, and the railway, facilitate the arrival and departure of merchandise. Two large structures contain the steam-engines and boilers; while the smoke from the furnaces finds an exit up an Italian campanile tower, 250 feet high. Reservoirs for 500,000 gallons of rain water, and gas works for 5000 jets, are provided. There is complete working room and machinery for from 4000 to 5000 hands; and the town of Saltaire was founded by Sir Titus Salt, and built by him expressly for these hands and their families, and provided with churches and chapels, clubs, libraries, and a public park, and educational and sanitary arrangements far in advance of those in most manufacturing towns. Sir Titus Salt was created a baronet in 1869; he is a justice of the peace and deputy-lieutenant for the West Riding, and a magistrate of Bradford, which borough he represented in parliament from 1859 to 1861, in the Liberal interest.

SALVI, GIOVANNI BATTISTA. [SASSOFERRATO, E. C. S.] SANCHEZ-COELLO, ALONZO, an eminent early Spanish painter, was born about 1515, at Benifayro, in Valencia. He began to practise his art in Madrid, and there formed the ac-

quaintance of Antonio Moro, whom he accompanied to Lisbon in 1552, and entered the service of the Prince John. On the death of the prince, his widow recommended Sanchez-Coello to the protection of her brother, Philip II. of Spain, who gave him an apartment in one of his palaces. Sanchez soon became a great favourite of the king, who used to enter his painting-room at all times without ceremony, in order to watch him work, and gave him frequent sittings. Sanchez painted the king on foot, on horseback, in a full suit of armour, in state and in ordinary costume; the queen, Anne of Austria, and the leading members of the court, and principal nobles; the ambassadors and chief prelates; the popes Gregory XIII. and Sixtus V.; the Emperor of Germany, the King and Queen of Portugal, and other distinguished potentates. He also painted several altar-pieces, especially the high altar of Del Espinar; but he was greatest in portraiture, in which he was the worthy precursor of Velasquez, though wanting his breadth and majesty of style and handling. Many of his best works perished in the fire at the Alcazar and Pardo palaces, but those preserved vindicate his reputation. A portrait of the unhappy Don Carlos, son of Philip II., another of Antonio Perez, his almost equally unhappy minister, and one of Philip's favourite daughter, Isabel, in the Museo, Madrid, are good examples of his style. Sanchez died at Madrid in 1590. —His daughter and scholar, DOÑA ELISABETH SANCHEZ-COELLA, born at Madrid 1564, died there February 5, 1612, had a great reputation as a portrait-painter.

* SAND, GEORGES [DUDEVANT, MADAME AMANTINE AURORE, E. C. vol. ii. col. 658].

* SANT, JAMES, R.A., was born in London in 1820. In 1840 he entered the Royal Academy as a student, having previously been a pupil of John Varley. Mr. Sant early acquired a high position as a portrait-painter; his portraits of ladies and children being especially admired for their grace and beauty, and his pictures generally for their rich, warm colour. Mr. Sant has painted portraits of the Prince Consort, the Princesses Helena, Louisa, and Beatrice, and a large number of the nobility and members of the fashionable world. Among his portraits may be named a series, exhibited in London in 1860, of twenty portraits of distinguished persons, painted for the Countess of Waldegrave. But Mr. Sant has not confined himself to portraiture; his works exhibited at the Royal Academy and the British Institution include, among others, the 'Children in the Wood'; 'Samuel'; 'Saxon Women watching a Battle Field'; 'The Whisper'; 'Alone'; 'The Schoolmaster's Daughter';—his diploma work, 1871; and a few landscapes. Mr. Sant was elected A.R.A. in 1861, and R.A. in 1870. On January 27, 1871, he was appointed principal painter in ordinary to her Majesty in the room of the late Sir George Hayter.

* SANTA-ANNA, ANTONIO LOPEZ DE. [E. C. vol. v. col. 276.] During the brief French occupation of Mexico in 1864, Santa-Anna reappeared on the scene, but was ordered by Marshal Bazaine to quit the country. Some months later, however, he was made by Maximilian grand marshal of the empire. On the fall of the empire Santa-Anna withdrew to the United States, and took up his residence on Staten Island, near New York. In 1868 he planned an expedition against Juarez, and set sail from New York on board a merchant steamer trading between that port and Vera Cruz. His arrival was anticipated by agents in his interest, who had landed on the coast of Mexico, and proceeded to disseminate a proclamation drawn up by Santa-Anna, in order to prepare the minds of the people for his disembarkation. The first blow which he intended to strike was for the possession of Juan d'Ulloa, the fortress of Vera Cruz. The commander of the fortress and of the city of Vera Cruz made a pretence of entering into negotiations; but when the vessel on board of which Santa Anna was a passenger had arrived in the neighbourhood of the fortress, a boat containing an armed crew put off from the fort, boarded the steamer, and captured Santa-Anna and his secretary, whom they compelled to enter the boat, and conveyed as prisoners to the castle. Santa-Anna underwent a trial by court-martial, and was condemned to death; but, after some delay, President Juarez extended to him a free pardon, on condition that he would leave Mexico, and never return to that country. He has since resided on Staten Island, where he is reputed to divide his time between cock-fighting and three-card monte.

SANTI, or SANZIO GIOVANNI, an Italian painter of eminence in his day, but now better known as the father of Raffaele, was born towards the middle of the 15th century, at Colbordolo, in Urbino, where was a small family property. He settled in Urbino, where his famous son was born, in 1483, and

he died there on the 1st of August, 1494. Giovanni Santi was a careful, conscientious, and able painter; but his works display, with the tendency to mysticism which belonged to his age, something of timidity in the treatment and poverty of colour. Many of his female heads have great sweetness and gentleness of expression, and his children are always pleasing. He was his son's first teacher, and something of his father's manner may be observed in Raffaele's early works. The best extant picture by Giovanni Santi—the altar-piece in the Berlin Gallery long attributed to him being now by general agreement transferred to another hand—is a 'Madonna and Child surrounded by Saints,' in the church of the Franciscans at Urbino. A 'Madonna and Saints,' in the hospital church of Santa Croce, is also highly esteemed. Several other works by him are still preserved in the churches of Urbino and Ancona, the Brera Gallery, &c. The National Gallery possesses a 'Madonna and Child' (No. 751) ascribed to Giovanni Santi.

SARPI, PIETRO. [PAUL, FATHER, E. C. vol. iv. col. 695.]

SARS, MICHAEL, zoologist, was born at Bergen, August 30, 1805, and educated at Christiania. In 1830 he was appointed pastor of Kinn, and in 1840 was transferred to Manger, both of which places are seaside villages near Bergen. In 1854 he became professor of zoology in the University of Christiania. He died October 22, 1869. He spent much of his time in investigating the zoology of the Norwegian coasts, to which subject most of his seventy-four published works and articles are devoted. These form an important section of zoological literature. His first paper was a 'Bidrag til Söedryenes Naturhistorie,' published in 1829. His most celebrated work was a 'Fauna littoralis Norwegiæ,' 1846—1856; and his last work, 'Mémoires pour servir à la connaissance des Crinoides vivants,' 8vo, Christiania, 1868. He discovered the remarkable changes of form which the medusa-bearing *Hydrozoa* pass through during development; and he was the first to show that the apicrioid family of echinoderms, which was supposed to be extinct, was still represented by living species in the depths of the Norwegian seas. The species he found was named *Rhizocrinus loffotensis*; and about the same time Pourtales found an apicrioid in deep water off Florida, which he referred to *Bourgueticrinus*, but which has been ascertained to belong to the same species as Sars found. This discovery was the first main inducement for prosecuting zoological researches by means of dredging operations in deep seas, which operations form one of the most characteristic features of the present phase of zoological science.—One of his sons, GEORGE OSSIAN SARS, is well known as an authority on the crustaceans of Norway, on which he has written several elaborate and profusely illustrated memoirs.

SASSOFERRATO, GIOVANNI BATTISTA SALVI, Italian painter, called, from his birthplace, Sassoferrato, was born July 11th, 1605, and learned painting of his father, Tarquinio Salvi, but became one of the followers of the Carracci. His works are smooth, elegant, and highly finished, much resembling those of Carlo Dolce, and have always been popular; but they display little originality and less power. Most of the great galleries possess pictures by him; the Louvre has three, all Madonnas; the National Gallery, two,—No. 200, 'The Madonna in Prayer,' No. 740, 'The Madonna with the Infant Christ.' Sassoferrato died at Rome on the 8th of August, 1685.

SAVIGNY, FRIEDRICH CARL VON. [E. C. vol. v. col. 289.] The last years of the great jurist and scholar were spent in the retirement of private life. He died on the 25th of October, 1861, in the 83rd year of his age.

SAXO, commonly known, on account of his learning, as SAXO GRAMMATICUS, the most celebrated of the old Danish historians, was a native of the island of Zealand, and flourished in the latter part of the 12th century. He is generally described as having been provost of Roskilde, which, although now a place of inconsiderable importance, was, for several centuries before Copenhagen was founded, the residence of the kings of Denmark. But this assertion has been lately challenged as involving a confusion of his identity with that of another Saxo, his contemporary. Little is known about the events of his life, the greater part of which was probably spent in a monastery in Scania, or Schonen, of which Lund is the capital. In spite of the difficulties arising from the limited number of classical authors to which he had access, he became the most celebrated Latin scholar of his age and nation; and the masterly force, vividness, and elegance with which he used that language in the work by which he is at present remembered, have called forth the praise and admiration of several learned critics, and especially of Erasmus. He found a patron in the celebrated Absalon,

Archbishop of Lund, one of the most remarkable men of his time, to whom he acted as secretary, and by whom he was commissioned to undertake a history of Danish affairs, for the execution of which the materials of former collectors and annalists were placed at his disposal. He accordingly devoted himself for about twenty years before his death, in 1204, to the composition of his '*Historia Danica*,' in sixteen books, which he brought down to the year 1186. Of this work the first nine books are legendary and uncritical, although they throw valuable light upon the manners and customs of the ancient Scandinavians; but the last seven books, which carry the history forward from the 10th century, may in general be considered as presenting an authentic narrative of events. The principal editions of the great work of Saxo, '*Regum Heroumque Danorum Historiæ*,' are those published in folio, Paris, 1514, folio, Basel, 1534, folio, Frankfurt-am-Main, 1576, and folio, Sorø, 1644, the last of which is rendered more valuable by the Prolegomena of Stephanus, 4to, Leipzig, 1771, and an edition, which is esteemed the best of all, in 2 vols. 8vo, Copenhagen, 1830—58. Amongst the Danish translations by which the '*Historiæ*' has been rendered popular may be mentioned one published in folio, Copenhagen, 1575 and 1845—51, and another by Grundtvig, in 2 vols. 4to, Copenhagen, 1818—22.

SAY, HORACE ÉMILE, a French writer on political economy, eldest son of the distinguished economist, Jean Baptiste Say [E. C. vol. v. col. 294], was born at Noisy, near Paris, on the 11th of March, 1794, and received his education at Geneva. He commenced his career in the counting-house of his relative, M. Delaroché-Delessert; and in 1813 made a voyage to the United States in the capacity of supercargo. Two years afterwards he repaired to Brazil, where he stayed for a considerable period; and, during all the remainder of the Legitimist restoration, devoted himself exclusively to the affairs of commerce. In 1831 he was appointed judge of the Tribunal of Commerce of the Seine; and in 1834 became a member of the Chamber. Henceforth his functions were undisturbed by political considerations, and remained unaffected by the successive changes in the form of the government of France. He held office as a member of the Municipal Council; and in 1837, and again in 1846, was elected a member of the Conseil Général for the Department of the Seine. He was elected a member of the Council of State by the National Assembly in 1849, and vacated this office on the occasion of the coup d'état, December 2nd, 1851. From 1848 to 1851 he directed the inquiry undertaken by the Chamber of Commerce into the statistics of the various industries of Paris; and his '*Report*' obtained in 1853 the statistical prize awarded by the Académie des Sciences Morales et Politiques, of which he was elected an honorary member in 1857. He became a chevalier of the Legion of Honour; and died at Paris, on the 26th of July, 1860.

The principal works of M. Horace Say are a brochure, entitled '*Avant Propos à la Discussion d'une nouvelle Loi sur les Faillites*,' 8vo, Paris, 1836; '*Histoire des Relations commerciales entre la France et le Brésil, et Considérations sur les Monnaies, les Changes, les Banques, et le Commerce extérieur*,' 8vo, Paris, 1839, "avec Plans, Carte, et Tableaux;" '*Études sur l'Administration de la Ville de Paris et du Département de la Seine*,' 8vo, Paris, 1846; and '*Paris. Son Octroi et ses Emprunts*,' 8vo, Paris, 1847. He was a contributor to MM. Ch. Coquelin and Guillaumin's '*Dictionnaire de l'Économie politique*;' to the '*Dictionnaire du Commerce et des Marchandises*;' the '*Encyclopédie du Droit*;' the '*Journal des Économistes*;' and other scientific publications. M. Horace Say is also known for his careful issue of the later editions of his father's most important works:—'*Cours complet d'Économie politique*,' 2 vols. 8vo, Paris, 1839, new (third) edition, 1852; '*Traité d'Économie politique*,' 8vo, Paris, sixth edition, 1841; '*Œuvres diverses*,' 8vo, Paris, 1848; and especially for his arrangement and annotation of manuscripts left by his father, consisting of moral, economical, and political reflections, and collected under the title of '*Petit Volume contenant quelques Aperçus des Hommes et de la Société*,' 32mo, Paris, 1839. The family reputation for economical science is upheld in the present generation by

* JEAN BAPTISTE LÉON SAY, son of the preceding, who was born in 1826; and who, having distinguished himself as a journalist, as a writer on economic science, and for his administrative skill as a director of the Chemin de Fer du Nord, is at present discharging (December, 1871), under the government of M. Thiers, the functions of Prefect of the Seine. It was in this capacity that, accompanied by M. Vautrain, president of the Municipal

Council of Paris, he visited London, October, 1871, in order to express the gratitude of the French people for the assistance derived from the "Lord Mayor's Fund," which had been raised by public subscription in Great Britain and Ireland for the re- victualling of Paris after the capitulation of that city to the Germans. M. Say was the bearer from the French government of the grand cross of the Legion of Honour for the Lord Mayor; together with a representation in bronze, finely executed, and on a large scale, of the Hôtel de Ville, as it appeared up to the time of the memorable fire, inscribed, "*La Ville de Paris à la Cité de Londres. Ravitaillement de Paris. Février, 1871. Témoinage de Reconnaissance*." He was also the bearer to the Lord Mayor, for the City of London, of two medals—one in gold, from the Société de Prévoyance des Pharmaciens de la Seine, and the other, in silver, from the mayors of the department of the Seine, each bearing an appropriate inscription commemorative of the circumstances under which it was presented. M. Léon Say arrived in London early on the morning of Tuesday, October 17th, 1871, and became the guest of the Lord Mayor at the Mansion House; where, on the evening of the following day, he was publicly entertained at a splendid banquet in the Egyptian Hall.

SAY, THOMAS, entomologist and conchologist, was born at Philadelphia, July 27, 1787, and educated at a school at West Town, near Philadelphia. On leaving school his father, who was an apothecary in Philadelphia, took him into his shop, and afterwards established him in a business. Owing to want of prudence in money matters, and a general aversion to commercial pursuits, he got involved in debt, and turned to his zoological knowledge for the means of support. In 1812 he joined the Academy of Natural Sciences of Philadelphia, of which he was one of the earliest members, and to whose publications he was a constant contributor. At first the academy was simply a social club for naturalists, but it gradually developed into a scientific society. In 1818 he visited some of the more southern of the United States. He was employed in the two expeditions sent out by the United States Government under Major Long, his duty being to describe the zoology of the regions visited. In 1825 he joined Messrs. Maclure and Owen in their social scheme of establishing a happy brotherhood at New Harmony, Indiana, which ended before many years had passed in the members of the brotherhood quarrelling, and seeking the aid of the lawyers in settling their disputes. He then went to take charge of some property at Wabash; but he had not been there long before he contracted a fever, of which he died October 10, 1834. Mr. Say was for several years professor of natural history in the University of Philadelphia. His principal claim to notice is that he was the founder and pioneer of entomological science in the United States. His writings are numerous. They mainly consist of diagnoses of species, of which not a few are wanting in clearness, owing partly to the haste in which they were drawn up, in order to secure priority of publication, and partly to the inadequate knowledge he possessed of exotic species. His knowledge of the American species was, however, very extensive so far as regards their forms, for he paid little attention to their habits or internal structure. He described more new species than perhaps any other naturalist of his time. His principal work was '*American Entomology*,' costly and well executed, which however, only reached to the third volume. His '*American Conchology*,' 8vo, New Harmony, 1830, &c., is less meritorious, although important on account of the numerous species which were first described in it. His publications have been brought together in the following works:—'*The Complete Writings of Thomas Say on the Conchology of the United States*. Edited by W. J. Binney,' 8vo, New York, 1858; and '*The Complete Writings of T. Say on the Entomology of North America*. Edited by J. E. Leconte. With a Memoir of the Author, by G. Ord,' 2 vols. 8vo, New York, 1859.

SCHADOW-GODENHAUS, FRIEDRICH WILHELM, VON. [E. C. vol. v. col. 306.] Despite the increasing infirmities of age and failure of sight, Von Schadow-Godenhaus retained the directorship of the Düsseldorf Academy till 1859, when he was permitted to retire. He died on the 19th of March, 1862, aged 72. A street in Düsseldorf has been named after him.

* SCHAMYL, a Circassian warrior-priest and patriot, whose name in its various forms of Shamyl, Shamil, and others, is equivalent to Samuel, was born in June, 1797, at the *aul*, or village, of Himry, in the north of Daghestan. He hardened a feeble frame and constitution into vigour and robustness by

bold and manly exercises; and in his youth gave signs of a rare energy and determination of character. Early initiated into the doctrine of Sufeyism, the object of which was the purification and reformation of Islamism, Schamyl recognised in its teaching the possible realisation of the theological unity, as well as a firmer national cohesion amongst his countrymen, at that time divided by schism and political differences. He became a fervid mystic; and in accordance with one of the leading tenets of Sufeyism, which inculcates the periodical appearance of a man elected by God to the government of his fellows, set himself to the task of winning the divinely commissioned vicegerency. For this purpose he laboured to turn the full tide of Sufeyite enthusiasm into the practical and patriotic channel of opposition to the Russians, with whom he first joined issue about 1824, as one of the followers of Ghazy Mollah, the leader of the Lesghians, who were the most warlike of the tribes. In 1831 he so distinguished himself in a terrible encounter against odds, which was fatal to Ghazy Mollah, that he was called upon by the popular voice to succeed him as *Imam*. The grievous wounds which he had sustained made it impossible, however, for him to accept the dignity, to which he did not arrive until a few years afterwards, when, in spite of the opposition of a minority, he was elected to fill the office left vacant by Ghazy Mollah's successor. Schamyl now exhibited himself at once as a valiant champion of independence and an able politician; and was so skilful an administrator that for twenty-five years he was able to keep up the struggle against the overwhelming power of Russia. He combined with the ardour and courage of the warrior the functions of the priest and the sanctity and reverence of the prophet; and made religion the centre and motive of all his policy. He brought a considerable amount of method to bear upon the internal administration of the affairs of the country, the *élite* of the youthful valour and patriotism of which he formed into a guard who were specially devoted to the execution of his military designs and to the security of his person. The troops at his disposal at one time amounted to between 50,000 and 60,000 men of all arms, whom he made constant and partially successful efforts to strengthen with the newest weapons and other warlike resources of European civilisation. He was generous and even lavish in his rewards; prompt and severe in the exaction of compensation or the infliction of punishment. The latter qualities, although traceable, like all others of his character, to his patriotism and religion, excited enmity and opposition, so that, despairing of his ability to keep up a regular warfare against the Russians, he opposed them by ambushes, surprises, and other practices of the guerilla. Thus he was able to destroy their armies in detail; and his power and influence were so great that, during the earlier stages of the Crimean war, the allies calculated upon his co-operation, which he was diverted from according by the arrogance of the Turkish authorities. Worn out by his successes, his power gradually declined before the introduction of more competent methods on the part of the Russians; and in December, 1859, he was surprised by superior numbers on the plateau of Gounib. At this place, after a most heroic defence, in which he lost all but forty-seven out of the four hundred men under his command, he surrendered to Prince Bariatinsky, the Russian commander-in-chief, who sent him under escort to St. Petersburg. He was received with much consideration and kindness by the Emperor Alexander II., who assigned him the town of Kaluga, about a hundred miles S. S. W. of Moscow, as his residence, and allotted him a pension of 10,000 roubles. In his retirement the dreaded warrior, whose romantic career had presented a graphic theme for the romancer and the dramatist, has conducted himself and his family affairs with quiet dignity and resignation, bowing to the fate which, in overtaking himself, had, he knew, overthrown the independence of his native country, and presenting an ideal of the Mussalman of the highest and most spiritual type.

* SCHARF, GEORGE, F.S.A., secretary and keeper of the National Portrait Gallery, was born in London in 1816. He learned drawing and the principles of design from his father, George Scharf, a skilful German artist settled in London, who was for many years draughtsman to the Geological Society, and in due time became a student at the Royal Academy. He accompanied Mr. (afterwards Sir Charles) Fellows as draughtsman in his journeys of exploration in Lycia, 1839–44 [FELLOWS, SIR CHARLES, E. C. vol. ii. col. 886], and made a vast number of drawings of the scenery and antiquities, many of which were engraved for Sir C. Fellows's account of his dis-

coveries, 8vo, 1841, and folio, 1847, while many of the most interesting were deposited in the British Museum, and others supplied the materials for several oil paintings which were exhibited at the Royal Academy and British Institution. Mr. Scharf's success with these drawings led to his being much employed for some years in making drawings, chiefly in outline, for illustrating books of a classical character, such as Dean Milman's 'Life and Works of Horace,' 8vo, 1849, for which he made 300 drawings from the antique of coins, gems, &c.; Macaulay's 'Lays of Ancient Rome,' 1847, &c.; Schmitz's 'History of Greece'; 'The Poetical Works of John Keats,' 8vo, 1849 (120 designs); Wordsworth's 'Greece,' &c. Mr. Scharf, who had in 1847 published 'Observations on the Peculiarities of Sculptures seen on the Monuments of Ancient Lycia,' was elected a fellow of the Society of Antiquaries in 1852, and by his contributions to the *Archæologia* and elsewhere became known as an accomplished archæologist and art-critic, as well as an able artist, and in 1857 he was requested to act as art secretary to the Manchester Art-Treasures Exhibition, his successful conduct of which, and the papers he wrote in connection with it, added greatly to his reputation. But a new field had already been opened for his exertions. In 1856–57 the National Portrait Gallery was founded, and, fortunately for its successful operation, Mr. Scharf was appointed the secretary and keeper. He addressed himself with energy to its organization, and by the end of the year had brought it into good working order, and arranged the portraits for exhibition. Since then the management and extension of the gallery have been his chief occupation, and in connection with it he has prosecuted his study of English portraiture till he has acquired the position of a leading authority on the subject. Besides the official Catalogue of the gallery, which, however, is biographical rather than artistic, he has delivered courses of lectures on portraiture at the Royal and London Institutions, and written valuable papers 'On the principal Portraits of Shakespeare,' on 'The Visit of Queen Elizabeth to Blackfriars in 1600: being a new interpretation of the Hunsdon Picture,' 1868; a paper on the more interesting portraits in the collection at Hampton Court; 'Observations on the Westminster Abbey portrait and other representations of King Richard II.,' 1867; &c. Besides these and other contributions to the *Archæologia* and *Journal of the Archæological Institute*, Mr. Scharf has written 'A History of the Characteristics of Greek Art,' for a new edition of Wordsworth's 'Greece,' 1859; 'Notes on the Old Tapestry in St. Mary's Hall, Coventry'; 'Artistic Notes on the Windows of King's College Chapel, Cambridge,' 1855; 'Artistic and Descriptive Notes of the most remarkable Pictures in the British Institution Exhibition of the Ancient Masters,' 1859; 'Catalogue raisonné; or, a List of the Pictures in Blenheim Palace,' 8vo, 1861; 'Catalogue of Pictures belonging to the Society of Antiquaries,' 8vo, 1865; and popular catalogues of the Blenheim pictures and the Greek, Roman, and Pompeian Courts at the Crystal Palace.

SCHEFFER, ARY. [E. C. vol. v. col. 308.] This eminent French painter died at Paris on the 15th of June, 1858. His death produced a deep impression in France, and various memoirs of him and criticisms of his works were published. The most valuable was 'L'Œuvre d'Ary Scheffer reproduit en photographie par Bingham: avec Notice, &c., par Vitet,' folio, Paris, 1860. A brief 'Life of Ary Scheffer,' by Mrs. Grote, was published in London, 8vo, 1860.

SCHEFFER, HENRI [E. C. vol. v. col. 308], the youngest brother of Ary Scheffer, and a very able portrait-painter, died on the 15th of March, 1861, aged 62. His daughter is the wife of Ernest Renan.

SCHLAGINTWEIT, ADOLPH, naturalist and traveller, was born January 9, 1829. He was one of five brothers, four of whom have taken a more or less active part in investigating the physical and biological phenomena of India, more especially the northern part of that continent, comprising the mountainous regions of the Himalaya range, and of the area immediately to the north of it. As his travels were undertaken, for the most part, in conjunction with his brothers Hermann and Robert (born 1833), further details are given in the notice of Hermann, which follows. Adolph Schlagintweit's death is said to have occurred on August 26, 1857.

* SCHLAGINTWEIT-SAKÜNLÜNSKI, BARON HERMANN VON, the explorer of the Alps and Himalayas, was born at Munich, May 13, 1826. He and his brother Adolph made most of their researches together. Their first scientific expedition was to the Alps, in examining which mountain range they spent upwards of two years, 1846–1848. The results of

their investigations appeared in 'Untersuchungen über die physikalische Geographie der Alpen in ihren Beziehungen zur den Phänomenen der Gletscher, zur Geologie, Meteorologie und Pflanzen-Geographie,' 4to, Leipzig, 1850. Humboldt praised this work highly, and became one of the Schlagintweits' warmest friends. The two brothers then visited England and Scotland, after which they returned to Berlin. In 1851 they continued their researches in the Alps, and, amongst other feats, ascended Monte Rosa, August 28, 1851, the summit of which had never previously been reached. In 1852 and 1853 Hermann lectured on meteorology and physical geography in the University of Berlin. In 1854 was published 'Neue Untersuchungen über die physikalische Geographie . . . der Alpen,' 4to, by himself and Adolph. These works on the Alps won for the brothers a high reputation, so that Humboldt was easily able to procure for them an appointment to make a scientific voyage in India, the expense of which was to be defrayed jointly by the East India Company and the King of Prussia. Their brother Robert was associated with them. The three started for Egypt, September 20, 1854. In India the brothers sometimes worked together, and sometimes singly. They went from Bombay overland to Madras, following two routes. Adolph and Robert then explored the north-west provinces, and in May, 1856, they joined Hermann at Simla. They then travelled together through Sikkim, Bhotan, and Assam; then Ladak, Kashmir, and Baltistan were examined. Hermann and Robert next traversed the Muztagh and Kuenlun ranges, and returned to the Punjab in December, 1856. The two brothers landed at Trieste, June 8, 1857. Adolph remained in India, his intention being to cross the Himalayas and make his way overland to Russia. He was arrested before he had proceeded far on his long and perilous journey. He reached Kashgar, a city which had, in modern times, been visited by one European, and that a Russian named Ephraïmoff. Here Adolph was murdered in August, 1857, by Wulle Khan, who had temporarily usurped the supreme power of the country, but who was himself killed by Yakoub Beg, the Ataligh Ghazee (i.e. Defender of the Faith) and ruler of Eastern Turkistan. The Indian researches of the brothers are given in 'Results of a Scientific Mission to India and High Asia,' by H., A., and R. de Schlagintweit, 4 vols. 4to, Leipzig, 1860—1866, and a large folio atlas, with 120 plates. This work is replete with information on the subject to which it relates. The Paris Geographical Society awarded it their gold medal, and Hermann was ordered by the King of Prussia to assume the honorary name of Sakintlinski in August, 1864, he being the first to make a scientific expedition to the Kuenlun mountains.

SCHLOSSER, FRIEDRICH CHRISTOPH. [E. C. vol. v. col. 329.] This eminent German historian, after having served for over forty years as professor of history at the University of Heidelberg, died on the 23rd of September, 1861, within two months of the completion of the 85th year of his age. (Gervinus, *Nekrolog Schlossers*, 8vo, Leipzig, 1861.)

* SCHNEIDER, EUGENE, French manufacturer and legislator, was born at Nancy, April, 1805. He was engaged for a time in the banking house of M. Seillière; but, turning his attention to mechanical engineering, became manager of the Bazeilles Iron Works. In 1830 he removed to the works at Creuzot, situated between Autun and Chalons-sur Saône. These iron works, established in 1769, first attained importance by the discovery of coal close to the surface in 1782. During the wars of Napoleon large numbers of cannon balls and bombs were cast there; and after the war, machines and iron-work for general engineering, together with the mining of coal, became the staple trades of the place. The proprietorship changed hands in 1815 and in 1826; and after M. Schneider had managed the works for a few years, he and an elder brother became the proprietors in 1837, at which time the works gave employment to about one thousand hands. The bridges of Brest and of Freiburg, the large steam-boats on the Rhone, the rails for several thousand miles of railway, many of the largest iron-wrought erections of France, and almost all kinds of locomotives, steam-engines, and machines have come from Creuzot. Even some of the English railways have been supplied from thence with locomotives since 1865. The works have undergone repeated enlargements, until they now employ 11,000 persons, and support the town of Creuzot, with a population of 20,000. No women or girls are employed at the works; no boys under 14. Houses, churches, and schools have been built and maintained for the workpeople. More than 400 children attend the schools, which furnish the more skilled and intelligent workpeople; some of them being

especially trained as accountants, mechanical draughtsmen, and metallurgists. Many of the most experienced engineers of France have received part of their training at Creuzot.

In 1845 M. Schneider entered the Chamber of Deputies (of which his elder brother and their cousin, General Schneider, had been members) as representative of Saône-et-Loire, for which department he was re-elected in the following year. He also succeeded his brother as member of the Conseil-Général for the same department. In the early part of 1851 he was appointed Minister of Agriculture. After the coup d'état, at the end of that year, he formed one of the "Commission Consultative" to assist in drawing up a scheme for the Empire, and in 1852 was chosen member of the Corps Législatif. He was re-elected in 1857, 1863, and 1869; and such was his influence in the Corps that he held the post of vice-president from 1852 to 1865, and then that of president until 1870. As regent of the Bank of France, and president of various Chambers of Agriculture, Commerce, and Manufactures, he has been intimately associated with the industrial and commercial progress of France. Instigated by the International Society, a formidable strike took place at Creuzot in January, 1870, but the tact and firmness of M. Schneider brought it to a satisfactory termination.

SCHOMBURGK, SIR ROBERT HERMANN [E. C. vol. v. col. 335]. The explorer of British Guiana, died February 11, 1865, in his 61st year.

SCHÖNLEIN, JOHAN LUK [E. C. vol. v. col. 336], returned in 1859 to his native place, Bamberg, where he died on the 23rd of January, 1864, aged 70.

SCHOOLCRAFT, HENRY ROWE [E. C. vol. v. col. 336]. Mr. Schoolcraft, or COLCRAFT, as his name was written in his later years, completed his great work on the Indian tribes of the United States, in six quarto volumes, the last being published in 1860. He died at Washington, December 10, 1864.

SCHOPENHAUER, ARTHUR, a German philosopher, son of a merchant of Dantzic, was born in that city on the 22nd of February, 1788; and manifested an early determination to the study of metaphysics. He was educated successively at the Universities of Göttingen, Berlin (where he was an unsatisfied pupil of Fichte), and Jena, where he took his doctor's degree in 1814. Subsequently he made the acquaintance of Goethe and of Frederick Mayer, the orientalist, at Weimar, where he passed a winter, and became inspired with a taste for the study of Indian antiquities. He afterwards alternated his residence in Germany, where he principally sojourned at Dresden or Berlin, and in Italy, where he stayed chiefly at Rome or Naples. In 1831 he settled at Frankfurt-am-Main, where he died of cholera on the 21st of September, 1860.

The leading idea of the system of Schopenhauer, which assimilated much of the ancient speculations of India, is a kind of philosophical apotheosis of Will; and everything besides the immense, eternal, and infinite Volition which he conceived, he regarded as phenomena merely, from which category even the reason itself was not excepted. The supreme Will was invested with the attributes of fate; and human wisdom was made to consist in a self-abnegation which extended to personal annihilation. With the infinite Will an infinite Love was united, which embraced, in conformity with the philosophical doctrines of India, all the phenomena and existences of the world, from man and animals down to plants and stones. After many years of neglect, the system of Schopenhauer found an ardently appreciative expositor in Dr. Julius Frauenstädt, who brought out an edition of one of his most popular works, as well as a volume of his Remains, consisting of Essays, Observations, Aphorisms, and Fragments, entitled 'Aus Arthur Schopenhauer's Handschriftlichem Nachlass. Abhandlungen, Anmerkungen, Aphorismen, und Fragmente,' 8vo, Leipzig, 1864.

The principal works of Schopenhauer, who, in addition to Dr. Frauenstädt, had many commentators and critics in Germany, France, and England, are an Essay on Sight and Colours, 'Ueber das Sehen und die Farben,' 8vo, Leipzig, 1816, second edition, 1854; the World considered as Will and Phenomena, 'Die Welt als Wille und Vorstellung,' 8vo, Leipzig, 1819, second (enlarged) edition, 2 vols., 1845, a work which offers the most full and characteristic exposition of the author's system; an Essay on the quadruple Root of the Proposition of the Sufficient Reason, 'Ueber die vierfache Wurzel des Satzes vom zureichenden Grunde. Eine philosophische Abhandlung,' 8vo, Rudolstadt, 1813, second edition, 8vo, Frankfurt-am-Main, 1847, third (posthumous) edition, by Julius Frauenstädt, 8vo, Leipzig, 1864; On Will in Nature, &c., 'Ueber den Willen in der Natur,' &c., 8vo, Frankfurt, 1836, second edition 1854; Two Dissertations

on the Fundamental Problems of Ethics, 'Die beiden Grundprobleme der Ethik,' 8vo, Frankfurt, 1841, second edition, Leipzig, 1880, comprising an Essay on the Freedom of the Human Will, 'Ueber die Freiheit des menschen Willens,' and another on the Foundation of Morals, 'Ueber das Fundament der Moral,' which obtained the prizes severally of the Royal Scientific Society of Drontheim and the Academy of Copenhagen; and a collection of Philosophical Miscellanies, entitled 'Parerga und Paralipomena: kleine philosophische Schriften,' 2 vols., 8vo, Berlin, 1851, second edition, 1862.

SCHOUW, JOACHIM FRIEDRICH [E. C. vol. v. col. 340], botanist, died April 23, 1852.

* SCHRADER, JULIUS, German painter, was born at Berlin, June 16th, 1815. He studied under Schadow at Düsseldorf, but was the most prominent among the younger painters who departed from the severe academical style of that master. Herr Schrader spent some years in Italy and the East, and laboured to introduce a richer and more Venetian tone of colour among his countrymen. His earlier works were chiefly of Eastern and general subjects; his later, more strictly historical, several having been from English history. The titles of a few of his principal pictures will sufficiently indicate his class of subjects:—'Odalisques in a Harem'; 'The Temptation'; 'Edward III. Pardoning the Burgesses of Calais'; 'Milton Dictating to his Daughters'; 'Lady Macbeth Walking in her Sleep'; 'The Death of Leonardo da Vinci at Fontainebleau.' The last two were sent by the artist to the International Exhibition of 1862, but hardly sustained the estimate of the painter's power formed by native critics. He has since painted 'Cromwell at his Daughter's Deathbed,' a sentimental perversion of history, now in Cologne museum, and several portraits.

* SCHRANDOLPH, JOHANN, German painter, was born in 1808, at Qberdorf, in Bavaria. He studied in the Munich Art Academy under Cornelius; and then spent some time in Rome, studying the early Italian masters. Herr Schrandolph was one of the painters so liberally patronised by Ludwig I. of Bavaria. He has almost exclusively devoted himself to the painting of religious subjects, and he has for some years held the post of professor of religious painting in the Munich Academy. His chief work is the vast series of frescoes on gold grounds in Speier cathedral, on which he was engaged for ten years, 1844—53. He also painted several of the frescoes in the basilica of St. Bonifacius, and in some other of the churches of Munich; and he assisted in the decoration of Ratisbon cathedral. In the New Pinacothek are two of his large gallery pictures, purchased by Ludwig I., 'The Ascension' and 'Christ and the Disciples of St. John the Baptist.' Several of his pictures have been engraved.

SCHUBERT, GOTTHILF HEINRICH VON [E. C. vol. v. col. 341], naturalist, died at Laufzorn in Bavaria, July 1, 1860. One of his latest works was 'Der Erwerb aus einem vergangenen und die Erwartungen von einem zukünftigen Leben. Ein Selbstbiographie,' 3 Bde. 8vo, Erlangen, 1854—1856.

SCHULTZ-SCHULTZENSTEIN, KARL HEINRICH [E. C. vol. v. col. 342], botanist and physiologist, died suddenly at Berlin, March 23, 1871.

SCOTT, WINFIELD, general of the United States Army, was born at Petersburg, Virginia, January 13th, 1786. His father, a Scotchman, had fought for the Pretender, and escaped to America after the events of 1745. Winfield Scott studied for two years at the William and Mary College, Virginia; then directed his attention to the law, and was called to the bar in 1806. After practising for a short time at Charleston, he abandoned the law, adopted the military profession, and became captain of light artillery stationed at Baton Rouge, in Louisiana, in 1808. Having spoken disrespectfully of his chief, General Wilkinson, he was suspended for a year, which he spent in the diligent study of the military sciences. At the commencement of the war with England in 1812, he was sent as lieutenant-colonel to Blackrock, on the Canadian frontier. He fought at Queenstown Heights, and was taken prisoner, but was speedily exchanged, and resumed active service in 1813. As colonel and adjutant under General Dearborn, he captured Fort George in Upper Canada, where he was wounded by an explosion. With the rank of brigadier-general, he was actively engaged in the campaign of 1814; won the battles of Fort Erie and Chippewa, in the latter of which he defeated General Riall. At Lundy's Lane, or Niagara, he was twice wounded, and had two horses killed under him. His bravery in this service, and his success in training recruits at a camp of instruction, obtained for him promotion to the rank of major-general. When the war was

ended, he was offered, but declined, the post of secretary of war. He came to Europe in 1815, partly for the recovery of his health, partly to study the organisation and tactics of the French army. He returned to America in 1816, married, and retired from the service for several years. In 1832, and thence till 1838, he was engaged in the operations against the Black Hawk and Seminole Indians; in settling slave-state insurrections in South Carolina; and in quelling disturbances on the Canadian frontier. With the rank of general of division, he remained at head quarters from 1842 till the breaking out of the Mexican war in 1846. Throughout this war, he successfully commanded the United States army. At Vera Cruz, in March, 1847; at Cerro Gordo, Jalapa, and Perote, in April; at Puebla, in May; at El Penon, Contreras, and Churubusco, in August; at Molino el Rey and Mexico city, in September, he defeated the Mexican general Santa Anna at all points, and brought the war to an advantageous conclusion. Although held in high esteem, General Scott failed in two attempts to obtain the presidency of the Republic; being defeated by Taylor in 1848, and by Pierce in 1852. In 1855 he was made lieutenant-general, the highest rank in the American army. When the civil war broke out in 1861, the Confederates made urgent appeals to him, as a Southerner, to join their flag; but he refused, and proceeded to defend the district of Columbia and the city of Washington. He thought President Buchanan's policy was too Southern, President Lincoln's too Northern, in its sympathies, to hold out hopes of pacification; and, finding his own counsels disregarded, he retired from the army early in the struggle, but at the ripe age of seventy-five. The Congress of the United States, to mark their sense of his long services, passed a special act to enable him to retain his full pay and allowances. He again visited Europe for a few months, but, returning to America, he died at Washington, May 29th, 1866. He was the author of 'General Regulations for the Army,' 1825; 'Infantry Tactics' (from the French), 1835; and 'Autobiography,' 2 vols., 1864.

SCRIBE, AUGUSTIN EUGÈNE. [E. C. vol. v. col. 374.] This prolific dramatist continued to put forth vaudevilles, comediettas, and librettas with unabated fertility till death stayed their production, February 20, 1861. There has, we believe, been no complete edition of his dramatic works: one of the fullest is that of 1855—58, of which 20 volumes only were published.

SCRIVEN, EDWARD, an eminent engraver in the chalk and dotted manner, was born at Alcester, Warwickshire, in 1775. He was a pupil of Robert Thew, and after quitting him continued to engrave in the style of his master. Scriven at first executed a few plates for Boydell; he was afterwards employed by the Dilettanti Society in engraving their 'Specimens of Ancient Sculpture,' and in executing for publishers various illustrations of costly books. One of his most extensive series of plates was 'The Beauties of the Court of Charles II.,' after Lely. He was in his manner an excellent engraver, refined in style, careful in finish, and admirable in expression. As a man he was much esteemed, and he deserves remembrance as the most active and zealous of the founders of that useful institution, the Artists' Fund. He died August 23rd, 1841.

* SCROPE, GEORGE POULETT, F.R.S., geologist and writer on social reforms, is the son of J. Poulett Thomson, Esq., and was born in London in 1797. He was educated at Harrow and Cambridge. In 1819 he commenced his researches on volcanoes by a study of Vesuvius and the neighbouring country, which was followed by a careful examination of the volcanic area of which Etna is the prominent feature. In 1821 he married and assumed the family name of his wife, which was Scrope. He then explored the extinct volcanoes of Central France, the volcanic districts of Northern Italy, and in October, 1822, witnessed the great eruption of Vesuvius, then in full activity. In 1823 he visited the volcanic district of the Lower Rhine province. In 1824 he and Sir Charles Lyell were the secretaries to the Geological Society. In 1828 he published his work 'Considerations on Volcanoes, the character and probable causes of their phenomena, and their connection with the present state and past history of the Earth,' &c., of which a second edition appeared in 1862. In 1827 another work of his was issued, entitled 'On the Geology and Extinct Volcanoes of Central France,' with an atlas of maps and plates. The former work did not meet with a favourable reception, owing in part to its novel views, and in part to the manner in which these were brought forward. The latter work met with more success. The second edition of his earlier work was greatly improved by a more systematic treatment of the subject, and by the incorporation of new matter. His original

views regarding the volcanic origin of lavas, trachytes, and other igneous rocks, and more especially the important share which water has had in their production, were more fully illustrated by the confirmatory experiments which had been made by Sorby, Daubree, and others. His works on volcanoes also deal with another subject, namely, that of denudation. He showed conclusively that in Central France the moulding of the earth's surface into eminences and depressions has been almost entirely effected by meteoric agents. His views on sub-aërial denudation were long neglected, but have latterly found many supporters. In 1867 the Geological Society of London conferred on him the Wollaston Medal for his researches on volcanoes. Mr. Scrope was member of parliament for Stroud from 1833 to 1868; he felt great interest in the condition of the agricultural labourer, and wrote in consequence several pamphlets and reports on the revision of the poor laws; and took a prominent part in all the discussions on this subject. He is a fellow of the Royal, the Geological, and numerous other societies.

* SEELEY, PROFESSOR JOHN ROBERT, son of the late Mr. Seeley, publisher, of Fleet Street, London, was born about the year 1835, and was educated successively at the City of London School, of which he became "captain," and at Christ's College, Cambridge, of which he became a fellow in July, 1858. He took his B.A. degree in 1857, when he was bracketed with three others at the head of the first class in the Classical Tripos; and was soon afterwards declared senior Chancellor's medallist of the year. He proceeded M.A. in due course; and in 1863 was appointed to the Professorship of Latin in University College, London, where, on the 13th of October, he delivered an introductory lecture, afterwards published with the title of 'Classical Studies as an Introduction to the Moral Sciences,' 8vo, London, 1864. On the 24th of September, 1869, he was promoted to be Regius Professor of Modern History in the University of Cambridge; and has since been elected a life-governor of University College, London.

The principal work of Professor Seeley is entitled 'Ecce Homo: a Survey of the Life and Work of Jesus Christ,' 8vo, London and Cambridge, 1866 [1865], fifth edition, with a new Preface, 8vo, London, 1868, and subsequent editions. All Protestant Christendom was stirred by this publication, and presently a host of works, having more or less reference to it, appeared, manifesting various degrees of sympathy or antagonism, and generally suggesting by their own titles the title of the book which had called them into existence. A few of them may be mentioned:—'Ithuriel's Spear: or, Is this Christianity? Being a Vindication of Christian Doctrine, and an Examination of the Book called "Ecce Homo,"' &c., 8vo, London, 1867, by H. Shephard; 'Ecce Deus. Essays on the Life and Doctrine of Jesus Christ, with controversial Notes on "Ecce Homo,"' 8vo, Edinburgh, 1867, third edition, 8vo, London and Frome, 1868, American edition, Boston, 1867, by Joseph Parker, D.D.; 'Ecce Homo,' 8vo, London and Edinburgh, 1868, being a reprint of articles contributed, as a review of Professor Seeley's work, to 'Good Words,' by the Right Hon. W. E. Gladstone; "'Ecce Homo": its Character and Teaching,' 8vo, London and Bristol, 1868, by Edward Ash, M.D. In America, the controversy was represented by works entitled respectively, 'Deus Homo: God-Man,' 8vo, Chicago, 1867, by Theophilus Parsons, LL.D.; 'Ecce Deus Homo: or, the Work and Kingdom of the Christ of Scripture,' 12mo, Philadelphia, 1868; 'Semper Deus,' and, by the same author, 'Deus Semper,' Philadelphia, 1869; and 'The Life of Jesus the Christ,' 8vo, New York, 1870, by Henry Ward Beecher, D.D. It may be interesting to mention the fact that the title of 'Ecce Homo' is not a new one, as it was borne by a French work, an English translation of which, by G. Houston, was published as 'Ecce Homo: or, a Critical Enquiry into the History of Jesus Christ, being a Rational Analysis of the Gospels,' 12mo, London, 1799, second edition, 1813.

Very early in life Mr. Seeley contributed a 'Parallel between Shakespeare's Tragedy of King Lear and the Œdipus in Colono of Sophocles,' to a volume produced jointly by himself and Messrs. W. Young and E. A. Hart, and entitled, 'Three Essays on Shakespeare's Tragedy of King Lear. By Pupils of the City of London School,' 8vo, London, 1851; and he contributed an article on 'Liberal Education in Universities,' to a volume edited by the Rev. F. W. Farrar, with the title of 'Essays on a Liberal Education,' 8vo, London, 1867; and an essay on 'The Church as a Teacher of Morality,' to 'Essays on Church Policy,' &c., 8vo, London, 1868, edited by the Rev. Walter Lowe Clay. Besides numerous contributions to 'Macmillan's Magazine' and other periodicals, Professor Seeley has edited a series of articles

collectively entitled, 'The Student's Guide to the University of Cambridge,' 8vo, Cambridge, 1863, second edition, revised, 8vo, Cambridge and London, 1866; and has further published a volume of 'Lectures and Essays,' 8vo, London, 1870; and, conjointly with the Rev. E. A. Abbott, M.A., Head Master of the City of London School, 'An English Primer: or, Course of English Instruction for Schools,' 8vo, London, 1869. His latest literary employment partakes more strictly still of an academical character, and consists in the preparation of an edition of 'Livy,' the first Book of which has just been issued as one of the "Clarendon Press Series," "with Introduction, Historical Examination, and Notes," 8vo, Oxford, 1871. In this volume Professor Seeley takes up a sceptical position with regard to the credibility of the early (regal) history of Rome, about which the only trustworthy sources of information are laid down to be, (1) The physical geography and topography of the region in which the history transacted itself; (2) Comparative philology, which will give a series of historical facts respecting the migrations and intercourse of tribes; (3) Comparative mythology; (4) Comparative law; (5) Archæology; and (6) The later history of Rome, from which we may infer a considerable number of facts about the earlier.

SEGNA DI BUONAVENTURA, an early Italian painter, is said to have been a pupil of Duccio di Buoninsegna; but all that is certainly known of him is that he was occupied in painting at Siena between the years 1305 and 1319. His works are extremely scarce. The most important is a signed painting of the Virgin, St. Paul, and two other saints, in the gallery at Siena. In the National Gallery is a large altar-piece (No. 567) of the Crucifixion, with an inscription on the projecting nimbus which surrounds the head of the Saviour: it was formerly in the Vanni Collection at Siena.

* SEN, KESHUB CHUNDER (KESAVA CHANDRA), a Hindoo reformer, leader of the progressive or liberal party in the Brahmo Somaj, or Society of the one God [BRAHMO SOMAJ, E. C. S., ARTS & SCIENCES DIV., col. 354], founded in 1830 by the late Rajah Rammohun Roy, was born at Calcutta, about the year 1836, of a family belonging to the Vaidya, or physician caste, and was the grandson of Ram Comul Sen, the associate and coadjutor of the late Professor H. H. Wilson, of Oxford, during the many years in which the latter was principal of the Sanskrit College at Calcutta. His father died early, and his education devolved upon his uncle, who placed him at an English school, which he left for the College of Calcutta; where, although he did not graduate, he attained an extensive knowledge of the language, literature, and history of England. Early in his career he learned to despise the worship of idols; and, shrinking from the utter scepticism which on the other hand threatened him, he arrived, through much anguish of mind, and by thought, reflection, and prayer—the last being, as he afterwards averred, the main instrument—at a belief in monotheism, and in 1859 gave in his adhesion to the Brahmo Somaj, then under the direction of Debendra Nath Tagore. Under the guidance and with the co-operation of this gentleman, who was a Brahman of high position, of great wealth, and of great dignity of character, Keshub Chunder Sen at once proceeded to found a Sunday school in connection with the Calcutta Brahmo Somaj, with the object of bringing together a number of young men, and to impart to them in weekly lectures a regular course of instruction in Brahmic theology and ethics. The course extended over three years; and after that term had been reached with much encouragement arising from the success of the system on the pupils, several of whom became missionaries of the Brahmo Somaj, the school closed, to be re-opened again in 1867, by Keshub Chunder Sen, who, on the 5th and 12th of May, delivered two remarkable lectures on 'The Religious Importance of Mental Philosophy,' being the first two lectures of a course on the Philosophy of Religion, delivered for the purpose of supplementing, by religious instruction, the secular studies of the young university students at Calcutta. These lectures were published in England, in a volume entitled 'The Brahmo Somaj. Lectures and tracts by Keshub Chunder Sen. First and second series. Edited by Sophia Dobson Collett,' 8vo, London, 1870. In June, 1860, Keshub Chunder Sen commenced the issue of a long series of addresses with a tract, 'Young Bengal,' in which, as in the succeeding ones, he insisted upon the necessity of religion as the only possible basis on which to found a superstructure of practical and beneficent reform. From this time he devoted himself to missionary journeys in Bengal, the north-western and the central provinces, the Punjab, Bombay, and Madras, founding new branch

churches, and writing and preaching with an amount of fervour and eloquence that well-nigh made him the object of idolatry to many of his less-instructed countrymen. His labours attained their utmost expansion, however, only after he seceded from the Calcutta Brahmo Somaj, which, under Tagore, was too conservative and too tender of Hindooism, and proceeded, November, 1866, to enrol the younger and more liberal members into a progressive society, called the Brahmo Somaj of India, with the design of making it the Brahmic centre of the entire country. As the head of a reforming party amongst reformers, he became what Lord Lawrence (who was in some degree instrumental in inducing Sen to pay a visit to England) described as "the representative of the most advanced section of the great reforming party which was rising in Bengal." The visit to England was paid in 1870. On the 12th of April of that year, a "Welcome Soirée" was given to Mr. Sen in the Hanover Square Rooms, London, "on the invitation of the committee of the British and Foreign Unitarian Association;" which body also organised the "Farewell Soirée," held in the same place, on the 12th of September. Early in the morning of the 17th, he left London for Southampton, where, after delivering a farewell address in the Unitarian "Church of the Saviour," he embarked for India the same afternoon. During his stay in this country he delivered numerous sermons, speeches, and addresses, in London, Edinburgh, Glasgow, Liverpool, Leeds, Birmingham, and other principal towns, and was throughout received with very general sympathy and admiration. The burden of his addresses, as described by himself, was "the sweetness and the all-conquering power of God's mercy, of man's unworthiness, and the need of prayer and humility. He protested against worldliness and weak faith, against the heartless worship of an abstract and absent Deity, and against impurity of character concealed under the cloak of theological conformity. He pointed out the difference between the spirit of Christ and the dogmas of Christianity; and protested against all manner of sectarian antipathy and unbrotherliness, and advocated the purification of all churches and sects in the love of the One True God. He denounced war and the use of intoxicating liquors, and advocated the Peace movement and the Temperance movement. He discoursed also on England's duty to India, and urged the importance of diffusing the blessings of liberal education among all sections of the Indian population, high and low, men and women; and demanded, in the name of justice and humanity, a better treatment of his countrymen by the dominant race."

The works of Keshub Chunder Sen include his 'Jesus Christ: Europe and Asia, being the Substance of a Lecture delivered extempore in the Theatre of Calcutta Medical College, &c., Saturday, May 5th, 1866,' 8vo, London, 1866, reprinted in the 'Brahmo Somaj,' 8vo, London, 1870, already mentioned; in which were also reproduced his lecture on 'Great Men;' his sermon on 'Prayer,' delivered on the 26th of March, 1868, before the Prarthana Somaj, or Prayer Association of Bombay; his tract on 'True Faith,' issued in 1866, and "intended to be a guide to Brahmo Missionaries;" and the 'Theist's Prayer-book,' which first appeared in 1861, third edition, 1870. Another volume, likewise under the editorship of Miss Collett, and comprising his addresses and sermons delivered in England, was published with the title of 'The Brahmo Somaj. Keshub Chunder Sen's English Visit,' 8vo, London, 1871.

SENANCOUR, ÉTIENNE PIVERT DE, was born at Paris, in November, 1770, the son of a contrôleur des rentes. He was educated at the Collège de la Marche, and afterwards at Saint-Sulpice; but he had adopted the opinions of Rousseau, and feeling an invincible repugnance to the priesthood, he left the seminary, and, after a period of hesitation, went to reside in Switzerland. Here, for some years, he led an errant life; at times rambling about the mountains, at others settling for a while in a country village, occupying himself in landscape painting (which, however, he soon abandoned), and always pursuing with more or less avidity his literary and philosophical studies. Whilst in Switzerland he married, somewhat unhappily, and, it is said, fell into intemperate habits. He had been denounced at Paris as an emigrant; but his resources became exhausted, and he ventured to return to Paris, where he sought a livelihood by his pen. He seems to have written for various journals and miscellaneous publications, and performed any work that publishers would entrust to him. His first separate publication, evidently suggested by his study of Rousseau, was entitled 'Réveries sur la Nature primitive de l'Homme,' 8vo, Paris, 1798, and several times reprinted. This was followed, however, by a far more original

and remarkable book, 'Obermann: Lettres,' 2 vols. 8vo, Paris, 1804. This is Senancour's chief contribution to French literature, and that by which his name will be long remembered. Though read, and producing a certain impression at the time of publication, it was far from reaching popularity. But, after almost passing out of memory, it has been revived again and again—most notably in the editions of 1840, to which Sainte-Beuve prefixed a highly appreciative introduction, and those of 1844 and 1863, for which Georges Sand wrote a sympathetic preface; and now it may be considered to have taken permanent rank as a French classic. 'Obermann' is not a system of philosophy, nor, as some have represented it, an attack on Christianity; but it is impregnated with a dreary, depressing philosophy of man and nature, and is studiously depreciatory of religion, as Senancour found it in France. Over some minds the book exerts a strange fascination, and those who least like its general spirit admit that it abounds with passages full of poetry, beauty, and pathos, with striking thoughts and admirable descriptions. 'Obermann' was followed by another volume, 'De l'Amour,' 8vo, 1805, which has also been reprinted at distant dates, but has never been much read. He was now driven by necessity more and more to fugitive writing, and he never again published anything which displayed much original power. The most original of his remaining works, and the only one calling for mention, was his romance, 'Isabelle,' 8vo, 1833; but, though it contained brilliant passages, it was for the most part desultory, forced, and extravagant, while as a story it was utterly devoid of interest. In his later years M. Senancour was in the receipt of a small pension, granted by the ministry of M. Thiers, which was afterwards somewhat increased through the friendly interest of M. Villemain. He died at St. Cloud in January, 1846, at the age of seventy-five, asking as his last request that only the words "Éternité, deviens mon Asile!" might be inscribed on his tombstone.

SENARMONT, HENRI HUREAU DE, mineralogist, was born at Broué, September 6, 1808. In 1826 he entered the École Polytechnique, and from it passed into the École des Mines. As his object was to be an engineer, one of the duties entrusted to him was to superintend the steam-engines in the Seine department. This avocation required a large amount of travelling, of which he availed himself by examining the geological structure of the country, one result of which examination was the publication of geological maps of some of the home departments. His reputation, however, is based not on these, but on his researches into the physical properties of crystals. His investigation of the behaviour of reflected light at the surfaces of crystals was conducted with remarkable skill and judgment. He also studied the relationship which exists between the crystalline form and the conducting power of heat and electricity. He made valuable experiments on the artificial formation of minerals by the moist way, and demonstrated that mineral veins can be formed by the agency of hot springs, as also that pressure and temperature exercise great influence in modifying the affinities of substances as ordinarily known. Thus he proved that, under certain circumstances, anhydrous and insoluble compounds may be formed in the midst of liquids, which compounds, it was thought by some, could only be formed by the dry way. His researches on isomorphism are important, more especially on account of their indicating why bodies having similar crystalline forms possess different optical properties. He was, for a time, director of the Creuzot Iron Works; but during the later portion of his life he was professor of mineralogy, director of studies, librarian, and secretary to the council at the École des Mines, as also professor of physics at the École Polytechnique. He died at Paris, June 30th, 1862.

SENIOR, NASSAU WILLIAM, a political economist, eldest son of the Rev. J. R. Senior, vicar of Durnford, Wilts, was born on the 26th of September, 1790, at Compton, in Berkshire, and was educated successively at Eton and at Magdalen College, Oxford, where he graduated B.A., taking a distinguished first class in classics on the 14th of January, 1812, and proceeded M.A. on the 16th of June, 1814. On the 28th of June, 1819, he was called to the bar by the Society of Lincoln's Inn; and in 1836, during the chancellorship of Lord Cottenham, was appointed a Master in Chancery. He was elected in 1825 to the then newly-founded professorship of political economy in the University of Oxford—an office which he resigned in 1830, and to which he was re-appointed in 1847, after it had been occupied in the interval successively by Dr. Whately, afterwards Archbishop of Dublin, and Dr. Travers Twiss. The infirmities of age forced him to final re-

tiement in 1862, and he died at Kensington Gore on the 4th of June, 1864.

The writings of Mr. Senior, who for several years acted as examiner in political economy in the University of London, are almost exclusively conversant about the science which he academically professed. The principal of these are 'An Introductory Lecture before the University of Oxford,' 8vo, London, 1827, and many succeeding editions; 'Three Lectures on the Transmission of the Precious Metals from Country to Country, and the Mercantile Theory of Wealth, delivered before the University of Oxford,' 8vo, London, 1828; 'Two Lectures on Population, &c., to which is added a Correspondence between the Author and Mr. Malthus,' 8vo, London, 1829; 'Three Lectures on the Rate of Wages, with a Preface on the Causes and Remedies of the Present Disturbances,' 8vo, London, 1830; 'Three Lectures on the Cost of obtaining Money, and on some Effects of Private and Government Paper Money,' 8vo, London, 1830; 'A Letter to Lord Howick on a Legal Provision for the Irish Poor, a Commutation of Tithes, and a Provision for the Catholic Clergy,' 8vo, London, second edition, 1831, third edition, 1832; 'An Outline of the Science of Political Economy,' 4to, London, 1836, originally contributed to the 'Encyclopædia Metropolitana'; 'Letters on the Factory Act, as it affects the Cotton Manufacture,' 8vo, London, 1837, &c.; 'A Lecture on the Production of Wealth,' 8vo, Oxford, 1847; 'Political Economy,' 8vo, London, 1850; 'Four Introductory Lectures on Political Economy, delivered before the University of Oxford,' 8vo, London, 1852; 'A Journal kept in Turkey and Greece in the Autumn of 1857 and the Beginning of 1858,' 8vo, London, 1859, French version, 'La Turquie Contemporaine,' 12mo, Paris, 1861; 'Suggestions on Popular Education,' 8vo, London, 1861; 'American Slavery,' 8vo, London, 1861, being a reprint of an article on 'Uncle Tom's Cabin,' of which a portion was inserted in No. CCVI. of the 'Edinburgh Review,' and of Mr. Sumner's speech of the 19th and 20th of May, 1856, delivered before the Senate of the United States, and afterwards published as 'The Crime against Kansas,' 12mo, Washington, 1856; 'Biographical Sketches,' 8vo, London, 1863, of all of which law and lawyers are the topics, and seven of which originally appeared in the 'Edinburgh Review,' whilst the remaining three were reprinted from other periodicals; 'Essays on Fiction,' 8vo, London, 1864, a collection of articles on Scott, Thackeray, Mrs. Stowe, and others, which had made their first appearance in the leading Reviews between the years 1851 and 1857; and a volume of posthumous publication, consisting, with one exception, of reprints from the 'Edinburgh Review,' and entitled 'Historical and Philosophical Essays,' 2 vols. 8vo, London, 1865, "edited by M. C. M. Senior."

* SÉQUARD, CHARLES EDWARD BROWN, one of the most eminent of living experimental physiologists, was born in the island of Mauritius, where his early boyhood was spent. His father was Edward Brown, a native of Philadelphia, and his mother was a Séquard, whose name he adopted. In 1838 he went to Paris for the purpose of completing his education, and in 1840 he took his degree of M.D. there. In 1847, a paper by him was inserted in the 'Comptes Rendus,' on the duration of the life of frogs in autumn and winter, after the spinal column and other parts of the nervous system had been removed, which was the first of the hundred and odd papers which have followed it in quick succession. A large proportion of these contain accounts of experiments on nerves, while another large proportion are devoted to the properties of muscles. These researches have won for him five prizes from the Academy of Sciences at Paris, and more than one grant from the fund which government has placed under the management of the Royal Society for the prosecution of scientific inquiries. The facts he has collected are of the highest value, although his interpretation of their meaning has frequently been contested. He found that blood, which had been deprived of its fibrin, regained it on being injected into the separated limb of an animal, and excited muscular irritability, even after it had been removed from the body for many hours. He demonstrated by experiment the correctness of Sir C. Bell's views, that the anterior roots of the spinal nerves conduct motor impulses, while the posterior transmit sensory impressions; as also of Lockhart Clarke's description of the course of the nervous fibres, based upon the examination of prepared sections. He has ascertained that while certain poisons cause a considerable reduction in the temperature of the body, the effect of artificially raising or maintaining the temperature of the body is to retard or weaken the action of the poisons. His other experiments and researches are important, but too numerous for detailed notice here.

BIOG. DIV.—SUP.

His earlier papers are published in the 'Comptes Rendus,' and in the 'Mémoires' of the Biological Society of Paris; and his later papers are given in the 'Journal de la Physiologie de l'Homme et des Animaux,' which was started in 1858, and of which he is the editor. He has delivered successful courses of lectures at the Royal College of Surgeons, London, and in America. Amongst his separate works, which are few in number, may be cited the 'Course of Lectures on the Physiology and Pathology of the Central Nervous System,' 8vo, Philadelphia, 1860, and his lectures on the principal forms of paralysis in the lower limbs.

* SERRANO Y DOMINGUEZ, FRANCISCO, DUKE DE LA TORRE, a Spanish marshal and statesman, and a grandee of the first class, son of General Serrano y Cuenca, was born at San Fernando, near Cadiz, on the 10th of November, 1810. At fifteen years of age he entered the army as a cadet, and on the breaking out of the war of succession, after the death of Ferdinand VII., September 29th, 1833, adopted the cause of the infant queen, and especially of the queen-mother, Maria Christina, through whose influence he had attained, at the age of thirty, the rank of a general of division. On the 11th of May, 1843, being at that time a major-general, deputy of Malaga, and vice-president of the Chamber of Deputies, he undertook the ministry of war, in the nine days' administration of Lopez, whose resignation, to the great anger of the people, was forced upon him through the want of co-operation on the part of the Regent Espartero, to effect whose downfall Serrano, jointly with Prim and Narvaez, now devoted himself. This was presently accomplished; and on the 24th of July, 1843, the supporters of the cause of the queen-mother made a triumphant entry into Madrid, where Serrano encountered much popular odium for not carrying out the terms of capitulation. On the 19th of November of the same year he commenced a ten days' tenure of office as minister of war under Olozaga, for whose overthrow he successfully intrigued with Narvaez, with the intention of retaining his portfolio in the administration of Olozaga's successor. Serrano now spent some time in retirement, and even in a sort of exile, from which he emerged in 1845, when he was promoted to be a lieutenant-general and a senator, and held in successive short-lived ministerial combinations the position of minister of war. The influence which he acquired over the queen soon after her unhappy marriage, October 10, 1846, was the occasion of quarrels and estrangement within the palace, and of scandal without; and the ministry of the day thought it expedient to remove him from Madrid, by appointing him to the military command of Navarre. This he refused to accept; and, after the institution of proceedings against him for his contumacy, and a short sojourn in Andalusia for the benefit of his health, from which he was recalled in a few days at, as is said, the express desire of the king, he was appointed in the latter part of 1847 to be captain-general of Granada. For being implicated in an insurrection which broke out at Saragossa in February, 1854, he was sentenced to exile, from which he returned to join Espartero and O'Donnell in the revolution of July of the same year, which resulted in the overthrow of the government of the queen-mother, and in the formation of a cabinet in which Espartero held the office of president of the council, and O'Donnell that of minister of war. Serrano was appointed captain-general of artillery, but exchanged this post in 1856 for that of captain-general of New Castile, of which position he took advantage to give strong military support to the coup d'état by which O'Donnell drove his colleague and benefactor, Espartero, into resignation, in July of the last-named year. In 1857 he succeeded Olozaga as ambassador to the court of the Tuileries, from which he was recalled after the fall of the O'Donnell administration in September; and in 1859 was appointed director and colonel-general of artillery. Soon afterwards he was appointed to the governorship of the island of Cuba, and signalled his term of office by the negotiations and the expedition which brought back St. Domingo, in March, 1861, to the sovereignty of Spain. The colony was abandoned in 1866; but the temporary extension of the empire, of which Serrano was the agent, occasioned, in 1862, his promotion to be Duke de la Torre, and a grandee of the first class. Returning to Spain, Marshal Serrano became in June, 1865, captain-general of Madrid; and, in September, 1868, having been exiled in July previous, took a prominent part in the insurrection which drove the queen to seek refuge in France, and resulted in the formation of a provisional government, under which he became president of the council of ministers, on the 8th of October, 1868. On the 18th of June, 1869, he was ap-

pointed Regent of Spain; and though he used the power and influence of his position for the encouragement and consolidation of liberal measures, he was of accord with Prim in the desire to secure and to perpetuate a monarchical form to the government of Spain. This aspiration was gratified, at length, by the acceptance of the crown by Amadeo, duke of Aosta, son of the king of Italy, who entered Madrid, and took the oaths as sovereign, on the 2nd of January, 1871, in the presence of the Cortes Constituyentes, into whose hands Serrano had just surrendered his powers as regent. On the 3rd of January, he was placed, by a royal decree, at the head of an administration, in which he combined the offices of president of the council and minister of war, formed on principles of comprehension and conciliation, and including unionists, progressists, and democrats. He resigned on the 20th of July, 1871; and being baffled in his attempts to form a new cabinet, in which he would have retained his old offices, and many of his old colleagues, was succeeded, on the 24th, by Zorilla, who assumed office with a cabinet entirely composed of Progressistas.

SEVERINO, SAN. In the early part of the 15th century the brothers Lorenzo and Jacopo di San Severino were among the most distinguished painters in Urbino. Lorenzo, the elder brother, was the abler artist; but they painted together, and, among other things, in 1416, a series of frescoes in the oratory of San Giovanni Battista, representing the leading events in the history of St. John the Baptist and of the Saviour, some of which are still extant, though much injured. Lanzi says that the brothers were living and painting in 1470, which hardly seems probable. A 'Marriage of St. Catherine,' formerly the altarpiece in the sacristy of S. Lucia in Fabriano, and now in the National Gallery (No. 249), has the name of the painter "Laurentius II. Severinus" inscribed on it, and has usually been attributed to the elder of the brothers; but Mr. Wornum ('Cat. of Nat. Gal.') thinks, from the lateness of the execution, and the fact of the signature being Laurentius II., that it was perhaps the work of "a second Lorenzo di San Severino, who may have been the son of the first Lorenzo." It is, however, by no means certain that the 'Marriage of St. Catherine' is not by the celebrated Lorenzo: at any rate, artistic biography is silent as to a second of that name.

* **SEWARD, WILLIAM HENRY**, an American statesman, was born at Florida, Orange county, in the State of New York, May 16, 1801. His father, who had realised a moderate fortune as a physician and a merchant, and who had also held the post of magistrate, placed him, in 1810, at a school in Goshen, and, in 1816, at the Union College. In 1819, while engaged for a few months as teacher of a school in Georgia, he formed opinions so unfavourable to slavery as to influence his political conduct in later life. He returned home, took a degree, studied law, was called to the bar in 1822, and settled at Auburn in partnership with Mr. Miller, whose daughter he married. He began to engage in politics in 1824, attracted attention by a speech made at Syracuse in 1825, became a recognised member of the Republican or anti-slavery party, was chosen president of a State Convention in 1828, and in 1830 entered the Senate of New York state, where he distinguished himself in an opposition raised at that time against the Freemasons. In 1833 he visited Europe, and wrote letters on the politics and society of Europe, for insertion in the Albany 'Evening Journal.' On his return to America in 1834, he competed in an election for governor of New York, but was defeated by the Democratic candidate. In 1836, he accepted a lucrative appointment as American agent of the Holland Land Company. A second candidature for the governorship of New York being successful in 1838, he entered actively into new schemes for social and commercial improvement, especially popular education, a geological survey of the state, an improvement in the banking system, the establishment of lunatic asylums, law reform, abolition of imprisonment for debt, facilities for the reception of immigrants, the encouragement of public works, and the discouragement of slavery. Resigning the governorship in 1840, he resumed practice at the bar, by which he greatly increased his fame and fortune. Elected to the Senate of the United States in 1849, as representative of the state of New York, he speedily became leader of the Republican party, uniformly opposing the slave-owning senators from the South, and being in almost perpetual conflict with them. In discussing the terms on which California was to be admitted as a State into the Union, he adverted to "the law of God, and the interests of humanity," as being paramount to any law of Congress in regard to slavery; and, in 1868, laid it down

as an axiom, that the struggle between freedom and slavery was irrepressible, never to cease until the United States had become entirely free labour or entirely slave-owning. In 1859, Mr. Seward made a tour in Europe, Egypt, and the Holy Land. On returning to America, he again plunged into the turmoils of public life; he had been re-elected to the Senate in 1855, and had tried unsuccessfully for the presidency in 1856. He attempted again in 1860, but finding Abraham Lincoln to be the probable favourite, he threw all his energies into insuring Lincoln's success, making speeches in his favour throughout the western states. He became secretary of state, or foreign secretary, to President Lincoln; and from 1861 till 1869 the career of Mr. Seward was bound up with the foreign relations of the United States. The 'Trent' difficulty and the 'Alabama' difficulty with England, especially the latter, were the subjects of voluminous despatches by him, in which there was a tone of asperity, and a hardihood of assertion, which sorely tried the temper of the British Government, and did not enhance Mr. Seward's reputation for statesmanship. He was, nevertheless, one of the assenting parties to the drawing up of an amicable settlement of the 'Alabama' question in 1867—68, by Lord Stanley and Mr. Reverdy Johnson—a settlement, however, cancelled and annulled by the Senate of the United States in 1869. Mr. Seward was uninterruptedly secretary of state throughout the presidencies of Abraham Lincoln and Andrew Johnson; but his official labours were temporarily suspended in April, 1865, by a wound which he received from a confederate of the assassin of Mr. Lincoln. During the presidency of General Grant, 1869—72, Mr. Seward has been free from official duties, and has availed himself of his leisure to make an extended tour. He has written 'Notes on New York,' 1842, being part of a larger work published by the legislature of that State; 'The Elements of Empire in America,' 1844; 'Life of John Quincy Adams,' which has run through many editions; 'Life of De Witt Clinton'; orations on Quincy Adams, O'Connell, and Lafayette; mortuary speeches on Clay, Webster, and Clayton; addresses and speeches at colleges, schools, and public meetings; political speeches, messages, and official papers; forensic arguments, and miscellaneous papers. His works, edited by G. G. Baker, have been published at New York, in 4 vols. 8vo, 1853—61.

SHEEPSHANKS, JOHN [E. C. vol. v. col. 468], the munificent donor of the Sheepshanks Collection of Paintings to the South Kensington Museum, died on the 5th of October, 1863, at the age of 75.

* **SHERIDAN, MAJOR-GENERAL PHILIP HENRY**, of the United States army, was born of humble Irish parents at Albany, New York state, in 1831. His early years were passed at Somerset, Ohio, whence, attracting the notice of General Ritchie, he was sent to the West Point Military Academy in 1848. Graduating in 1853, he obtained his first commission as lieutenant of a cavalry regiment, with which he served in Texas, Oregon, California, and the Indian territories. When the civil war began in 1861, he was engaged as captain and quartermaster with the South-West Missouri army. In 1862, as quartermaster of the western department, and colonel of the 2nd Michigan Volunteer Cavalry, he fought under General Buell against General Bragg; cutting the enemy's line of communication south of Corinth, and being actively engaged at Baldwin, Gunton, and Boonesville. He was then raised to the rank of brigadier-general, and placed in command of the third division of the army of Ohio. Early in 1863 he fought under Rosecranz at Murfreesboro; and when the field of Chickamauga was lost, he earned reputation by a clever flank march. Promotion rapidly awaited the still-young officer: he was made major-general; and, after various cavalry skirmishes, by which he gained for himself the title of "the Murat of America," he became early in 1864 commander of the cavalry in the army of the Potomac. He worked round to the rear of General Lee and the Confederate forces, defeated detached bodies of them at Danville and elsewhere, and laid waste much of the country to which the Confederates had looked for their supplies. In the Shenandoah valley, where Generals Early and Longstreet were threatening the approaches to Washington, he encountered them, defeated them at Winchester, Cedar Creek, and other places, and compelled them to retreat. In the early months of 1865 he pressed closely upon Lee's forces, and, by winning the battle of Five Forks, compelled the Confederates to retreat. Another victory by Sheridan at Sailor's Creek, on April 6th, rendered Lee's position hopeless; and he surrendered to Grant on the 9th. Sheridan, by these services, established his name as the best cavalry officer

in the army. When the war closed, he was commander of all the cavalry in Grant's army, as well as general of the fifth army corps. In 1866 he was appointed commander of the department of the Gulf of Mexico; and had trying duties to perform at New Orleans in organising the new relations between the South and the North. A fifth military district being established, with Louisiana as its centre, he was placed in command of it; but, owing to a difference with President Johnson (in which General Grant protested against the President's views), Sheridan resigned it in 1867, and took a command under Sherman in the department of Missouri. During 1868 and 1869 he was actively engaged in settling the remaining Indians on reserved lands between the Mississippi and the Rocky Mountains.

* **SHERMAN, LIEUTENANT-GENERAL WILLIAM TECUMSEH**, a distinguished American commander, was born at Lancaster, in the state of Ohio, February 8th, 1820. He entered West Point Military Academy in 1836, graduated in 1840, received the commission of second lieutenant in the same year, and that of first lieutenant in the following year. He served in the Mexican war, and in 1847 filled the post of assistant adjutant-general in California. With the higher ranks of captain and commissary, he remained in California in 1848 and following years. Resigning the Californian appointment in 1853, he was made president of the State Military Institute of Louisiana, at New Orleans. When the civil war broke out in 1861, he at once asked for active service on the side of the Federals, obtained a commission as colonel of the 13th infantry, and shared the disasters of the first battle of Bull Run. In November he was placed in command of the Port Royal forts, in North Carolina. After the reorganisations of the Federal forces in the ensuing winter, he became brigadier-general of volunteers, acting first near the Cumberland River, and then near the Missouri. Distinguished services which he rendered to General Grant at the battle of Shiloh, in 1862, obtained for him the rank of major-general; and later in the year he commanded the 15th army corps, with which he made an unsuccessful attempt to take Vicksburg. In 1863 he commanded a wing of the army that captured Fort Hindman, in Arkansas, in January; took part in the successful siege of Vicksburg in July; received from General Grant the command of the department of Tennessee; forced the Confederates under Longstreet to retreat; and, with General Thomas, defeated Bragg at Chattanooga. In the spring of 1864 he encountered checks at Mobile and at Sabine Cross Roads; but recovered his ground by the march or raid which has made his name famous. Placed in command of the army of Georgia in May, he defeated the Confederates under Johnston, and then three times under Hood, who slowly retreated to Atlanta, from which place Sherman drove him in September. Hood, however, by taking up a new position, threatened Sherman in turn, and placed in peril his supplies and lines of communication. Then it was that Sherman adopted his bold course of marching across Georgia to Savannah and Charleston, and feeding his army by what he could find on the way. He left Atlanta on November 21st, started with 200 head of cattle, rationed his troops at the farms as he passed, and brought 1200 head of live stock into Savannah; he also brought in 700 negroes, and an immense train of horses, mules, and waggon. His line of march was sometimes 60 miles wide, so far did he send out his foraging parties. He stormed Fort M'Alister, and then took possession of Savannah; and on the 22nd of December telegraphed to President Lincoln, "I beg to present you, as a Christmas gift, the city of Savannah, with 500 heavy guns, plenty of ammunition, and 25,000 bales of cotton." This achievement was of great importance, inasmuch as it gave the Federals command of a line of sea-coast, with a new base of operations for acting against the Confederates in South Carolina. Early in 1865 Sherman marched into that State, defeated Johnston, and made with him a treaty so liberal that the Cabinet refused to sanction it; and Johnston was thereupon forced to surrender with his army. With Sherman on the south, and Grant on the north, the Confederate commander, General Lee, was obliged to yield, and the war ended. In 1866 a special Act of Congress conferred the rank of general upon Grant, and lieutenant-general upon Sherman, they being the only holders of such ranks in the United States army. Sherman was placed in command of the military division of Missouri, with head-quarters at St. Louis; and in 1868 he conducted the settlement of the few remaining tribes of Indians between the Mississippi and the Rocky Mountains. General Sherman shares with Grant the reputation of being the best Federal commanders produced by the war; like Lee and Stonewall Jackson on the other side, they are spoken of with respect

both by North and South. The great march through Georgia has been made the subject of many military pamphlets; of which may be named, 'Sherman and his Campaign,' by Bowman and Irwin; 'Sherman's March from Chattanooga,' by Heady; 'Story of the great March of General Sherman through Georgia,' by Nichols; and 'Sherman's Feldzug in Georgien,' by F. S. A. Von Meerheimb.

SIAM, KINGS OF. [E. C. vol. v. col. 489.] Somdetch Phra Paramendr Maha Mongkut, or, according to his Siamese names, Chom Klan Chau yu Hua, First King of Siam, died on the 1st of October, 1868, of fever caught while on a visit to Hua Wau to witness an eclipse. He was succeeded in the rank and title of first king by his brother, the Second or Junior King, Somdetch Pin Klan Chau yu Hua; George Kromamun Bawarawichi Chau, the eldest son of the late First King, succeeding his uncle as Second or Junior King.

* **SIEBOLD, CARL THEODOR ERNST VON**, physiologist and anatomist, was born at Würzburg, February 16, 1804. His earlier education was received from his father at home, and subsequently he went to Heilsberg and Königsberg. In 1835 he was appointed director of the Lying-in Hospital at Dantzic; in 1840, professor of zoology at Erlangen; in 1850, professor of physiology at Breslau; and at a later period professor of physiology, comparative anatomy, and zoology in the Physiological Institute founded by himself at Munich. He has contributed largely to our knowledge of the structure, development, and modes of reproduction of the entozoa and other invertebrates. His 'Lehrbuch der vergleichenden Anatomie der wirbellosen Thiere,' 2 vols. 8vo, Berlin, 1848-1849, is an excellent manual of its kind, and has been translated into English and French. His 'Wahre Parthenogenesis bei Schmetterlingen und Bienen,' 8vo, Leipzig, 1856, attracted much attention. Amongst his other works are the 'Reports on the Progress of Zoology,' first published in German, and afterwards translated into English, to form part of the Ray Society's collection of works; 'On Tape and Cystic Worms,' 8vo, 1857, published by the Sydenham Society; 'Ueber die Band- und Blasenwürmer,' 8vo, Leipzig, 1854; 'Ueber Parthenogenesis,' 4to, Munich, 1862; and 'Die Süßwasser Fische von Mittel Europa,' 8vo, Leipzig, 1863. He is joint editor with Kölliker of the 'Zeitschrift für wissenschaftliche Zoologie,' to which he has contributed many papers.

SIEBOLD, PHILIPP FRANZ VON, traveller and naturalist, and brother of the subject of the preceding notice, was born at Würzburg, February 17, 1796. He was educated at, and took his degree of doctor from, the university of that town. In 1820 he entered the Dutch service, and proceeded to Java as a sanitary officer. While occupying this post, he was attached to a scientific expedition to Japan. He received unusual facilities from the Japanese authorities, and was thus enabled to examine most parts of the kingdom. He spent several years in Japan, but his stay was brought to a summary conclusion, in consequence of his having received from the Emperor of Japan's librarian a copy of the map of the country, which had just been issued by the Japanese government. He was arrested, imprisoned, and dismissed the country. His return to Europe occurred in July, 1830. In 1859 he again visited Japan, and was employed to negotiate various diplomatic subjects with the Tycoon. In 1862 he returned to Europe, and lived for a time at Würzburg. In 1866 he went to Munich, in order to found an ethnographical museum in that city. His magnificent collections of Japanese objects now form part of the museums at Leyden and Munich. He died at Munich, October 18, 1866. His works are the principal authorities on most matters connected with Japan. The titles of the more important are as follows:—'Epitomæ linguae Japonicæ,' Batavia, 1826; 'Nippon. Archiv zur Beschreibung von Japan und dessen Neben und Schutzländern,' 6 vols. folio, Leyden, 1832-1852; 'Fauna Japonica,' 5 vols. folio, 1833-1850, in which he had the assistance of Temminck, Schlegel, and Haan; 'Bibliotheca Japonica,' 6 vols. 4to, 1833-1841; 'Flora Japonica,' 1835-1853; and 'Voyage au Japon,' 8vo, and folio atlas, 1838, &c.

SIGOURNEY, LYDIA HUNTLEY. [E. C. vol. v. col. 511.] In 1857 Mrs. Sigourney published a volume, entitled 'Olive Leaves,' which reached a second edition in 1870; and, in 1860, 'Lucy Howard's Journal.' 'Biographies of Great and Good Women,' and 'Letters of Life,' 8vo, New York, 1866, were of posthumous publication. She died on the 11th of June, 1865.

SILLIMAN, BENJAMIN, founder of 'The American Journal of Science and Arts,' and one of the most eminent of the science teachers of America, was born at Trumbull, Connec-

ticut, August 8, 1779. He entered Yale College in 1792, graduated in 1796, became a tutor in the same institution in 1799, and remained on its teaching and governing staff for 54 years. At first he intended to enter the legal profession, and, having studied with that end, he was admitted to the bar in 1802. But shortly before this occurred, Dr. Dwight, the president of Yale College, told him confidentially that a professorship of chemistry and natural history was about to be established, and offered his influence in obtaining Silliman the appointment. Accordingly, in September, 1802, he was elected to the professorship, although at the time he knew very little about chemistry. The lectures, however, were not to be commenced for some time, and the interval was actively employed in preparation, principally by attendance on the classes at Philadelphia. His first lecture was given in April, 1804; and from the first he met with great success, both in the treatment of his subjects and the conducting of the experiments. In 1805 he visited Europe on a commission to collect books for the library of Yale College, and he usefully employed his time in sight-seeing, making the acquaintance of the principal scientific celebrities, and attending classes in London and in Edinburgh. At that time science was in a very backward state in America, and the information which he acquired in Europe materially helped forward the standard of teaching in his own college. He gave three courses of lectures, which respectively related to chemistry, mineralogy, and geology. The acquisition of the Gibbs collection of minerals, the Clark telescope, and the Trumbull gallery of paintings, was mainly due to his influence. He also aided in founding and establishing the medical institution connected with Yale College. In 1818 he established the 'American Journal of Science,' and was the principal editor from the beginning until within a short period of his death. His occupations as professor and editor left him little leisure for original research, so that apart from these he wrote little. He was frequently called upon to give courses of lectures on geology at New Haven, Boston, New Orleans, and many other of the cities of the United States, which were exceedingly popular. He visited Europe in 1851. The results of this, as also of the earlier visit, were published by him, and passed through several editions. The titles of his principal works are—'Elements of Chemistry,' 2 vols. 8vo, Newhaven, 1830; 'A Journal of Travels in England, Holland, and Scotland, and of two Passages over the Atlantic in the years 1805 and 1806,' second edition, 2 vols. 8vo, Boston, 1812, third edition, 3 vols. 1820; and 'A Visit to Europe in 1851,' 2 vols. 8vo, New York, 1854. In 1853 he retired from active service, but retained the honorary distinction of professor emeritus. He died November 24, 1864. A life of him has been compiled by G. P. Fisher, in 2 vols. 8vo, 1866, which consists mainly of selections from his own letters and from the autobiographical sketch which he left in manuscript.

* SILLIMAN, BENJAMIN, son of the foregoing, was born at Newhaven, December 4, 1816. He graduated at Yale College in 1837; and in the following year commenced teaching in that institution chemistry, mineralogy, and geology. In 1842 he opened a laboratory for analytical chemistry. In 1846 he was appointed professor of chemistry applied to the arts in the Sheffield scientific school, which was founded in connection with Yale College. From 1849 to 1854 he was professor of toxicology and medical professor in the University of Louisville, Kentucky; but in the last-mentioned year he returned to Yale College as successor to his father. He accompanied his father in his visit to Europe in 1851. He was for many years secretary to the American Association for the Advancement of Science, and editor of its 'Transactions.' He has been one of the editors of the 'American Journal of Science' since 1838, and has contributed numerous papers to that journal. In the United States he is well known as a popular lecturer on scientific subjects. His separate works are not numerous: the more important are, 'First Principles of Chemistry,' 12mo, Philadelphia, 1847; and 'Principles of Physics,' 8vo, 1858, second edition, 1861.

SILVESTRE DE SACY, ANTOINE ISAAC. [SACY, ANTOINE ISAAC SILVESTRE DE, E. C. vol. v. col. 235.]

SIMEON, REV. CHARLES, M.A., who in his day occupied the foremost rank amongst the leaders of the Evangelical party in the Church of England, was born at Reading on the 24th of September, 1759, and was educated successively at Eton, where he was in due course admitted on the foundation, and at King's College, Cambridge, which, having succeeded to a scholarship, he entered on the 29th of January, 1779. A few days after his commencement of residence, he was thrown into an agony of preparation, extending over three weeks, previous to a com-

pulsory reception of the Sacrament; and the impressions of which he at that time became the subject continued with him throughout his after-life. Whilst still an undergraduate he obtained a fellowship at King's College, upon which, as a title, he was admitted to deacon's orders on Trinity Sunday, May 26, 1782, in Ely Cathedral, by Dr. Yorke, bishop of the diocese; and soon afterwards commenced his clerical career by undertaking the charge of St. Edward's Church, Cambridge, in the absence of the incumbent during the long vacation. Whilst still in deacon's orders, he was presented by Bishop Yorke, into whose hands the patronage of the living had fallen by sequestration, to the vicarage of Trinity, Cambridge, in the church of which parish—his first and final preferment—he commenced his duties on the 4th of January, 1783. On the 28th of September following, he was ordained priest in the chapel of Trinity College, by Dr. Hinchcliffe, Bishop of Peterborough and Master of Trinity. From the very first, he had much opposition to encounter, and the zeal with which he performed his pastoral duties, and the affectionate concern which he showed for the spiritual interests of the students of the University, whom he regarded as the future evangelists of the country, rendered him obnoxious to the charge of fanaticism. He was scorned and rejected by high and low. It was considered to be almost an abandonment of reputation for a clergyman to officiate in Trinity Church; and those who worshipped there were thought to have repudiated common sense, sobriety, and attachment to the establishment. Some of the principal persons of his own parish joined the clamour against him, not only refusing to attend themselves, but locking their pew doors that others might not occupy them. "The truth is," as Dr. Dealtry states, "that the fashion, and feelings, and manners of the times were against him," and intimates that, "amidst a prevailing unconcern about religion," there was not wanting some "hostility to religion itself." His services were liable to disturbance, and in the streets his personal safety was occasionally so much endangered that a number of undergraduates, who attended and prized his ministrations, formed themselves into a body-guard for his defence. His disposition did not predispose him to conciliation. His temper, which was naturally quick and vehement, was the more easily provoked from certain feelings of vanity and self-importance, which during the whole of his life were a subject of conflict and trial to him. Nearly two-thirds of his ministry were passed under very considerable discouragement; but, after a protracted period of difficulty, coldness, and resistance, he enjoyed, during the closing twelve or fifteen years of his career, the full influence and honour which belonged to his experience, piety, and activity. He was remarkable for his assiduous application to duty; for his consistency and decision of character; for his moderation in contested and doubtful points of theology; for his devotional spirit; for the laborious preparation he bestowed on his sermons, of one of which he told Mr. Carus that he had re-composed the plan nearly thirty times; and for the close and frequently munificent interest which he exhibited in various religious and philanthropic societies,—as the Society for Promoting Christian Knowledge; the Church Missionary Society, of which he may be considered as one of the founders; the British and Foreign Bible Society; the Society for the Conversion of the Jews; the Prayer-book and Homily Society; and the London Clerical Education Society. But the phase of activity most peculiar to himself was his plan of purchasing advowsons and presentations, in order to bestow them upon clergymen who gave prominence to those views of Christian truth which he deemed most important. The number of advowsons so purchased amounted in 1836 to more than forty; and at present the "Trustees of the Rev. Charles Simeon" hold in their hands the patronage of between fifty and sixty benefices, distributed over about half the counties of England, and generally in populous districts. He exercised a diligent oversight over the parishes for whose spiritual wants he thus sought to provide; and in the early part of the summer of 1836, he commenced a tour of visitation to the churches under his patronage, from the completion of which the infirmity of his health compelled him to desist. In September following he preached his last sermon in the church of which he had been vicar for nearly fifty-four years; and died on the 13th of November, 1836, at which time he had been for a considerable period the senior fellow of his college, in the chapel of which he was buried on Saturday, the 19th of the same month, amidst profound tokens of respect and affection from all classes both of the town and the University. Five of the funeral sermons delivered in Cambridge on the day of his interment or on the day following (Sunday) were published; and

biographies and other illustrative works of greater or less volume and pretension have been produced in considerable numbers. Amongst these may be mentioned 'A Brief Memoir of the Rev. Charles Simeon,' &c., 12mo, London, 1348; 'Souvenirs de Charles Simeon, Ministre de l'Eglise de la Trinité,' &c., 12mo, Toulouse, 1853, issued by the Société des Livres Religieux; 'Recollections of the Conversation Parties of the Rev. Charles Simeon. With Introductory Notice by Abner William Brown,' 8vo, London, 1863; and last, what is really the standard biography, the 'Memoirs of the Life of the Rev. Charles Simeon, M.A., late Senior Fellow of King's College, and Minister of Trinity Church, Cambridge. With a Selection from his Writings and Correspondence. Edited by the Rev. William Carus, M.A., Fellow and Senior Dean of Trinity College, and Minister of Trinity Church, Cambridge,' 8vo, London and Cambridge, 1847, and other editions, American edition, with an Introduction by Bishop Mac Ilvaine, 8vo, New York, 1847, which incorporated much of the early autobiography drawn up by Mr. Simeon in the summer of 1813, when on a visit in search of health to Sandgate.

Mr. Simeon was indefatigable in the use which he made of the press as an instrument of propaganda. His works include 'Claude's Essay on the Composition of a Sermon. With an Appendix containing One Hundred Skeletons of Sermons,' 8vo, 1796; 'Helps to Composition: or, Six Hundred Skeletons of Sermons,' 2 vols. 8vo, Cambridge, 1802, second edition, 5 vols. 8vo, London, 1808, third edition, 1815; 'Candour: or, Four Sermons preached before the University of Cambridge,' 8vo, London, 1816; 'The Excellency of the Liturgy, in Four Discourses preached before the University of Cambridge,' &c., 8vo, London, 1816; 'Horæ Homileticæ: or, Discourses (in the Form of Skeletons) upon the whole Scriptures,' 11 vols. 8vo, London, 1819–20; 'Appendix to the Horæ Homileticæ,' 6 vols. 8vo, London, 1828. These volumes, along with other subsequent groupings and collections of sermons, are reproduced in an edition of Simeon's works, 'Horæ Homileticæ. To which is annexed an improved Edition of a Translation of Claude's Essay on the Composition of a Sermon. With copious Indexes by the Rev. Thomas Hartwell Horne,' 21 vols. 8vo, London, 1832–33, and other editions, in which are contained 2536 sermons and skeletons of sermons.

* SIMON, JULES, a French philosopher and politician, whose name is more fully read as Jules François Simon Suisse, was born at Lorient, in the department of Morbihan, on the 31st of December, 1814; and, having received his preparatory education at the Collège of his native town, and other institutions, was entered in 1833 as a student of the École Normale. In 1836 he was admitted *agrégé de philosophie*, and became a teacher in that faculty successively at the Lycée of Caen and the Lycée of Versailles, at each of which he continued about a year. He was recalled by M. Cousin, one of whose most promising pupils he had been, to Paris; where, after an interval during which he acted as professor of the history of philosophy at the École Normale, he entered, in 1839, on the assistant-professorship, under M. Cousin, of the same subject, at the Sorbonne, where for a period of twelve years he lectured with great reputation and success. His academical duties were suspended, on account of the obnoxiousness of his political principles to the Prince-President, by a decree of the 16th of December, 1861; and they were finally terminated a few months later. The public life of M. Simon commenced after the Revolution of February, 1848, with his election as a member of the Constituent Assembly, for the department of Côtes-du-Nord, for which, two years previously, he had been an unsuccessful candidate; and in the course of the insurrection of June following, he distinguished himself as a member of the moderate republican party. His career in the Chamber was chiefly remarkable for his devotion to questions of domestic, economic, and social interest, and especially to the cause of education, whether superior or primary; the latter of which, in his opinion, should be at once gratuitous and compulsory. Besides acting as a prominent member of commissions bearing upon public instruction, M. Simon was a member, and also the secretary, of the provisional commission formed to exercise the functions of the Council of State, a body at that time in abeyance, and of which, upon its re-organisation in the beginning of 1849, he served for some time as a member, and as president of the committee of pardons. Upon ceasing to be a member of the Council of State, M. Simon indulged in a vacation from political life; and, from the year 1855, paid several visits to Belgium, in the chief towns of which he delivered lectures on philosophical subjects which met with an almost enthusiastic acceptance. In 1863 he was returned as a

member of the Corps Législatif by the eighth circumscription of the Seine; by which constituency, as well as by that of the second circumscription of the Gironde—for which he preferred to take his seat—he was returned in the general elections of May, 1869. M. Simon's opinions gravitated more and more in the direction of democracy, so that he has acquired a rather sinister reputation as "Number 606 of the International;" but he continued his advocacy of a liberal system of public instruction in its widest sense, whether as conducted by the school or the press; and he distinguished himself for the statistical ability with which he advocated the principles of free trade, and especially for the power of the arguments with which, on the 21st of March, 1870, he presented and sustained a proposition in favour of the abolition of capital punishment. He is at present, December, 1871, a member of the government of M. Thiers, in whose name he delivered—with the credit, according to current Paris opinion, of having previously composed it—the "President's Message" of the 13th of September, which preceded by three days the prorogation of the Assembly to the 4th of December.

M. Simon, who on the 27th of April, 1845, was made a knight of the Legion of Honour, and on the 21st of February, 1863, was elected a member of the Académie des Sciences Morales et Politiques, in succession to M. Dunoyer, is a voluminous author on the subjects which have been already indicated. His works comprise a thesis, 'Du Commentaire de Proclus sur le Timée de Platon,' 8vo, Paris, 1839; 'Études sur la Théodicée de Platon et d'Aristote,' 8vo, Paris, 1840; 'Histoire de l'École d'Alexandrie,' 2 vols. 8vo, Paris, 1844–45, new edition, 1861; the sections entitled 'Logique' and 'Histoire de la Philosophie,' in the volume entitled 'Manuel de Philosophie, à l'Usage des Collèges,' 8vo, 1845, fourth edition, 8vo, 1863, to which M. Amadée Jacques and M. E. E. Saisset were his fellow-contributors; 'Le Devoir,' 8vo, 1854, fourth edition, 1856; 'La Religion naturelle,' 8vo, 1856, second edition, 12mo, 1856, English translation, by J. W. Cole, and edited, with Preface and Notes, by J. B. Marsden, 8vo, London, 1857; 'La Liberté de Conscience,' 12mo, 1857, fourth edition, 8vo, 1867, a summary of the lectures delivered by the author in Belgium; 'La Liberté,' 2 vols. 8vo, Paris, 1859, and 12mo, 1859; 'La Liberté civile,' 8vo, Paris, third edition, 1867; 'L'Ouvrière,' 8vo, 1861, second edition, 12mo, 1861, &c., German translation, by F. Nessler, 'Die Arbeiterin,' 8vo, Zurich, 1862; 'L'École,' 8vo, Paris, 1864, third edition, 1865; 'Discours sur la Loi des Coalitions' (29 Avril, 1864), 12mo, Paris and Versailles, 1864; 'Discours sur la Situation des Instituteurs et des Institutrices' (19 Mai, 1864), 12mo, Paris and Versailles, 1864; 'Le Travail,' 8vo, Paris, second edition, 1866; and 'La Peine de Mort,' 12mo, Paris and Saint Germain, 1869. M. Simon has also produced new editions of the philosophical works of four writers, the titles of which vary in nothing but the names of the authors, entitled respectively 'Œuvres Philosophiques de Jacques Bénédict Bossuet. Nouvelle Édition, collationnée sur les meilleurs Textes et précédée d'une Introduction,' &c., 12mo, Paris, 1842; 'Œuvres Philosophiques d'Antoine Arnauld,' &c., 12mo, Paris, 1843; 'Œuvres Philosophiques du P. Nicolas de Malebranche,' &c., 2 vols. 12mo, Paris, 1842, new edition, 1859; 'Œuvres Philosophiques de René Descartes,' &c., 12mo, Paris, 1850, &c., new edition, 1865; and a Preface to M. F. Passy's 'De la Propriété intellectuelle,' 12mo, 1859.

SIMON, THOMAS, an eminent medallist, was born about 1612, of French descent, but a native of Yorkshire. In 1633 he became pupil and assistant to Nicholas Briot, engraver to the Mint; and when Briot left England after the execution of Charles I., Simon was appointed his successor. His first important work was a new broad seal for the Admiralty in 1636; and in 1643 he engraved a new great seal of England. Simon cut the great seals, commemoration medals, and coins during the protectorate of Oliver Cromwell and that of Richard Cromwell. At the Restoration he was deprived of his place as engraver to the Mint, notwithstanding he produced a now famous "trial-piece," in order to show that he was not inferior to the French engraver who displaced him. Simon retained, however, the post of engraver of the royal seals till his death, which occurred in June of the plague-year, 1665. Thomas Simon was by far the ablest engraver of the national seals, medals, and coins we have ever had; and his coins and seals are not only admirable as works of art, but also as historical memorials. He always represented faithfully the protector or the sovereign as he then was, unlike the foolish custom of recent engravers to the Mint, who give an always youthful and idealized portrait, worthless as a likeness

and misleading as a memorial. At a recent sale a copy of Simon's "crown trial-piece" sold for the surprising sum of £275. Besides the dies executed for the government, Simon engraved several private medals of eminent persons; a great seal for the Royal Society, &c. A quarto volume of engravings, and descriptions of the 'Medals, Coins, Great Seals, &c., of T. Simon,' was published by Vertue, the engraver, in 1753.

SIMPSON, SIR JAMES YOUNG, BART. [E. C. vol. vi. col. 1023.] In 1867 Sir J. Y. Simpson published a treatise on 'Archaic Sculpturings of Cups, Circles, &c. upon Stones and Rocks in England, Scotland, and other Countries.' A third volume of his collected works, on the diseases of women, is almost ready for publication. In consideration of his high professional services he was created a baronet, and a D.C.L. at Oxford, in 1866; and, in 1869, the corporation of Edinburgh presented him with the freedom of the city. He died at Edinburgh, May 7, 1870.

SINCLAIR, MISS CATHERINE [E. C. vol. v. col. 522], died on the 6th of August, 1864.

SJÖGREN, ANDREAS JOHANN [E. C. vol. v. col. 529], died on the 18th of January, 1855.

* **SLINGENEYER, ERNEST**, Belgian painter, was born, May 20th, 1823, at Loochristy, near Ghent. He studied under Baron Wappers in the Antwerp Academy, but ranks among the followers of M. Gallait. M. Slingeneyer's subjects are chiefly historical episodes or biographical incidents. Among his best-known pictures are—the 'Death of Jacobsen,' in the collection of the King of the Belgians; the 'Death of Claessens,' in that of the King of Holland; the 'Death of Nelson,' 'An Episode in the Massacre of St. Bartholomew,' 'The Shipwreck of Camoens,' &c. In the International Exhibition of 1862, his pictures of the 'Physician Vésale following the Army of Charles V.,' from the Musée Royal, Brussels, and 'A Christian Martyr under Diocletian,' attracted general notice—the latter especially, on account of some curious effects of sunlight, which, however, were rather tricks of art than belonging to the legitimate province of painting of an elevated order. M. Slingeneyer is a member of the Académie royale de Belgique, commander of the order of Leopold, and knight of the orders of the Lion of the Netherlands, of Merit, Saxony, of Our Lady of Villa Viciosa, of Nichan Iftikhar, &c.

* **SMILES, SAMUEL**, was born at Haddington, Scotland, about the year 1816. He practised as a surgeon for some time at Leeds; but abandoned the medical profession in order to take the editorship of the 'Leeds Times.' In 1845 he again changed his profession, and became secretary of the Leeds and Thirsk Railway Company; he resigned this in 1852 for the secretaryship of the South-Eastern Railway Company, which some years later he exchanged for a similar post in the National Provident Assurance Company.

Mr. Smiles's publications are numerous, and many of them have had a large sale. They comprise the following:—'Physical Education,' Edinburgh, 8vo, 1837; 'History of Ireland and the Irish People, under the Government of England,' 8vo, 1844; 'Railway Property, its Condition and Prospects,' 8vo, 1849; 'Life of George Stephenson, Railway Engineer,' 8vo, London, 1857, Dutch translation by A. Winckler-Prins, Amsterdam, 1864; 'Story of the Life of George Stephenson' (an abridgment of the above), 8vo, London, 1859; Biographical Sketch prefixed to 'Poetical Works of George Massey,' 8vo, London, 1860; 'Self-Help, with Illustrations of Character and Conduct,' 8vo, London, 1859, French translation by Talandier, 1865, Russian translation, 1868; 'Lives of the Engineers, with an Account of their Principal Works, including also a History of Inland Communication in Britain,' 3 vols. 8vo, 1861—62; 'Workmen's Earnings, Strikes, and Savings' (reprinted from the 'Quarterly Review'), 8vo, 1861; 'Industrial Biography: Iron-workers and Tool-makers,' 8vo, 1863, translated partially into Italian, by G. Strafforello, 'Storia di Cinque Lavoranti e Inventori,' 8vo, Leghorn, 1868; 'The Huguenots: their Settlement and Industries in England and Ireland,' 8vo, London, 1867, American edition, with an Appendix relating to the Huguenots in America, by the Hon. G. P. Disoway, 8vo, New York, 1868; 'Lives of George Stephenson and of his son Robert Stephenson' (a revised and enlarged edition of vol. iii. of 'Lives of the Engineers'), 8vo, London, 1868; 'Lives of Boulton and Watt: principally from the original Soho MSS., comprising also a History of the Invention and Introduction of the Steam Engine,' 8vo, 1865; 'Character,' 8vo, 1872.

SMIRKE, SIR ROBERT, R.A. [E. C. vol. v. col. 540.] Having for some time withdrawn from professional practice, Sir Robert Smirke in 1859 resigned his position as R.A., retiring

into the ranks of the honorary academicians. He died at his residence, Cheltenham, on the 18th of April, 1867, aged 86, and was interred in Leckhampton churchyard.

SMITH, ALBERT [E. C. vol. v. col. 543]. This popular writer and diverting lecturer died, after a brief illness, on the 23rd of May, 1860, aged 44.

SMITH, ALEXANDER, a poet and essayist, was born on the 31st of December, 1829, at Kilmarnock, in Ayrshire, from which town, some few years after, he removed with his family successively to Paisley and Glasgow. Circumstances combined to determine him to the profession of his father, who was a designer of patterns; and it was whilst he was engaged in this occupation that much of his earlier verse was composed. For some time he contributed fugitive poetry to the 'Glasgow Citizen,' but at length sent in 1851 a selection of his poems to the Rev. George Gilfillan, of Dundee, who introduced his name and his efforts to the world of letters in the 'Critic' and the 'Eclectic Review.' The 'Life Drama' was published by instalments in 1852, and attracted attention as the occasion of a controversy, at one pole of which was admiration for its power, and at the other reprobation for its assumed plagiarism. Being reproduced with other pieces in a volume entitled 'Poems,' 12mo, London, 1853, of which ten thousand copies were sold in a few months, it was proved to be popular, if it had to be conceded that it was spasmodic. In 1854 Mr. Smith, who was then engaged in editing the 'Glasgow Sentinel,' a weekly literary serial, was appointed secretary to the University of Edinburgh; and, removing to the capital, made the acquaintance of Mr. Dobell, with whom he afterwards became the joint author of a volume entitled 'Sonnets on the War,' 12mo, London, 1855. In the spring of 1857, he married Miss Flora Macdonald, from Skye, eldest daughter of Mr. Macdonald of Ord, and nearly akin by blood to the historic heroine of that name. From this time his biography resolves itself pretty much into a record of literary intercourse and literary production, scarcely broken by the annual recurrence of the summer vacation which was generally spent in Skye, the scenery of which inspired him with the theme he has treated in 'A Summer in Skye,' 2 vols. 8vo, London and Edinburgh, 1865, &c., American edition, 12mo, Boston, 1865. In the summer of 1866, Mr. Smith felt the effects of overwork of the brain, and the August holiday which should have restored him was interrupted by the cares and distractions incidental to publication. He returned to Edinburgh but little benefited by his nominal vacation; and dating his formal illness from the 20th of November of the same year, he died on the 5th of January, 1867, and was buried in Warriston cemetery.

The works of Mr. Smith, besides those already mentioned comprise 'City Poems,' 8vo, Cambridge and London, 1857, American edition, 16mo, Boston, 1857—a volume which contained six pieces, and met with only a very modified success; 'Edwin of Deira,' 8vo, Cambridge and London, first two editions, 1861, American edition, 16mo, Boston, 1861, and also republished in 'Harper's [New York] Monthly,' October 1861, and which was on the whole well received, notwithstanding that, already more than half written before the issue of the 'Idylls of the King,' it had the misfortune to be published after them, and hence provoked the charge of imitation; 'Dreamthorp. A Book of Essays written in the Country,' 8vo, London and Edinburgh, 1863, &c., American edition, 16mo, Boston, first two editions, 1864, a work in which the friends of the author detected most of his idiosyncrasy; and 'Alfred Hagart's Household. A Tale,' 2 vols. 8vo, London and Edinburgh, 1866, &c., American edition, 12mo, Boston, 1865, which the author contributed to 'Good Words,' and which he regarded as a tentative of what he might accomplish in fiction. Mr. Smith contributed to various magazines and newspapers, making his first serious attempt in prose in an article entitled 'Scottish Ballad Poetry,' which appeared in the volume of 'Edinburgh Essays,' 1857. Some of his fugitive productions had a posthumous publication as 'Last Leaves. Sketches, and Criticisms by Alexander Smith.' Edited, with a Memoir, by Patrick Proctor Alexander, M.A., 8vo, Edinburgh, 1868, third edition, 1869. Amongst other works of a biographical nature may be mentioned, 'The Early Years of Alexander Smith, Poet and Essayist. A Study for Young Men. Chiefly Reminiscences of Ten Years' Companionship. By the Rev. T. Brisbane,' 12mo, London and Frome, 1869. Mr. Smith edited 'The Poetical Works of Robert Burns. With a Memoir,' &c., 2 vols. 8vo, London and Cambridge, 1865, forming part of the 'Golden Treasury Series,' and 'Poems, Songs, and Letters, being the complete Works of Robert Burns,' &c., 8vo, London, 1866, forming the 'Globe' edition; Bunyan's 'Divine Emblems, &c.,

With Preface,' &c., 12mo, 1864; and J. W. S. Hows's 'Golden Leaves from the American Poets. With an Introductory Essay,' &c., 8vo, London and Edinburgh, 1866.

SMITH, LIEUTENANT-COLONEL CHARLES HAMILTON [E. C. vol. v. col. 544], was born in West Flanders, December 26, 1776. He entered the British army in the Netherlands as a volunteer, and in 1797 joined a regiment which was going to the West Indies. He served there for twelve years, then returned to Europe, and accompanied the Walcheren expedition as deputy quartermaster-general. From 1813 to 1816 he was in active service in the Netherlands; next he went on a mission for the Foreign Office to the United States and Canada; and in 1820 he retired. He gave considerable attention to history, archaeology, and zoology. He wrote the article 'War' in the 'Encyclopædia Britannica'; drew most of the original figures in Sir S. Meyrick's 'Critical Inquiry into the History of Ancient Armour'; and he left many volumes of manuscript notes, most of which had not been published. He was a fellow of the Royal and Linnæan Societies, and the first president of the Devon and Cornwall Natural History Society. During his later years he lived at Plymouth, and there he died, September 21, 1859.

* **SMITH, FRANCIS PETTIT**, inventor, or one of the inventors, of the screw-propeller, was born at Hythe, in Kent, February 9th, 1808. As a boy he showed a fondness for amateur boat-building; nor did his later avocations as a grazing-farmer deter him from making experiments in that direction. About 1834 he constructed a model boat, in which an Archimedean screw was made to revolve by means of a spring; and he formed an opinion that, with the number and pitch of the threads determined by experiment, such a screw, if rotated by steam-power, would form a useful substitute for the paddle-wheels of a steam-boat. A banker aiding him with a little capital, and an engineer with a few practical hints, he spent two or three years in developing his idea, experimenting with larger boats and improved forms of screw. He tried his apparatus at Dover and Folkestone in 1837. In the following year he was enabled to bring the subject to the attention of the Government; and the Admiralty, as a means of testing the invention, ordered a steamer to be constructed, to bear the name of the 'Archimedes,' and to have a screw-propeller instead of paddle-wheels. There was another screw-propeller—Ericsson's—competing for favour about the same time; and Mr. Smith had many struggles in the endeavour to make profitable use of the patent he obtained for his invention. Screw-propellers began to be adopted for merchant steamers in 1840; in 1841 the Admiralty ordered the building of the first screw war-vessel, the 'Rattler'; and by the year 1845 the progress made had been so rapid that there were 23 such ships in the royal navy. In 1848 the Admiralty, and in the following year the merchant service, verified the usefulness of the "auxiliary" screw—a screw-propeller to render occasional aid in a ship mainly moved by sails. In 1848 the government screw-ships, building and built, were 45 in number; and the screw every year more and more superseded the paddle, as in the cases of the 'Duke of Wellington,' the 'Great Eastern,' and the 'Agamemnon.' In 1856, when Mr. Smith's patent expired, there were 78 screw war-steamers in the British navy, besides a much larger number of smaller vessels, and whole fleets of merchant steamers. His own profit derived from the invention was, from various causes, inadequate: to make up in some degree the deficiency, the Queen granted him a pension of £200 a year, while the chief marine engineers and shipbuilders subscribed for him £2000 and a service of plate. In 1860 Mr. Smith received the appointment of curator of the Patent Office Museum, South Kensington. The controversy respecting the screw-propeller forms almost a body of literature in itself; and it is only in practical works on the subject that the relative priority and merits of different inventions can be sufficiently discussed.

SMITH, GEORGE, a celebrated landscape painter, known as **SMITH OF CHICHESTER**, was born in 1714, and appears to have learned his art by close study of the scenery around the city where he passed his life. His pictures have no claim to a high place in English landscape art, though they sold for higher prices than those of his great contemporary, Wilson. They are mostly quiet country scenes, such as are common in the Sussex valleys, and bordering the South Downs. But several of them were admirably engraved by Woollet, and will thus be preserved, proofs of the prints being now often of more value than the pictures. George Smith died in 1766.—His elder brother, **WILLIAM SMITH**, born 1707, died 1764, was a portrait-painter, but occasionally painted fruit, flowers, and landscapes.—**JOHN SMITH**, a younger brother, born 1717, died 1764, painted land-

scapes in the manner of George, and with nearly equal skill. All the brothers resided at Chichester. John and George Smith etched a set of 53 landscapes from their own designs, and some after Rembrandt. A series of 'Select Views in England and Wales,' by the Smiths, was engraved by Vivares and others. William Pether engraved the likenesses of the three brothers in one print.

* **SMITH, GOLDWIN**, a writer on historical, academical, and political subjects, the son of a physician at Reading, was born in that town in the year 1823; and, having received his earlier education at Eton, was entered at Christ Church, Oxford, from which he migrated shortly afterwards, on his election to a demyship at Magdalen College in the same university. He obtained the Hertford scholarship, "for the promotion of the study of Latin," in 1842; carried off the prize for Latin verse, and Dean Ireland's scholarship, in 1845; and on the 10th of May in the last-named year took his B.A. degree, being first class in *literis humanioribus*, and proceeded M.A. in due course. In 1846 he was the winner of the Chancellor's prize for a Latin essay, and for an English essay in 1847; and, having become a fellow and tutor of University College, was elected several years afterwards to an honorary fellowship of Oriel. He was called to the bar by the Society of Lincoln's Inn, on the 11th of June, 1850, but did not seek to establish a practice; and he served respectively as assistant secretary and secretary to two successive university commissions. On the 9th of April, 1858, he was appointed regius professor of modern history, and published several of the lectures which he delivered in that capacity:—'An Inaugural Lecture,' &c., 8vo, Oxford and London, 1859, second edition, 1864; 'On the Foundation of the American Colonies,' &c., 8vo, 1861; 'On the Study of History. Two Lectures,' &c., 8vo, 1861; 'On some supposed Consequences of the Doctrine of Historical Progress,' &c., 8vo, 1861; which were all collected in a volume, entitled 'Lectures on Modern History delivered at Oxford, 1859—1861,' 8vo, first two editions, 1861, another edition, 12mo, New York, 1866. An ardent liberal, whether in social, political, or academical affairs, and an admiring apologist of the institutions of America, he paid a visit to the United States in 1864; where, his arrival having been anticipated by his reputation as an advocate of Northern interests in the war against the South, he was enthusiastically received. America "welcomed him," to use the words of the 'North American Review' for October, 1864, "not as a stranger, but as a son." During his stay on this occasion he received, on the 7th of September, the degree of LL.D. from Brown University, Providence, Rhode Island; and, amongst other public appearances, delivered a lecture on 'England and America,' 8vo, Boston (U.S.), 1865, the several publications of which are traced in the title of an English one, 'England and America. A Lecture delivered by Goldwin Smith, before the Boston Fraternity, during his recent Visit to the United States. Reprinted from the 'Atlantic Monthly' (December, 1864). With an Introduction addressed by the Author to the President of the Union and Emancipation Society, Manchester,' 8vo, Manchester, 1865; before which society Mr. Smith afterwards delivered an address on 'The Civil War in America,' 8vo, London and Manchester, 1866. Professor Goldwin Smith resigned his chair of modern history at Oxford, in July, 1866; and, having devoted some months to the delivery of lectures on political reform, accepted, in July, 1868, the professorship of English and general constitutional history in Cornell University, Ithaca, New York, where he delivered his inaugural lecture on the 17th of November following. Since his emigration to America, the event of his life most saliently interesting to the English people has been a passage at arms between him and Mr. Disraeli, who had offensively described him, although without naming him, in his novel of 'Lothair,' as "quite a young man of advanced opinions on all subjects, religious, social, and political; gifted with a great command of words, which took the form of endless exposition, varied by sarcasm and passages of ornate jargon—the last person one would have expected to recognise in an Oxford professor."

Besides producing the works already mentioned, Mr. Goldwin Smith has been a contributor to 'Anthologia Oxoniensis'; to the 'Oxford Essays' for 1856 and 1858; and to 'Essays on Reform,' 8vo, London, 1867, to which he supplied an article on 'The Experience of the American Commonwealth'; and he has also been an extensive writer in periodicals and journals, especially in 'Macmillan's Magazine' and the 'Daily News.' His substantive publications, some of which have had a previous circulation in a fugitive form, include 'The Empire. A Series of Letters published in the 'Daily News,' 1862—1863,' 8vo,

Oxford and London, 1863; and three 'Letters' on 'The Irish Question,' 8vo, London, 1868, originally addressed to the editor of the 'Daily News'; 'Irish History and Irish Character,' 8vo, Oxford and London, 1861, second edition, 1862, cheap edition, 1868; 'Rational Religion and the Rationalistic Objections of the Bampton Lectures [Mansel's] for 1858,' 8vo, Oxford, 1861; 'Does the Bible sanction American Slavery?' 8vo, Oxford and London, and 12mo, Cambridge (Massachusetts), 1863; 'A Plea for the Abolition of Tests in the University of Oxford,' 8vo, Oxford, first two editions, 1864; a collection of 'Speeches and Letters, from January, 1863, to January, 1865, on the Rebellion,' 2 vols. 8vo, New York, 1865; 'Three English Statesmen (Pym, Cromwell, and Pitt). A Course of Lectures on the Political History of England,' 8vo, London and Oxford, 1867, 8vo, New York, 1867, and 8vo, Cambridge and London, 1868; and a pamphlet on 'The Reorganisation of the University of Oxford,' 8vo, Oxford and London, 1868.

SMITH, LIEUT.-GENERAL SIR HENRY GEORGE WAKELYN, BART., G.C.B. [E. C. vol. v. col. 545.] Sir Harry Smith received the grand-cross of the Order of the Bath for his distinguished services, and was appointed to the command of the Western district, but did not advance to a higher grade in military rank. He died in 1860.

SMITH, JAMES, geologist and Biblical critic, was born at Glasgow, August 15, 1782, and was educated in that city. In 1806 he bought a yacht, and occupied much of his time in sailing along the west coast of Scotland, with a view to studying archaeology and natural history. It was during these voyages, which sometimes lasted for weeks at a time, that he discovered the vitrified fort on Burnt Island, in Bute-shire, and made those researches on the later geological events and form of the country, which have won for him the distinguished title of the father of post-pliocene geology. He wrote several papers on the subject, such as those relating to the evidence of recent change in the level of the land, on the arctic climate of the post-pliocene period, and on the scratched boulders of Scotland. These and other kindred papers have been collected in his 'Researches in Newer Pliocene Geology,' 8vo, Glasgow, 1862. He spent many years in the south of Europe, and was thus led to investigate the geology of Gibraltar, and to trace out the numerous fluctuations of level which that peninsula has undergone. He also studied the kindred phenomena manifested by the temple of Serapis and on the north coast of France. His most important literary work was, 'The Voyage and Shipwreck of St. Paul,' 8vo, London, 1842, third edition, 1866, for which he had special qualifications in his classical knowledge, in acquaintance with natural history, and the experience he acquired by yachting and travelling. He contributed greatly to the prosperity of the Andersonian Institution at Glasgow by his exertions as president from 1830 onwards, and by his founding and supporting the museum of natural history connected therewith. The fine collection of Scotch coins in that museum was presented by him. He died at his residence, Jordan Hill, near Glasgow, January 17, 1867.

SMITH, ADMIRAL SIR SIDNEY. [E. C. vol. vi. col. 1023].

SMITH, THOMAS, landscape-painter, usually called SMITH of DERBY, to distinguish him from his contemporary, Smith of Chichester, was, in the words of Edwards ('Anecdotes of Painting,' p. 30), "one of the first artists who explored and displayed the beautiful scenes of his native country." He was born early in the 18th century; was a contributor to the first exhibitions of the Royal Academy, and painted many views in the Peak of Derbyshire, a series of forty of which were engraved by Vivares, and published by Boydell in 1760. Engravings from his pictures were also executed by Elliot, Mason, and others. Smith died at Bristol Hot Wells, in 1769. J. Raphael Smith, the celebrated mezzotint engraver, was his son and pupil. [SMITH, JOHN RAPHAEL, E. C. vol. v. col. 549.]

SMITH, THOMAS SOUTHWOOD, M.D. [E. C. vol. v. col. 559.] This distinguished physician and earnest advocate and promoter of measures for the improvement of the public health, died December 10, 1861.

SMITHSON, JAMES LEWIS, was a natural son of Hugh, third duke of Northumberland. At first he assumed the name of MACIE, but afterwards exchanged it for his father's family name, Smithson. He was educated at Oxford, and whilst there became known as a skilful chemist. After leaving the University he associated with the most eminent scientific men of the day, such as Wollaston, Banks, and others. In 1790 he became a Fellow of the Royal Society, and contributed several papers on chemical analysis to the 'Philosophical Transactions.' He also

contributed papers to the 'Annals of Philosophy.' He was considered to be one of the most skilful chemists of the time in analysing small quantities; and as an illustration of his dexterity, he once analysed the half of a tear-drop from a lady's cheek, and detected four or five different substances held in solution by it. He is, however, best known as the founder of the Smithsonian Institution, Washington, U.S., for the establishment of which he left all his property, valued at nearly 130,000*l.* He died at Genoa, on the 27th of June, 1829.

* SMYTH, CHARLES PIAZZI [E. C. vol. vi. col. 1026]. Of late years Mr. Smyth has devoted much time to the study of the metrical and astronomical value of the Egyptian pyramids: the results of his investigations are set forth in 'Life and Work at the Great Pyramids during the Months of February, March, and April, A.D. 1865, with a Discussion of the Facts ascertained,' 3 vols. 8vo. Edinburgh and London, 1867.

SMYTH, REAR-ADMIRAL WILLIAM HENRY [E. C. vol. vi. col. 1024], died September 9, 1865.

SOUTH, SIR JAMES, F.R.S., &c. [E. C. vol. v. col. 607], died at his residence, Campden Hill, Kensington, on the 19th of October, 1867, aged 82.

SOWERBY, JAMES DE CARLE [E. C. vol. vi. col. 1026], botanist and draughtsman, died August 26, 1871.

SPAGNA I.O. GIOVANNI DI PIETRO, called Lo SPAGNO and Lo SPAGNOLO, was, next to Raffaele, the ablest of the scholars of Pietro Perugino, retaining, according to Vasari, more of the master's colour, whilst he excelled in purity of design and beauty of form. Later, however, carried away, like many of his contemporaries, by the brilliancy and success of Raffaele, he became an imitator of that great painter, to the entire loss of the freshness and severe simplicity of his own manner. All that is known of his life is that he was working as a painter in 1503; that he married and was admitted a citizen of Spoleto in 1516, and was alive in 1530. His most celebrated picture is a representation of the 'Madonna enthroned,' in the chapel of San Stefano, in the church of San Francesco at Assisi, painted in 1516. A series of frescoes of 'The Brotherhood of San Francesco,' in the choir of the church Degli Angeli, and the 'Acts of St. James,' in the church of San Jacopo, near Spoleto, are also greatly admired. His works are rare in galleries: the National Gallery possesses a fine example, 'The Glorification of the Virgin,' No. 282, and a small 'Ecce Homo,' No. 691. A 'Virgin and Infant Christ with St. John,' in the same collection (No. 181), and there ascribed to Perugino, is said by Sir Charles Eastlake (note to Kugler's 'Handbook of Painting: the Italian Schools,' part i., p. 260) to be "more probably the work of this painter;" but it is certainly in the manner of Perugino, has Petrus Peruginus inscribed in gold on the hem of the Virgin's mantle, and there can be little doubt is rightly ascribed to him.

SPARKS, JARED. [E. C. vol. v. col. 625.] This distinguished American historian retained a nominal connection with Harvard University till his death, though, owing to the infirmities of age, he was not of late able to participate actively in its management. He died on the 15th of March, 1866, in the 77th year of his age, he having been born on the 10th of May, 1789.

SPEKE, JOHN HANNING, traveller in Africa, was born at Orleigh Court, near Bideford, Devonshire, May 4, 1827, and educated at the grammar school at Barnstaple. In 1844 being then only seventeen years of age, he obtained a commission in the 46th Regiment of Bengal Native Infantry. He took an active share in the war of the Punjab, and, during leaves of absence, employed himself in investigating the geography and zoology of India. Wherever he went—and he traversed several tracts previously unvisited by Europeans—he made rough sketch-maps, so that his mere sporting adventures contributed to a knowledge of the country. He then made one of the finest collections of the fauna of northern India brought together by one individual. The museums of India and England were greatly enriched by his contributions. In 1854 he commenced his explorations in eastern Africa. He joined Captain Burton in an expedition to the Somalis. In 1856 he again joined Captain Burton in a more extensive enterprise, the object of which was to ascertain the position of the great lakes of the interior, of which confused accounts had been received from the Arabs; the relation which they have to the Nile basin, and the nature of the surrounding country. The expedition started from Zanzibar, in June, 1857, and details respecting it are given under NILE, E. C. S., GEOG. DIV. In February, 1858, Lake Tanganyika was discovered, and was partially explored in the following month. In July, Captain Speke traversed the route running north from Kazeh, and in August

discovered the south end of the Victoria Nyanza lake. Zanzibar was reached on the return, in March, 1859. For his discovery of the Victoria Nyanza lake, the Royal Geographical Society awarded him their gold medal in 1860. He considered that this great lake was the source of the Nile, in which opinion he differed from Captain Burton and other geographers. In order to settle the question, another expedition was organised under Captain Speke's leadership. He had Captain Grant for an associate. The start from Zanzibar was made on August 17, 1860, and the former route was followed as far as Kazeh. Then the expedition traversed the country to the west of the Victoria Nyanza, and nothing was seen of the lake until nearly 2° to the north of the spot which Captain Speke first visited in 1858. At two other places lake waters were seen, which were assumed to be the northern portion of one and the same lake. It was not proved that only one lake was seen; and the testimony of the natives and Arabs indicate that the supposed site of the Victoria Nyanza is really a lake district, containing many lakes. From the north end of this lake, or lake district, a river flowing north, and out of the lake, was discovered, which he claimed to be the White Nile. This river was followed for a short distance, then left, and struck again about a degree farther north. The river was then followed to the Karuma Falls, after which the party went overland, and did not reach the Nile before arriving at Gondokoro. Sir S. W. Baker immediately after followed the Nile up into the Albert Nyanza Lake, and traced its connection with the river seen by Captains Speke and Grant at Karuma Falls. But it remains doubtful whether the river seen to flow from the Victoria Nyanza is the head of the Nile, owing, in part, to its whole course not having been followed, and in part to uncertainties as to the extent and relative levels of the large lakes. Captain Speke was to have discussed the subject at a meeting of the British Association at Bath, but was prevented in consequence of his sudden death from an accidental shot, on September 15, 1864. A monument has been erected to his memory in Kensington Gardens. His discoveries and adventures were described by him in a 'Journal of the Discovery of the Source of the Nile,' 8vo, Edinburgh and London, 1863; and in 'What Led to the Discovery of the Source of the Nile,' 8vo, Edinburgh, 1864.

SPENCE, WILLIAM [E. C. vol. v. col. 630], entomologist, died January 6, 1860.

* SPENCER, HERBERT, biologist and sociologist, was born at Derby, in 1820, and received his education from his father, who was a teacher in that town. At the age of 17 he was placed with a civil engineer, but he afterwards abandoned this profession for literature. He contributed articles to the 'Civil Engineer's and Architect's Journal' and to the 'Nonconformist'; but his first work of importance was 'Social Statics,' 8vo, London, 1851, in which he analysed the principles regulating societies. This was followed in 1855 by 'The Principles of Psychology,' 8vo, London, which passed through a second edition in 1870. He has also contributed numerous articles to the scientific and ordinary periodical publications, in which he has applied the idea of evolution to various subjects. Some of these have been republished in a collected form as 'Essays; Scientific, Political, and Speculative,' 2 vols. 8vo, London, 1858—1863. His most important publication is a work on biology, which has appeared in sections. It is entitled 'First Principles,' 8vo, London, 1862, second edition, 1867; 'The Principles of Biology,' 8vo, London, 1864, &c. 'The Principles of Psychology' will form part of this work, which is not completed. He is one of the foremost thinkers of his time on biological subjects, and more particularly the doctrine of evolution.

SPINDLER, KARL [E. C. vol. v. col. 637.] This prolific German novelist died at Baden Baden, where he had resided since 1832, on the 12th of July, 1855. He was born at Breslau on the 16th of October, 1792. His complete works, 'Sämmtliche Werke,' Stuttgart, 1831—54, are in 102 volumes.

SPINELLO DI LUCA SPINELLI, commonly called Spinello Aretino. [ARETINO, SPINELLO, E. C. vol. i. col. 302.] There is now in the National Gallery a large painting, in three compartments, by this artist, (No. 581) 'St. John the Baptist with St. John the Evangelist and St. James the Greater.' It was formerly in the Hospital Church of SS. Giovanni e Niccolo, near Florence, and was purchased from the Lombardi-Baldi Collection in 1857.

SPOHR, LUDWIG. [E. C. vol. v. col. 645.] During his last years the great musician had to endure many mortifications, on account of the free expression of his liberal political opinions; but he retained his post as capellmeister to the Duke of Hesse Cassel till 1857, when he retired upon a pension. Though

broken down in health and spirits, he was induced to take part in a grand festival of the Conservatorium at Prague, in July, 1858, where he conducted his Jessoada, and also at a concert given in his honour at Meiningen in April, 1859, at which only his music was played. In the previous January he had broken his arm by a fall on the ice, and he died at Cassel on the 22nd of October, 1859. He was born at Brunswick on the 5th of April, 1784.

SPRENGER, ALOYS, M.D., a learned German orientalist, was born September 3rd, 1813, at Nasseureut, in the Tyrol. He received his early education in the Innsbruck Gymnasium, and thence, 1832, passed to the University of Nasseureut, where he studied medicine (in which he took his doctorate), science, but especially the oriental languages. In 1836 he came to London to assist the Earl of Munster in the preparation of his work on the military art of the Mohammedans, and, on the earl's death in 1842, obtained employment in the East India Company's civil service. He had already displayed his scholarship by an essay 'De Originibus Medicinæ Arabicæ sub Khalifatu,' 8vo, 1840, and the translation from the Arabic of El Masudi's historical encyclopædia, entitled 'Meadows of Gold and Mines of Gems,' of which the first volume was printed by the Oriental Translation Fund in 1841. He served at first in 1843 as a physician in Calcutta, but was shortly after engaged in improving the systems of education adopted in the native schools, and in 1845 went to Delhi as director of the College. He remodelled the course of studies, established a lithographic press, at which he printed 'Selections from Arabic Authors,' 1845; Othby's 'History of Mahmud of Ghazna,' 1847; and a journal for the natives, 'Kiran Alsadain,' on the model of the 'Penny Magazine.' In 1848 he went to Lucknow, with the rank of assistant-resident, and made a catalogue of the library of the king of Delhi, of which the first volume was printed at Calcutta, in 1854. In 1850, Dr. Sprenger was appointed examiner at the College of Fort William, director of the Mohammedan College at Calcutta, and secretary of the Asiatic Society at Bengal. He had travelled through a considerable portion of India, over the Himalayas and into Tibet, and in 1854 he visited Ceylon, Syria, Egypt, and Turkey. In 1856 he quitted India with a pension; and after a tour in Europe accepted the office of professor of the oriental languages at Bonn. Besides the works already mentioned, Dr. Sprenger has published among others, Isaba's 'Arabic Bibliography,' edited in Arabic by Dr. A. Sprenger; 'Dictionary of the Technical Terms used in the Sciences of the Mussulmans,' edited in Arabic by Mawlawy Mohammad Wajih, Mawlawies Abd Al-Haqq and Gholam Kadir, and Dr. Sprenger; 'Risalah Shamsyiah, the Logic of the Arabians,' in Arabic and English; Ibn Hajar's 'Biographical Dictionary of Persons who knew Mohammad'; 'Tusy's List of Shy'ah Books and Alam Al-Hoda's Notes on Shy'ah Biography,' edited in Arabic by Dr. A. Sprenger and Mawlawy Abd Al-Haqq; 'Sayuti's Itqan on the exegetic Sciences of the Quran in Arabic'; 'Khirad-Namahe Iskandary (the Sikandar-Namahe Bahry) by Netzamy'; 'Abdu-R-Razzag's Dictionary of the Technical Terms of the Sufies.' But his most important original work is his 'Life of Mohammad,' 8vo, Allahabad, 1851, which in its revised and expanded form 'Das Leben und die Lehre des Mohammad,' 3 vols. 8vo, Berlin, 1861, &c., though still unfinished, is by far the most complete and comprehensive life of Mohammad that has yet been written.

* SPURGEON, CHARLES HADDON, one of the most remarkable preachers of the day—son of Mr. John Spurgeon, who, occupied as a layman during the week, was the pastor of a small Independent congregation at Tollesbury, Essex, and grandson of the Rev. James Spurgeon, an Independent minister at Stambourne, near Halstead, who died on the 12th of February, 1864, at the age of 87—was born at Kelvedon, in Essex, on the 19th of June, 1834. After spending most of his childhood at his grandfather's house, he returned to the care of his father, then resident at Colchester, at a school in which town he was educated for several years. About the age of 15 he was sent to an agricultural college at Maidstone; and in 1849 was engaged as usher in a school at Newmarket, where he devoted his leisure to the study of Greek and French. His life at Newmarket was characterised by considerable mental and spiritual disquiet; and as he was led to the adoption of Baptist principles, he was baptised on the 3rd of May, 1850, at Isleham. He now became an active tract-distributor and Sunday-school teacher, and a zealous advocate of Christian missions; and having spent a year at Newmarket, left that town for Cambridge, where, still following his avocation as a school-teacher, he connected himself with the congregation formerly under the pastoral care of the Rev. Robert

Hall, and joined the Lay Preachers' Association, one of the benevolent agencies of that society. He preached his first sermon in a cottage in the village of Teversham, about four miles from Cambridge, after which he laid himself out to preach every evening at one or other of the thirteen village stations within the sphere of the association, officiating sometimes in a cottage, sometimes in a chapel, and sometimes in the open air. His popularity was almost immediately established; and crowds flocked to the ministrations of the "boy-preacher." He was soon invited to become the pastor of a congregation at Water-beach, where what was formerly a barn had been improved into a chapel; and at the age of eighteen he undertook this charge, his flock being so small and so poor that he was still obliged to continue his duties of usher at Cambridge. Here he laboured for upwards of two years, in the course of which he doubled the number of church members, and effected a reformation throughout the entire parish, a straggling agricultural community of about 1300 souls. In the autumn of 1853, being then a little more than 19 years of age, he accepted an invitation to London for the purpose of preaching before the congregation of New Park Street Chapel, the affairs of which from having been at one time flourishing, had reached almost the extreme of disaster. In January, 1854, he entered upon the pastorate of this church, and the result of his preaching was soon apparent in constantly overflowing congregations; for the better accommodation of which the services were removed first to Exeter Hall, where he preached for the first time on Sunday morning, February 11th, 1855, and afterwards, when it was found that New Park Street Chapel, which had been enlarged, was still insufficient, to the Surrey Music Hall, where, on the 19th of October, 1856, a deplorable accident, consequent upon a false alarm of fire, resulted in the death of seven persons, and in serious injuries to several others. On Wednesday, October 7th, 1857, Mr. Spurgeon addressed the largest audience of modern times at the Crystal Palace, where he preached a sermon on the occasion of the national fast, directed to be held on account of the Indian mutiny, to a congregation of nearly 24,000 persons. The foundation-stone of his new Tabernacle, known as the Metropolitan Tabernacle, was laid at Newington Butts, on the 16th of August, 1859; and after the opening of this immense building in 1861, it became the centre of all the pastoral and congregational activity which radiated from it in various forms and directions in town and country. The evangelistic and philanthropic agencies connected with it include a Pastors' College—first instituted at Camberwell, in 1856—where a large number of students are trained under Mr. Spurgeon's superintendence, as president, for the Christian ministry; the Stockwell Orphanage, for Fatherless Boys, Clapham Road, of which Mr. Spurgeon is president, and the foundation-stone of which he laid in September, 1867; the Golden Lane Mission; and the Colportage Association. It was to serve, *inter alia*, as a monthly report of the "efforts of those churches and associations which are more or less intimately connected with the Lord's work at the Metropolitan Tabernacle," that Mr. Spurgeon began, on the 1st of January, 1865, to edit a magazine, entitled 'The Sword and the Trowel: a Record of Combat with Sin and Labour for the Lord,' which he still continues to conduct. He is said for many years to have delivered on the average one sermon a day, and he has carried his ministrations to many towns and districts of England and Scotland, as well as to some parts of the Continent, to which he has paid more than one visit, the last of which, made to Italy, and especially to Rome, took place in December, 1871. He has delivered many lectures on various subjects, as well as addresses to the Young Men's Christian Association. His claims to the honours of authorship rest mainly upon his 'Sermons,' the regular weekly publication of which, under the title of the 'New Park Street Pulpit,' was commenced in the autumn of 1854; and the 'Sermons,' thus issued in detail, have been collected into yearly volumes, the issue of which commenced in 1856, and still continues. They have been republished in America, where their aggregate sale has reached to about 400,000 volumes; and several groups of them have been translated into German, as 'Predigten,' 3 vols. 8vo, Hamburg, 1860–64, and 'Ausgewählte Predigten,' 2 vols. 8vo, Basel, 1862–63, and into French, as 'Choix de Sermons,' 2 vols. 12mo, Paris, 1860, and several single sermons have been translated into French, German, and other languages. Selections of another kind have been made from his writings, with the titles of 'Gems from Spurgeon: or, Extracts from the Note-Book of a non-professional Reporter,' 16mo, London, 1857; and 'Spurgeon's Gems: being brilliant Passages from the Discourses,' &c., 8vo,

1859, American edition, 12mo, New York, 1858. Mr. Spurgeon has likewise written or edited two devotional works, entitled 'Morning by Morning: or, Daily Readings,' 8vo, London, 1866, &c., American editions, 12mo, New York, 1867, &c.; and 'Evening by Evening: or, Readings at Eventide,' 8vo, London, 1868, &c., and 12mo, New York, 1869, both of which have been immensely popular in England and America; 'Feathers for Arrows: or, Illustrations for Preachers and Teachers. From my Note-Book,' 8vo, 1870; and 'John Ploughman's Talk: or, Plain Advice for Plain People,' 8vo, London, 1868, &c. and 16mo, New York, 1869, &c. The real and reputed peculiarities which marked especially the early period of Mr. Spurgeon's London experience, and the great influence which he has won and exercised by his zeal and eloquence, have attracted much criticism, both of a friendly and a hostile kind; and the biographical and other literature conversant about his career may be here represented by a 'Sketch of the Life and Ministry, &c., from original Documents,' 12mo, London, 1857, and New York, 1857; 'Life,' &c. London, 1857; 'Mr. Spurgeon's Critics Criticised. By a Churchman,' 8vo, London, 1857; and 'Anecdotes and Stories of the Rev. C. H. Spurgeon. Collected by O. Creyton,' 12mo, 1866.

* SQUIER, EPHRAIM GEORGE, an American archaeologist and geographer, was born at Bethlehem, State of New York, June 17th, 1821. After a few years of school-teaching and engineering, he removed to Albany in 1840, and began to write for the press as editor of the 'Mechanic.' In 1843 he edited the 'Hartford Journal,' and in the following year the 'Scioto Gazette' at Chillicothe, Ohio. Soon afterwards he commenced exploratory journeys into various parts of America, to investigate such ancient monuments as still remained. Some of these researches in Central America were greatly facilitated by the position which he held in 1849 and 1850 as *chargé d'affaires* to Guatemala and the neighbouring States. The years 1851 to 1853 he spent mostly in Europe, where he was elected member of several learned societies in England, France, and Denmark, and received the gold medal of the Geographical Society of France. Returning to America, he conceived the idea of a railway across Central America from the Atlantic to the Pacific, surveyed the route, obtained a concession from the Honduras government, and formed a company among the capitalists of New York. He next made a second visit to Europe, obtained support from English and French capitalists, and guarantees of neutrality from the governments of the two countries. He was instrumental also in drawing up a treaty between Great Britain and Honduras, which paved the way for the settlement of some disputed points. Notwithstanding all his exertions, however, his great scheme fell to nothing; Central America is still without its railway or canal. The chief works published by Mr. Squier are the following:—'Notes and Illustrations' to G. T. Lay's 'The Chinese as they Are,' edit. of 1843; 'Observations on the Mounds of the West, with an Attempt at their Classification,' Newhaven, 1847; 'Ancient Monuments of the Mississippi Valley, comprising the Results of extensive original Surveys and Expeditions,' by E. G. Squier and E. H. Davis, a work of great labour and value, forming volume i. of the 'Smithsonian Contributions to Knowledge,' published by the Smithsonian Institution, 4to, Washington, 1848; 'Aboriginal Monuments of the State of New York,' forming volume ii. of the same collection, 1848, new edition, with "Supplement on the Antiquities of the West," 12mo, Buffalo, 1853; 'The Serpent Symbol and the Worship of the reciprocal Symbols of Nature in America,' New York, 1851, Spanish translation by Don José de Garcia, Havana, 1855; 'Nicaragua: its People, Scenery, Monuments, and the proposed Inter-oceanic Canal,' 2 vols. 8vo, 1852, German translation by E. Höpfer, Leipzig, 1854; 'Honduras Inter-oceanic Railway,' New York, 1854, French translation, Paris, 1855; 'Notes on Central America, particularly the States of Honduras and San Salvador,' New York, 1855, Spanish translation by Don Leon Alvarado, Paris, 1856, German translation by Karl Andree, Leipzig, 1856; 'The States of Central America: their Geography, Topography, Climate, &c.' 8vo, New York, 1858 (a much enlarged edition of the 'Notes'); 'Collection of rare and original Documents and Relations concerning the Conquest of America, chiefly from the Spanish Archives: published in the original, with Translations, illustrative Notes, Maps, and Biographical Sketches,' 4to, New York, 1860, &c.; 'Is Cotton King?' (reprinted from the 'Providence Journal'), New York, 1861; 'Monograph of Authors who have written on the Languages of Central America, and collected Vocabularies or written Works on the Native Dialects of that Country,' 4to,

New York, 1861; 'Tropical Fibres, their Production and Economic Extraction,' 8vo, 1863.

STANDISH, MILES, popularly known through Longfellow's poem as the "Puritan Captain," a member of the family of the Standishes of Duxbury, near Chorley, Lancashire, whose ancestor, Hugh Standish, was a cadet of the ancient house of Standish of Standish, in the same county, was born in Lancashire about the year 1584. Notwithstanding that he is set down in the genealogical records as a younger son, he is described by Longfellow as having been the "heir unto vast estates, of which he was basely defrauded." After serving in the Protestant interests against the Spaniards in the Low Countries, he joined the first emigration of the Pilgrim Fathers, and landed from the 'Mayflower' at Plymouth, in New England, on the 11th of November, 1620. He was a man of short stature, but strongly built, and athletic, "broad in the shoulders, deep-chested, with muscles and sinews of iron;" and being of great courage, energy, and determination, and having the reputation of being the bravest soldier and the best linguist of the colony, became the leader or captain of a band of sixteen men who were fitted out for the purpose of exploration, before a decision should be come to as to the site of a settlement. The tract of country traversed by the pioneers is embraced within the present limits of Provincetown and Truro; and their excursion, although not a long one, was yet one of tediousness, danger, and difficulty. Every man carried "his musket, sword, and corslet;" and at times their march, according to Bradford, one of their number, who was afterwards their historian, lay through coppices so dense, tangled, and all but impassable, that they "tore our very armour in pieces." The advance terminated at a spot known to the present inhabitants of the district as Hopkins' Cliff, near the mouth of the Little Pamet river at Truro Centre, from which point may be seen Pamet Harbour, into which the "Great Pamet discharges its waters." The expedition was successful; and Captain Standish, through a series of subsequent years, rendered important services to his fellow-colonists, whose interests he protected against the savages who annoyed or threatened the settlement, and who, from the courage and skill of his attacks upon them, conceived a great admiration and awe for his military prowess. In 1625 he paid a visit to England as an agent for the colony; and after his return settled at Duxbury, which he had named in memory of the seat of his family in Lancashire, and where, for the remainder of his life, he held a magisterial office. He died at Duxbury, on the 3rd of October, 1656. A romantic episode of his life has inspired the poem of Longfellow, entitled 'The Courtship of Miles Standish;' and the Rev. B. F. De Costa, of the Protestant Episcopal Church, diocese of Massachusetts, has more recently illustrated his career, and especially his primary exploring expedition, in a small work which bears the title of 'Footprints of Miles Standish,' 8vo, Charlestown (Mass.), 1864, which, originally a contribution to the 'Church Monthly,' was reprinted for private circulation.

STANFIELD, CLARKSON, R.A. [E. C. vol. v. col. 662.] Mr. Stanfield continued to paint as long as he could control his pencil, but, after the date of the memoir above cited, he produced no pictures of importance. His powers gradually yielded before the advances of age, and, after a lingering illness, he died at his residence, Hampstead, May 18, 1867, aged 73, and was interred in the Roman Catholic Cemetery, Kensal Green.

* STANLEY, VERY REVEREND ARTHUR PENRHYN, D.D., Dean of Westminster. [E. C. vol. v. col. 671.] The more recent career of Dr. Stanley has been characterised by the same unintermitting literary and professional activity, and by the same bold and decided liberality in theology, politics, and academical and ecclesiastical affairs, which had been already indicated at the period of our earlier notice, and by a succession of honourable appointments and preferments. The three inaugural lectures of his professorial course were delivered in the Lent term of 1857; and they were respectively conversant about the province, the study, and the advantages of ecclesiastical history. They were published with the title of 'Three Introductory Lectures on the Study of Ecclesiastical History; the commencement of which he traced to the call of Abraham. His professorial teaching is embodied in various works, which may be thus enumerated:—'Lectures on the History of the Eastern Church,' 8vo, London, 1861, fourth edition, 1869, American issue, 8vo, New York, 1862, &c., new edition, 1870, a Review of which, reprinted from the 'Record,' was published with the title of 'Anglican Neology,' &c. 16mo, London, 1862; 'Lectures on the History of the Jewish Church,' Part I., 'Abraham to Samuel,' 8vo, London, 1862, fourth edition, 1866, and 8vo, New York,

1863, new edition, 1870: Part II., 'Samuel to the Captivity,' 8vo, London, 1865, &c., and 8vo, New York, 1866, new edition, 1870; Contributions to Dr. William Smith's 'Dictionary of the Bible,' of which the article 'David' is the most complete and remarkable; to which may be added the 'Lectures on Solomon,' delivered on two evenings before the Edinburgh Philosophical Institution. In January, 1872, he addressed the members of the same society in a series of Lectures on the History of the Church of Scotland. Canon Stanley took the degrees of B.D. and D.D. in 1858, in which year, March 13th, he became a canon of Christ Church; and in the early part of 1862 accompanied the Prince of Wales on his Eastern tour, one of the memorials of which is a volume of 'Sermons preached before H.R.H. the Prince of Wales during his Tour in the East in the Spring of 1862: with Notices of some of the Localities visited,' 8vo, London, first two editions, 1863, &c., and 12mo, New York, 1863. On the 28th of March, 1862, he became honorary chaplain to the Queen, to whom he was appointed one of the deputy clerks of the closet, on the 23rd of January, 1863; and on the 16th of February following he was appointed one of four honorary chaplains to the Prince of Wales. Later in the same year he was promoted to be dean of Westminster; and on the 22nd of December, the same day on which his appointment was gazetted to the deanery, married Lady Augusta Bruce, daughter of the late Earl of Elgin, and an extra woman of the bedchamber to her Majesty. On Advent Sunday, 1863, Canon Stanley, on the eve of laying down that title, preached his farewell sermon, 'Great Opportunities,' 8vo, Oxford and London, 1863, in Christ Church Cathedral; and on the 10th of January, 1864, being the day following his installation, preached in Westminster Abbey a sermon afterwards published with the title of 'A reasonable, holy, and living Sacrifice,' 12mo, Oxford and London, 1864, many parts of which are constructed with a careful and generous reference to Canon Wordsworth, at present (March, 1872) bishop of Lincoln, who had felt it his duty to make a determined protest against Dr. Stanley's appointment. In his position as dean of Westminster, Dr. Stanley has kept up those extraordinary services which were initiated by his predecessor, the present archbishop of Dublin, and has always been ready to give his pulpit and his powers to the advocacy of every philanthropic and Christian institution; and as custodian of the Abbey, the "very heart of England's heart," he has made its treasures and monuments more readily accessible, whilst he has added to their popular intelligibility by acting as *cicerone* to proletarian visitors. The literary evidences of his enthusiastic interest in the "collegiate church of St. Peter" are contained in a discourse, entitled 'Dedication of Westminster Abbey. A Sermon preached December 28th, 1865, being the 800th Anniversary of the Foundation of the Abbey,' &c., 8vo, Oxford and London, 1866; and a volume devoted to the exposition of the 'Historical Monuments of Westminster Abbey,' 8vo, London, 1868, third edition, revised and illustrated, 1869. He has been a prominent and effective advocate of the purposes of the Palestine Exploration Fund, and a contributor to the 'Transactions' of the Archaeological Institute, as well as to the 'Classical Museum,' the 'Edinburgh' and 'Quarterly' Reviews, the 'Contemporary Review,' 'Good Words,' and 'Fraser's' and 'Macmillan's' Magazines. As intolerant only of intolerance, he has been the apologist, in Convocation and elsewhere, of the authors of 'Essays and Reviews,' and especially of his friend Dr. Temple, now bishop of Exeter; and has endeavoured to mitigate the violence of the attacks directed against Bishop Colenso. Dr. Stanley has been not unfittingly described as "the modern apostle of the doctrines of toleration."

A few of Dr. Stanley's more remarkable works and discourses remain to be mentioned. They include 'The Epistles of St. Paul to the Corinthians. With critical Notes and Dissertations,' 8vo, London, 1858, third edition, 1865; a 'Preface' to Miss Winkworth's translation of Baron Bunsen's 'God in History,' 3 vols. 8vo, London, 1868; 'The Unity of Evangelical and Apostolical Teaching. Sermons preached mostly at Canterbury Cathedral,' 8vo, London, 1859; 'Freedom and Labour. Two Sermons,' &c., 8vo, Oxford and London, 1860; 'The Grieving of the Spirit. A Sermon,' 8vo, Oxford and London, 1863, forming No. 5 of the 'Oxford Lenten Sermons;' 'The Bible: its Form and its Substance. Three Sermons,' 8vo, Oxford and London, 1863; 'Letter to the Lord Bishop of London on Subscription,' 8vo, Oxford and London, 1863; 'The Encouragement of Ordination. A Sermon,' 8vo, Oxford and London, 1864; 'The Creation of Man. A Sermon preached in Behalf of the Royal Society for the Prevention of Cruelty to Animals,' &c., 8vo, Oxford and London, 1865; 'The Crusade of Charity. A

Sermon,' 8vo, Oxford and London, 1866; 'The Coronation of William the Conqueror and its Consequences. A Sermon preached in Westminster Abbey on Christmas Day, 1866,' 8vo, Oxford and London, 1867; 'Scripture Portraits, and other Miscellanies. Collected from the published Works of Dean Stanley,' &c., 8vo, London, 1867, second edition, 1869; 'The Three Irish Churches. An historical Address delivered at Sion College, on January 28th, 1869,' 8vo, London, 1869; 'An Address on the Connection of Church and State, delivered at Sion College on February 15th, 1868,' 8vo, London, first two editions, 1868; 'Sermon [on Luke xv. 3, xvi. 19—21] preached in Westminster Abbey on the Sunday following the Funeral of Charles Dickens,' 8vo, London, 1870; and 'Essays on Questions of Church and State, from 1850 to 1870,' 8vo, London, 1870.

* STANTON, EDWIN, American statesman, was born at Steubenville, Ohio, in 1815. His father, a physician, gave him a good education, and then placed him under a barrister who was also a member of the Senate, and who took him into partnership. While practising at the bar, he published two volumes of 'Condensed Reports of Decisions in the Supreme Court of Ohio,' 1842. In and after 1847, at Pittsburg, he was engaged in many important cases, some of which brought him under the notice of Abraham Lincoln. In 1857 he was entrusted by President Buchanan with the management of an important Mexican case, which he conducted skilfully; and in the following year removed to Washington. He steadily held aloof from politics until the commencement of the troubles at the close of 1860, when, at the solicitation of Buchanan, he accepted the office of Attorney-General. During 1861 his advice, when solicited, was always in favour of a vigorous prosecution of the war against the Confederates. In January, 1862, when Mr. Cameron resigned the post of Secretary of State for War, President Lincoln offered it to Mr. Stanton; the offer was accepted. Much of the success with which vast armies were raised, equipped, and brought into the field during the subsequent three years was due to the skill and indomitable energy of the War Minister. The responsibilities and labours connected with the raising of three successive armies of 300,000, 300,000, and 500,000 men, however, were very great. Mr. Stanton was frequently in collision with Federal generals and statesmen on matters of policy, and was not generally popular. He continued at the head of the war department after the assassination of President Lincoln, in 1865; but there were unseemly struggles between him and President Johnson, which continued till the latter was succeeded by General Grant in 1869. Many of Mr. Stanton's Official Reports are printed in the Washington Blue-books.

STAUNTON, SIR GEORGE THOMAS, BART., D.C.L., was the only son of Sir George Leonard Staunton, who accompanied Lord Macartney as secretary to the first embassy to China in 1792. He was born in May, 1781, and died August, 10, 1859. He succeeded his father to the baronetcy in 1801. He was educated under his father's eye, and studied languages, mathematics, and the natural sciences. He accompanied his father to China as page to the Ambassador, having prepared himself by studying Chinese at Naples, under two native Chinese missionaries from the Propaganda College. He excited great surprise in China by his skill in the language, and had the honour of conversing with the Emperor, who referred to him as "the little boy who could speak Chinese." On leaving China his father engaged a Chinese servant in order to keep up his knowledge of the language.

In 1799 he obtained the appointment of writer in the factory of the East India Company, and proceeded a second time to China. He remained at Canton (with occasional visits to Europe) until 1817, having become chief of the factory. He was the first among the members of the factory who had a command of the language, and he succeeded in getting rid of the native interpreters, who, from fear of the local authorities, were not to be trusted. He translated several Chinese works into English, one of which, the Chinese penal code, was published in 1810; others have since appeared. In 1816 Sir George was one of the commissioners in the second embassy, an account of which, in the form of a private journal, was printed for distribution among his friends. On his return to England, Sir George settled in Hampshire and represented South Hants, and afterwards Portsmouth, in Parliament. His habits were somewhat shy and retiring; his chief amusement was in his numerous hothouses and conservatories, filled with rare trees and plants. Although his health was delicate, he attained his 79th year.

* STEENSTRUP, JOHAN JAPETUS SMITH, Danish

naturalist, was born at Vang, March 8, 1813. From 1836 to 1841 he made a series of expeditions to various parts of North Europe for the purpose mainly of investigating the phenomena of marshes. His paper on the marshes of Denmark received a prize from the Danish Academy of Science; in 1845 he was appointed the professor of zoology at Copenhagen, and in 1848 one of the directors of the Royal Museum of Natural History. He has contributed numerous papers on zoology to scientific works, but is principally celebrated on account of his researches in the development of the lower animals, and as the discoverer of what is known as the alternation of generation. His chief works are 'Om Forplantning og Udvikling gjennem vexlende Generations rækker, etc.' 4to, Kjöbenhavn, 1842, of which an English translation by Professor G. Busk was published by the Ray Society; and 'Undersøgelser ver Hermaphroditismus tilværelse i Naturen,' 4to, Kjöbenhavn, 1845, German translation, Greifswald, 1846.

STEINBACH, ERWIN VON. [ERWIN VON STEINBACH, E. C. S. col. 505].

STEINLA, MORITZ, an eminent German line engraver, was born in 1791. The son of a clergyman at Steinla, named Müller, he assumed the name of his birthplace in order to distinguish himself from several other engravers of the name of Müller. He studied art in the Dresden Art Academy, and engraving of Böhn, and for a time was in business with a general engraver, named Bertuch. He then went to Italy, and at Milan worked under Longhi, and at Florence under Raphael Morghen. Here he distinguished himself by an engraving of the 'Cristo della Moneta' of Titian, and still more by the Pieta of Fra Bartolomeo in the Pitti palace. On his return to Dresden in 1831 he was appointed professor in the academy, and soon after engraved Raffaele's drawing of the 'Massacre of the Innocents.' His next, and most famous prints were Holbein's 'Madonna,' and the 'Madonna di San Sisto' of Raffaele, both in the Dresden Gallery. He also engraved Raffaele's portrait of Pope Julius II., and his 'Madonna del Pesce,' to study which he visited Madrid. Shortly after he had finished this plate his health gave way. He died September 21st, 1858. Steinla was one of the best engravers of our time. Always scrupulously faithful to his original, and true in expression, he displayed also great precision of drawing, firmness of line, and general mastery over his graver, with largeness and refinement of style.

STEPHEN, THE RIGHT HON. SIR JAMES, K.C.B., LL.D. [E. C. vol. v. col. 697.] Sir James Stephen died on the 14th of September, 1859, at Coblenz, where he had gone for the benefit of his health. He was born at Lambeth, Surrey, January 3rd, 1789. A memoir of Sir James Stephen, by his son, Fitz-james Stephen, barrister-at-law, was prefixed to a new edition of the 'Essays in Ecclesiastical Biography,' 8vo, 1860.

STEPHENSON, ROBERT. [E. C. vol. v. col. 710.] This celebrated engineer finished, in 1859, the Great Victoria Railway Bridge over the River St. Lawrence, near Montreal, which he had commenced five years before; but he did not live to witness the formal opening of the work in the early part of 1860. He applied a similar tubular principle to the construction of a railway bridge over the Nile at Damietta. As a proof that even the greatest engineers sometimes venture on rash predictions concerning schemes which they do not approve, it may be mentioned that in his last speech in the House of Commons, Mr. Stephenson spoke of the Suez Canal in the following terms:—"I have surveyed the line; I have travelled the whole distance on foot; and I declare there is no fall between the two seas. Honourable members talk about a canal! A canal is impossible; the thing would be only a ditch." Mr. Stephenson went in his steam yacht to Norway in the summer of 1859; he was ailing in health at the time, and came home with congestion of the liver, jaundice, and dropsy; he sank under these accumulated maladies, and died on the 12th of October. Like his father, Robert Stephenson was offered knighthood, and, like him, declined it. He was buried in Westminster Abbey, by the side of Telford. A bronze statue of him was placed, in 1871, in the new opening at Euston Square to the London and North-Western Railway Terminus. 'Stephenson Memorial Schools' have been erected on the site of the old cottage at Willington Quay. He was a fellow or member of many scientific societies, including the Royal Society and the Institution of Civil Engineers; the degree of D.C.L. was conferred upon him by the University of Oxford, and the Emperor of the French decorated him with the Legion of Honour. The life of Robert Stephenson has been published in various forms by Mr. Samuel Smiles. Also by Mr. J. C. Jeaffreson—'The

Life of Robert Stephenson ; with Descriptive Chapters on some of his most important Professional Works,' 8vo, London, 1864.

* STEVENS, ALFRED, celebrated Belgian painter, was born at Brussels in 1828, and studied under M. Navez at Brussels, and M. C. Roqueplan at Paris. He made a successful début in 1849, and has ever since been among the more conspicuous exhibitors in the salons of Paris and Brussels. He has been long settled in Paris, but his works are still eagerly sought after by his countrymen. His speciality is in depicting circumstances of social life in the higher circles, and he treats his subjects with much elegance and refinement, and with great technical knowledge and skill. 'Absence,' 'Consolation,' 'Meditation,' 'The Widow,' 'At Home,' 'Uncertainty,' 'A Painter,' and similar titles tell little, but they indicate the kind of simple suggestive incident he usually treats. Many of his pictures are in English collections. M. Alfred Stevens is a commander of the Order of Leopold, Belgium ; an officer of the Legion of Honour, France ; and an officer of the Order of Merit, Bavaria.

* STEVENS, JOSEPH, elder brother of the preceding, was born at Brussels about 1819, and began at an early age to paint animals from nature. He has ever since continued the practice, and has long held the first place in his native city as a painter of animals, and especially of dogs, which he represents with singular truth, spirit, and artistic effect. The incidents he represents are indicated by such titles as 'Les Mendians, ou Bruxelles le Matin ;' 'Le Chien qui porte à son cou le Dîner de son Maître ;' 'Le Philosophe sans le savoir ;' 'Une pauvre bête ;' 'Un heureux Moment ;' 'Un Métier de Chien ;' 'Intérieur de Saltinbanques ;'—the last two, it may be remembered were in the International Exhibition of 1871. M. Joseph Stevens is an officer of the Order of Leopold and a knight of the Legion of Honour.

STEVENS, THADDEUS, American politician, and one of the leaders of the abolitionist party, was born at Peacham, Caledonia county, Vermont, April 4th, 1793. He was of humble origin, but found means to enter Dartmouth College, where he graduated in 1814. He then went to York in Pennsylvania, where he kept a school, and studied the law. Admitted to the bar, he entered upon practice at Lancaster, in Pennsylvania. He began to take part in politics in 1828, and in 1833 became a member of the State legislature of Pennsylvania, joining what was then known as the Whig party. His vehement speeches and determined policy gradually placed him at the head of the party. In 1848 he was elected to Congress. It was about 1856 that he became a self-appointed, rather than acknowledged, leader of the Republican or extreme Abolitionist party ; this position he held to his death ; for his implacable hatred of slavery and slave-owners impelled him to a fierce rejection of all compromise, and therefore to an ultra-partisanship. He easily obtained re-election to the House of Representatives at every quadrennial election ; but he never succeeded in obtaining office, nor admission into the Senate. Always demanding to be the leader of his party, whatever it might be ; relentlessly pursuing any plan that he had formed ; ready, witty, and sarcastic in debate—he was formidable to his opponents, and secretly disliked even by those who voted with him. When in his prime, he was regarded as the best debater in Congress ; there was always an influx of members whenever he was expected to speak. Throughout the civil war, 1860-65, he never deviated from the most extreme Abolitionist policy ; holding himself ready to vote even against his own party if they did not go fast or far enough to please him. The war was commenced by the North to preserve the Union ; but it was by Stevens' indomitable persistence that the extinction of slavery itself became a settled part of the plan. It was he, too, that compelled a half-reluctant Congress to impeach President Johnson. His love of equality between man and man led him into resolute hostility against the Freemasons, whose exclusive pretensions were hateful to him, and whom he vainly tried to suppress by legislative enactment. He was never married ; but his peculiar notions led him into relations with a mulatto female, which had the effect of shutting him out from the society of most American ladies. His opinion concerning the equality of whites and blacks was otherwise practically asserted by his arrangements in his domestic household. Equality, too, had something to do with his strange repudiation of national honour, in advocating the payment of the public debt in depreciated paper money, notwithstanding the national pledge that it would be paid in gold ; he contended that as the government officers and the army contractors were paid in notes, equality demanded that the public creditors should be paid in like manner, irrespective of pledges given. He attended Con-

gress almost to his last hour ; gaunt, hollow-eyed, feeble, he was kept alive by the intense volition of a resolute will, and poured forth his fierce invectives even though he could speak but a few minutes at a time. He died August the 12th, 1868, in his 76th year.

STIFTER, ADALBERT, a popular novelist of Germany, celebrated especially for his delineations of country life and character, was born on the 23rd of October, 1806, at Oberplan, in Southern Bohemia, where his father was a weaver in poor circumstances. His talent attracted the attention of the priest of the village, from whom he received his earlier education. At twelve years old he entered upon his philosophical and philological studies at an educational institution at Kremsmünster, which he left in 1826 for the purpose of devoting himself to the faculty of law at the University of Vienna. Here, in addition to his acquirements in political economy, history, mathematics, and natural science, he became a proficient in the art of landscape-painting, to which he was determined by the same poetic love of the phenomena of nature which he afterwards exhibited to so great a degree in his tales and novels. He was twenty-seven years of age before he published, in Witthauer's 'Zeitschrift,' the first fruits of his literary talent in the shape of a series of tales, entitled 'Feldblumen,' 'Der Condor,' and 'Das Heidedorf,' of the last of which an English version, by C. C. Mackley, was produced with the title of 'The Heather Village. A study from the German,' &c., 8vo, London, 1868. These stories at once became popular, not only in Austria, but all over Germany ; and the reputation of the author increased as the number of his works multiplied. He was selected by Prince Metternich, about 1840, to act as tutor, especially in mathematics and the natural sciences, to his son Richard, afterwards Austrian ambassador at the Court of the Tuileries ; and, a few years later, contributed, with several other writers, to the production of a volume on Vienna, &c., entitled 'Wien und die Wiener, in Bildern aus dem Leben. Mit Beiträgen,' &c., 8vo, Pesth, 1844. In the last-named year he commenced the issue of his collections of tales, entitled 'Studien,' 6 vols., 12mo, Pesth and Leipzig, 1844-50, sixth edition, illustrated, 2 vols., 8vo, Pesth, 1864, two of the finest stories of which were separately published as 'Abdias,' 16mo, Pesth and Leipzig, 1853, and, with illustrations by G. J. M. Kaiser, 4to, 1866 ; and 'Der Hochwald,' 16mo, Pesth and Leipzig, 1852. Another of his stories, the Old Bachelor, 'Der Hagestolz,' 16mo, Pesth and Leipzig, 1852, was translated into French, with the title of 'Le Vieux Garçon,' 16mo, Brussels, 1858. In 1849 Stifter was appointed a councillor of public instruction, in which capacity he removed from Vienna to Linz, on the Danube, where he died on the 28th of January, 1868.

Besides the 'Studien,' Stifter published another collection of tales with the title of 'Variegated Stones,' 'Bunte Steine,' &c., 2 vols., 8vo, Pesth, 1853, in which occurred a story called 'Bergkrystall,' afterwards separately published in an illustrated edition, as Christmas Eve, 'Der Weihnachtsabend,' 4to, Pesth, 1864 ; a novel entitled 'Der Nachsommer,' 3 vols., 8vo, Pesth and Leipzig, 1857, and another entitled 'Witiko,' 3 vols., 8vo, Pesth, 1865, &c. ; and he was also concerned in the production or the conduct of one or two works for the furthering of education. Several of Stifter's stories or groups of stories have been published in England, with the titles respectively of 'Pictures of Life,' &c., translated by Mary Howitt, and forming vol. 75 of the 'Parlour Library,' 8vo, London, 1847, &c. ; 'Mount Gars : or Marie's Christmas Eve, adapted from the German,' &c., 12mo, Oxford, 1857 ; and 'Pictures of Rural Life in Austria and Hungary,' 3 vols., 12mo, London, 1850, translated by Mary Norman. Amongst the works conversant about the career or the genius of Stifter, may be mentioned a biographical and critical Notice, with selections from his works, entitled 'Adalbert Stifter,' forming vol. 39 of 'Klassiker moderne. Deutsche Literaturgeschichte der neueren Zeit in Biographien, Kritiken, und Proben. Mit Portraits,' 60 vols., 16mo, Cassel, 1852-54 ; and 'Adalbert Stifter,' 8vo, Vienna, 1868, which is a critical estimate of his writings, by Emil Kuh.

STILKE, HERMANN, a celebrated German painter, was born at Berlin in 1803. He studied in the Berlin Academy, and afterwards in that of Düsseldorf under Cornelius, whom he accompanied to Munich, and assisted in his great works there. After a brief sojourn in Italy he returned to Düsseldorf, 1833, where he became known as a permanent member of what is called the Düsseldorf school of religious art. Whilst at Düsseldorf, Stilke painted a large number of religious pictures, and a few of secular subjects, as 'Pilgrims in the Desert,' and 'John,

the blind King of Bavaria, led into Battle.' The late king of Prussia invited him to paint the Rittersaal in the castle of Stolzenfels, and he subsequently painted a series of frescoes in the court theatre. His later works were mostly easel pictures in oil, the most important being 'Judith and Holofernes,' 'Tristan and Isolde,' and an Amazon: he also painted many portraits and subject pieces. He died, September 22nd, 1860.

* STOCKS, LUMB, R.A., line engraver, was born at Lightcliffe, near Halifax, Yorkshire, November 30th, 1812; and learned engraving of Mr. Charles Rolls. At first Mr. Stocks was chiefly engaged on prints for the annuals and other books. He afterwards engraved several plates for Finden's Gallery, and many of the best plates in the 'Art Journal.' But he has also engraved many separate prints for the Art-Unions of London and Glasgow, the association for promoting the Fine Arts in Scotland, &c. Two of his largest and best prints were Frith's 'Many Happy Returns of the Day,' engraved for the Glasgow Art-Union, and 'Claude Duval.' His prints of Webster's 'Dame School'; the series of the 'Dowie Dens of Yarrow,' after Sir J. N. Paton; the 'Gentle Shepherd,' after Wilkie; 'O Nannie, wilt thou gang wi' me,' after T. Faed, R.A.; and 'Marie Antoinette listening to the act of accusation the day before her trial,' after E. M. Ward, R.A., are also much admired. Mr. Stocks was elected associate engraver of the Royal Academy in 1853, associate of the new class in 1855, and R.A. on December 20th, 1871.

STONE, FRANK, A.R.A. [E. C. vol. v. col. 739.] After suffering long from delicate health, Mr. Stone died suddenly of heart disease, on the 18th of November, 1859, aged 59. The picture which was on his easel at the time of his death, 'The Merry and Sad Heart,' was exhibited at the Royal Academy in 1860. His son, *MARCUS STONE, is also winning reputation as a painter. His earlier works were very much in the manner of his father; but of late he has more commonly painted historical and biographical incidents, such as 'The Princess Elizabeth obliged to attend Mass by her sister Mary,' 1869; 'Henry VIII. and Anne Boleyn observed by Queen Katharine,' 1870; 'The Royal Nursery, 1536,' 1871.

STOSS, VEIT, a celebrated early sculptor and engraver, was by birth a Pole, having been born in 1447 at Cracow, where his father, a German, was settled. Stoss seems to have practised with success as a sculptor in his native city up to 1495, when he removed to Nürnberg. There he carved numerous works in wood; painted several pictures, and engraved on copper various scriptural subjects designed by himself. He became blind in his later years, and died in 1542 at the age of ninety-five. Stoss was the contemporary of Martin Schön and Albert Dürer, both of whom are supposed to have studied and profited by his works. He has, though less strongly marked, the distinctive characteristics of those masters, his amplitude of drapery especially recalling that of Albert Dürer. Among the most admired of his productions are the 'Rosenkranztafel,' two reliefs in wood, of the 'Coronation of the Virgin,' and the 'Last Judgment' in the Kaiserkapelle of Nürnberg Castle; the 'Crucifixion' over the high altar at St. Sebald; and the 'Entombment' sculptured in wood at the high altar of the Church of the Holy Cross. Outside Nürnberg his works are extremely rare; of his prints only twelve are known to collectors; Bartsch had only met with three, but Passavant describes nine others, two of which are in the British Museum.

* STOWE, HARRIET ELIZABETH BEECHER. [E. C. vol. v. col. 749.] In 1859, Mrs. Stowe published a novel, 'The Minister's Wooing,' and in 1862, 'Agnes of Sorrento,' a tale which had previously appeared in the 'Cornhill Magazine' and the 'Atlantic Monthly,' to which last periodical she has been a somewhat frequent contributor. Her next separate work was, we believe, 'Little Foxes,' published in 1865; and this was followed in 1867 by 'Light after Darkness: Religious Poems.' Another novel, 'Old Town Folks,' appeared in 1869; and 'Little Pussy Willow,' 'Pink and White Tyranny,' and 'My Wife and I,' in 1871.

If these stories excited little interest, the same cannot be said of one which she put forth before the latest of those just named. This was entitled 'The True Story of Lady Byron's Life,' and was printed in the 'Atlantic Monthly' and in 'Macmillan's Magazine' (September 1869). Written in an elaborately melodramatic style, it produced a profound sensation wherever the English language was read—a sensation due, however, not to the style, but to the "terrible secret" it disclosed. This secret, confided to her, as she stated, thirteen years before by Lady Byron, was that Lord Byron was guilty of incest with his sister, Mrs. Leigh, and that it was the discovery of this fact that caused the

separation. During "two years of convulsive struggle," after Lord Byron had himself revealed the truth, and "argued his case with all the sophistries of his powerful mind," Lady Byron remained with him—she "would neither leave him nor betray him;" but do her best to reclaim him, and it was only after "the anguish and conflict of these two years," the failure of all her efforts, and the birth of their child, that she brought her mind to resolve on a separation.

This is not the place to go over the details of the revolting narrative; but as reference was made in our memoir of Lady Byron [E. C. S. col. 342] to the notice of the lady who first gave publicity to the story for such particulars as it seemed requisite to give, we must proceed a little further. Mrs. Stowe's statement was soon shown to be inaccurate in the dates, and in its leading features. Lady Byron could not have maintained "two years of convulsive struggle" before leaving her husband, for she left him within thirteen months of their marriage—they were married January 2, 1815, and she left him January 15, 1816. Her letters of that date and long after give no hint of that or anything like it as the cause of separation; indeed, as late as 1818 she writes to her most intimate friend, Lady Anne Barnard, that her wishes "never were to injure Lord Byron in any way; for though he would not suffer me to remain his wife, he cannot prevent me from continuing his friend," which a wife so injured would hardly desire. But further, as was pointed out, Lady Byron up to and some time beyond the separation, wrote frequently to Mrs. Leigh herself in terms of the warmest affection: in one letter assuring her that "in this at least I am *truth itself* when I say that, whatever the situation may be, there is no one whose society is dearer to me, or can contribute more to my happiness;" in another that it is her "great comfort" under the separation, that his sister remains with her husband. She even has her child named after the woman who has done her such grievous wrong. Sentiments and conduct like this were, it is needless to say, not merely incompatible with Mrs. Stowe's story, but render so much of the story impossible.

So far, then, it was plain that Mrs. Stowe's story had little truth in it. Her assertion that her narrative was substantially that contained in a written statement which Lady Byron had prepared with a view to publication after her death, was met by a formal contradiction on the part of the solicitors of Lady Byron's descendants and representatives, who stated authoritatively that Mrs. Stowe's "article is not 'a complete' or 'authentic' statement of the facts connected with the separation, that it cannot be regarded as Lady Byron's own statement, and that it does not involve any direct evidence on Lady Byron's history." Still more emphatically did Lord Wentworth, Lady Byron's grandson, repudiate the whole narrative. "About three years ago," he wrote "a manuscript in Lady Noel Byron's handwriting was found among her papers, giving an account of some circumstances connected with her marriage, and apparently intended for publication after her death; but as this seemed not quite certain, no decision as to its publication was come to. . . . This statement in Lady Byron's own handwriting does not contain any accusation of so grave a nature as that which Mrs. Stowe asserts was told her, and Mrs. Stowe's story of the separation is inconsistent with what I have seen in various letters, &c., of Lady Byron's."

Mrs. Stowe returned to the charge in 1870, in a volume entitled 'Lady Byron Vindicated. A History of the Byron Controversy;' but which was rather an attack on the whole character of Lord Byron, than a vindication of Lady Byron, or a confirmation of her previous statements. Everything that could be found in disparagement of Lord Byron's morals—and there matter was not far to seek—to tarnish his fame, and to sully his memory, was set forth in language happily almost without parallel in recent English literature for virulence, malignity, and prurience. His writings were ransacked for obscene passages; the sentiments expressed by his dramatic personages having reference to a like crime were cited as his own sentiments; and a farrago of equally baseless assertion, asseveration, and irrelevant and disingenuous criticism added, but not an atom of additional evidence. As left by her, the story rests wholly on her assertion. Still, taking into account all that has been published on the subject, it appears certain that Lady Byron did in her later years hold, in some shape, the opinion attributed to her, and repeat it to various persons. But that it was therefore true by no means follows. She had a habit of reasoning out conclusions, and, once arrived at, she adhered to them with undeviating tenacity: that she could be wrong hardly seems to have entered into her imagination. Lord Byron's warm affection for his

sister was never disguised; and some unusual expression of it, contrasted with, it may be, a harsh or untimely expression of indifference for herself, ranking in her memory, may have formed the nucleus about which other suspicious fancies, and perhaps words of "whispering tongues that poison truth," gathered till it assumed the hideous shape in which it startled the world. She had illusions, we know, the fruit of her strong, and not unnatural, jealousy, and this was probably one of them.

At any rate, after having for the purpose of this article gone again, carefully and consecutively, through all that has been published bearing on this repulsive subject, down to Karl Elze's 'Lord Byron: a Biography' (8vo, 1872) with the translator's preface and notes, we must record it as our deliberate conclusion that there is an entire absence of direct, positive, and trustworthy testimony for the charge; that it is not merely unproved, but that it is untrue. Lady Byron, we have no doubt, believed the story, or something like the story, but her belief is not evidence, and there is absolutely nothing to show that it was not a slow and morbid growth of her diseased imagination. Her reception of the belief, and dwelling on and nursing of it as she appears to have done during her later years, are matters for sorrow and silence rather than wonder; Mrs. Stowe's revelation of it—remembering the circumstances under which she states that it was confided to her, and that, although Lord and Lady Byron and Mrs. Leigh were dead, their descendants were living—was alike gratuitous and indefensible; the manner in which she set it forth and defended it, was even worse.

* **STRATHNAIRN, HUGH HENRY ROSE, GENERAL LORD**, a distinguished military commander, was born in 1803. He was a son of Sir G. Hugh Rose, many years English representative at the court of Prussia, and a grandson of the statesman, the Right Honourable Sir George Rose. Receiving his education at Berlin, where his father then resided, he entered the British army in 1820 as ensign, was promoted to be lieutenant in 1821, captain in 1824, major in 1826, and lieutenant-colonel in 1830. He served in the Syrian campaign, 1840—41, and was rewarded with the rank of C.B., the Prussian Order of St. John of Jerusalem, and a sword of honour from the Sultan. He spent many years in diplomatic service, as chargé d'affaires in Syria, and then as secretary of embassy and chargé d'affaires at Constantinople. In the last-named capacity he urged the entrance of the British Mediterranean fleet into the Black Sea in 1853, as a means of restraining Russia from making those aggressions which brought on the Crimean war; but the advice was not followed. In 1855—56, with the rank of major-general (he had been promoted to colonel in 1851), he acted as British military commissioner at the head-quarters of the French army outside Sebastopol; he was wounded in the trenches. For this service he was honoured with the decorations of K.C.B., the Legion of Honour, and the Turkish Order of the Medjidie. As Major-General Sir Hugh Rose, he fought in India during the wars of the mutiny, undertaking very harassing duties in 1857—58. To curb the mutineers and hordes of rebels in the region known as Central India, southward of Agra and Cawnpore, he was placed in command of a column called the Malwah Field Force, afterwards augmented, and called the Central India Field Force. From the later months of 1857 to the summer of 1858 he was almost incessantly marching and fighting. He relieved Saugur; besieged and captured Jhansi and Calpee; took Katghur, Shahghur, and Chundergee; chased the active rebel chieftain, Tanteea Topee, from one stronghold to another; captured Gwalior; and replaced on the Mahratta throne the Maharajah Scindia (who was faithful to the British, although his native troops were not). To use the words of Lord Canning, governor-general of India, Rose's army "marched from Bombay to the Jumna and Gwalior, from success to success, without a check, under hardships heroically borne, although seldom endured even in India." This was done, as he himself expressed it, "against overwhelming numbers which cut off my base as I advanced through an unknown country, and a line of operations some 700 or 800 miles long defended by forts." By this march Sir Hugh, who fought sixteen battles, captured 150 pieces of artillery, and received no defeat, secured for himself the reputation of being one of the most consummate strategists in the British army. The wars of the mutiny being now nearly closed, he returned to Bombay to recruit his shattered health. In reward for these services, he was made lieutenant-general, commander-in-chief of the army of Bombay, G.C.B., knight of the Star of India, and received the thanks of parliament. Sir Hugh next became commander-in-chief of the whole British armies of India. It was his duty in this office to reorganise the native regiments, to

weed out the disloyal from the loyal, and to amalgamate into one body the Queen's officers and regiments with those until that time in the service and pay of the East India Company—the latter a somewhat difficult and delicate task. Resigning his command in India, Sir Hugh returned to England in 1865; was appointed commander of the forces in Ireland, and made a member of the Irish Privy Council. In July, 1866, he was raised to the peerage, with the title of Lord Strathnairn. He was promoted to the rank of general in 1867, received the colonelcy of the Royal Horse Guards in 1869, and the degree of D.C.L. (Dublin) in 1870. His lordship is unmarried. In the House of Lords, Lord Strathnairn speaks seldom, but with great effect on military questions; his speech on the defective strategical education of officers in the army, March 28, 1871, was one of the most remarkable ever delivered in that assembly on such a subject.

* **STREET, GEORGE EDMUND, R.A.**, was born about 1824, at Woodford, Essex; received his general education at Camberwell Collegiate School, and, after a preparatory training under Mr. O. Carter, F.S.A., at Winchester, became the pupil of Mr. George Gilbert Scott, with whom he remained for five years. Entering upon practice on his own account as an architect in 1850, Mr. Street received the appointment of architect for the diocese of Oxford, obtained a good ecclesiastical connection, and soon became known as a leader of the "advanced Goths," a prominent member of the Ecclesiological Society, and treasurer of the Church Union. He has steadily continued in the same course; has advocated his views with pen and pencil, and illustrated them by his buildings, and in all has turned to account a somewhat wide study of the Gothic edifices of the Continent. Mr. Street's principal publications are—'An urgent Plea for the Revival of True Principles of Architecture in the Public Buildings of the University of Oxford,' 8vo, Oxford and London, 1853; 'Brick and Marble in the Middle Ages: Notes of a Tour in the North of Italy,' 8vo, 1855; 'Some Account of Gothic Architecture in Spain' (with illustrations), 8vo, 1865; an essay on 'The Study of Foreign Gothic Architecture, and its Influence on English Art,' published in Shipley's 'Church and the World,' 8vo, 1866. He has also published a lecture, 'Architecture in the Thirteenth Century,' 8vo, 1863; 'Some Account of the Church of St. Mary Stone, near Dartford,' which originally appeared in the *Archæologia Cantiana*, vol. iii.; and contributed papers to professional and ecclesiological journals. Mr. Street erected Cuddesdon College; and Uppingham Grammar School, both Gothic buildings of considerable extent and importance, and several other secular structures of more or less magnitude; but he is chiefly known as a church builder, and his churches have largely influenced the tastes and practice of the younger church architects. Among the more noteworthy of Mr. Street's churches are those of Wantage, 1857; Whitwell, Yorkshire, 1860; St. James the Less, Garden-street, Westminster, 1861, an elaborate brick edifice, and one of the first in which a foreign element was made to predominate; St. Philip and St. James, and St. Giles, Oxford—two among the most admired and criticised of his churches; St. Peter, Bournemouth; Chalvey, by Slough; St. George, Wellington; Whelford, Gloucestershire; All Saints, Clifton; St. John, Torquay; SS. Peter and Paul, Teddington; St. Mary Magdalene, Paddington; Holy Trinity, Eltham; St. Margaret, Prince's Park, Liverpool; St. Peter, Swinton, near Manchester; St. Andrew, Kettering; Long Eaton, Derbyshire; Flyingdale, near Pickering, Yorkshire; Christ Church, Barnston, Cheshire; four or five in Yorkshire for Sir Tatton Sykes; others at Eastbourne, West Malvern, and many other places. Mr. Street has also been very extensively engaged in church restoration, and is now occupied in erecting a new nave, west front, and two western towers to Bristol Cathedral; and in the complete restoration of Christ Church Cathedral, Dublin, and adding to it a new choir, and a synod hall for the Disestablished Irish Church. In 1857, Mr. Street won one of the 100l. prizes for a design for a new Foreign Office, his design being Italian Gothic in style. He was also one of the eleven architects who competed for the National Gallery, 1867, and for the Courts of Law. In the latter his elaborate drawings were successful in obtaining, with those of Mr. E. M. Barry, the suffrages of the professional advisers, and those two gentlemen were provisionally appointed the architects of the new buildings. Subsequently the commission was given solely to Mr. Street. His original design was afterwards superseded, and now, 1872, the foundations are being constructed for another and modified structure, but which will still be next to the Houses of Parliament, the largest and costliest building of recent erec-

tion. The design has been most severely criticised, but it would be out of place here to discuss the merits or demerits of a building that at present exists only upon paper, and the details, and probably many of the leading features of which will undergo many alterations in the course of erection. Mr. Street was elected A.R.A. in 1866, and R.A. in 1871. He is a fellow of the Society of Antiquaries; a fellow and vice-president of the Royal Institute of British Architects; and an honorary fellow of the American Institute of Architects.

STRUVE, FRIEDRICH GEORG WILHELM, an eminent astronomer, was born at Altona, April 15th, 1793. He was sent for his education to the university at Dorpat, in Russia; and, being well grounded in astronomical studies, he received, in 1813, the appointment of one of the assistants at the Dorpat Observatory. He rose to be director of the observatory in 1817. During twenty-two years' occupation of this office his labours were incessant, and of a high degree of importance. His chief researches were into double and multiple stars, of which he produced entirely new catalogues; while his trigonometrical calculations, connected with the measurement of an arc of the meridian, were of still greater practical value. The results of his labours appeared in many scientific journals, especially the *Transactions of the Imperial Academy of St. Petersburg*. Among other works published separately during his residence at Dorpat, the following are the principal:—*Observationes Astronomicas institutas in specula Universitatis*, 4to, Dorpat, 1817; *Ueber die Doppelsterne*, 4to, Dorpat, 1827. An important trigonometrical survey, made in conjunction with Wrangel, is described in *'Beschreibung der unter Schutze von der Universität an Dorpat veranstalteten Breitengradmessung in den Ostseeprovinzen Russlands'*, 4to, Dorpat, 1831. Some of his double-star observations, made with the magnificent Fraunhofer equatorial (13½ feet focus, 10 inches diameter), are described in *'Stellarum duplicium et multiplicium mensuræ micrometricæ per magnum Fraunhoferi Tubum annis à 1824 ad 1837, in specula Dorpatensi Institutæ'*, folio, St. Petersburg, 1837. A mode of employing the transit instrument is treated in *'Sur l'emploi de l'instrument des passages pour la détermination des positions géographiques'*, 4to, St. Petersburg, 1838. In 1839 Struve was appointed director of the Observatory at Paulkova, near St. Petersburg, perhaps the finest and best arranged in the world. He described this establishment in *'Description de l'Observatoire Astronomique Centrale de Paulkova'*, 2 vols. folio, St. Petersburg, 1845 (forming the Introduction to *'Annales de l'Observatoire Centrale'*). During the twenty-five years of his labours at this Observatory, he continued his observations on double and multiple stars, until his catalogues noticed no less than 120,000 of them. He also assisted in those vast trigonometrical surveys which at length led to the completion of an arc of the meridian, extending from the North Cape to Turkey, covering 20° of latitude. Separate publications, descriptive of these and other researches, are the following:—*'Catalogue de 514 étoiles doubles et multiples découvertes sur l'hémisphère céleste boréal par la grande lunette de l'Observatoire Centrale de Faulkova'*, folio, St. Petersburg, 1843; *'Sur le Coefficient Constant dans l'aberration des étoiles fixes'*, 4to, St. Petersburg, 1843; *'Expédition chronométrique exécutée par ordre de Sa Majesté Nicolas I. entre Paulkova et Altona pour la détermination de la longitude géographique relative à l'Observatoire Central de Russie'*, 4to, St. Petersburg, 1844; a similar comparison between Paulkova and Greenwich, 4to, St. Petersburg, 1846; *'Librorum in bibliotheca speculæ Pulcovensi contentorum Catalogus Systematicus'*, 8vo, St. Petersburg, 1845; *'Études d'Astronomie stellaire. Sur la voie lactée, et sur la distance des étoiles fixes'*, 8vo, St. Petersburg, 1847; *'Sur la dilatation de la glace, d'après les expériences faites en 1845 et 1846'* (in conjunction with Schumacher, Pohrt, and Moritz), 4to, St. Petersburg, 1848; *'Notice sur l'instrument des passages de Repsold établi à l'Observatoire de Paulkova'*, 4to, St. Petersburg, 1852; *'Stellarum fixarum imprimis duplicium et multiplicium positiones mediæ pro epocha 1830'*, folio, St. Petersburg, 1852; *'Arc du Méridien de 25° 20', entre le Danube et le Mer Glaciale'*, 4to, St. Petersburg, 1857. Some of Struve's works were officially printed in Russian, but were afterwards reprinted in French, German, or Latin. He edited new editions of Fuss, Sawitch, Sabler, and Fedorow, on *Trigonometrical Surveys*, and a new edition of Weisse's *Star Catalogue*. He died at St. Petersburg, November 23rd, 1864.

* STRUVE, OTTO WILHELM, son of the preceding, and, like him, a distinguished astronomer, was born at Dorpat, May 7th, 1819. His whole life may be said to have been spent in connection with the Observatory in his native town. Qualifying

himself for the duties by receiving a scientific training, he became, when a young man, assistant to his father, retained that post till 1864, and then succeeded him as director. His astronomical papers, inserted in various scientific journals and transactions, are numerous. They relate to double stars; a satellite of Neptune discovered by him; Saturn's ring; the periodic motions of double stars; the motion of the solar system in space, &c. Some of his papers, after insertion in the memoirs of the Imperial Academy of St. Petersburg, have been published separately. *'Bestimmung der Constante des Präcession, mit Berücksichtigung der eigenen Bewegung des Sonnensystems'*, 4to, St. Petersburg, 1842, an important contribution to our knowledge of the motion of the solar system in space; *'Catalogue revu et corrigé des étoiles doubles et multiples découvertes à l'Observatoire Centrale de Paulkova'*, 4to, St. Petersburg, 1850; *'Détermination de la Parallaxe de l'étoile Groombridge 1830'*, 4to, St. Petersburg, 1850; *'Nouvelle détermination de la Parallaxe annuelle des étoiles α Lyræ et 61 Cygni'*, 4to, St. Petersburg, 1859; *'Observations de la grande Nébuleuse d'Orion, faites à Cazan et à Paulkova'*, 4to, St. Petersburg, 1859; *'Pulkowaer Beobachtungen des grossen Cometen von 1858'*, 4to, St. Petersburg, 1859; *'Beobachtung der totalen Sonnenfinsterniss vom 18 (6) Juli, 1860'*, 4to, St. Petersburg, 1859; a new and revised edition of his father's *Catalogue of the library at Paulkova*, 8vo, St. Petersburg, 1860; *'Tabulæ quantitatum Besselianarum quibus apparentes stellarum positiones in medias convertuntur adhibitis numeris constantibus Pulcovensibus pro annis 1840 ad 1864 computatæ'*, 4to, St. Petersburg, 1861, an important treatise on the proper motions of the stars; new edition of Weisse's *'Positiones mediæ Stellarum fixarum in Catalogum Ordinatæ'*, 4to, St. Petersburg, 1863.

STUART, JAMES E. B., Confederate general during the American civil war, was born in Patrick county, Virginia, in 1832. He received his professional training at West Point Military Academy, where he graduated in 1854. He rose through two grades in a cavalry regiment; and then, when the civil war broke out in 1860, resigned his commission in the Federal army, and threw in his lot with the Confederates. He commanded the cavalry at the first battle of Bull Run; was made brigadier-general in September, 1861; and took part in many engagements. During the winter of 1861—62 he re-organised the Confederate cavalry in Virginia. In June, 1862, a cavalry raid which he made in the rear of McClellan's army near Richmond almost severed the line of communication of the Federals, and compelled them to change their base of operations. In August, while with Lee's army, he made another raid, marching on Pope's head-quarters, and carrying off valuable papers and plans of campaigns; he approached at night, during a terrific thunderstorm, and threw the Federals into great confusion. In October, with 2,000 horse and four pieces of light artillery, he crossed the Potomac between Williamsport and Hancock, rode completely round the Federal lines, capturing some horses and a few camp supplies, and re-crossed the Potomac into Virginia, without the loss of a man. These daring manœuvres gained for General Stuart the credit of being one of the best cavalry officers of his time. In 1863 he was engaged in various services, and rendered good aid to Lee in covering the retreat of the Confederates from Gettysburg. He was desperately wounded on the 9th of June, 1864, in a cavalry engagement with the Federals under Sheridan, and died two days afterwards.

STÜLER, AUGUST, a distinguished German architect, was born at Berlin, January 28th, 1800. He was a pupil of Schinkel, and remained with him as assistant till about 1830. He first attracted notice by various architectural and ornamental designs, published in professional journals, and a work prepared in conjunction with Strack, entitled *'Vorlegeblätter für Möbeltischler'*, 1835. His earliest building of importance was the Rathhaus, Perleburg, Italian Gothic in style, 1840. The King, Frederick William IV., about this time became his warm patron. Amongst the many important buildings which he erected for the king, were the churches of St. James, St. George, St. Matthew, &c., in Berlin; the Chapel Royal; several new saloons in the palace of Potsdam; the royal porcelain manufactory, and other government works. But his most important buildings were the New Museum, a large and costly structure; and the still more magnificent Exchange, the large model of which is now in the South Kensington Museum. For private patrons he erected the mansion of the Grand Duke of Mecklenburg-Schwerin, and many other costly buildings in Berlin and its vicinity. Out of Prussia his chief works are the New Winter Palace at St. Petersburg, the Exchange at Frankfurt, &c. After holding various official

posts, he was made in 1846 chief inspector of buildings, in 1849 joint director of the Academy of Architecture, and in 1850 ministerial counsellor. He died suddenly on the 18th of March, 1865. Stüler is considered the ablest of the scholars of Schinkel. His style, like that of his master, is "classic," but it is by no means of the "severe" character of our leading English classicists. In all his works there is a great deal of ornamentation, and the ornament is not always pure. Several of his buildings are Italian in style.

SUE, MARIE JOSEPH EUGÈNE. [E. C. vol. v. col. 808.] The coup d'état of December 2nd, 1850, drove Eugène Sue from France. He continued to write, but without the old spirit, and his writings met with diminishing popularity. He died in exile, August 3rd, 1857, at Annecy, in Savoy.

SUGER, ABBÉ. Regent of France, was born towards the close of the 11th century (1082 and 1087 are the dates variously given), either at St. Denis or St. Omer. The son of a peasant, he was admitted at the age of ten as a scholar in the Abbey of St. Denis, where Prince Louis, son of Philip I. of France, was at the same time receiving his education. Admitted in due time a member of the monastery, Suger distinguished himself by the range of his studies, his keen intelligence, and business habits. His acquaintance with the abbey charters proved of great benefit to the abbey, which by his means recovered much property of which it had been deprived by the neighbouring lords; and he defended the ecclesiastical rights of the abbey against the Bishop of Paris before Pope Pascal. When Prince Louis ascended the throne of France as Louis VI. in 1108, he called Suger, with whom he had maintained friendly relations, to his side, and made him his chief guide and counsellor. Suger at once set about strengthening the royal power, and reducing that of the great vassals of the crown, over whom the king then held little more than a nominal supremacy. In furtherance of this object, he suggested the establishment of communes, and the granting of charters to the chief towns, by which the election of magistrates was conferred on the citizens—two measures which proved of vast importance to France. Suger had been created prior of Berneval, in Normandy, and in that capacity carried on the struggle with the feudal lords. He armed his vassals and himself appeared at their head with the army of the king when the Emperor Henry V. invaded France. He was intrusted on various occasions with the negotiations between the kings of France and England; and he concluded the treaty of peace in 1120. In 1122 he went on a mission to Rome, and whilst there the abbot of St. Denis having died, Suger was elected his successor. At the court, and as the king's minister, he had participated in the luxurious and splendid habits of the princes and nobles with whom he associated, but now, convinced by the appeals of St. Bernard, he began a new and stricter life, and earnestly set about the reformation of his abbey. Carrying out the policy he had recommended to the king, he emancipated the serfs on the abbey estates; at the same time, while he adopted a rigid economy in the abbey, he enforced to the utmost its rights, and encouraged in all ways the offerings of the devout. To the end of the life of Louis VI., Suger retained the king's confidence, was intrusted with the conduct of the most important missions and measures, and had the entire direction of the prince's education. From the death of Louis VI. (1137), the influence of Suger seemed to increase; the young king, Louis VII., regarding the opinions of his old tutor with reverence. But Suger in vain endeavoured to prevent the king from going himself on the crusade which he had been persuaded by St. Bernard to undertake. Suger approved of the crusade, but held that the king's first duty was to stay in his kingdom. Louis went, but appointed the abbé regent during his absence, 1147—1149. The crusade was unsuccessful, but the wise rule of the regent was said to have in a great measure compensated France for her misfortunes. The government of France was not, however, the only thing which at this time engaged his thoughts. Ever since he became abbot of St. Denis he had been accumulating wealth, and preparing his plans; and about the time he became regent of France he commenced rebuilding his abbey on a scale of magnificence and in a style till then unknown in France. At least, it is to the Abbey of St. Denis that the best recent authorities attribute the origin of the Pointed Style of architecture in France. The abbey is, indeed, rather what is called Transitional than perfect Gothic in style, but it was the first important departure from the Romanesque, and as such was the parent of the many splendid Gothic structures which were soon after erected in France, and imitated, with more or less success, in other parts of Europe. Some writers have gone so far as to rank

BIOG. DIV.—SUP.

Suger as the architect of the building, and to attribute to him the designs of some of the splendid glass windows which were erected in this and other churches about this time. He gave a great impetus to the arts in France; but though he may have studied art whilst a monk in St. Denis, and probably did, we may be sure that, with the government of the kingdom resting on him, he had neither time nor desire to engage in occupations which he could find others able and willing to perform. He was beyond doubt a warm and generous patron of the arts, and he probably gave valuable suggestions and wise advice to the artists who worked for him; it would be idle to suppose he did more. But he was not the patron of art merely. He sought to improve agriculture, and to ameliorate the condition of the labourer; he founded numerous villages; gave new charters to towns, and promoted in all ways he could the industry and commerce of the country. He died at St. Denis, January 30th, 1152.

* **SUMNER, CHARLES,** American politician, was born at Boston, Massachusetts, January 6th, 1811. He graduated at Harvard University in 1830; studied law under Judge Story, and was admitted to the bar in 1834. He gave lectures at the Law School in the university, but declined a professorship. From 1837 to 1840 he travelled in Europe, and then became popular in Massachusetts as a barrister and law writer. In 1845 he attracted attention by his first political speech, on the 'True Grandeur of Nations,' in which he advocated arbitration as a substitute for war. In the same year he opposed the Fugitive Slave Law; the annexation of Texas; and in the following year the Mexican war. In 1850 he entered the Senate as representative of Massachusetts, and took a leading position among anti-slavery advocates by his declaration that "freedom is national, slavery sectional." In 1856 a speech on the Kansas question so violently enraged the senators from the Southern States that one of them, Mr. Brooks, inflicted a violent personal assault, which injured the health of Mr. Sumner for three or four years. On his re-entering the Senate in 1859, he attacked the slaveowners by speech and by writing, and was instrumental in insuring the election of Mr. Lincoln to the presidency in the following year. When the civil war began in 1861, he opposed all compromise, insisting that the total abolition of slavery should be an indispensable condition of peace. As chairman of the Committee of the Senate on Foreign Relations, he was antagonistic to England, especially in relation to the 'Alabama' question. He opposed President Johnson in any show of leniency to the South during the process of reconstruction after the war. In 1869 he denounced the treaty signed by Mr. Reverdy Johnson and the Earl of Clarendon, and obtained its rejection. His rancorous speech against England was very generally disapproved by his countrymen, who felt that such a line of conduct in a prominent public man could not fail to lower the statesmanship of America in the eyes of intelligent foreigners: and this feeling probably had much to do with his removal, in March, 1871, from his position as chairman of the Foreign Affairs Committee of the Senate. He has pursued a similar course with reference to the Washington Treaty, and he has the credit of having invented, or given form to, the monstrous proposition of "consequential damages" as a part of the Alabama Claims, and which, being unhappily embodied in the American Case, has imperilled what appeared likely to be a friendly settlement of the differences between the two countries.

Many of Mr. Sumner's speeches, addresses, orations, and lectures have been printed, relating to Slavery, White Slavery, Unionism, Peace, National Greatness, the Origin of the Civil War, Education, Abolitionism, the Kansas Question, the Fugitive Slave Law, the Law of Human Progress, &c. Two collected reprints of these appeared in 1850 and 1856. His larger published works include a 'Catalogue of the Law Library of Harvard University,' 1834; contributions to and editing of eight volumes of the 'American Jurist'; 'Reports of Cases in the Circuit Courts of the United States,' 3 vols. 1836—1841; American edition of Dunlop's treatise, 'On the Practice of the Admiralty Courts in Cases of Civil Jurisdiction at Sea,' 1836; 'On the Foreign Relations of the United States,' 1837 (written at the request of General Cass when American ambassador at Paris); American edition of Vesey's 'Chancery Reports,' 20 vols. 1844, &c.; Additions to Justice Story's 'Commentary on the Law of Bills of Exchange,' 1853, &c.

SUMNER, MAJOR-GENERAL EDWIN VOSE, an officer in the United States army, was born at Boston, Massachusetts, in 1796. He received his training at Boston, and entered the army in 1819 as second lieutenant of the 2nd Infantry. After

seeing service in the Black Hawk war, he was appointed captain of the 2nd Dragoons, when that regiment was raised by General Jackson; and was for many years engaged with it on the Indian frontier. He was then placed in command of the School of Cavalry Practice at Carlisle, Pennsylvania. Promoted to the rank of major in 1846, he participated actively in the Mexican war; led the cavalry charge at Cerro Gordo, where he was wounded; fought at Contreras and Churubusco; and commanded the cavalry at Molino del Rey. In 1848, with the rank of lieutenant-colonel, he received the command of the department of New Mexico; in 1855 was made colonel of the 1st Cavalry; in 1856 received the command of Fort Leavenworth, Kansas; in 1857 led successfully an expedition against the Cheyenne Indians; and in 1858 was placed in command of the department of the West. On the breaking out of the civil war he was promoted to the rank of brigadier-general, and was made commander of the first army corps in the army of the Potomac. During the seven days' fighting on the Chickahominy he was wounded. As major-general of volunteers, and brevet major-general in the regular army, he took command of the second corps of the army of the Potomac, after its re-organization. After various operations under McClellan and Burnside, he quitted the army of the Potomac, and accepted the command of the army of the frontier; but while going thither he sickened at Syracuse, New York state, and died March 21, 1863.

SUMNER, JOHN BIRD, D.D., Archbishop of Canterbury. [E. C. vol. v. col. 828.] This excellent prelate and amiable man was gathered to his fathers on the 6th of September, 1862, at the age of 82. He was interred in Addington churchyard, Surrey.

SWAINSON, WILLIAM [E. C. vol. v. col. 842], geologist, died December 6, 1855.

* SWINBURNE, ALGERNON CHARLES, a poet and critical writer, eldest son of Admiral Charles Henry Swinburne and of Lady Jane Henrietta Swinburne, daughter of George, third Earl of Ashburnham, and the grandson of Sir John Edward Swinburne, Bart., of Capheaton, Northumberland, was born on the 5th of April, 1837, in Chester Street, Grosvenor Place, London, and received his earlier education successively in France and at Eton. In 1857 he was entered a commoner of Balliol College, Oxford; and his name still (1872) appears in the Calendar as an undergraduate member of the University. His first literary venture was a volume "affectionately inscribed to Dante Gabriel Rossetti," consisting of two plays entitled respectively 'The Queen Mother,' and 'Rosamond,' 8vo., London, 1860, &c., 16mo, Boston, U. S., 1866, which, although comparatively little known to the reading public, exhibits a singular literary power, the richness of which is intellectual and poetical, rather than dramatic. The heroine of the 'Queen Mother,' which is in five acts, is Catherine de' Medici, mother of Charles IX. of France, the scene being Paris, and the time, August 22-24, 1572, that of the Massacre of St. Bartholomew. 'Rosamond,' whose heroine is "not Rose the chaste, but Rose the fair," is a play in one act, the scene of which varies between Woodstock and Shene. In May, 1864, Mr. Swinburne, attracted by his admiration for the late Walter Savage Landor, who died on the 17th of September following, and fortified with a letter of introduction from Lord Houghton, went out to Florence for the sole purpose of paying homage to Landor, at whose feet, as he expressed it in a letter announcing his arrival, it was his eager wish to lay, what he could never hope to put into adequate words, his profound gratitude and life-long reverence. It was to the memory of Walter Savage Landor, "the highest of contemporary names," that Mr. Swinburne dedicated his 'Atalanta in Calydon,' 4to, London, 1865, and other editions, 16mo, Boston, U. S., 1865, the chief power of which was recognised as lying in its lyrical expression and description, and which at once made his reputation as a poet who out of an imitation of Greek form and feeling knew how to evolve originality. To 'Atalanta' succeeded 'Chastelard: a Tragedy,' 8vo, London, 1865, and other editions, 16mo, New York, 1865, a poem, which, dramatic in form, was chiefly remarkable for its power of poetic expression, and, being devoted to the unpalliated loves of the hero and Mary, Queen of Scots, was repellent of human sympathy and human interest, so that even its warmest admirers conceded that it must be regarded as a less absolute achievement than 'Atalanta.' About the same time, Mr. Swinburne edited, for the series known as 'Moxon's Miniature Poets,' 8vo, London, 1865, &c., 'A Selection from the Works of Lord Byron,' to which he prefixed an independent and remarkable essay upon the noble poet; and in the following year produced a volume of 'Poems and Ballads,' 8vo, London, 1866, which, having become unanimously obnoxious

to the charges of heresy, profanity, and uncleanness, were promptly withdrawn from circulation by Messrs. Moxon and Co., the publishers. Copies of the suppressed edition are said to have been sold for five guineas each; and when the issue of the work had been undertaken by another publisher, it went through several editions, both in this country and America, where it was brought out with the modified title of 'Laus Veneris, and other Poems and Ballads,' New York, 1866. Mr. Swinburne replied in 'Notes on Poems and Reviews,' 8vo, London, 1866, and 8vo, New York, 1866, to the critical animadversions which the manifold offences of the 'Poems,' &c., had called forth, in a form compounded of qualified apology and impenitent defiance. Carrying into his polemics the alliterative habit which is recognised as one of the overdone mannerisms of his poetry, he protested against the "prurient prudery and the virulent virtue of pressmen and prostitutes;" and, admitting that he did not write for children or for girls, claimed to deal neither "in poison nor in pap." Mr. W. M. Rossetti, who published a volume entitled 'Swinburne's Poems and Ballads: A Criticism,' 8vo, London, 1866, by way of apology for the idiosyncratic sensuousness and the "religious mutiny" of his friend, observed that, "in fact, Mr. Swinburne's mind appears to be very like a *tabula rasa* on moral and religious subjects, so occupied is it with instincts, feelings, perceptions, and a sense of natural or artistic fitness and harmony. . . . He has no idea of what philosophers call a sanction." The record of Mr. Swinburne's life is mainly a record of his literary activity, to which the following works, later than the above-mentioned, are owing:—'A Song of Italy,' 8vo, London, 1867, &c., and Boston, U. S., 1867, and re-published in the New York 'Weekly Tribune,' for May 1st, 1867, a poem conceived in a dramatic spirit, although lyrical in form, the rhapsodist of which seems to be an Italian patriot, probably a Roman, and certainly a republican and a fiery worshipper and partisan of Mazzini; 'William Blake: a Critical Essay. With Illustrations from Blake's Designs in Facsimile, coloured and plain,' 8vo, London, 1867, second edition, 1868, an exposition of the ideas of the artist-mystic in religion, morality, and design; 'Siena. A Poem,' 16mo, Philadelphia, U. S., 1868, and 8vo, London, 1868, reprinted from 'Lippincott's Magazine,' for June, 1868; the 'Second Part' of 'Notes on the Royal Academy Exhibition,' 8vo, London, 1868, the 'First Part' of which was furnished by Mr. W. M. Rossetti; 'Ode on the Proclamation of the French Republic, September 4, 1870,' 8vo, London, 1870, with a dedication to M. Victor Hugo, a work the anti-monarchical inspiration of which he further exhibited a few months later in a volume dedicated to Mazzini, and entitled 'Songs before Sunrise,' 8vo, London, 1871, in which the "Sunrise" indicated is characterised by a pantheistic theology and a republican form of government. In two of the 'Songs,' one entitled a 'Hymn of Man,' and the other 'Before a Crucifix,' the author, besides expressing his own views, assails the beliefs and the most consecrated associations of other people with a wanton violence which is more than offensive. Mr. Swinburne has been an occasional contributor to various periodicals, the 'Fortnightly Review,' 'Cornhill Magazine,' 'Lippincott's Magazine' (American), and others; and he has also edited, with an introductory essay, a volume forming part of Low's 'Bayard Series,' and entitled 'Christabel, and the Lyrical and Imaginative Poems of S. T. Coleridge. Arranged and introduced,' &c., 16mo, London, 1869. The 'Athenæum' for January 13, 1872, announced the completion of "the first part, entitled 'The Sailing of the Swallow,' of Mr. Swinburne's new poem, 'Tristram and Iseult,'" the prelude of which had appeared a few weeks before in an annual called 'Pleasure.'

SYME, JAMES, surgeon, was born in Kinross-shire in 1800. He was educated at Edinburgh, and in 1817 commenced his anatomical studies under Liston. In 1821 he was elected a member of the College of Surgeons, and from 1825 to 1832 he delivered courses of lectures in Edinburgh, which were considered to be of unusual excellence by the most eminent surgeons of the day. He maintained, partly at his own expense and partly by means of subscriptions, a special hospital where he delivered lectures on clinical practice. The operations which he effected on the patients were among the most successful and difficult in the whole range of surgery. In 1833 he was appointed to the chair of clinical surgery in the University of Edinburgh, and, with the exception of a short interval in 1847 and 1848, he held it till his resignation in 1869. He was surgeon to the Queen in Scotland. He died June 26, 1870, at Millbank, near Edinburgh. Professor Syme made many improvements in his art, more especially in his treatment

of senile gangrene, and in substituting the excision of the diseased part for the amputation of the limb. He wrote many works and papers on surgery, amongst them a 'Treatise on Excised Joints,' 1831; 'Principles of Surgery,' 1832, 2nd edition, 1856; 'Treatise on the Diseases of the Rectum,' 1838—46; 2nd edition, 1853; and others.

SYMINGTON, WILLIAM, one of the improvers of the steam engine, and co-inventor of steam navigation, was born about the year 1760, at Leadhills, in Lanarkshire, where his father was manager of the lead mines. He was trained at Edinburgh University, and was intended for the Church; but turned in preference to mechanical pursuits. Before his 21st year he had made improvements in the steam engine; and in 1785, while engineer at the Wanlockhead lead mines, near Sanquhar, he patented an invention connected with steam mechanism. At the same time he published a descriptive pamphlet, in which he claimed that his improved engine, with the same diameter of cylinder as Watt's, would produce more power, and with a less consumption of fuel. He at the same time offered to convert any other engine to his plan at a moderate expense. He obtained rotary motion without a beam; but his mechanism of chains, catches, and ratchet-wheels had eventually to be abandoned. Mr. Miller, of Dalswinton, saw a model of Symington's engine at Edinburgh in 1786, and conversed with Symington himself. Then followed the joint operations of Miller, Taylor, and Symington at Dalswinton Loch. [MILLER, PATRICK, E. C. S. col. 890; TAYLOR, JAMES, E. C. S. col. 1129] Symington, and after his decease, his relations asserted that both Miller and Taylor were conversant with his inventions before the Dalswinton experiments began—Taylor, as an old college acquaintance, and Miller through seeing the model at Edinburgh. The claims put forth by or for the other two inventors are noticed in the articles here cited. We need only add that the larger degree of credit seems to be due to Symington, who had evidently thought out the subject of the steam engine with great assiduity and intelligence in its principles and its details. Moreover, it is asserted that Fulton derived his idea of steam navigation from Symington—a statement disputed in America. Several years later, in 1801, Symington

took out a patent for a crank motion to turn paddle-wheels—a great improvement on his former chains and ratchets; he also compacted the machinery into a much smaller space than before, to suit the requirements of boats. In 1802 Lord Dundas, chairman of the Forth and Clyde Canal Company, invited Symington to try his engine on the canal. It was fitted to a boat called the 'Charlotte Dundas,' which drew two barges of seventy tons each nineteen miles and a half in six hours, against a strong head wind—by far the best achievement in steam navigation up to that time. Unfortunately, the company, apprehensive that the wash caused by the paddles would injure the banks of the canal, declined to pursue the matter further. The Duke of Bridgewater ordered eight of the new steamboats to be built for his canal, but his death caused the cancelment of the order. This was a blow to Symington's prospects, which he never overcame. He soon afterwards removed to London as a practical engineer; but his skill in dealing with mechanism was greater than in dealing with men; and he remained nearly unknown to the world. In 1824, after trying in vain for a small pension, the Government gave him 100*l.* and another 50*l.* soon afterwards, for his inventions of 1784—1802; and Mr. James Walker, the civil engineer, obtained a little more for him from the Thames steamboat owners. Symington died March 22nd, 1831, and was buried in Aldgate churchyard.

SZECHENYI, STEPHAN, COUNT VON. [E. C. vol. v. col. 879.] In retirement at Döbling, Count Szechenyi slowly recovered from the mental aberration referred to in the above memoir. He returned to his home, resumed his place in society, and began again to take part in industrial and political affairs. But the Austrian police pretended that he was engaged in intrigues against the government, and availed themselves of the publication in London of a pamphlet, entitled 'Ein Blick auf den anonymen Rückblick,' to subject his house to a search and his papers to examination. This indignity, and the knowledge that he was under strict police surveillance, threw him into a state of intense excitement, during which he shot himself on the night of April 7—8, 1860. (Recskmethy, *Graf Stephan Szechenyi's staatsmännische Laufbahn*, Pesth, 1866.)

T

TACHONI, or TACCONI, FRANCESCO, an Italian painter who practised his art with success at Cremona, in the last half of the 16th century. In 1464 Francesco and his brother Fillipo were exempted from the payment of municipal taxes as a reward for painting a loggia in the Town Hall, Cremona. The works of Francesco Tachoni are very rare. The latest known to have been executed by him were the doors of the organ in the church of St. Mark, Venice, which bore the date, May, 1490. In the National Gallery is a 'Virgin Enthroned,' inscribed "Francisi Tachoni," 1489. (Moschini; Wornum.)

TAINÉ, HIPPOLYTE ADOLPHE, a French writer on art, philosophy, and literature, was born on the 21st of April, 1828, at Vouziers, Ardennes, and was educated successively at the Collège Bourbon, where he carried off the rhetoric prize in 1847, and at the École Normale. In 1853 he took the degree of docteur-ès-lettres, upon which occasion he exhibited two theses, respectively in Latin and French, the former being entitled 'De Personis Platoniciis,' and the latter, 'Essai sur les Fables de La Fontaine,' 8vo, Paris, 1853, second edition, 1854, which was subsequently expanded and developed under the modified title of 'La Fontaine et ses Fables,' 12mo, Paris, 1860, new edition 1861. In March, 1853, he was appointed examiner in literature at the military school of Saint-Cyr; and on the 26th of October, 1864, was promoted to the professorship of aesthetics and art-history at the École impériale et spéciale des Beaux Arts at Paris.

M. Taine, who is a D.C.L. of Oxford, is the author of two books of travel, bearing the several titles of 'Voyage aux Eaux des Pyrénées, Avec 65 Vignettes par G. Doré,' 12mo, Paris, 1855, third edition, 8vo, 1860, and 'Voyage en Italie,' 2 vols., 8vo, 1866, of which an English translation by J. Durand was

issued, with the title of 'Italy, Naples, and Rome,' 8vo, London, 1867; 'Essai sur Tite-Live,' 8vo, Paris, 1856, second edition, 1860; 'Les Philosophes français du XIX^e Siècle,' 12mo, Paris, 1857, second edition, 1860; 'Essais de Critique et d'Histoire,' 12mo, Paris, 1858, and 'Nouveaux Essais,' &c., 8vo, Paris, 1865, each of which volumes consisted of a collection of articles originally contributed to the 'Revue des Deux Mondes,' the 'Journal des Débats,' and the 'Revue de l'Instruction publique;' 'L'Idéalisme anglais: Étude sur Carlyle,' 12mo, Paris, 1864, and 'Le Positivisme anglais: Étude sur Stuart Mill,' 12mo, Paris, 1864, each of which formed a part of the 'Bibliothèque de Philosophie contemporaine,' and the latter of which was translated into English, and published in 8vo, London, 1870; 'Philosophie de l'Art. Leçons Professées à l'École des Beaux Arts,' 12mo, Paris, 1865, and 'Philosophie de l'Art en Italie,' &c., 12mo, Paris, 1867, each of which formed one of the series entitled 'Bibliothèque de Philosophie contemporaine,' as did also a treatise 'De l'Idéal dans l'Art,' &c., 8vo, Paris, &c., 1867, English translation by J. Durand; 'The Ideal in Art,' 12mo, New York, 1870; 'De l'Intelligence,' 2 vols., 8vo, Paris, 1870; and 'Notes on England. Translated by W. F. Rae, with an Introduction by the Translator. Reprinted, with Additions, from the "Daily News,"' 8vo, London, 1872. The most characteristic of M. Taine's achievements, however, is perhaps his production of a work entitled 'Histoire de la Littérature anglaise,' 4 vols., 8vo, Paris, 1863-64, English translation by H. Van Laun, with a Preface by the author, 2 vols., 8vo, Edinburgh, 1871, in which, whilst his criticism is generally sympathetic, he propounds theories of some novelty and in accordance with the doctrines which have otherwise won for

him the reputation of a favourer of fatalism. The three primary forces which "call forth and regulate the unknown creations towards which the current of ages is drawing us," are race, *milieu*, and momentum. The literature of a nation depends on the national history and character, and it follows conversely that the history of a nation may be constructed from a perusal of its literature. From a literary work we can argue to the psychology of an individual, often to that of an epoch, and occasionally to that of a whole race. Thus a great poem, a fine romance, or the confessions of a man of superior intellect, will impart more instruction than a pile of histories, than fifty volumes of charters or a hundred volumes of treaties. In seeking for a national literature the most adapted for the illustration of his principles, M. Taine found it in the literary history of England, which he divides into four periods:—(1) *Les Origines*, which commences in the Scandinavian forests, and virtually ends with Chaucer and his followers; (2) the *Renaissance*, which has to deal with the colossal minds of the Elizabethan era, and lasts till the Restoration; (3) the *Age Classique*, including in its scope a magnificent procession of poets, essayists, historians, and orators, and bringing us down to the latter part of the eighteenth century; and (4) the *Age Moderne*, commencing with Burns, embracing the period of the "Lake Poets," and ending with Lord Byron.

* TAIT, RIGHT HONOURABLE and MOST REVEREND ARCHIBALD CAMPBELL, ARCHBISHOP OF CANTERBURY, son of Craufurd Tait, Esq., of Harviestoun, Clackmannanshire, a Scottish laird and lawyer, was born at Edinburgh, on the 22nd of December, 1811, and received his earlier education successively at the High School and the Academy of his native city. In 1827 he entered the University of Glasgow, and in 1830 was elected, by the votes of the professors, as an exhibitor on Snell's foundation to Balliol College, Oxford, where he gained an open scholarship within a month of his matriculation. He graduated as B.A. on the 5th of December, 1833, when he was first class in classics; proceeded M.A. on the 25th of May, 1836; took the degree of D.C.L. on the 20th of October, 1842; and was created D.D. in 1869. He became a fellow and tutor of his college; and in 1841, the year in which he acted as public examiner, was one of the four tutors who drew the attention of the University authorities to Tract XC. of the 'Tracts for the Times,' which, at a meeting of the Vice-Chancellor and Heads of Houses, March 15th, 1841, was censured for affirming the proposition that men holding the principles of the Church of Rome might honestly subscribe the Articles of the Church of England. The authorship of the Tract was next day acknowledged by the Rev. J. H. Newman, with an avowal of his continued belief in the soundness of its teaching. In 1838 Mr. Tait's proposed candidature for the lucrative professorship of Greek in the University of Glasgow, vacant by the death of Sir Daniel K. Sandford, was barred by the fact of his being a clergyman of the Church of England, in which he took deacon's orders in 1836, and was admitted to the priesthood in 1838. On the death of Dr. Arnold, June 12th, 1842, he was elected to succeed him in the head-mastership of Rugby School, and performed the duties of this office until 1849, when a severe illness, induced by his anxious and incessant application, which showed itself in the flourishing condition of the school, warned him to resign. Early in 1850 he received the appointment of Dean of Carlisle; where, although he subsequently professed in the House of Lords that he was a certain number of years in finding out what the duties of a Dean in the Church of England might happen to be, he displayed great activity in the origination of additional pulpit services on Sundays, in the visitation of the poor, the instruction of the young and ignorant, and the superintendence of charities. As custodian of the cathedral, one of his chief cares was the restoration of that building, which was effected at a cost of about 15,000*l.*; and it was mainly owing to his exertions that the Grammar School of the city was rebuilt, and its system of education extended and improved. He was also an active member of the Oxford University Commission, 1850—52, the secretary of which was his friend Dr. Stanley, in conjunction with whom he had formerly produced a pamphlet on the 'Revival of the Professorial System.'

Dr. Tait, who had married whilst at Rugby, lost five children by scarlet fever in the spring of 1856, a circumstance which evoked much sympathy from all quarters, including the highest, and which possibly quickened the perception of his merit on the occurrence of a vacancy in the see of London, consequent upon the retirement of Dr. Blomfield. He was appointed to the vacant bishopric in October, 1856, and was enthroned in

St. Paul's Cathedral on the 4th of December following. He signalled his incumbency, which extended over more than twelve years, by the kindly and comprehensive manner in which he was able to reproduce for himself the thoughts and position of others, to understand their difficulties, and to make allowance for their exaggerations. He brought to his new sphere of duty the same benevolent interest in the people which he had manifested in the artisans of Carlisle. He preached in Covent Garden Market; to the weavers of Bethnal Green; and to omnibus-drivers and cabmen in a stable-yard at Islington. He took part also in the special services at St. Paul's and at Westminster Abbey, where his sermons were characterised by their robust sense, their interesting reference to past or current history, their close, logical argument, and kindly and pointed appeal. The sermons delivered before the University of Oxford in his capacity of select preacher, 1844—45, are equally unaffected, while exhibiting more learning and elaboration. They were republished about fifteen years after their delivery, together with a few miscellaneous sermons, as an antidote to the 'Essays and Reviews,' and entitled 'The Dangers and Safeguards of Modern Theology. Containing Suggestions offered to the Theological Student under present Difficulties (a revised edition), and other Discourses,' 8vo, London, 1861. The most remarkable of Dr. Tait's exertions for the spiritual advantage of his diocese is his establishment of what is known as the "Bishop of London's Fund," propounded in May, 1863, for the purpose of a complete re-organisation of the church system in the metropolis, and an extension of it so comprehensive as to make up for arrears, and to provide for the exigencies of the future. His plan was to raise the sum of 1,000,000*l.* in the course of ten years; and although this has not been completely realised, a vast amount of beneficence in this direction has been the result. On the 4th of December, 1868, Dr. Tait was unanimously elected by the Dean and Chapter to the archiepiscopal see of Canterbury, in which he was confirmed on the 30th of December; and the duties of which, owing to his failing health, which necessitated first repose and then foreign travel, it was found expedient to lighten by the consecration, in 1870, of Dr. Edward Parry as Suffragan Bishop of Dover.

The incidental honours of Dr. Tait are numerous. He is one of the Lords of the Privy Council; an Extraordinary Visitor of Eton College; Visitor of All Souls' and Merton Colleges, Oxford; President of the Council of King's College, London; Visitor of Dulwich College, of St. Augustine's College, Canterbury, and of other collegiate and scholastic institutions; President of various religious societies; and a principal Trustee of the British Museum.

Dr. Tait has published several Lectures, Addresses, Speeches, and Charges; amongst the last of which may be especially mentioned his 'Charge delivered at his primary Visitation,' 8vo, London, first seven editions, 1858, which occupied five hours in speaking, and treated extensively the most pressing ecclesiastical matters of the day. Two other works remain to be particularised:—'The Word of God and the Ground of Faith. Sermons, &c.,' 2 parts, 8vo, London, 1863—64; and 'Harmony of Revelation and the Sciences, &c.,' 8vo, Edinburgh, 1864.

TAYLOR, ISAAC. [E. C. vol. v. col. 930.] In 1862 Mr. Taylor published a volume, entitled 'The Spirit of Hebrew Poetry,' which had been originally delivered as a course of lectures at Edinburgh. During 1864 he wrote a series of papers in 'Good Words,' with the general title of 'Personal Recollections,' and he was busily occupied in writing an essay on the religious history of England during the previous fifty years, when, in the spring of 1865, he was seized with the illness which, after three months of suffering, proved fatal. He died at his residence, Stanford Rivers, Essex, on the 28th of June, 1865, within a few weeks of the completion of his 78th year. A revised edition of his memoir of his sister, Jane Taylor, with 'The Family Pen,' an essay from the 'Personal Recollections' prefixed, appeared posthumously, under the editorship of his son, the Rev. Isaac Taylor, who added a brief sketch of his father's life; the title of the whole being 'The Family Pen. Memorials, Biographical and Literary, of the Taylor Family of Ongar,' 2 vols. 12mo, London, 1867.—His eldest sister, Mrs. GILBERT (Ann Taylor, born January 30, 1782, noticed in the E. C. memoir of the Taylors of Ongar), died at Nottingham, on the 20th of December, 1866, within a few weeks of having completed her 84th year. Isaac Taylor's eldest son,—

The REV. ISAAC TAYLOR, M.A., vicar of Holy Trinity, Twickenham, born at Stanford Rivers, March 3rd, 1829, is the author

of 'The Liturgy and the Dissenters,' and one or two other theological pamphlets; but he has best maintained the hereditary title of the Family Pen to literary distinction by the volume entitled 'Words and Places; or, Etymological Illustrations of History, Ethnology, and Geography,' 8vo, 1864, of which a "second edition, revised and enlarged," was published in 1865. This is a work of great research as well as erudition, and has done more towards the elucidation of the local names of English places than any book yet published.

TAYLOR, JAMES, one of the inventors of steam navigation, was born in 1758. In 1786, when tutor to the sons of Mr. Patrick Miller, of Dalswinton, Dumfriesshire, he was familiar with the experiments made by that gentleman on boats propelled by hand-worked wheels or paddles. According to a memorial presented to a committee of the House of Commons nearly thirty years afterwards, Mr. Taylor told Mr. Miller that the results of the experiments would not be important unless a better motive power were employed, and advised the trial of a steam engine to move the wheels. Mr. Miller asked Taylor to show how the engine could be connected with the wheels, which he did by means of a few rough sketches. Mr. Miller then desired Mr. Taylor to find an engineer who could construct a small steam engine suitable for the purpose. Mr. Symington was applied to, and the three then worked the idea into practical form, under the circumstances narrated in MILLER, PATRICK, E. C. S. col. 890, and SYMINGTON, WILLIAM, E. C. S. col. 1125. Mr. Taylor drew up an account of the man-boat voyage of 1787, and another of the steamboat voyage of 1788, for insertion in several Scotch newspapers; but in neither account did he mention his own name as an inventor. Another little steamboat, more successful than the first, was launched and tried in 1789; but Mr. Taylor could never again persuade Mr. Miller to continue his researches, or to take out a patent, which had at one time been proposed. This is all that seems to be known of Mr. Taylor's connection with steam-engine discoveries or inventions. Mr. Alexander Nasmyth, the artist, in a letter to Miss Taylor, in 1834, states that he was present at the conversation in 1787; that Taylor suggested the use of a steam engine; and that the suggestion was evidently a novel one to Miller; but the letter contains nothing further concerning the invention of steam navigation. Mr. Bennett Woodcroft, in an analysis of the evidence on this subject, states that Mr. Miller undoubtedly availed himself of the advice and assistance of Mr. Taylor in his several experiments; but he adds, "It is clear from his own statements and those of his friends, that he (Taylor) was neither the inventor of the machinery by which either of those boats was driven, nor of the mode of connecting the engine to the boat and wheels. This, it is admitted, was done by Symington. Neither was Mr. Taylor the first person to suggest the use of the steam engine to propel boats." In other words, his merits consisted in suggesting and assisting, not in discovering or inventing. Mr. Taylor died at Cumnock, Ayrshire, September 28th, 1825. The government gave a pension of 50*l.* per annum to his widow, and afterwards a gift of 50*l.* to each of his four daughters.

* TCHIHATCHEF, PIERRE DE, geologist and physical geographer, was born at Gatchina, near St. Petersburg, in 1812. His connection with the Russian Embassy at Constantinople led to his residence for three years in that city, and to his taking an interest in the scientific exploration of Asia Minor. In order to qualify himself for this task he quitted the diplomatic service in 1844, and went through a course of study at the Mining School of Freiberg. In 1846 he made a tour through the Altai Mountains, under the direction of his government, and wrote a report thereon. This done, he prepared for the more arduous work which he had planned by giving up his official appointment and realising his property. He has since passed most of his time in travelling about Asia Minor, and examining that country in its botanical, zoological, meteorological, geological, and archaeological aspects. The intervals between his various journeys have been mainly passed in Paris. The results of his researches have been given in various articles, but his great literary work is 'Asie Mineure, description physique, statistique et archéologique de cette contrée,' 7 vols. 8vo and 4to, Paris, 1853—1869. He is a member of the Academy of Sciences of France, and of many other learned institutions.

TEMPMINCK, CONRAD JACOB [E. C. vol. v. col. 956], was born at Amsterdam, March 31, 1778. Early in life he obtained a situation in the service of the Dutch East India Company, in which he had many opportunities of studying the objects of natural history, which were brought from time to time from the East Indies. His father, who had a taste for

natural history, became acquainted with Le Vaillant, and the specimens which that traveller brought home from Africa were prepared by the younger Temminck, who thus acquired great skill in the preservation of animals. His mode of preparing fishes is known as "Temminck's method." His intimacy with Le Vaillant had much influence in forming his taste for zoology, but Bernhard Meyer, the ornithologist, was his most influential friend and instructor. His first contribution to literature was a systematic catalogue of the collection of birds and monkeys which he had himself formed. His most important work was a 'Manuel d'Ornithologie,' which first appeared in 1815, but was afterwards enlarged into four volumes, 8vo, 1835—40. Another work of importance is a 'Nouveau Recueil de Planches coloriées d'Oiseaux,' folio, 1820—44, consisting of 600 plates. In 1820 he became director of the Natural History Museum at Leyden, which he soon rendered one of the finest museums in Europe. He always took an interest in the East Indies, and wrote several valuable works respecting them; amongst others, 'Coup d'œil général sur les possessions Néerlandaises dans l'Inde Archipelagique,' 3 vols. 8vo, Leyden, 1847—49. He superintended the 'Verhandelingen over de natuurlijke Geschiedenis des Nederlandsche over zeeische bezittingen,' 3 vols. folio, which was drawn up by the officers of the Leyden Museum. He materially assisted Von Siebold in his work entitled 'Fauna Japonica.' He was a member of most of the principal scientific bodies of Europe, and received many honours. He died January 30, 1858.

* TEMPLE, RIGHT REVEREND FREDERICK, BISHOP OF EXETER, son of the late Major Octavius Temple, Lieutenant-Governor of Sierra Leone, was born on the 30th of November, 1821, at Santa Maura, Ionian Islands; and was educated at Blundell's School, Tiverton, and at Balliol College, Oxford, where he entered in 1839, and of which he became successively scholar, fellow, and tutor. He graduated as B.A. on the 18th of May, 1842, when he was double first-class; proceeded M.A. on the 11th of March, 1847; and took the degrees of B.D. and D.D. in June, 1858. He was ordained deacon by Dr. Bagot, then Bishop of Oxford, on the 7th of June, 1846, and priest, by Bishop Wilberforce, on the 19th of December, 1847; and in 1848 was appointed principal of the Training College, Kneller Hall, near Twickenham. He resigned this office in 1855; and having for some time held an inspectorship of training schools, was elected head master of Rugby School, on the 12th of November, 1857, on the resignation of Dr. Goulburn, thus being the third Balliol scholar selected successively for this honour. He endeavoured to extend the efficacy of the school by widening the area of the operation of its endowments and advantages; a course of conduct for which, as well as for his defence of the proposed disestablishment of the Irish Church, he was attacked with offensive vigour and personality by Mr. C. N. Newdegate, on the 26th of October, 1868, when that gentleman met the supporters of the Conservative candidates for North Warwickshire, in the Town Hall, Rugby. Mr. Newdegate professed to find in his defence of the interests of his constituents, so far as these were concerned in the endowments of the school, a reason for the irritation of Dr. Temple; "and I am apprehensive," he said, "that his determination to take this property from you, and his hitherto want of success in that object, has exasperated him against me as your representative." Dr. Temple made several endeavours to mount the platform in the course of the strictures of Mr. Newdegate; but was opposed in every effort, and finally ejected from the meeting by force. He was recalled upon Mr. Newdegate's suggestion, but the meeting had become demoralised; and as no one could hear a sentence Dr. Temple spoke, the chairman in despair dissolved the assembly, declaring it impossible that it should be continued in consequence of the tumult and disturbances. The good service which Dr. Temple had done the Gladstone administration in the apology for measures which were so obnoxious to Mr. Newdegate, was, however, rewarded by his nomination to the bishopric of Exeter, October 1869; an appointment which gave rise to an excitement and discussion of almost national dimensions, on account of Dr. Temple's connection with the volume entitled 'Essays and Reviews,' 8vo, London, 1860, to which he had contributed the first of the seven articles of which it was composed. An opposition was organised, and at a meeting of the English Church Union, at Devonport, October 11th, 1869, it was unanimously resolved to request the Dean and Chapter of Exeter to refuse to act upon the royal congé d'élire. Dr. Pusey with unusual virulence described the appointment as a horrible scandal; and preferred disestablishment at once, which "must come in ten years at

latest," rather than that the Church should wait to be bared of all external help until after it had been paralysed by such appointments. The Bishop-nominate, Dr. Pusey said, was "recommended as the guardian of the faith which once he destroyed; as a chief pastor of the sheep whom once he betrayed to the wolf." The *congé d'élire* was "Gazetted" on the 26th of October; and about the same time Dr. Temple, in a letter to a public journal, expressed his regret at the anxiety and excitement caused by his nomination, and which he would be glad to be able to allay. Still he felt it inexpedient, as likely to form a precedent for the infringement of the liberty of the ministers of the Church, to make any other declaration than those which the law required. He declined, therefore, to offer any explanatory statement; and confidently trusted that personal intercourse with the clergy of his diocese would dissipate all uncomfortable feeling. On the 28th of October he received from the inhabitants of Rugby an address expressive of their mingled congratulation at his promotion and regret at his departure. His election took place on the 11th of November, when a majority of thirteen against a minority of six voted in his favour, the opposition in the Chapter being led by Dr. Trower, sub-dean of the diocese, and formerly Bishop of Gibraltar, who, with other remonstrants, renewed the opposition on the confirmation of the election, in Bow Church, London, on the 8th of December. The case of the objectors was stated at length by Dr. Deane, Q.C., and, at the close of his arguments, the Vicar-General, Sir Travers Twiss, declared that the statute gave him no discretion, and that he was bound to confirm the choice of the Dean and Chapter; upon which the Bishop-elect made the usual declaration. Still the opposition did not determine; and four bishops sent in written protests against his consecration, which took place on the 21st of December, in Westminster Abbey, whilst four other bishops, in a less formal manner, signified their dissent from the proceedings. The new bishop was enthroned in his own Cathedral of Exeter, on the 29th of December, when he preached a sermon from the text, "The Word was made flesh, and dwelt among us." It was now possible for Dr. Temple to make some concession; and at a meeting of Convocation, February 9th, 1870, it was announced by Archdeacon Freeman—authoritatively, although not on the Bishop's behalf—that the obnoxious essay should not appear in any future edition of the 'Essays and Reviews.' This announcement was met with another on the part of Archdeacon Denison, that he "would surcease from the opposition" he intended proceeding with against Dr. Temple; whilst the latter, on the 11th of February, explained that in withdrawing the Essay he did not mean any retraction of what he had written, or condemnation of the other essayists. He admitted the book might have done harm—Luther's writings had perhaps done harm—but it had done much more good. It was better, he thought, to allow discussion within the Church than to compel it to take an unhealthy form outside.

The academical and other educational experience of Dr. Temple has been in various ways turned to public account; and he is especially known as an important member of the Schools Inquiry Commission, whose 'Report,' folio, London, 1868, based upon nineteen other volumes of 'Evidence,' folio, London, 1868, is all but exhaustive and inestimable. It may be added that in the year after the publication of 'Essays and Reviews,' Dr. Temple published a volume, apparently intended as a manifesto of orthodoxy, entitled 'Sermons preached in Rugby Chapel in 1858—60,' 8vo, London, 1861.

TENERANI, PIETRO, CAVALIERE. [E. C. vol. v. col. 960.] This distinguished Italian sculptor died at Rome on the 15th of December, 1869.

TENNENT, SIR JAMES EMERSON, BART. [E. C. vol. v. col. 962.] Sir James resigned his secretaryship to the Board of Trade in 1867, and in the same year was made a baronet. He died suddenly, from apoplexy, in Pimlico, London, March the 5th, 1869.

* **TENNYSON, ALFRED, D.C.L.** [E. C. vol. v. col. 965.] The life, and it may be almost said the existence, of the Laureate is chiefly known to the outer world by the frequently recurring publication of his several works; one of the most remarkable instances of his breach of the rule of seclusion which ordinarily governs his conduct being his appearance at an Oxford Commemoration, at which the University conferred upon him the degree of D.C.L. The expected volume, the issue of which, as mentioned in the notice to which the present one is supplementary, had been delayed, was at length published with the title of 'Idylls of the King,' 8vo, London, 1858, &c., of which a new edition, with a noble 'Dedication' to

the memory of the late Prince Consort, was published in 1862, the 'Dedication' being one of the few poems the production of which has prevented the laureateship, in Mr. Tennyson's hands, from being a sinecure. The 'Idylls' consisted of four poems, which were severally published, with illustrations by Gustave Doré, as 'Enid,' folio, London, 1863, French translation, folio, Paris, 1869; 'Vivien,' folio, London, 1867, French translation, folio, Paris, 1868; 'Elaine,' 4to, London, 1867, French translation, folio, Paris, 1867; and 'Guinevere,' folio, London, 1867, French translation, folio, Paris, 1868. The 'Idylls of the King' present an image of the hero of ancient national romance, King Arthur, to the exposition of whose character and fate the author returned ten years afterwards in 'The Holy Grail,' and other Poems, 8vo, London, 1869, &c., in which, besides the eponymous poem, occur the legends entitled 'The Coming of Arthur,' 'Pelleas and Ettarre,' and 'The Passing of Arthur,' with a few miscellaneous poems, which include 'The Northern Farmer' and 'The Death of Lucretius,' the last of which had appeared a few months previously in 'Macmillan's Magazine.' The other more recent works of Mr. Tennyson include a short poem addressed to the Princess Alexandra, entitled 'A Welcome,' &c., 8vo, London, 1863, and an edition, illuminated by Owen Jones, 4to, London, 1863; and 'Enoch Arden,' and other Poems, 8vo, London, 1864, a volume which also contained 'Aylmer's Field' and 'Sea Dreams,' a shorter piece, originally published in 'Macmillan's Magazine,' and which, despite the apparent homeliness of the theme—the thoughts and conversations of a city clerk and his wife, in lodgings at the sea-side, on account of their little daughter's health—exhibits a high imaginative quality. It was in this volume that the public first became acquainted with 'The Northern Farmer,' to whom, as has been seen, Mr. Tennyson returned in 'The Holy Grail,' &c., and who presents an extraordinarily faithful picture of a stolid agriculturist pouring forth his ideas in the dialect of North Lincolnshire. An edition of 'Enoch Arden,' illustrated by Arthur Hughes, was published in 1865; a Danish translation, in 12mo, Copenhagen, 1866; and a Latin version, by W. Selwyn, in the following year, entitled 'Enoch Arden. Poema Tennysonianum, Latine redditum,' &c., 4to, London and Cambridge, 1867. Mr. Tennyson's latest volume is one containing twelve brief lyrics, which, about the year 1866, he was requested by Mr. Sullivan to produce as a "little song-cycle, German fashion, for him to exercise his art upon. He had been"—the words are from Mr. Tennyson's preface—"very successful in setting such old songs as 'Orpheus with his lute,' and I drest up for him, partly in the old style, a puppet whose almost only merit is, perhaps, that it can dance to Mr. Sullivan's instrument. I am sorry that my four-year-old puppet should have to dance at all in the dark shadow of these days [December, 1870]; but the music is now completed, and I am bound by my promise." The result of the labours of poet and composer was entitled 'The Window: or, the Songs of the Wrens. Words written for Music by Alfred Tennyson. The Music by Arthur Sullivan,' 4to, London, 1871. A recent poem, a new Idyll of the King, entitled 'The Last Tournament,' which appeared in the 'Contemporary Review' for December, 1871, had the effect of at once sending that periodical through several editions. Mr. Tennyson's works have been extensively circulated in this country and America, and indeed in all English-speaking countries; and translations of many of them have been made into the leading continental languages. 'A Selection from the Works of Alfred Tennyson' forms part of 'Moxon's Miniature Poets,' 8vo, London, 1865; and the 'Poetical Works,' &c., 4 vols. 16mo, Leipzig, occupy vols. 501—504 of the 'Tauchnitz Collection of British Authors,' 1841, &c. Amongst the works illustrative of his poems or his genius, may be mentioned, 'An Index to "In Memoriam,"' 8vo, London, 1862, "in which every separate clause is referred to under the headings of one or more of the principal words contained in it"; 'Analysis of Mr. Tennyson's "In Memoriam,"' 16mo, 1862, by the late Rev. F. W. Robertson, of Brighton, a small work well calculated to assist the general reader to a comprehension of the poem; Mr. A. H. Japp's 'Three Great Teachers of our own Time: being an Attempt to deduce the Spirit and Purpose animating Carlyle, Tennyson, and Ruskin,' 8vo, London, 1865; Mr. E. C. Tainsh's 'Study of the Works of Alfred Tennyson,' &c., 8vo, London, 1868, new edition, 1869 and 1870; 'A Concordance to the Entire Works of Alfred Tennyson. By D. B. Brightwell,' 8vo, London, 1869, and London and Bungay, 1870; and 'Horæ Tennysonianæ: sive Eclogæ e Tennysono Latine redditæ. Cura A. J. Church,' 8vo, London and Cambridge, 1870.

TESTA, PIETRO, called IL LUCCHESINO, a celebrated Italian painter and engraver, was born at Lucca in 1617. He was first a pupil of Paolini at Lucca, and then of P. da Cortona, at Rome, who, however, turned him out of his school for speaking disparagingly of his teaching. After this he studied the works of Domenichino; but his manner is considered to have been influenced by his intimacy with N. Poussin. He was a laborious student, and is said to have made drawings of all the principal antiquities in Rome. His imagination was fertile; he possessed much poetic feeling, his style was varied and vigorous, and he composed with facility; but he was of a gloomy temperament, sarcastic in speech, and unsocial, and he had few friends and fewer patrons. He drowned himself in the Tiber in 1650. His best pictures are 'The Death of Beato Angelo,' in S. Martino a Monte; 'Joseph sold by his Brethren,' in the Gallery of the Capitol; and 'The Massacre of the Innocents,' in the Spada Palace. He painted some works for churches in Lucca, and a cupola in the oratory of the Lippi Palace. Testa is perhaps more widely known as an engraver than a painter. He left many prints etched in a free and masterly manner from his own designs.

TEXIER, CHARLES-FELIX-MARIE, a distinguished French archaeologist, was born at Versailles, August 29th, 1802. Of a family of artists, his attention was in the first instance directed to architecture; he entered the École des Beaux-Arts, and published an essay, 'Sur les Ports des Anciens,' which was crowned in 1831 by the Académie des Inscriptions, and another on the 'Architecture et la Lithologie anciennes.' But gradually his attention was directed to archaeology, and in 1833 he was entrusted by the French government with the conduct of a mission to Asia Minor, to examine the vestiges of antiquity remaining or discoverable there. During the next ten years he made four visits to that region, and whilst there diligently explored, measured, and made drawings of the various ancient monuments. At home he devoted himself with equal zeal to working out for publication the results of his researches. In 1839-49 he published, under the auspices of the government, a 'Description de l'Asie Mineure: Beaux-arts, Monuments-historiques, Plans et Topographies des Cités antiques,' 3 vols. folio; and in 1842-52 a 'Description de l'Arménie, de la Perse, et de la Mésopotamie,' 2 vols., folio. These superb works, richly illustrated with line engravings and chromolithographs from the drawings of the author, are as instructive and valuable to the archaeologist, and to all whose studies lie in the direction indicated by the titles, as they are gratifying to the admirers of handsome books. He has since published 'Édesse et ses Monuments,' 8vo, Paris, 1859; 'Asie Mineure,' 8vo, 1863; and in conjunction with Mr. P. P. Pullan, 'L'Architecture Byzantine; ou Recueil de Monuments des premiers temps du Christianisme en Orient,' English and French editions, folio, London, 1864. M. Texier received the decoration of the legion of honour in 1837, and was elected a member of the Académie des Inscriptions in 1855. He died at Paris, July 1, 1871.

THACKERAY, WILLIAM MAKEPEACE [E. C., vol. v., col. 982]. Whilst Mr. Thackeray was at Oxford as a candidate for the representation of that city in the House of Commons, he despatched his agent to Mr. Dickens, urging the latter to "come down to make a speech, and tell them who he was, for he doubted whether more than two of the electors had ever heard of him, and he thought there might be as many as six or eight who had heard of Mr. Dickens." Just after the failure of his candidature he delivered a public lecture in London, which he introduced with a reference, that was full of good sense, good spirits, and good humour, to his electioneering disappointment.

One of the most salient events of the later life of Mr. Thackeray, besides his ordinary activity in the way of literary production, was his connection with the 'Cornhill Magazine,' the first number of which was brought out under his editorial care in January, 1860, and which he continued to conduct until the 1st of April, 1862. His reign of little more than two years, was characterised by qualities which endeared him to his collaborators. "He was," says Mr. Anthony Trollope, in a short obituary article in the 'Cornhill,' for February, 1864, "the kindest of guides, the gentlest of rulers, and, as a fellow-workman, liberal, unselfish, considerate, beyond compare. It has been said of him that he was jealous as a writer. We of the 'Cornhill' knew nothing of such jealousy. At the end of two years Mr. Thackeray gave up the management of the magazine, finding that there was much in the very nature of the task which embarrassed and annoyed him. He could not bear to tell an ambitious aspirant that his aspirations were in vain; and, worse again, he could not endure to do so when a lady was his sup-

pliant. Their letters to him were thorns that festered in his side, as he has told us himself. In truth it was so. . . . He lacked hardness for the place, and therefore, at the end of two years, he relinquished it." But in quitting office, he did not sever his connection with the Magazine as a contributor. His 'Roundabout Papers,' 8vo, London, 1863, and other editions, were commenced in the first number of the 'Cornhill,' were carried on through 1862, and were completed in the early part of 1863. 'Lovel the Widower,' 8vo, London, 1861, and other editions; and 'The Four Georges,' 8vo, London, 1861, which had previously been delivered as lectures in America and in England, appeared in the 'Cornhill' under his own editorship, and a French translation of the latter 'Les Quatre Georges,' &c., 12mo, Paris, 1869, by M. Le Foyer, with a Preface by M. Prévost-Paradol, formed part of the collection entitled 'Bibliothèque d'Histoire contemporaine.' 'Philip' was commenced in like circumstances, but was completed after its author had vacated the editorship. This work, the most elaborate of all his contributions to the 'Cornhill,' was published with the title of 'The Adventures of Philip on his Way through the World: showing who robbed him, who helped him, and who passed him by,' 3 vols., 8vo, London, 1862. The last words Mr. Thackeray lived to publish, were those of a paper which appeared in the 'Cornhill' for November, 1863, entitled 'Strange to Say, on Club Paper;' in which he ridiculed a silly report as to Lord Clyde, then recently deceased, which had spread itself about the town. When Mr. Thackeray died he was still at work for the 'Cornhill,' for which he left an incomplete novel, upon which he wrought, as it seemed to Mr. Dickens, "in the healthiest vigour of his powers. In respect of earnest feeling, far-seeing purpose, character, incident, and a certain living picturesqueness blending the whole, I believe it to be much the best of all his works. That he fully meant it to be so, that he had become strongly attached to it, and that he bestowed great pains upon it, I trace in almost every page. . . . The condition of the little pages of manuscript where Death stopped his hand, shows that he had carried them about, and often taken them out of his pocket here and there, for patient revision and interlineation." The fragment thus feelingly commended by the author's friend and fellow-novelist was published in the 'Cornhill,' and afterwards in a substantive form, with the title of 'Denis Duval,' 8vo, London, 1867; in which year a volume appeared in America, with an introductory essay by J. T. Fields, entitled 'Early and late Papers hitherto uncollected,' 8vo, Boston and Cambridge (U.S.), 1867. The only remaining work calling for individual mention is 'The Virginians: a Tale of the Last Century,' 2 vols., 8vo, London, 1858-59, which, like many other of the author's productions, formed a part of the Tauchnitz Collection of British Authors, and has been frequently reprinted in this country and America. The smaller productions of Mr. Thackeray have been combined in various groupings both in English and in foreign languages; many of his works have been translated into French, chiefly as forming part of a series entitled 'Bibliothèque des meilleurs Romans étrangers;' and most of them have been translated into German. He had suffered from attacks of illness—cold shiverings "which quite took," as he said, "the power of work out of him"—for more than a week before he died; but the fatal event came suddenly and unexpectedly. On the night of Christmas Eve, December 24th, 1863, he was found lying with his head back on his pillow and with his arms thrown up, according to his custom when very weary, so peaceful, composed, and undisturbed, that he appeared to be asleep. But in fact he was dead; and on the 30th of December, he was buried in a simple grave at Kensal Green, where, wrote Mr. Dickens, "the heads of a great concourse of his fellow-workers in the Arts, were bowed around his tomb." A bust by Marochetti has since been erected to his memory in Poet's Corner, Westminster, and near it his friend Dickens now lies.

Of the works published in illustration of his life and career may be mentioned Mr. James Hannay's 'Brief Memoir,' &c., 8vo, Edinburgh, 1864, reprinted from the 'Edinburgh Courant;' Mr. William B. Reed's 'Haud Immemor: a few Personal Recollections of Mr. Thackeray in Philadelphia.' [With Extracts from his Correspondence], 8vo, Philadelphia, 1864, privately printed; Mr. Theodore Taylor's 'Thackeray, the Humourist, and the Man of Letters. The Study of his Life, including a Selection from his Characteristic Speeches, now for the first time gathered together,' 8vo, London, 1864; and 'Studies on Thackeray,' 16mo, London, 1869.

THEED, WILLIAM, R.A., was born in 1764; became a student of the Royal Academy in 1786, and practised for a while

as an historical and portrait painter. He then went to Rome and by the advice of Flaxman, learned to model and use the chisel, and studied the ancient sculpture. On his return to England, Flaxman introduced him to Wedgwood, by whom he was employed to make designs for his pottery; and some years later he was engaged as designer and modeller by Messrs. Rundell and Bridge, the silversmiths, in whose service he remained for fourteen years. For these firms he made designs of great beauty and refinement; his independent works include several pieces of great merit, the best known being the bronze group of 'Thetis with the arms of Achilles,' in the royal collection, of which he executed a duplicate for Mr. Hope. In his later years he was much occupied on monumental sculpture. He was elected A.R.A. in 1811 and R.A. in 1813, and died in 1817. His son,

* WILLIAM THEED, born about the beginning of the century, the pupil of his father and of the Royal Academy, has also attained distinction as a sculptor. His early works were classical or scriptural as 'Prometheus,' 'Psyche,' the groups of 'Rebekah at the Well,' 'The Prodigal's Return,' &c., and within the last few years he has executed a series of reliefs for the Houses of Parliament, a colossal statue of the Bard for the Mansion House, Burke for St. Stephen's Hall, and other works of a poetical and historical order, but he has been more employed on portrait busts and statues, in which he has achieved a reputation for fidelity of likeness, animation of character, and elevation of style: among well-known examples are his Sir James Mackintosh in Westminster Abbey, Hallam in St. Paul's, Sir Isaac Newton, at Grantham, the Prince Consort at Balmoral, and the group of the Queen and Prince Consort, in Saxon costume of the nineteenth century, in the principal corridor of Windsor Castle.

THIERS, ADOLPHE. [E. C. vol. v. col. 1029.] For the first twelve years of the rule of Louis Napoleon, whether as President or Emperor, M. Thiers devoted himself exclusively to literature, painting, and the fine arts; and did not re-enter the Chamber until June, 1863, when he was elected for Paris, with MM. Émile Ollivier, Jules Favre, and other opposition candidates, the particular constituency of M. Thiers being the second circumscription of the Seine. He successively attacked the administration of the finances, the municipal administration of M. Haussmann, and the foreign policy of the Emperor. He denounced the conduct of France with regard to Rome and Italy, with regard to the Mexican expedition, and with regard to the war between Prussia and Austria in 1866. In the long and memorable debate of March, 1867, when M. Rouher, apologising for the Government, maintained that it had committed no faults, M. Thiers concentrated his opposition in the taunt, "Vous n'avez plus de fautes à commettre." All the speeches he afterwards delivered upbraided the government with the loss of its foreign prestige, and tended to precipitate France into the disastrous war of 1870, repeatedly reproaching the Emperor with allowing the union of North Germany to be accomplished without intervening to prevent it; and yet, when war became inevitable, M. Thiers bitterly opposed it as inopportune, and demonstrated that the government was unprepared, and was rushing headlong to certain defeat. The war, in his opinion, came too soon; in the opinion of others, his warning came too late.

A few months before the war broke out, M. Thiers had explained to a friend the plan he had traced out for passing his declining days. "See here," he said, laying his hand on a pile of papers, "these are the materials I have gathered for making my political testament. Here is deposited my experience of men and things. Out of these notes I mean to extract a philosophy of history as I understand it—that is, such a work as I might leave to my son, if I had one, to guide him in his conduct through life." The performance of such a work is presumably held in abeyance, and it will not be strange if it never advances beyond the stages of promise and intention.

The early disasters of the war summoned M. Thiers to prominence and activity. On the 17th of August, 1870, he expressed a hope that Paris would, in case of necessity, oppose an invincible resistance to the enemy. For that purpose he insisted that it was necessary to make a waste round Paris, with the double object of depriving the enemy of sustenance and of causing abundance in the capital by allowing the people of the surrounding country to take refuge in it with all their produce. On the 27th of August he was appointed a member of the Paris Defence Committee; and although he declined to become a member of the Government of National Defence, formed after the downfall of the Empire, he assumed the position of a negotiator abroad for the purpose of requesting the intervention of the neutral

nations to drive Germany back beyond the frontiers of France, if the Germans should not immediately retire upon their remonstrance. Accordingly, he arrived in London on the 13th of September, and, after conferences with Mr. Gladstone and Earl Granville, left on the 18th to prosecute his mission at the courts of St. Petersburg, Vienna, and Florence, the last of which cities he left, on his return to Tours, on the 18th of October. Ten days afterwards, in accordance with the proposal of the four neutral powers, he proceeded, as envoy extraordinary of the French Republic, to Versailles, then the Prussian head-quarters; and, having received from the Paris government the completion of the powers with which he had been entrusted by the Delegation at Tours, opened negotiations with Count Bismarck on the 1st of November for a twenty-five days' armistice, which should stay the effusion of blood, and should allow France to constitute, through elections freely held, a regular government, with which it would be possible for Prussia to treat in a valid form. The negotiations were broken off on the 6th of November on the question of the revictualling of the besieged fortresses, and specially of Paris, during the armistice, a concession which was refused by Count Bismarck in deference to the representations of the Prussian military leaders; and M. Thiers returned to Tours to place himself again at the disposal of the Delegate Government, which on the 9th of December removed from Tours to Bordeaux, the former of which towns fell on the 21st of the same month into the hands of the Prussians.

The surrender of Paris on the 28th of January, 1871, was followed on the evening of the same day by an armistice which was arranged in order that elections might be held throughout France for a National Assembly, which was to meet at Bordeaux, for the purpose of concluding peace with the German Empire. To this Assembly M. Thiers—who was only twentieth on the list of members elected by the constituencies of the capital—was returned by one-third of the nation; and this unrivalled popularity, which itself was a sign of the universal appreciation of his patriotic endeavours, naturally pointed him out to the Assembly as the future head of the Provisional Government, and one of the first acts of the Chamber, which met for a preliminary sitting on the 12th of February, was to confer that dignity upon him, February 17th. Two days afterwards he delivered a speech in the National Assembly, in which he stated that, although appalled at the painful task imposed upon him by the country, he accepted it with obedience, devotion, and love, and with hope in the youth, resources, and energy of France. Besides the prerogatives of the Chief of the State, he enjoyed the privileges of a deputy, and was allowed to take part in the deliberations of the Assembly whenever he pleased—a circumstance which, however it may have subsequently been a hindrance to public business, he turned to good and decisive account, when, during the debates on the terms of peace, he had to counteract and control the passionate appeals of such deputies as M. Keller and other advocates of *guerre à outrance*, who protested against the abandonment of any portion of French territory.

On the 28th of February, M. Thiers introduced to the Assembly the treaty of peace, which he had assisted to conclude on the 26th at Versailles, subject to the ratification of the National Assembly, which was sorrowfully voted on the succeeding day by a majority of 546 over 107. By this treaty France had to submit to the loss of a fifth part of Lorraine, including Metz and Thionville, and Alsace, less Belfort, and to the payment of a war indemnity of five milliards of francs, or 200,000,000*l.* This enormous sum was to be paid by successive instalments, extending over a period of three years, or up to the month of May, 1874. A certain number of the departments of France were to be occupied by German troops as a security for the fulfilment of the pecuniary engagements of the conquered country, and were to be redeemed only in the same proportion as the obligations were discharged. The object nearest to the heart of M. Thiers has been to precipitate the emancipation of French territory; and his government has been enabled already to pay three half-milliards of francs, or 60,000,000*l.*, in consequence of which the immediate neighbourhood of the capital and several western and northern departments have been already set free. By an "evacuation treaty" concluded at Berlin on the 12th of October, 1871, the German government consented to the acceptance of negotiable bills for a fourth half-milliard in the place of cash, in order to accelerate the restoration to France of six other departments, the evacuation of which by the Germans had otherwise been fixed for the beginning of May, 1872.

Early in March, 1871, the National Assembly removed to Versailles; on the 18th of that month Paris fell into the hands of the Communists, who, about the 15th of May, destroyed the house of M. Thiers; and it was only on the 28th of May that the capital was completely recovered to the government by the army of MacMahon. The supplementary elections of July gave additional power to the policy of M. Thiers in the Assembly; which, by a law passed by a very large majority on the 31st of August, prolonged his tenure of office "until it shall have concluded its labours," increased his powers, and changed his designation from "Chief of the Executive Power" to that of "President of the French Republic." At the opening of the sitting of the National Assembly on the 1st of September, M. Grévy, its president, read a first "Message" of thanks and encouragement to the Assembly, in which the new President of the Republic pledged himself to the utmost devotion for the benefit of his country. In a longer "Message" from M. Thiers, prepared on the eve of prorogation, and read before the Assembly on the 13th of September, by M. Jules Simon, the President of the Republic recited the long and important labours performed by the Assembly during the period of nearly eight months that it had been in session. "To complete peace, to gather up again the reins of government, which had fallen off or become loosened, to transport the entire administration from Bordeaux to Versailles, to deal with the most terrible insurrection of any time, to restore credit, to pay our ransom to the enemy, to watch continually all incidents connected with the foreign occupation in order to guard against consequences sometimes very alarming, to undertake a reconstitution of our army, to re-establish our commercial relations by negotiations with all our neighbours, to effect the liberation of our soil (which is every day progressing), and to endeavour to restore order to men's ideas, after restoring it in respect of acts—such has been the work which during the past eight months we have performed together." The Message then proceeds with a heavy programme for presidential and ministerial labour during the recess, and to foreshadow the future duties of the Assembly. "My colleagues and myself," the President resumes, "do not seek for rest: what we ask for is time to work, to prepare the subjects for your deliberations next year; to draw up a normal Budget, if possible; to complete the practical reorganisation of the army as relates to the reconstitution of our regiments, to restore to them the unity which they have lost, to equip them, to distribute them, to arm them; to observe the course of the administration, to regulate it according to your views and ours; to terminate the negotiations which should place our commercial system upon a fixed basis; finally, to continue that infinite and incessant task—the reorganisation of a country cast into disorder by two terrible wars, domestic and foreign wars unexampled in their character, but the effects of which may be modified by our common devotion." M. Thiers recommended the deputies, upon their separation and departure for their own homes, to gather up public opinion in their several localities, so that they might bring back to a resumption of their labours sufficient light and knowledge upon the great question—which had been held in abeyance from February to September, in virtue of the "Pact of Bordeaux"—as to "whether it is after the tradition of the past—the glorious tradition of a thousand years—that our country is to be constituted, or whether, abandoning itself to the torrent which to-day precipitates human societies towards an unknown future, it is to put on a new shape in order peacefully to fulfil its noble destinies. This country, the object of passionate attention by the universe—shall it be a Republic or a Monarchy?"

On the 17th of September, four days after the delivery of the Message, the Assembly was prorogued to the 4th of December, during which interval a committee of twenty-five of its members, elected for that purpose, was to watch over the course of the government in accordance with the provisions of the Constitution of 1848. On the 26th of September, Senor Olozaga, the Spanish ambassador, presented to M. Thiers a royal warrant by which the King of Spain conferred upon the President of the French Republic the Order of the Golden Fleece.

After a recess, during which M. Thiers endeavoured to prepare the way to a settlement of those questions to which his Message had particularly referred, and during which he had manifested especial interest in military affairs, had expressed his willingness to give an asylum to the Pope, and had received, November 23rd, the Chinese ambassadors who had waited a year for the ceremony, the Assembly re-opened at Versailles on the

BIOG. DIV.—SUP.

4th of December. M. Thiers, who seemed to wish to gather up the expressions of provincial and parliamentary sentiment before expressing his own, did not deliver his Message until the 7th of December, when it was received with demonstrations of applause now from one side of the Chamber, now from the other, and again from neither. He reviewed at great length the condition and prospects of the country, but with less courage and decision than had led him, either in his valedictory Message of September 16th or during the preceding session of the Assembly, to express, upon more than a dozen important subjects that would have to be debated, opinions in opposition sometimes to the feeling of one section of the Chamber, sometimes of the other, and frequently of both. Scarcely a step has been definitively taken; and the Assembly, which, with the consent of the Government, declared itself constituent, still maintains (March, 1872) a provisional republic, although one or both of the monarchical parties have from time to time displayed impatience. One of the most significant events of recent occurrence has been the taking of their seats by the Orleans princes, the Duc d'Aumale and the Prince de Joinville, who for several months had failed of their duty as representatives of constituencies, owing to the promise which they had given to M. Thiers, when chief of the executive power, not to take their seats. Being at length relieved from their engagement, they entered, December 19th, on the active duties of members of the Assembly, where, although they profess themselves ready to accept a republic, they cannot help at the same time representing royalty.

At the official reception given by M. Thiers on the 1st of January, 1872, the Papal Nuncio did not, as formerly, speak in the name of the Diplomatic Body. Every ambassador or head of legation addressed the President separately, who, in his turn, replied separately to each. On the same day M. Thiers received numerous congratulatory telegrams, one of which was commissioned with the good wishes of the Emperor of Germany for the success of the patriotic efforts of the President of the French Republic.

Of M. Thiers' literary labours, the completion of his great work should be noticed, '*Histoire du Consulat et de l'Empire, faisant suite à l'Histoire de la Révolution Française*,' 20 vols. 8vo, Paris, 1845—62, vol. 21, '*Table Analytique*,' 8vo, Paris, 1869, English translation, by D. F. Campbell, 20 vols. 8vo, London, 1845—62, Modern Greek translation, by X. B. *Βουγιωρakis*, 8vo, Athens, 1860, &c., illustrated edition, 4to, Paris, 1865; and he has also published many of his speeches:—'*Discours prononcés dans la Session 1863—1864, sur la Dette flottante, les Libertés nécessaires à la France, les Candidatures officielles, l'Expédition du Mexique, la Marine marchande, et les Finances de la France*,' 8vo, Paris, 1864; '*Discours . . . sur la Politique intérieure. Corps Législatif, Discussion de l'Adresse, Séance du 11 Janvier, 1864*,' 12mo, Paris, 1864; '*Discours . . . sur l'Expédition du Mexique, prononcés dans la Discussion de l'Adresse au Corps Législatif, Séances des 26 et 27 Janvier, 1864*,' 12mo, Paris, 1864; '*Discours sur les Libertés Politiques, prononcé . . . au Corps Législatif dans la Séance du 28 Mars, 1865*,' 8vo, Paris, 1865; '*Discours . . . sur la Question Romaine, prononcés les 13 et 15 Avril, 1865, au Corps Législatif*,' 12mo, Paris, 1865; '*Discours . . . sur les Libertés Politiques, la Question Romaine, et les Finances*,' 3 parts, 8vo, Paris, 1865; '*Discours . . . sur la Politique extérieure, prononcé au Corps Législatif dans la Séance du 3 Mai, 1866*,' 8vo, Paris, 1866; '*Discours . . . sur les Principes de 1789*,' &c., 8vo, Paris, 1866; '*Discours . . . sur la Politique extérieure de la France, spécialement en ce qui concerne l'Allemagne et l'Italie, prononcés au Corps Législatif dans les Séances des 14 et 18 Mars, 1867*,' 8vo, Paris, 1867; '*Discours . . . sur l'Expédition du Mexique, prononcés au Corps Législatif dans les Séances des 9 et 10 Juillet, 1867*,' 8vo, Paris, 1867; Speeches, collected in a popular edition, entitled '*Discours prononcés au Corps Législatif. Mexique. Question Romaine. Les Libertés nécessaires. Agriculture. Affaires d'Allemagne*,' 12mo, Tours, 1867; and '*Discours prononcés au Corps Législatif sur la Question Romaine . . . et sur la Politique extérieure*,' &c., 12mo, Tours and Paris, 1868.

THIERSCH, FRIEDRICH WILHELM. [E. C. vol. v. col. 1031.] Professor Thiersch was elected president of the Munich Akademie der Wissenschaften in 1848. He died on the 25th of February, 1860. (*Friedrich Thiersch's Leben*, by his son, Heinrich Thiersch, 2 vols. 8vo, Leipzig, 1866.)

*THOMAS, MAJOR-GENERAL GEORGE HENRY, of the United States Army, was born in Southampton County, Virginia, July 21st, 1816. He entered the West Point Military Academy

in 1836, received four years' training, left the academy in 1840, and entered on his soldier's career as sub-lieutenant of the third regiment of artillery. He became first lieutenant in the following year, and was for some time engaged in operations against the Florida Indians. During the war with Mexico, 1846 and 1847, he greatly distinguished himself, and was promoted to the rank of captain, and afterwards to that of major. In 1848 he served again in Florida; then for a few years was professor of artillery studies at West Point; and, in 1855, fought against the Indians in Texas, as major of the second cavalry. When the civil war broke out in 1861, the superior officers of the regiment (one of whom was Robert Lee) went over to the Confederates; whereupon Thomas, who remained with the Federals, at once became colonel of the regiment. In November he was appointed brigadier-general of volunteers. Early in the following year he defeated Zollikofer at Somerset, in Kentucky, and by an effective flank movement drove him beyond the Cumberland. Promoted to the rank of brigadier-general in the regular army, he took the command of the first corps of the army of Ohio in October, 1862, under Rosecranz. He led the centre at Murfreesboro, fought stubbornly, chased the enemy from Tullehorna, won a cavalry action at Morris Ferry, and compelled the enemy to evacuate the region near the river Elk. In September, 1863, when Rosecranz, after taking up a strong position at Chattanooga, was defeated by Bragg at Chickamauga, Thomas, by his firmness, partially retrieved the loss of the day, and was rewarded with the command of that army. In November Sherman and Thomas defeated Bragg at Chattanooga. Acting under General Grant, Thomas was engaged in much active service in 1864. Amongst other engagements, he repelled an attack made by Hood at Franklin, and shortly afterwards defeated him near Nashville, thereby clearing Tennessee from the enemy. With the rank of major-general, Thomas earned the credit of being a cool and steady, rather than brilliant officer. Since the war he has been engaged in the command of some of the military districts into which the United States were reorganised.

THOMAS, JOHN, sculptor and architect, was born at Chalford, Gloucestershire, in 1813. Whilst apprenticed to a stone-cutter in a neighbouring village, he taught himself to paint and engrave, and thus earned a few extra shillings by engraving door-plates and painting sign-boards in his over hours. When out of his time he was for awhile with a brother, an architect in Birmingham, and later in Leamington. Under his direction, Mr. Thomas carved and erected an elaborate Gothic monument at Huntingdon, and some other works of a like kind. These procured for him the commission to execute the stone carvings of the Grammar School, Birmingham, of which Mr. (afterwards Sir Charles) Barry was the architect, and thus laid the foundation of his future prosperity. For so well satisfied was Barry with his work, that when he had to erect the New Houses of Parliament, he gave Mr. Thomas the commission to superintend the whole of the stone carvings of that vast edifice. On this immense work the best years of his life were spent. All the statues, as well as carvings of the exterior, the decorative stone carvings of the interior, and some of the bronze statues of the barons, were designed by him, and executed under his superintendence. His labours on the Houses of Parliament brought him into general notice, and he received commissions for architectural and decorative sculpture far beyond any other sculptor of his day, and which it required a large establishment to supply. Among other works he executed some on an important scale at Buckingham Palace and Windsor Castle; at the Euston Station of the North-Western Railway; the colossal lions for the Britannia Tubular Bridge; the carvings for the National Bank, Glasgow, and for a large number of other companies and commercial establishments. He also executed the interior as well as external carvings of many private mansions, among them being the costly internal decorations for the late Mr. Holdsworth, of Glasgow. But whilst thus extensively occupied on decorative sculpture, Mr. Thomas devoted a good deal of time to works of a more ambitious order. Of this class, he exhibited at the Royal Academy statues or groups in marble of Musidora, a Nymph (for her Majesty), 'Boadicea addressing the Britons,' 'Lady Godiva on Horseback,' and 'Una and the Lion.' He also executed many portrait statues, and busts of the Prince Consort, Maclise, Frith, &c. To these must be added several memorial statues, including those of Mr. Sturge, at Birmingham, and Sir Hugh Middleton, erected at Islington shortly after the sculptor's death. His most pretentious effort in this line, however, was the colossal memorial of Shakespeare, of which the model formed a conspicuous object in the International Exhibition of 1862.

The same building also contained his principal work in ornamental art, the well-known majolica fountain under the eastern dome, constructed by Messrs. Minton from Mr. Thomas's designs, and since erected in the garden of the Horticultural Society. As an architect, Mr. Thomas designed Somerleyton hall and village, Norfolk, for Sir Morton Peto; Preston Hall, Maidstone, Kent, for Mr. Betts; the Earl of Harrington's town house at Kensington, and some others. Mr. Thomas was the most distinguished architectural sculptor of his day; a man of various accomplishments, of considerable inventive and executive skill, and of indefatigable industry; but honourable as his works were, he was more of a manufacturer than an artist in the higher sense of the term. He died April 9th, 1862.

THOMPSON, JOHN, an eminent wood engraver, born in 1785, was a pupil of Mr. Branston. He engraved the vignettes for Whittingham's Cabinet Library; many of the woodcuts in Mr. Charles Knight's and Mr. Van Voorst's illustrated works, and other of the high-class publications of the time; and much of the best work issued by French publishers before French wood engravers attained their present skill. A large number of William Harvey's best drawings, and the whole of Mulready's illustrations to the 'Vicar of Wakefield,' were cut by him; as were also Mulready's celebrated postage envelope, and Maclise's figure of Britannia for the Bank of England notes. Thompson was perhaps the best wood engraver, especially of figure pieces, of recent times. His execution was neat, firm, spirited and thoroughly artistic. He belonged to the time and school of English artists who engraved their blocks without the aid of journey-work, and was one of the ablest and most conscientious of the school. In his later years he conducted the class of female students in wood engraving at the Central School of Design, and he presented to the South Kensington Museum an excellent collection of examples illustrating the history of wood engraving, including proofs of the finest of his own cuts. He died at Kensington on the 20th of February, 1866.

THOMPSON, MAJOR-GENERAL THOMAS PERRONET, F.R.S. [E. C. vol. vi. col. 9.] General Thompson retained his seat as member for Bradford till 1859, when failing health led to his retirement. He died at his residence, Blackheath, near London, on the 7th of September, 1869, at the ripe age of 86.

THOMSON, MRS. A. T. [E. C. vol. vi. col. 12.] Katherine, the wife of Dr. Anthony Todd Thomson, was the daughter of Thomas Byerly, Esq., of Etruria. Besides the works enumerated in the article cited, she wrote a 'Life of Wolsey' for the series of lives published by the Society for the Diffusion of Useful Knowledge; a 'Life of Raleigh'; 'Memoirs of Villiers, Duke of Buckingham'; and a novel, 'Constance.' Her latest works were light, anecdotal volumes, entitled 'Wits and Beaux of Society,' 'Queens of Society,' and 'Literature of Society,' written in conjunction with her son, J. C. Thomson, but published as "by Grace and Philip Wharton." Mrs. Thomson died at Dover on the 19th of December, 1862. Her son, J. C. Thomson, was drowned whilst bathing at Tenby a few months before.

* THOMSON, RIGHT HONOURABLE AND MOST REVEREND WILLIAM, Archbishop of York, was born on the 11th of February, 1819, at Whitehaven, where his father was engaged in the local commerce of the place; and was educated at Shrewsbury Grammar School, and at Queen's College, Oxford, of which he was successively scholar, fellow, tutor, dean, bursar, and provost, and with which he still continues to be connected as visitor. He took a third-class degree as B.A. on the 25th of June, 1840; proceeded M.A. on the 26th of January, 1844; and took the degrees of B.D. and D.D. in 1856. He was ordained deacon in 1842, and priest in 1843; and, after four years' experience of parochial work at Guildford and Cuddesden, returned to Oxford, where he acted as a tutor of his college, and was chosen, in 1848, select preacher to the University. Soon afterwards he published a work which, considering its subject, has attained a wonderful popularity, and which has been adopted as a text-book in several universities in this country and America, entitled 'An Outline of the necessary Laws of Thought: a Treatise on pure and applied Logic,' 8vo, London, 1849, seventh thousand, 8vo, 1864; and being Bampton lecturer in 1853, delivered in that capacity a series of discourses which were collectively issued as 'The Atoning Work of Christ, viewed in Relation to some current Theories. In eight Sermons preached before the University of Oxford in the Year MDCCCLIII.' &c., 8vo, Oxford and London, 1853, &c., of which he gave the sum and substance in a simpler, clearer form, and stripped of the critical apparatus of learned authorities, in an essay on 'The

Death of Christ,' which he contributed to a volume entitled 'Aids to Faith: a series of Theological Essays,' &c., 8vo, London, 1861, third edition 1862, written by several writers, and produced under the editorship of Dr. Thomson, with a view of counteracting the effect of the 'Essays and Reviews,' then recently published. He was appointed to the rectory of All Souls, Marylebone (Langham Place), in 1855; and in the same year contributed to the first issue of the 'Oxford Essays,' a treatise on 'Crime and its Excuses,' in which he especially deals with the question of unsoundness of mind in criminal cases. In November, 1855, he was elected Provost of Queen's College, Oxford, and carried into his schemes for the discipline and efficiency of this society the same active and reforming spirit for which he had been remarkable during his career as a tutor and a member of convocation. In 1856, he was a second time appointed select preacher before the university; was elected preacher at Lincoln's Inn, on the 16th of April, 1858, the literary result of which office was a volume entitled 'Sermons preached in Lincoln's Inn Chapel,' 8vo, London, 1861; and became chaplain in ordinary to the Queen in 1860. In November, 1861, he was promoted to the Bishopric of Gloucester and Bristol, from which he was translated in December, 1862, to the Archbishopric of York, where, whether as the chief pastor of a diocese or as the metropolitan of a province, he has exhibited a philanthropic and multiform activity, devoting himself especially to church extension, and to the furtherance of education. Dr. Thomson is a member of several learned societies, and holds several offices of honour and usefulness, being one of the Lords of the Privy Council; an elector of St. Augustine's College, Canterbury; a governor of the Charterhouse, and of King's College, London, &c. Besides the works which have been already particularised, he is the author of various pamphlets, articles, addresses, charges, and occasional sermons, delivered for ecclesiastical, missionary, or generally benevolent purposes; amongst which may be mentioned the articles 'Jesus Christ,' and 'Gospels,' which, with other smaller ones, he contributed to Dr. Smith's 'Dictionary of the Bible;' and 'The Limits of Philosophical Enquiry.' Address delivered to the Members of the Edinburgh Philosophical Institution, November 6, 1868, 8vo, Edinburgh, 1868. Archbishop Thomson has also produced a volume entitled 'Life in the Light of God's Word,' 8vo, London and Edinburgh, 1868.

* THORNYCROFT, MARY, sculptor, was born at Thornham, Norfolk, in May, 1814. She learned to model of her father, the late Mr. John Francis, a sculptor of reputation, and early contributed to the exhibitions of the Royal Academy statues of Penelope, Ulysses, a Flower Girl, &c. In 1840 she married Mr. Thomas Thornycroft, and in 1842 went with him to Italy. They stayed two years at Rome, where she benefited by the valuable advice of Mr. Gibson. At Rome she made several models, and among them one of a 'Sleeping Child,' which Mr. Gibson so much admired that, on being requested by the Queen to recommend a sculptor to execute statues of the Royal children, he named Mrs. Thornycroft. She accordingly received a commission for marble statues of the Princess Royal, the Prince of Wales, Princess Alice, and Prince Alfred, as the 'Four Seasons;' and afterwards others of the younger princes and princesses, as Peace, Plenty, &c. She has also executed busts of the Queen, the Prince Consort, the Prince and Princess of Wales, the Princess Louise, and other members of the Royal Family, and many of private personages. Besides these, she has exhibited several statues in bronze and marble, including a 'Girl Skipping,' 1867; a 'Young Cricketer,' 1869, &c.

* THORNYCROFT, THOMAS, born about 1813, was a pupil of Mr. J. Francis, but completed his studies in Rome. His early works were chiefly classical and academic in character. One of his first efforts in a more naturalistic manner was 'Alfred the Great and his Mother,' 1850; a later statue, which attracted some attention, was his 'Knitting Girl,' 1855. He afterwards executed a bronze statue of the Earl of Hereford, and marble statues of Charles I. and James I., for the House of Lords. For the Queen he executed a marble bust of the Prince Consort; and he designed several memorials of the prince, among others colossal bronze equestrian statues for Halifax, Wolverhampton, and Liverpool. The Liverpool statue was placed in front of St. George's Hall, and he has since completed a companion statue of the Queen. In 1870 a marble statue by him of the Marquis of Westminster was erected at Grosvenor Park, Cheshire, and he has executed a very large number of portrait and monumental statues and busts.

THORPE, BENJAMIN, a philologist and archaeologist, was

born about the year 1782, and through a long life acquired a reputation as an Anglo-Saxon scholar; and for his zeal in the cause of social progress and enlightenment. He was member of the Royal Academy of Sciences at Munich, and of the Society of Netherlandish Literature at Leyden. He lived to the advanced age of eighty-eight years; and expired, apparently without suffering, at his house at Chiswick, on the 19th of July, 1870.

The works with which he was connected, for the most part editorially or as a translator, include 'Cædmon's Metrical Paraphrase of Parts of the Holy Scriptures in Anglo-Saxon. With an English Translation, Notes, and a Verbal Index,' &c., 8vo, London, 1832, being one of the publications of the Society of Antiquaries; 'Analecta Anglo-Saxonica. A Selection in Prose and Verse from Anglo-Saxon Authors. With a Glossary,' 8vo, London, 1834, new edition, 12mo, London, 1846; 'Exeter Book. Codex Exoniensis. A Collection of Anglo-Saxon Poetry. With English Translation, Notes, &c.,' 8vo, London, 1842; 'Translations from Johann Martin Lappenberg's 'Geschichte von England,' &c., entitled 'A History of England under the Anglo-Saxon Kings, &c. With Additions and Corrections by the Author and the Translator,' 2 vols., 8vo, London, 1845, and 'A History of England under the Norman Kings. To which is prefixed an Epitome of the Early History of Normandy, &c. With considerable Additions and Corrections by the Translator,' 8vo, Oxford and London, 1857; 'Yule Tide Stories. A Collection of Scandinavian and North German Popular Tales and Traditions, from the Swedish, Danish, and German,' 8vo, London, forming part of 'Bohn's Antiquarian Library,' 1847, &c.; 'Tha halgan Godspel on Engliše. The Anglo-Saxon Version of the Holy Gospels. Edited, &c., from the original Manuscripts. Reprinted by L. F. Klipstain,' 12mo, New York, 1846, new edition, 8vo, New York, 1851; 'The Life of Alfred the Great. Translated from the German of Dr. R. Pauli [by A. P.]. To which is appended Alfred's Anglo-Saxon Version of Orosius. With a literal English Translation, and an Anglo-Saxon Alphabet and Glossary,' 8vo, London, 1853, forming part of 'Bohn's Antiquarian Library'; 'The Anglo-Saxon Poems of Beowulf, the Scöþ or Gleeman's Tale, and the Fight at Finneburg. With a literal Translation, Notes, Glossary,' &c., 8vo, Oxford, 1855; 'The Anglo-Saxon Chronicle, according to the several original Authorities,' 2 vols., (I.), 'Original Texts,' (II.), 'Translation,' 8vo, London, 1861, published by the authority of the Lords of the Treasury, under the direction of the Master of the Rolls, and forming part of the 'Chronicles and Memorials of Great Britain,' &c.; an edition of R. C. Raak's 'Grammar of the Anglo-Saxon Tongue, from the Danish,' &c., 8vo, London, 1865; and 'Diplomatariū Anglicū Ævi Saxonici. A Collection of English Charters, from the Reign of King Æthelbeht of Kent, A.D. DCV. to that of William the Conqueror. Containing (I.), Miscellaneous Charters; (II.), Wills; (III.), Guilds; and (IV.), Manumissions and Acquittances. With a Translation of the Anglo-Saxon,' 8vo, London, 1865.

THORPE, JOHN, an English architect who flourished in the reign of Elizabeth and the early part of that of James I. Of his personal history nothing whatever is known. He is referred to by Peacham in his 'Gentleman's Exercise,' and his works are ascertained by a volume, in atlas folio, of his drawings, comprising the ground-plans, with a few elevations, of the principal buildings erected by him. Attention was first called to this volume, and the name of Thorpe rescued from the oblivion into which it had fallen, by Horace Walpole, in the Supplement to the first volume of his 'Anecdotes of Painting in England' (1762). Thorpe's volume was then in the possession of the Earl of Warwick; it was afterwards lost sight of for a while, but reappeared at the sale of the library of the Hon. C. Greville, 1810, when it was purchased by Mr. (afterwards Sir John) Soane, R.A., for 28*l.* 17*s.* 6*d.*, and now forms one of the treasures of the Soane Museum.

From it we learn that Thorpe was the chief architect, if, indeed, he was not the inventor, of what is known as the Elizabethan style of domestic architecture. As Walpole pointed out, he "designed or improved most of the principal and palatial edifices erected in the reigns of Elizabeth and [the early part of] James I." His dated buildings range from Kirby, Northamptonshire, 1570, to Holland House, Kensington, 1607. One of the most characteristic of his buildings was Wollaton House, Nottinghamshire, of which an engraving is given under ELIZABETHAN ARCHITECTURE, E. C. vol. iii. col. 838. Among the other houses erected by him were Burleigh, near Stamford, for Lord Treasurer Cecil; Burleigh-on-the-Hill; Holdenby, for Sir Christopher Hatton; Audley End, Essex; Giddy Hall, Essex;

Amphill Old House, Bedfordshire; Amphill (afterwards called Houghton); the Strand front of Somerset House; and Longford Castle, Ireland. All his buildings are rich, stately, effective, and picturesque in general effect; the details full of fancy and ingenuity. The style reached at once its utmost perfection in his hands. Under the Jacobean architects it ran into extravagance, often bordering on the grotesque; and it gave way before the more regular Italian Renaissance introduced by Inigo Jones.

THOUVENEL, EDOUARD ANTOINE, French diplomatist and statesman, was born at Verdun, November 11th, 1818. In early life he made a tour in Hungary and the Danubian principalities, and published an account of it in the *Revue des Deux Mondes*, afterwards published separately as *La Hongrie et la Valachie: Souvenirs de Voyage, et Notices Historiques*, 8vo, Paris, 1840. He soon afterwards entered the bureau of the minister of foreign affairs; was appointed attaché at Brussels in 1844; became secretary of legation at Athens in the following year; and then chargé d'affaires at the same place. Changes of government did not much affect his position; Cavaignac confirmed him in his post in 1848, and in 1849 he was made minister plenipotentiary to Greece. He was engaged in the Pacifico dispute in 1850, on the side of France, and warmly seconded the mission of Baron Gros relating to it. His favour with King Otho of Greece led to his being well received by Otho's brother, the King of Bavaria, when M. Thouvenel went as minister plenipotentiary to Munich in 1851. The Emperor Napoleon III. appointed him minister of foreign affairs in 1852; two years later he took part in the Vienna conferences relating to the Russo-Turkish war; and in 1855 went as ambassador to Constantinople, where his policy was often antagonistic to England and Austria. He was raised to the senate in 1859, and in 1860 was made Grand Cross of the Legion of Honour. About the same time he resumed his position in the cabinet, succeeding M. Walewski as minister of foreign affairs. In a circular despatch addressed to the French representatives at foreign courts, he upheld the claim of France to maintain the occupation of Syria; and in the same year, 1861, he conducted commercial, maritime, and literary conventions with Belgium. Once again quitting the foreign office, he became president of the commission appointed in 1862 to arbitrate between the Pasha of Egypt and the Suez Canal Company. His participation in public affairs after this was chiefly as a senator. M. Thouvenel died October the 19th, 1866.

THWAITES, SIR JOHN, chairman of the Metropolitan Board of Works, was born at Meaburn, Westmoreland, in 1815. After receiving his education at Meaburn school, he came to London, and gradually formed an extensive trade as a woollen draper in Southwark. He took an active part in parochial affairs, became a leading member of the vestry-boards, and was one of the founders of the Surrey Consumers' Gas Company. The experience and influence thus obtained led to his election as representative for Southwark in the Metropolitan Commission of Sewers in 1852; and three years afterwards, when the Metropolitan Board of Works was founded, he was elected chairman. This post he retained during the remainder of his life. He was closely associated with the various important works undertaken by the Board, including the main drainage of the Metropolis, the Victoria Embankment on the north shore of the Thames, the Albert Embankment on the south shore, Finsbury and Southwark Parks, Commercial and Southwark Streets, the formation of other new streets and widening of old streets in various parts of the metropolis, and numerous improvements of minor character. In 1865 he received the honour of knighthood on the occasion of the public opening of the northern high-level and mid-level sewers; and about the same time published a 'Sketch of the history and prospects of the Metropolitan Drainage Question.' He was a magistrate for the county of Surrey, and a magistrate and deputy lieutenant for the county of Middlesex. He died August the 8th, 1870.

TICKNOR, GEORGE, [E. C. vol. vi. col. 52.] In 1863 Mr. Ticknor published an interesting memoir of his friend William H. Prescott, the historian, which was reprinted in London, 1864. He died on the 26th of January, 1871, in the 80th year of his age.

* TIDEMAND, ADOLPH, a distinguished Norwegian painter, was born August 14th, 1815, at Mandal, in Norway. He studied first in the Copenhagen Academy, and afterwards in that of Düsseldorf. Having settled in Norway, he obtained great success by his scenes of domestic and familiar life. He was appointed painter to the king, and commissioned to decorate

the royal palace near Christiania. His reputation steadily extended beyond his native country, and he is now very generally regarded not only as the chief of Norwegian artists, but as among the first painters of national manners in Europe. He confines his pencil to the representation of Scandinavian life, but this he depicts in its various phases with truth, refinement, feeling, and great technical skill. His pictures at the International Exhibition of 1862, excited very general admiration; they included some of his earliest and some of his latest productions, and afforded a good illustration of his style and range of subjects. They comprised a 'Bridal' and a 'Funeral Procession about to cross a ford'—the landscapes being painted by his countryman Gude; 'Sunday Afternoon,' an aged couple reading their bible; 'Administration of the Sacrament to Sick Persons and Cripples in a Norwegian Hut'; 'Haugians: a Norwegian Sectarian Minister, Preaching'; 'Schoolmaster Catechising'; 'Card Players,' &c. At the London International Exhibition of 1871, was exhibited 'The Grandparents' Visit,' painted in 1870. Several of Tidemand's pictures are in English collections. Tidemand is a professor in the Düsseldorf Academy; member of the Academies of Copenhagen, Stockholm, Berlin, and Amsterdam; knight of the Norwegian order of St. Orlaf, and of the French Legion of Honour.

TIEDEMANN, FRIEDRICH [E. C. vol. vi. col. 58.] anatomist, died at Munich, January 22, 1861.

* TISCHENDORF, LOBEGOTT FRIEDRICH CONSTANTIN VON, generally known as Constantin, a distinguished Biblical scholar and critic, was born on the 18th of January, 1815, at Lengenfeld, in Upper Saxony, where his father practised as a physician. After receiving his preparatory education at Lauen, the capital of his native territory of Voigtland, he repaired to the University of Leipzig, where he devoted himself especially to the study of philology and theology. He became a licentiate in 1838; and in the period just before and just after this year, produced two prize theses, entitled respectively, 'Doctrina Pauli Apostoli de Vi Mortis Christi satisfactoria,' &c., 8vo, Leipzig, 1837 and 'Disputatio de Christo, Pane Vitæ,' &c., 8vo, Leipzig, 1839; a volume of poems, entitled *Maybuds*, 'Maiknospen,' 12mo, Leipzig, 1838; a critical and exegetical dissertation, 'De Evangelio Matthæi, c. xix. v. 16, et seq.,' &c., 8vo, Leipzig, 1840; and a free translation, from the French of Louis Schneegans, of the account of the great pilgrimage of the Flagellants to Strasburg in the plague-year, 1349, 'Die Geissler, namentlich die grosse Geisselfahrt nach Strasburg im Jahre 1349,' 8vo, Leipzig, 1840. The biblical labours of Tischendorf more properly began when, subsidised by the Saxon government, he set out upon a journey of investigation to the principal libraries of Europe, for the purpose of consulting the best and the rarest manuscripts of the books of scripture. In 1843 he received from the University of Breslau the degree of D.D.; and published, as the results of a course of travel in Egypt, Syria, and Asia Minor, a Christmas sermon, preached at Lengenfeld, on his return from the East, 'Weihnachtspredigt. Bei seiner Heimkehr aus dem Morgenlande in seiner Vaterstadt Lengenfeld gehalten,' 8vo, Leipzig, 1845; 'Reise in den Orient,' 2 vols. 8vo, Leipzig, 1846, English translation, by W. E. Shuckard, 'Travels in the East,' 8vo, London, 1847; and a treatise, entitled 'De Israelitarum per Mare Rubrum Transitu. Cum Tabula,' 8vo, Leipzig, 1847. In 1845 and 1850 respectively, Dr. Tischendorf was appointed to an extraordinary and an ordinary professorship of theology in the University of Leipzig, where, in 1859, a chair of biblical palæography was specially instituted for him. He has more than once repeated his tour of the principal libraries of Europe, and in 1853 paid another visit to the East, from which he returned with new and valuable documents and material. During one of his visits to England, in 1865, he was admitted by the University of Cambridge, March 9th, to the honorary degree of doctor in the faculty of law, and to a like honour, on the 16th of March, by the University of Oxford, after he had been engaged at the Bodleian Library in carefully revising the Laudian Græco-Latin Manuscript of the Acts of the Apostles, and had gratified the scholars of this country by exhibiting to them the Leipzig fragments of his famous manuscript.

The labours of Professor Tischendorf have been almost exclusively directed to the illustration of biblical or collateral antiquities, and to the application of sound principles of textual criticism. He has edited 'Codex Ephraemi Syri Rescriptus: sive Fragmenta Veteris Novi Testamenti e Codice Græco Parisiensi celeberrimo quinti ut videtur post Christum Sæculi,' &c., 4to, Leipzig, 1842—46; 'Codex Friderico-Augustanus: sive Frag-

menta Veteris Testamenti e Codice Græco omnium qui in Europa supersunt facile antiquissimo in Oriente detexit, in Patriam attulit,' &c., folio, Leipzig, 1846; 'Monumenta Sacra inedita: sive Reliquiæ antiquissimæ Textus Novi Testamenti Græci. Ex Novem plus Mille Annorum Codicibus per Europam dispersis,' &c., 4to, Leipzig, 1846, 'Nova Collectio,' 1865, &c.; 'Codex Claromontanus: sive Epistolæ Pauli omnes Græce et Latine. Ex Codice Parisiensi celeberrimo Nomine Claromontani plerumque dicto sexto ut videtur post Christum Sæculi,' &c., 4to, Leipzig, 1852; 'Bibliorum Codex Sinaiticus Petropolitanus. Auspiciis Augusti Imperatoris Alexandri II. ex Tenebris protrahit, in Europam transtulit, ad juvandas atque illustrandas Sacras Litteras,' &c., 4 vols., folio, St. Petersburg and Leipzig, 1862; and 'Testamentum Novum Sinaiticum: sive Novum Testamentum cum Epistola Barnabæ et Fragmentis Pastoris. Ex Codice Sinaitico Auspiciis Alexandri II. omnium Russiarum Imperatoris,' 4to, Leipzig, 1863. The principal life-work of Professor Tischendorf, however, is his 'Testamentum Novum Græce,' 16mo, Leipzig, 1841, of which the first volume of an eighth edition appeared in 1869, in which the critical apparatus of former editions was entirely re-written in the light of eighteen new uncials MSS. for the Gospels, including the Sinaitic Codex, already edited in various forms. The last edition, therefore, represents an approximation to a standard text which scholars might accept as the best result of ripened judgment and enlarged experience. It bears the title of 'Novum Testamentum Græce. Ad antiquissimos Testes denuo recensuit, Apparatum criticum omni Studio perfectum apposuit, Commentationem isagogicam prætexit Constantinus Tischendorf. Editio octava critica major,' vol. i., Leipzig, 1869. Translations from antecedent Tischendorf texts appeared as 'The New Testament, from the Greek Text,' &c., 12mo, London, 1869, by the Rev. R. Ainslie, and in 8vo, 1869, by G. R. Noyes; whilst the thousandth volume of the 'Tauchnitz Collection of British Authors,' 16mo, Leipzig, 1841, &c., bears the title of 'The New Testament: the authorised English Version, with Introduction and various Readings from the three most celebrated Manuscripts of the original Greek Text, by Constantin Tischendorf,' 16mo, first two editions, 1869. A few other productions, to which Professor Tischendorf stands in the relation, either of author or of editor, remain to be mentioned. They include an Occasional Sermon, entitled the Spirit of Truth, 'Der Geist der Wahrheit. Zeitpredigt am Sonntag Cantate den 6 May, 1849, zu Leipzig gehalten,' 8vo, Leipzig, 1849; 'De Evangeliorum Apocryphorum Origine et Usu. Disquisitio historica critica, quam Præmio aureo dignam censuit Societas Hagana pro defendenda Religione Christiana,' 8vo., The Hague, 1851; 'Acta Apostolorum Apocrypha, ex XXX. antiquis Codicibus Græcis,' &c., 8vo, Leipzig, 1851; 'Synopsis Evangelica,' &c., 8vo, Leipzig, 1851, "editio 11 emendata," 1864, "editio in Commodum academicum repetita," 1854; 'Anecdota sacra et profana ex Oriente et Occidente allata: sive Notitia Codicum Græcorum, Arabicorum, Syriacorum, &c. Editio repetita emendata, aucta,' 4to, Leipzig, 1861; 'Wann wurden unsere Evangelien verfaast?' 8vo, Leipzig, 1865, fourth edition, 1866, English translation, by W. L. Gage, 'Origin of the Four Gospels,' 8vo, London, 1868, French translation, by L. DuRAND, 'A quelle époque nos Évangiles ont-ils été composés?' &c., 8vo, Paris, 1866, Italian translation, 16mo, Florence, 1868; and 'Responsa ad Calumnias Romanas, item Supplementum Novi Testamenti ex Sinaitico Codice Anno 1865 edita,' 8vo, Leipzig, 1870.

TOCQUEVILLE, ALEXIS CHARLES HENRI CLÉREL DE. [E. C. vol. vi., col. 102]. After the publication of 'L' Ancien Régime et la Révolution,' 1856, M. Tocqueville addressed himself to the preparation of a Second Part. He was anxious to complete the work by a comprehensive survey of the results of the revolution, and the influence of the Emperor and imperialism; but, whilst persistently labouring, his health was becoming more and more feeble. The rupture of a blood-vessel in June, 1858, rendered necessary a milder climate than that of Normandy. He removed to Cannes, but the malady had made too great progress to be arrested. He lingered till the 16th of April, 1859, when death terminated at once his labours and his sufferings. His 'Œuvres et Correspondance Inédites' were published in two volumes, 8vo, 1862, with a most interesting memoir of him by his friend, G. De Beaumont, prefixed; an English translation, by Mr. H. Reeve, appeared the following year. His 'Œuvres Complètes,' have been published in 9 vols., 8vo, Paris, 1861—66.

TODD, REV. JAMES HENTHORNE, D.D., son of Mr. C. H. Todd, a distinguished surgeon of Dublin, was born in that city, April 23rd, 1806. He was educated at Trinity College,

Dublin, where he graduated B.A. in 1825, and was elected to a fellowship in 1831. He remained closely connected with the college throughout his life, and at his death, which occurred at his residence, Rathfarnham, near Dublin, June 28th, 1869, he was senior fellow and librarian of Trinity; regius professor of Hebrew; and also treasurer and precentor of St. Patrick's Cathedral. While still young, Mr. Todd distinguished himself as a theologian, but later in life he became more eminent as a writer on the language, history, and antiquities of Ireland, on which subjects he was regarded as one of the first authorities of his time. His published works include 'Discourses on the Prophecies relating to Anti-Christ in the writings of Daniel and St. Paul,' 8vo, 1840; 'Discourses on the Prophecies relating to Anti-Christ in the Apocalypse of St. John,' 8vo, 1846, being the Donnellan lectures for those years; 'The Search after Infallibility,' &c. He also edited Wycliffe's 'Last Age of the Church,' and 'Apology for Lollard Doctrines,' and accompanied them with valuable prefaces and notes. The 'Life of St. Patrick,' 8vo, 1863, does much to disentangle the terribly confused biography of Ireland's patron saint, and equally valuable are his editions of 'The Book of Hymns of the Ancient Church of Ireland,' and the 'Martyrology of Donegal.' On Irish antiquities he contributed numerous valuable papers to the Transactions of the Royal Irish Academy, of which during five years he occupied the post of president; and he was one of the most active members of the Irish Archaeological Society. For the series of Chronicles and Memorials published under the direction of the Master of the Rolls, Dr. Todd edited the 'Wars of the Danes in Ireland:' written in the Irish language.

TODD, ROBERT BENTLEY, M.D., F.R.S., [E. C. vol. vi. col. 105], died January 30, 1860.

* TOMLINSON, CHARLES, F.R.S., was born in London, on the 27th November, 1808. His father, who was of an old Shropshire family, died while he was yet an infant, leaving a widow in circumstances of deep poverty, to bring up two boys as best she could. She was able to provide them with only the mere elements of education, and at about twelve years old each had to earn his own living. Both boys had a strong love for learning, and managed to acquire a considerable amount of knowledge after working hours. The elder soon became a junior usher in schools, and made his way steadily onwards until he managed to get to Oxford and study for the church. The younger, the subject of our sketch, whether as office boy or lawyer's clerk, gave nearly all his leisure to the study of languages and science, eagerly availing himself of such opportunities in the shape of lectures, classes, &c., as his very scanty means would allow. But a dearth of books, a home from which every luxury, as well as every opportunity of private study, was banished—most of all, the absence of a directing mind to indicate the best course of study—placed the young student under great disadvantages. In 1830, however, there was a promise of better things. His brother, who had just left college, and had accepted a curacy in conjunction with classical teaching, invited him to assist in the latter, an offer which was eagerly embraced, and which gave greater opportunities for the acquirement of systematic knowledge. A few years later the elder brother took a curacy in the diocese of Salisbury, and, in conjunction with Charles, opened a classical school in that city. The strong tendency to scientific pursuits which had always characterised the younger brother here led to the introduction of what was then a novel system in schools, namely, the teaching of experimental science by lectures and written and oral examinations. These lectures proved a success; they were carefully prepared, and embodied the results of the training Charles had undergone as a member of the London Mechanics' Institution under the presidency of Dr. Birkbeck, and also as an occasional attendant at lectures on chemistry by Professor Turner, of University College. Every opportunity of adding to his scientific knowledge seems to have been eagerly embraced during his vacation visits to London, and by the study of the best books. At this time also he made some feeble attempts at original research, and having sent an account of them, and of his science-teaching, to the 'Magazine of Popular Science,' he was invited by the editor (J. W. Parker, West Strand) to increase his connection with his house. This led to the collection and publication of his papers in a volume entitled 'The Student's Manual of Natural Philosophy,' which was adapted to the wants of a science-reading public at the time, as was proved by its rapid sale; also to a large amount of literary work in connection with the 'Saturday Magazine' and other publications, and finally to his settling in London in 1841. He then became a publisher's hack, taster, and intellectual Jack of

all trades. In this capacity, however, he sometimes fell upon congenial work. He assisted Sir W. Snow Harris in bringing out his book on *Thunderstorms*, Professor Daniell in a new edition of his *'Meteorology'*, Professor Brande in his *'Chemistry'*, and so on. Soon after his settlement in London, he made the acquaintance of Dr. Wm. Allen Miller, at that time demonstrator of chemistry at King's College, and this ripened into a steady friendship undisturbed to the time of Dr. Miller's death, a period of nearly thirty years. Several of their vacation rambles were taken in company, and it was during one of these that the idea of Miller's work on Chemistry was first broached, and was urged and encouraged by Tomlinson, who subsequently took a share in its revision. Early in his London career, Tomlinson was asked to receive into his house a few students from the department of applied sciences in King's College; and this led to the delivery of occasional lectures in King's College School, and afterwards to his appointment by the council as permanent lecturer on science. He held this post until 1868, when defective sight, brought on by almost incessant literary work, suggested rest and retirement.

Mr. Tomlinson was one of the first members of the Cavendish Society, and served on its council under Professor Graham during many years. He rendered considerable assistance to Professor George Wilson in his *Life of Cavendish*; also in some other works published by the society. He prepared a number of popular scientific treatises for the Society for Promoting Christian Knowledge. Most of these have passed through many editions. He wrote some of the most popular treatises in Weale's series. He has also published a *'Cyclopædia of Arts and Manufactures'*, of which a second and larger edition has appeared.

On retiring from King's College, and, indeed, for some years previously, Mr. Tomlinson gave his attention to original research, which had occupied his scanty leisure from an early date. In 1861 he began to publish in the *'Philosophical Magazine'*, and elsewhere, such papers as the following:—*'A Critical Examination of Welle's Theory of Dew'*, *'On the Cohesion Figures of Liquids'*, *'On Lightning Figures'*, *'On the supposed Action of Light on Crystallization'*, &c. He has also published numerous papers on a very difficult branch of physico-chemical science, namely, the phenomena of supersaturation and the action of nuclei. On this subject he has two memoirs in the *'Transactions'* of the Royal Society (of which he became a fellow in 1867), and several in the *'Proceedings.'* Many of the articles on physics, in the English *Cyclopædia* and Supplement, were written by him.

TONSON, JACOB, who has been styled the prince of booksellers, and immortalised by Pope as "left-legg'd Jacob," was born in 1656, the son of a barber-surgeon in Holborn, who, dying in 1668, bequeathed to Jacob, his elder brother Richard, and their three sisters, each 100*l.*, to be paid to them as they severally came of age. Jacob was apprenticed in 1670 to Thomas Basset, bookseller, and in 1677 admitted a freeman in the Stationers' Company. His father's bequest enabled him to enter upon business as a bookseller, at the sign of the Judge's Head, at the Fleet Street end of Chancery Lane. Here, shortly after, he published some of Otway's and Tate's plays, and in the following year Dryden's *'Troilus and Cressida.'* Tonson's relations with Dryden soon became very intimate; he continued to be his regular publisher, and though Dryden sometimes haggled and sometimes grumbled, the only occasion of temporary quarrel was while the poet was engaged on his translation of Virgil, and seemingly more than usually irritable. The publication of the celebrated *'Miscellanies'*, seems to have originated with Tonson, though the work was edited by Dryden, and hence perhaps it has always been called indifferently Tonson's or Dryden's *Miscellanies*. For the publication of the first worthy edition of Milton, and the first complete octavo edition of Shakspeare, the credit is wholly due to the bookseller. His *Cæsar*, published in 1703, was admittedly the handsomest book that had been issued by an English publisher. He also published Addison's *Companions*, and some of Pope's earlier verses. Tonson migrated to Gray's Inn Gate in 1697, where he continued till 1712, when he removed to the Shakspeare's Head, over against Catherine Street in the Strand. Tonson was now at the head of the trade, a man of wealth and influence. He had his warehouse in the Savoy, and printing-office in Bow Street, holding under patent the post and privileges of printer to the Excise. He had a pretty villa on the banks of the Thames at Barn Elms, where the most famous poets, wits, and notables of the day, used to assemble. Tonson was, if not the founder, the secretary and main stay of the famous Kit-Cat

Club, for whose meetings he built a room at Barn Elms, and round which he hung the portraits of the members painted for him by Sir Godfrey Kneller, of a size ever since known as Kit-Cat: this celebrated collection is still kept intact by the representative of the Tonson family, Mr. R. W. Baker, of Bayfordbury Park, Hertfordshire. Tonson retired from business in 1720. He had purchased an estate in the country, and he found occupation in its improvement. He died March 18th, 1736.

TOOKE, THOMAS, F.R.S., [E. C. vol. vi. col. 119], the author of the *'History of Prices'*, died on the 26th of February, 1858, in his 84th year.

TOOKE, WILLIAM, F.R.S., [E. C. vol. vi. col. 120], died on the 20th of September, 1863, at the age of 86.

* TOPETE, JUAN BAUTISTA, a Spanish admiral and politician, was born in Andalusia in the year 1820. Having served his country in his professional vocation through a series of years, and having especially distinguished himself by his conduct at the bombardment of Callao, in Peru, on the 2nd of May, 1866, when he received a serious wound, he occupied a prominent position in the revolution which put an end to the reign of Queen Isabella, in September, 1868. Being in command of the iron-clad squadron then anchored in the port of Cadiz, he issued a proclamation to the inhabitants of that town, in which he undertook to place himself in the van of the insurrection. The combined action of army and navy speedily accomplished the overthrow of the Queen; and Topete became a member of the Provisional Government which succeeded upon her flight to France, assuming the office of Minister of Marine, October 8th, 1868. Although he was of accord with Prim and Serrano in his desire to uphold the monarchical form of Government, he disagreed with his colleagues as to the person who should be elevated to the throne of Spain; and whilst a majority adopted the selection of the Duke of Genoa, Topete favoured the candidature of the Duc de Montpensier. Impelled by this divergence of opinion, he withdrew from the administration in November; upon which he was elected, almost unanimously, to the vice-presidency of the Cortes Constituyentes. In ceasing to be the ally of Prim and Serrano, however, he did not become their enemy; and he spoke no word of opposition until Friday, December 23rd, 1870, when, amidst the storm of angry and re-criminatory debates which at that period agitated the Cortes, he pronounced a spirited apology for his own conduct, and an attack upon the Government for the violation of the constitution and of parliamentary privileges of which they were guilty in their haste to introduce the king-elect. Having once broken his obedience and discipline for the honour of his country and for the sake of a constitutional government, he professed that his own honour demanded that for the future he should hold no command, and that the ruin of the ex-royal house should not seem to have been brought about in order to afford him a stepping-stone to greatness and to power. Continuing to favour in his own heart the claims of the Duc de Montpensier, he trusted that Spain might be happy and prosperous under the king-elect, whom, if he forbore to assist, he would equally forbear to embarrass. The circumstances of the next few days, however, made an appeal to his patriotism, too strong to be repudiated. On the evening of the 28th of December immediately after General Prim had received the wounds of which he died on the 30th, it was unanimously decided at a Council of Ministers, at which many of the leading deputies of the Cortes were present, to request Topete to assume the presidency of the Council, and to go down to Cartagena to receive the King, and to bring him to Madrid. After some natural reluctance on the score of seeming inconsistency, and after consultation with other partisans of the Duc de Montpensier, Topete frankly accepted the office and the mission thrust upon him, assuming at the same time the offices of Minister of State and Minister of War. But the offices were only temporary; and on the appointment of a ministry, January 5th, 1871, of which the ex-regent Serrano was at the head, Topete resolutely refused to accept a portfolio, even when requested to do so by the young King Amadeo. In July following, upon the resignation of Serrano, Topete accepted office in a reconstructed administration which was sought to be established under the presidency of the former; who, however, baffled by the difficulties he had to encounter, was succeeded on the 24th by Zorilla, who entered upon office with an administration formed exclusively of members of the Progresista party. On the 21st of December Admiral Topete took office in the Sagasta administration, as Minister of the Colonies, in which capacity the affairs of Cuba engaged much of his attention.

TORQUEMADA, TOMAS DE, Grand Inquisitor of Spain,

and compiler of the 'Instructions' of the council of the supreme inquisition, founded by Ferdinand in 1482. Torquemada was born at Valladolid in 1420; he died on the 16th of September, 1498. For particulars of the atrocious cruelties committed by the new tribunal whilst under Torquemada's direction, it will suffice to refer to the article, INQUISITION, E. C. Arts and Sciences Div. vol. iv., col. 881, &c.

TOYNBEE, JOSEPH, aurist, was born at Heckington, Lincolnshire, in 1815. His education was received at Lynn, after which he entered on his medical career by being articled to Mr. Wade, which was continued as a pupil in St. George's Hospital, the assistant curator at the Museum of the Royal College of Surgeons, surgeon to the St. George's and St. James's Dispensary, and as a practitioner. His earlier practice was general, but it was ultimately restricted to aural surgery. His practice in this special branch of his profession was very large. He gave great attention to the structure and functions of the various parts of the organ of hearing, both in their healthy and diseased conditions. He formed an excellent collection of about 1700 human temporal bones, most of which he described in the medical journals. At the time of his death he was making experiments with a view to finding out a method of introducing chloroform into the tympanic cavities of the ear; but having taken an over-dose at a time when no assistant was near, he was found dead in his chair, July 7, 1866.

TRENDELENBURG, FRIEDRICH ADOLF, a German philosopher, was born on the 30th of November, 1802, at Eutin, in Oldenburg, and was educated successively at the Universities of Kiel, Leipzig, and Berlin; at the last of which, having gone through the inferior academic grades, he became, in 1833, extraordinary, and in 1837 ordinary professor of philosophy. He was secretary of the Berlin Academy of Sciences, and a member of various learned and scientific societies. As a representative to the Prussian Chamber in 1849, he voted with the Conservatives, and favoured the cause of German unity, until his retirement in 1851. He died on the 24th of January, 1872.

The numerous works with which, either as editor or author, Professor Trendelenburg has been identified, include, 'Platonis de Ideis et Numeris Doctrina ex Aristotele illustrata,' 8vo, Leipzig, 1826; 'De Aristotelis Categoriis, Prolusio academica,' 8vo, Berlin, 1833; 'Aristoteles De Anima Libri tres,' &c., 8vo, Jena, 1833; 'Elementa Logices Aristotelice. In Usum Scholarum ex Aristotele excerptis, convertitis, illustravit,' and also with the title, 'Excerpta ex Organo Aristotelis,' 8vo, Berlin, 1836, fifth edition, 1862; 'De Platonis Philebi Consilio. Prolusio academica,' 8vo, Berlin, 1837; a work in illustration of the Aristotelian Logic, for the pupils of Gymnasias, 'Erläuterungen zu den Elementen der Aristotelischen Logik. Zunächst für den Unterricht in Gymnasien,' 8vo, Berlin, 1842, second edition, 1861; Two controversial Treatises on the logical Questions in Hegel's System, 'Die logische Frage in Hegel's System. Zwei Streitschriften,' 8vo, Leipzig, 1843; Considerations on the Beautiful and the Sublime, delivered before the Scientific Society of Berlin, entitled, 'Niobe. Einige Betrachtungen über das Schöne und Erhabene, vorgetragen im wissenschaftlichen Vereine zu Berlin,' 8vo, Berlin, 1846; Historical Contributions to Philosophy, 'Historische Beiträge zur Philosophie,' 2 vols., 8vo, Berlin, 1846—55; a political brochure, entitled, 'Eine Kammer oder zwei? und von welcher Art?' &c., 8vo, Berlin, 1848; several Discourses delivered at different times at the Royal Academy of Sciences, including those on the Moral Idea of Justice, 'Die sittliche Idee des Rechts,' &c., 8vo, Berlin, 1849, on the Fundamental Ideas of Spinoza and their Results, 'Ueber Spinoza's Grundgedanken und dessen Erfolg,' &c., 4to, Berlin, 1850, in Memory of Frederick the Great [30 January, 1851], 'Zum Gedächtniss Friedrichs des Grossen,' &c., 8vo, Berlin, 1851, in Memory of Leibnitz [July 1st, 1852], 'Leibnitz und die Philosophie Thätigkeit der Akademie im vorigen Jahrhundert,' &c., 8vo, Berlin, 1852, on Cologne Cathedral, 'Der Kölner Dom,' &c., 8vo, Cologne, 1853, in memory of Frederick the Great [January, 25, 1855], 'Machiavelli und Antimachiavelli,' &c., 8vo, Berlin, 1855, on King Frederick William IV. and the Royal Academy of Sciences, 'Die Königlich preussische Akademie der Wissenschaften über dem Könige Friedrich Wilhelm IV.,' &c., 4to, Berlin, 1861; a series of reprinted articles from the 'Abhandlungen' of the Berlin Royal Academy of Sciences, entitled, respectively, On Leibnitz's Design of a Universal Characteristic, 'Ueber Leibnizens Entwurf einer allgemeinen Charakteristik,' &c., 4to, Berlin, 1856; Frederick the Great and his Lord Chancellor, &c., 'Friedrich der Grosse und sein Grosskanzler Samuel von Cocceji,' &c., 4to, Berlin, 1863, Herbart's practical Philosophy, &c., 'Her-

bart's praktische Philosophie und die Ethik der Alten,' 4to, Berlin, 1856; a series of articles reprinted from the 'Monatsberichten' of the same Academy, respectively entitled, On some Passages, &c., 'Ueber einige Stellen im 5 Buche der nichomachischen Ethik,' 8vo, Berlin, 1850, On a new Explanation of Herbart's Metaphysics, 'Ueber Herbart's Metaphysik und eine neue Auffassung derselben,' 8vo, Berlin, 1854, second article, 8vo, Berlin, 1856; and several lectures on academical or philosophical subjects, especially a memorial lecture to Fichte, 'Zur Erinnerung an Johann Gottlieb Fichte. Vortrag, gehalten in der Königlich Friedrich-Wilhelms-Universität zu Berlin am 19 Mai, 1862,' 4to, Berlin, 1862. Professor Trendelenburg has also treated of the relations between Ethics and Natural Law, 'Naturrecht auf dem Grunde der Ethik,' 8vo, Leipzig, 1860; and has produced a work entitled Logical Investigations, 'Logische Untersuchungen,' 2 vols., 8vo, Leipzig, 1840, &c., and 1862.

TREVITHICK, RICHARD, inventor of the locomotive steam-engine, and of many improvements in machinery, was born at Illogan, Cornwall, April 13th, 1771. Under his father, the purser of a mining company, he was conversant with the Cornish mines, to one of which he became mechanical engineer. He noticed the imperfect action of much of the machinery employed, and constructed some steam-engines marked by several improvements which did not clash with James Watt's patents. Amongst other things, the 'waggon-tilt' boilers until then in use suggested to him the substitution of wrought-iron cylindrical boilers, which, when introduced, were found to effect a large saving of coal at the Cornish mines. About 1800 his attention was directed to the possibility of placing a steam-engine on wheels, to run on roads and tramways. Some such idea had occurred to Leupold, then to Watt; Cugnot made a rough attempt in this direction in 1770; and Murdoch constructed a small working model in 1784; but the solution of the problem was given by Trevithick, in introducing high-pressure steam as a substitute for the condensing action. In partnership with Andrew Vivian, who provided capital, he patented his new engine in 1802; and his locomotive ran upon a public road near Camborne in the following year. In 1804 another locomotive was tried on a tramway at Merthyr Tydvil, in South Wales; it drew a net load of ten tons at the rate of five miles an hour. Trial trips were also made in London, near the Bethlehem Hospital and the site of the present Euston Station. There was, however, not the necessary public enterprise to encourage the invention at that time; but the principle of steam locomotives on roads and railways was virtually established. Trevithick was employed in much engineering work in Cornwall, continually inventing and making improvements in machinery. In 1811 a silver mine in Peru ceased work on account of the extreme difficulty of getting any machinery up from the sea-coast to the mine in the mountains; an agent came to England, became acquainted with Trevithick's high-pressure steam-engine, and found it smaller and more compact than any condensing engine of equal power. He returned to Peru with a small engine, and proved its availability. An order was given to Trevithick to send out nine steam-engines, so packed in pieces that they could be conveyed by mules from the port up to the mines; this was done in 1814, and in 1816 Trevithick himself went out as engineer and part proprietor of the mines. He prospered for a time, but the civil war, which began in 1820, frustrated his plans; and he was for many years plunged in exciting adventures, in some of which he was associated with Lord Cochrane (afterwards Earl of Dundonald). In 1827 Trevithick landed at Falmouth, penniless. He was about to petition the House of Commons for a grant, on the ground that his steam-engine inventions had effected a vast saving of coals, and had greatly facilitated all the mechanical operations in the mining districts—facts which are indisputable—but meeting with partners who had command of a little money, he resumed operations as an engineer, introduced many inventions and mechanical improvements, and patented some of them. Besides land steam-engines, Trevithick invented and constructed new Mint machinery, which he took out with him to Peru; and his prolific mechanical genius displayed itself in inventions relating to warning apparatus, iron stowage-tanks, iron buoys, a gun-carriage for single-decked ships, a furnace for purifying silver ores, an hydraulic engine, floating docks, a salt-water distilling apparatus, &c. Early in the century he had been one among many engineers who engaged in attempts to excavate a tunnel under the Thames. He died at Dartford, Kent, April 22, 1833, little enriched by inventions which had enriched others, and added largely to the wealth of the country.

TRICOUP, or TRIKUPIS, SPIRIDION, [E. C. vol. vi., col. 166]. Notwithstanding the many changes of ministers and policy which followed the insurrection of 1859, in one at least of which, May, 1862, King Otho asked Tricoupi to form a ministry with himself as chief, Tricoupi retained his post as ambassador at the English court till 1867, when advancing years (he was born in 1791) and failing health, warned him that it was time to retire from public life. A second edition of his great History of the Hellenic Insurrection, 'Ἱστορία τῆς Ἑλληνικῆς Ἐπαναστάσεως,' appeared in four volumes, 8vo, 1862.

TRIMMER, JOSHUA, geologist, was born at North Cray, Kent, July 11, 1795. In 1806 he became the pupil of the Rev. W. Davison, who taught him classics and mathematics. In or about 1814 he superintended some copper mines in North Wales for his father, and was thus enabled to acquire a practical knowledge of mineralogy. He then managed his father's farm in Middlesex, which led him to give close attention to soils. In 1825 he worked some slate quarries in Carnarvonshire. Whilst thus engaged, he actively promoted the formation of a palæontological museum in Carnarvon; and frequently acted as a guide to Dr. Buckland, and pointed out to him the glacial and other geological phenomena observable in the district of which Snowdon forms the centre. In 1840 and subsequent years he was employed on the Geological Survey of Great Britain. He died in London, September 16, 1857. He wrote many valuable papers on geology, more especially as studied from an agricultural point of view. He discovered the marine fossils in the drift bed on Moel Tryfane, and at a great elevation above the sea. His maps of soils and subsoils, and his system of drainage, which was applied over extensive areas, were important results of his attempts to render his geological knowledge practically useful. His 'Practical Geology and Mineralogy,' 8vo, London, 1841; and treatise 'On the Agricultural Geology of England and Wales,' 8vo, London, 1852, are his principal separate works.

* TROCHU, LOUIS JULES, French general, was born March 12, 1815, at Le Palais, the capital of Belle-Ile, an island off the coast of Le Morbihan, a department of Brittany; and was educated at Saint-Cyr and the École d'Application du Corps d'État major. He obtained a lieutenant's commission in 1840, and three years after was promoted to a company; and served under Marshal Bugeaud in Algeria. He was appointed chef d'escadron in 1846, and became lieutenant-colonel in 1853; and having acted as aide-de-camp to Marshal Saint-Arnaud during part of the Crimean war, was promoted on the 24th of November, 1854, to be general of brigade, in which capacity he commanded until the termination of the campaign. He was made a commander of the Legion of Honour on the 22nd of August, 1855, and became grand officer on the 12th of August, 1861. He was also nominated as a member of the consultative committee of the État major; and was elected to succeed his father as a member of the conseil général of the department of Morbihan, for the canton of Belle-Ile. He served with considerable distinction during the Italian campaign as a general of division, to which rank he was promoted on the 24th of May, 1859; and at the close of 1866 was commissioned to procure information to serve as data for the re-organisation of the army. The literary result of this employment appeared in a publication, issued under the pseudonym of "Général X***," with the title of 'L'Armée Française en 1867,' 8vo, Paris, first eighteen editions, 1867, twentieth edition, 1870, the substance of which was incorporated in a German work, by F. Treuenpreuss, entitled, 'Die Französische Armee und ihre Reform. Nach den Schriften des Herzogs von Aumale, Changarnier, Trochu, &c.' 8vo, Berlin, 1867. On the 17th of August, 1870, when misfortune had already borne hard on the Imperial arms in the disastrous war against Germany, General Trochu was appointed Governor of Paris, and chief of all the forces entrusted with the defence of the capital. On the 4th of September, the day of the formal deposition of the Emperor, a deputation waited on General Trochu at the Louvre, inviting him to proceed to the Hôtel de Ville, and to become a member of the Provisional Government, with the office of Minister of War, under the Presidency of M. Jules Favre. The expression of an opinion, however, to the effect that what remained of the army would rally round him if he were the head of the Government of Defence, but that it probably would not do so under M. Jules Favre, was the occasion of his immediate nomination to the Presidency of that Government, in place of M. Jules Favre, who became Vice-President. For some time, relying upon the number of troops under his command, he declared confidently that the safety of the city was assured; but as he became more intimately acquainted with the material on

which he had to depend, General Trochu and the other members of the Government, after anxious deliberation unanimously agreed upon the adoption of a course suggested to them from without, of an ultimatum, which was an armistice, with the revictualling of Paris, elections in all the departments, and the convocation of a National Assembly. Whilst M. Thiers was at Versailles, fruitlessly endeavouring to negotiate an armistice on this basis, the Government of the besieged city were surprised and forcibly detained for several hours at the Hôtel de Ville, on the 31st of October, by a band of rioters organised by the partisans of the Commune. General Trochu was released in the evening by the 106th battalion of the National Guard.

After a series of sorties, especially on the 28th and 30th of November, and the 21st of December, the common result of which was the disorderly retreat of the besieged to recover the immediate protection of their forts, the Germans opened the bombardment of Paris, by an attack on Mount Avron, on the 27th of December, which, two days afterwards, was evacuated by its defenders, under the personal superintendence of General Trochu, who at length, on the 21st of January, 1871, resigned his command in consequence of the dissatisfaction expressed at a meeting of the Council of Defence. The city of Paris surrendered on the 28th of January; and on the 7th of February, General Trochu declined the honour of election to the Bordeaux Assembly. On the 31st of October, 1871, his election was announced as President of the Conseil Général of the department of Morbihan.

General Trochu has served as a prominent member of the Commission for the Re-organization of the Army, 1871—72; and is said to be awaiting the period when he will have a right to retire as a General, at present, March, 1872, only a few weeks distant, before tendering his resignation as a Deputy, and retiring completely into private life. His most recent contribution to contemporary literature is entitled 'Une Page d'Histoire devant l'Assemblée Nationale,' 8vo, Paris, 1871.

* TROLLOPE, ANTHONY, a voluminous novelist, who derives from the Lincolnshire family of which Lord Kesteven, formerly Sir John Trollope, is the head, was born on the 24th of April, 1815, and was educated successively at Winchester and Harrow. He received an appointment in the General Post Office; and it was whilst occupying a position in the Surveyor's department in Ireland, that he gave the first public indication of his powers as a writer of fiction, by the publication of two works illustrative of Irish life and character. These were entitled respectively 'The Macdermotts of Ballycloran,' 8vo, 1847, fourth edition, 1867, and 'The Kellys and the O'Kellys: or, Landlords and Tenants,' 8vo, 1848, sixth edition, 1867, less painful in its interest than its predecessor, but giving evidence of the same vividness and ability. After a period of probation, he was promoted to fulfil the duties of a surveyor at St. Martin's-le-Grand; and before his retirement from the service, about the year 1867, was for some time employed in the Secretary's department. During his later connection with the Post Office, he was sent abroad on various important missions, the object of which was to establish or to modify postal conventions between this and other countries. Wherever he went he found material for his literary activity; and the titles of some of his works bear witness to his experience of sojourn in the West Indies and in the United States of America, the latter of which he has frequently visited. Mr. Trollope has been an extensive contributor to the periodical literature of this country and of America; and many of his novels have made their first appearance in the 'Cornhill,' 'St. Pauls,' and other magazines, whilst some of them have had their first issue in the shape of serials. Mr. Trollope is the editor of 'St. Pauls,' which was commenced in October, 1867, and contained the first instalment of a novel afterwards published with the title of 'Phineas Finn, the Irish Member,' 2 vols., 8vo, London, 1869.

As a novelist Mr. Trollope has especially distinguished himself by a series of fictions in which the incidents are chiefly conversant about the domestic and worldly side of clerical life; and of this series 'The Warden,' 8vo, London, 1855, new edition, 1859, and, like most of his novels, republished in the 'Tauchnitz Collection of British Authors,' was the first. 'The Warden,' the scene of which is the cathedral town of Barchester, in the West of England, found its continuation in the 'Barchester Towers,' 3 vols., 8vo, London, 1857, new edition, 1858; to which succeeded 'Framley Parsonage,' 3 vols., 8vo, 1861, which changes the scene from the cathedral town to a country parish.

The other novels and miscellaneous works of Mr. Trollope include 'La Vendée: an Historical Romance,' 3 vols., 8vo, London, 1850; 'Doctor Thorne. A Novel,' 3 vols., 8vo, Lon-

don, 1858, ninth edition, 1867; 'The Three Clerks. A Novel,' 3 vols, 8vo, London, 1858, &c., new edition, 1865; 'The Bertrams. A Novel,' 3 vols., 8vo, London, 1859, seventh edition, 1867; 'The West Indies and the Spanish Main,' 8vo, London, 1859, fifth edition, 1867; 'Castle Richmond. A Novel,' 3 vols., 8vo, London, 1860, fifth edition, 1867; 'Orley Farm,' 3 vols., 8vo, London, 1861, cheaper one-volume edition, 1867; 'Tales of all Countries,' first and second series, 2 vols., 8vo, London, 1861—63, fourth edition, 1867; 'North America,' 2 vols., 8vo, London, 1862, fifth and cheaper edition, in one volume, 1867; 'Rachel Ray,' 2 vols., 8vo, London, 1863, ninth edition, 1867; 'Can you forgive her?' 3 vols., 8vo, London, 1864, cheaper one-volume edition, 1867; 'The Small House at Allington,' 2 vols., 8vo, London, 1864; 'Miss Mackenzie. A Novel,' 2 vols., 8vo, London, 1865, new edition, 1867; three volumes of reprints from the 'Pall Mall Gazette,' entitled respectively, 'Hunting Sketches,' 8vo, London, 1865, 'Travelling Sketches,' 8vo, London, 1866, and 'Clergymen of the Church of England,' 8vo, London, 1866; 'The Belton Estate. A Novel,' 3 vols., 8vo, London, 1866, fourth edition, 1867; 'The last Chronicle of Barset,' 8vo, London, 1867; 'The Claverings,' 2 vols., 8vo, London, 1867; 'Lotta Schmidt, and other Stories,' 8vo, London, 1867, a volume of reprints from 'Good Words,' and other magazines; 'British Sports and Pastimes, 1868,' 8vo, London, 1868, reprinted from 'Saint Pauls Magazine'; 'He knew he was right,' 2 vols., 8vo, London, 1869; 'An Editor's Tales,' 8vo, London, 1870; 'The Vicar of Bullhampton,' 8vo, London, 1870; 'Ralph the Heir,' 3 vols., 8vo, London, 1871; and 'Sir Harry Hotspur of Humblethwaite,' 8vo, London, 1871. Mr. Trollope is the reputed editor and real author of a work which he contributed to the early numbers of the 'Cornhill,' and which was republished with the title of 'The Struggles of Brown, Jones, and Robinson. By [George Robinson] one of the Firm. Edited by Anthony Trollope,' 8vo, London, 1870; and he has contributed the third volume, being 'The Commentaries of Cæsar,' 8vo, London, 1870, to a series entitled 'Ancient Classics for English Readers,' which is at present in course of publication under the editorship of Mr. William Lucas Collins. A story entitled 'The Eustace Diamonds,' which Mr. Trollope is at present contributing to the 'Fortnightly Review,' reached its thirty-second chapter in the number of that periodical for February, 1872; and another, called 'The Golden Lion of Grandpere,' the issue of which was commenced in January, 1872, in 'Good Words,' is announced to be "continued throughout the year."

TROLLOPE, FRANCES [E. C. vol. vi. col. 173]. Mrs. Trollope died in her eighty-fifth year, on Tuesday, October 6th, 1863, at Florence, which had for many years been the residence of her son, the subject of the following notice.

TROLLOPE, THOMAS ADOLPHUS, a novelist and historian, who was born on the 29th of April, 1810, and was educated successively at Winchester and at Magdalen Hall, Oxford, where he took his B.A. degree on his twenty-fifth birthday, 1835. His first two serious literary ventures were made under the auspices of his mother, and were entitled respectively 'A Summer in Brittany. Edited by Frances Trollope,' 2 vols., 8vo, London, 1840; and 'A Summer in Western France. Edited,' &c., 2 vols., 8vo, London, 1841. His residence at Florence quickened his interest in the fortunes of that city, and in Italian questions generally, with which a considerable proportion of his works is conversant. These, in addition to numerous contributions to periodical literature, include 'Impressions of a Wanderer in Italy, Switzerland, France and Spain,' 8vo, London, 1850; 'The Girlhood of Catherine de' Medici,' 8vo, London, 1856; 'Tuscany in 1849 and in 1859,' 8vo, London, 1859; 'A Decade of Italian Women,' 2 vols., 8vo, London, 1859; 'Filippo Strozzi. A History of the last Days of the old Italian Liberty,' 8vo, London, 1860; 'La Beata,' 2 vols., 8vo, London, 1861; 'Paul the Pope [i.e., Paul V.] and Paul the Friar [i.e., Pietro Sarpi]. A Story of an Interdict,' 8vo, London, 1861; 'A Lenten Journey in Umbria and the Marches,' 8vo, London, 1862; 'Marietta. A Novel,' 2 vols., 8vo, London, 1862; 'Giulio Malatesta. A Novel,' 3 vols., 8vo, London, 1863; 'Beppo the Conscript. A Novel,' 2 vols., 8vo, London, 1864; 'Lindisfarne Chase. A Novel,' 3 vols., 8vo, London, 1864; 'Gemma. A Novel,' 3 vols., 8vo, London, 1866, a story of Italian private life of the present day; 'Artingale Castle. A Novel,' 3 vols., 8vo, London, 1867; 'The Dream Numbers. A Novel,' 3 vols., 8vo, London, 1868; 'Leonora Casoloni. A Novel,' 2 vols., 8vo, London, 1868; and 'The Garstangs of Garstang Grange,' 3 vols., 8vo, London, 1869. Mr. Trollope's principal work is of a more serious character than

BIOG. DIV.—SUP.

any of the above-mentioned, being 'A History of the Commonwealth of Florence, from the Earliest Independence of the Commune to the Fall of the Republic in 1531,' 4 vols., 8vo, London, 1865, of which the first two volumes are devoted to the rise of the Florentine Commonwealth, whilst the third and fourth volumes are devoted to its fall. The wife of Mr. Trollope has produced an English translation of Niccolini's 'Arnoldo di Brescia,' and has likewise contributed to the 'Athenæum' some valuable papers on the social aspects of political movements in Italy.

TROPLONG, RAYMOND THÉODORE, a French legist and judge, was born at St. Gaudens, Haute Garonne, October 8th, 1795. Admitted to the bar as an advocate in 1816, he entered the bureau of the Prefect of Châteauroux; became substitute in the tribunal of Sartène, and in 1819 in that of Corse. At Bastia, in 1820 and subsequent years, he acted as substitute for the procureur-général of the Cour Royale; and afterwards practised as avocat-général at Bastia and at Nancy. His leisure was spent in the study of Roman and old French law. In 1822 he was appointed president of the Chamber of Nancy; and in 1835 councillor of the Court of Cassation. The Institute admitted him a member of the Academy of Moral Sciences, in the section of legislation, in 1840. In 1846 he was made a peer of France; in 1848 succeeded Baron Séguier as premier-président of the Court of Paris; and in 1852 became premier-président of the Court of Cassation. Among the offices which he filled were those of vice-president and president of the Senate, and president of the Council General of l'Éure. He drew up, for the Prince President Louis Napoleon, in 1852, a report on the establishment of the Empire; and his high reputation, together with his dictum that the empire "avait tous les avantages de la république sans en avoir les inconvénients," tended to strengthen the newly-elected Emperor. In 1858, M. Troplong became one of the members of the Imperial Council. He wrote largely in the 'Gazette des Tribunaux,' the 'Revue de Législation,' the 'Revue Européenne,' and other journals. Among his separately-published works were 'Du Pouvoir de l'État sur l'enseignement,' 8vo, Paris, 1844; 'De l'Influence du Christianisme sur le droit Civil des Romains,' 8vo, Paris, 1843, 3rd edition, 1868; 'De la Propriété,' 8vo, Paris, 1848, forming part of the 'Petits Traités' published by the Academy of Moral and Political Sciences. But his great work is 'Le Droit Civil expliqué, suivant l'ordre des Articles du Code depuis et y compris le titre de la Vente.' It is a continuation of Toullier's 'Commentaire du Code Civil,' and was published in sections at various dates extending over a period of more than twenty years. Other separate treatises are, 'Des Privilèges et Hypothèques,' 4 vols., 8vo, Paris, 1833, 5th edition, 1850; 'La Vente,' 2 vols., 8vo, Paris, 1834, 4th edition, 1851; 'La Prescription,' 2 vols., 1835, 3rd edition, 1841; 'L'Echange et la Louage,' 1840; 'Le Contrat de Société,' 1843; 'Le Prêt,' 1854; 'Le Mandat,' 'Le Dépôt,' 'Le Contrainement,' 'La Contrainte par Corps,' 1845—1847; 'Le Contrat de Mariage,' 4 vols., 1850; 'Les Donations,' 1855; 'La Transcription hypothécaire,' 1856. The whole series, extending to 28 volumes, is distinguished by much erudition and an animated style of treatment. M. Troplong died on the 2nd of March, 1869.

TROYON, CONSTANT, an eminent French animal and landscape painter, was born at Sèvres in 1813. For a time he was engaged in the royal manufactory of porcelain, and then entered the atelier of M. Riocreux. He afterwards worked much from nature in the rural districts of France, and visited Holland to study the methods of the animal painters of the Netherlands. M. Troyon soon occupied a prominent place in the Salon; and for some years before his death he ranked as the first painter of his class in France, and one of the very first in Europe. Animals in motion usually form the principal objects in his pictures, but not to the exclusion of the landscape. His pictures are mostly of rather large size; painted in a broad masculine manner; true to nature, but with marked individuality; and he was fond of striking effects of light and shadow, early morning scenes, &c. His large picture of 'Animals going forth to labour,' (from the Luxembourg), which was in the International Exhibition of 1862, and the 'Return of the Flock,' in the International Exhibition of 1871, were good examples of his style. Several of his pictures have been engraved. M. Troyon received three first-class medals; and was made knight of the Legion of Honour in 1849. He died March 20th, 1865.

TSCHUDI, JOHANN JAKOB VON [E. C. vol. vi. col. 1028].

TUCKERMAN, HENRY THEODORE, American writer,

was born at Boston, Massachusetts, April 20th, 1813. Between 1833 and 1839, he travelled much in Europe, and as the result of his travels published his first volume, 'The Italian Sketch Book,' 8vo, Boston, 1835, consisting of descriptive and historical sketches, essays, and tales. In 1845 he settled at New York, and thenceforth passed the usual uneventful life of a literary man. He was a voluminous contributor to the 'North American Review,' the 'Christian Examiner,' the 'Democratic Review,' 'Graham's Magazine,' the 'Southern Literary Messenger,' 'Putnam's Monthly,' the 'Atlantic Monthly,' and other periodicals. Among his separately published works are 'Sicily: a Pilgrimage,' 8vo, Boston, 1839, the fruit of his second voyage to Europe; 'Rambles and Reveries,' 12mo, Boston, 1841; 'The Spirit of Poetry,' 1843; 'Thoughts on the Poets,' 8vo, New York, 1846, third edition, 1848; 'Artist Life: a Sketch of American Painters,' 8vo, New York, 1847; 'Characteristics of Literature,' 8vo, New York, 1849; 'Over the Mountains on the Western Prairies,' 1852; 'Book of the Artists,' 1869. He died at New York on the 17th of December, 1871.

* TULASNE, LOUIS RENÉ, cryptogamist, was born at Azay-le-Rideau, in the Indre and Loire department, September 12, 1815. His botanical career commenced as the assistant of Auguste de St. Hilaire, in his work on the flora of Brazil. In 1842, he was appointed assistant naturalist in the Museum of Natural History at Paris. He has written many articles and works, amongst which may be mentioned 'Études d'embryogénie végétale,' 8vo, Paris, 1849; 'Mémoire pour servir à l'histoire anatomique et physiologique des lichens,' 8vo, Paris, 1852; and 'Podostemacearum monographia,' 4to, 1852. He is, however, best known on account of the works which he has written in conjunction with his brother, CHARLES TULASNE (born 1816), such as 'Fungi hypogæi,' folio, 1851; and 'Selecta fungorum carpologia,' folio, 3 vols. 1861—65. The last mentioned work is one of the most remarkable and valuable of the more recent additions to botanical literature. It contains a large amount of evidence on a subject to which the MM. Tulasne have devoted some of the best years of their lives, viz., the polymorphism of mushrooms.

* TULLOCH, VERY REV. JOHN, D.D., a divine of the Church of Scotland, and Principal of St. Mary's College, St. Andrews, was born in the year 1823, at Tippermuir, near Perth, of which parish his father was the minister. After having gone through the curriculum of arts at the United College of St. Leonard and St. Salvador, at St. Andrew's, where he matriculated in 1837, he became a student of theology at St. Mary's College, in the same University. He received a licence to preach the gospel in 1844, and in the following year was ordained to a charge in Dundee, which he vacated in 1849, on being presented to the parish of Kettins, near Cupar Angus. He had already attracted attention for his intelligence of the philosophical and theological questions of the day, and during a sojourn in Germany had become acquainted with the speculations of its thinkers, when he was called, in 1854, to the office he at present holds, in succession to the late Principal Haldane. Upon the occasion of this appointment he received the degree of D.D.; and his "inaugural lecture" was published with the title of 'Theological Tendencies of the Age,' 8vo, Edinburgh, 1855. In the last-named year he was awarded the second of the Burdett Prizes—of the value of 600*l.*, the first of which, value 1800*l.*, was presented to the Rev. Robert Anchor Thompson—which are periodically distributed to the writers of the best essays on the "Being and Attributes of God." Dr. Tulloch's essay was published with the title of 'Theism: the Witness of Reason and Nature to the All-Wise and Beneficent Creator,' 8vo, Edinburgh and London, 1856. Besides this, the most important of his works, Principal Tulloch has produced various sermons, lectures, and historical and biographical studies; including a sermon on the 'True Doctrine of Christian Unity,' which forms part of the second series of the 'Sacred Oratory' department of 'British Eloquence of the Nineteenth Century'; 'The Theological Faculties of the Scottish Universities in Connection with University Reform. A Letter to Her Majesty's University Commissioners for Scotland,' 8vo, Edinburgh, 1858; 'Leaders of the Reformation, Luther, Calvin, Latimer, Knox,' 8vo, Edinburgh, 1859, second edition, 1860; 'English Puritanism and its Leaders, Cromwell, Milton, Baxter, Bunyan,' 8vo, Edinburgh and London, 1861; 'Beginning Life. Chapters for Young Men on Religion, Study, and Business,' 8vo, Edinburgh, 1862, sixth thousand, London and Edinburgh, 1863; 'The Christ of the Gospel and the Christ of Modern Criticism: Lectures on M. Renan's "Vie de Jésus,"' 8vo, London and Cambridge, 1864; and 'Theological Contro-

versy: or, the Function of Debate in Theology. An Address delivered to the Members of the Theological Society in the University of Edinburgh. With an Appendix on the Study of the Confession of Faith,' 8vo, Edinburgh and London, fourth edition, 1866. Principal Tulloch has been a considerable contributor to the 'British Quarterly' and the 'North British Reviews'; and more recently has furnished a number of articles to the 'Contemporary Review,' of which the most remarkable are 'Rationalism,' March, 1866; 'Studies in the History of Religious Thought in England: I. John Hales; II. William Chillingworth,' which appeared respectively in June and September, 1867; 'Jeremy Taylor and the Liberty of Prophecy,' in two parts, October and December, 1868; 'Edward Stillingfleet and his "Irenicum,"' February, 1869; and 'The English and Scotch Churches,' December, 1871.

TURA, COSIMO, called IL COSMÈ, an early Italian painter, was a native of Ferrara, where he was born in the early part of the 15th century, and learned painting of Galasso Galassi. His most noted works were a series of frescoes, painted for the Duke Ercole of Ferrara, in the new palace of Scandiana. In process of time the palace was neglected, and is now used as a tobacco manufactory, and the frescoes were destroyed or covered over, but seven of them were recovered by Sig. A. Campagnoni in 1840. The chief works of Cosimo, who has been termed the Mantegna of Ferrara, are an 'Annunciation' and a 'St. George,' formerly in the cathedral, but now in the Costabili collection, Ferrara. A portrait of the poet Tito Strozzi is preserved in the Strozzi Palace. Outside Ferrara his works are rare. The National Gallery, however, contains three good specimens from his pencil: No. 772, 'The Madonna and Child Enthroned,' the centre of a large altar-piece from the Frizzoni collection, Bergamo; No. 773, 'St. Jerome in the Wilderness,' a very fine picture, formerly in the Certosa and afterwards in the Costabili collection, Ferrara; and No. 590, 'Christ placed in the Tomb,' from the Lombardi-Baldi collection. The Berlin Museum also possesses a carefully painted 'Madonna and Saints,' by Cosimo Tura. The exact date of Cosimo's death is unknown. He was alive in February, 1481.

TURGENEV, NIKOLAI IVANOVICH [E. C. vol. vi. col. 197]. The author of 'Russia and the Russians,' died at his residence near Paris, on the 10th of November, 1871, at the age of eighty-one years, the last forty-six of which had been spent in exile.

TURNER, CHARLES, an eminent mezzotint engraver, was born at Woodstock, Oxfordshire, in 1773. When a youth he obtained employment in the establishment of Alderman Boydell. In 1795 he became a student of the Royal Academy. As an engraver he distinguished himself by breadth of handling, richness of tone, and brilliancy. His large plate of the 'Shipwreck,' after J. M. W. Turner, is, of its class, the finest mezzotint ever published. He also engraved, in an admirable manner, several of the prints in our great landscape painter's 'Liber Studiorum,' and in his 'Rivers of England.' Among his landscapes after other masters, the best perhaps is Callcott's 'Water Mill.' Among the most noted of his portraits are the Marlborough Family, after Reynolds; James Watt, after Lawrence; and Sir Francis Chantrey, after Raeburn. During his later years Mr. Turner drew a great many portraits in chalk, and painted a few in oil. Mr. Turner was engraver in ordinary to George IV.; in 1828 he was elected associate engraver of the Royal Academy, and he died August 1st, 1857.

TURNER, DAWSON [E. C. vol. vi. col. 201], botanist, died June 20, 1858, at the age of 83.

TURRITA, FRA GIACOMO (or JACOPO) DA, one of the most famous of the early Italian workers in mosaic, was a native of Siena, and is sometimes called Fra Mino da Turrita, from a place in that territory. The year of his birth is not known, nor whether he studied under one of the Byzantine mosaicists then much employed in Italy, or in the Roman School, which at the beginning of the thirteenth century was celebrated. All that is really known is that in the mosaics he executed in the tribune of S. Giovanni at Florence, which bear the date 1225, he was considered to have surpassed all his predecessors, and from that time he was placed at the head of the living workers in mosaic. He introduced many technical improvements into the art, helped to rid it of some of its archaic conventionalisms, and altogether brought it to a higher stage than it had previously occupied. At Rome he executed mosaics in the chapel of the high altar at S. Giovanni Laterano; others in Santa Maria Maggiore, which appear still fresh, but have been "restored" and altered; and he commenced some important works in the

apse of the Duomo at Pisa, but died about 1289, before they were far advanced. Da Turrita was a monk of the order of Saint Francis.

TURTON, WILLIAM, M.D. [E. C. vol. vi. col. 209], conchologist, died at Bideford, December 28, 1835, aged 73.

TYLER, JOHN, tenth President of the United States of America, was born in Charles City, Virginia, March the 29th, 1790. He graduated at William and Mary College in 1807; was admitted to the bar in 1809, and attained extensive practice in the law. In 1811 he entered the State Legislature of Virginia, where he joined the party at that time known as the Democrats. Elected to Congress in 1816, he upheld the Democratic or States' rights policy on all occasions. He resigned his seat in 1819, was elected Governor of Virginia in 1825, and entered the Senate of the United States in 1827. During nine years he was actively concerned in the political antagonisms of Adams, Jackson, Calhoun, and Clay, on various questions of the time. He was unconnected with politics from 1836 to 1840; but in the last-named year was elected Vice-President of the United States. The death of President Harrison in 1841 led to the immediate accession of Mr. Tyler, who signalled his elevation by placing Whigs in office in substitution of Democrats. His change in party allegiance, together with an evasive policy in reference to a Bank Act, brought upon him the animosity of both parties in turn; many of his ministers quitted him, but he acquired the support of Calhoun, at that time an influential Southern Democrat. Tyler signed the Webster-Ashburton treaty with England in 1842, settling the north-eastern boundary question; and effected the annexation of Texas in 1845. At the close of his presidency, he had lost the confidence both of Democrats and Whigs, and abandoned an intention of seeking re-election. Selected in 1861 as a member of the Border or Neutral Committee, to endeavour to heal the breach between North and South, he joined the South on the failure of that attempt, and was a member of the Confederate Congress at Richmond at the time of his death, which took place January 17th, 1862.

* TYNDALL, JOHN, son of John Tyndall, of Leighlin Bridge, in Ireland, was born about the year 1820. He is descended from an English family, named Tyndall, or Tyndale, some of whom emigrated to Ireland in the 17th century. From his father he derived a love of independence, together with a taste for controversial divinity as set forth by Tyndale, Chillingworth, Tillotson, and others, whose works were, in fact, the first text books for the future natural philosopher. From a tutor named Conwill young Tyndall acquired a taste for mathematical knowledge, and in 1839, when he left school, he joined in the capacity of "civil assistant" a division of the ordnance survey stationed in his native place, under the command of Lieutenant George Wynne. Here he quickly acquired a practical knowledge of every part of the survey, and became, in turn, draughtsman, computer, surveyor, and trigonometrical observer. While stationed at Cork, he worked at mapping in the same room with a very able man, Mr. Lawrence Ivers, who was looked up to with great respect by his younger colleagues. Noticing the work and conduct of Tyndall, Mr. Ivers asked him how he employed his leisure time. "You have five hours a day at your own disposal," he said, "and these ought to be devoted to systematic study." Next morning Tyndall was at his books before five o'clock, and for twelve years afterwards he never swerved from the practice.

In 1844, seeing no prospect before him, Mr. Tyndall had nearly decided on going to America. But his friends opposed the notion; and engineering employment offering in the same year, he was induced to give up the idea. For three years he was engaged in railway work. Caution, accuracy, and perseverance distinguished his labours, and his resolution in overcoming difficulties is described as having been remarkable.

In 1847, Mr. Tyndall gave up this laborious life for the more retired one of a teacher in Queenwood College, Hampshire, where Frankland was resident chemist. During part of this period, Tyndall renounced a portion of his small income in order to get additional time for study; but his longing for better opportunities made him still dissatisfied with his position, and led to another change. In 1848, Frankland and Tyndall left England

together, and, attracted by the fame of Professor Bunsen, repaired to Marburg in Hesse Cassel. Bunsen was celebrated not only as a chemist, but as a natural philosopher. Tyndall attended his lectures, and worked hard in his laboratory. He also attended the lectures of the physicists, Gerling and Knoblauch, and the mathematical lectures of Stegmann. His first scientific paper was a mathematical essay on "screw surfaces," being his inaugural dissertation on taking his degree. He was first made known to the world of science by a paper published in the 'Philosophical Magazine' in 1850, being the result of an investigation conducted in conjunction with Professor Knoblauch, and entitled 'Magneto-Optic Properties of Crystals, and the relation of Magnetism and Diamagnetism to Molecular Arrangement.'

In 1851 Mr. Tyndall went to Berlin, and continued his studies in the laboratory of Professor Magnus. In the same year, however, we find him in London, making the acquaintance of Faraday, and by the originality of his investigations leading the late President of the Royal Society to request that he would offer himself for election into that body, which election followed in 1852. In the February of the following year, Tyndall was invited to give one of the Friday-evening lectures at the Royal Institution, and in June, 1853, he was unanimously elected to the appointment which he still holds, of Professor of Natural Philosophy at that institution. Various memoirs now appeared in the 'Philosophical Transactions' and the 'Philosophical Magazine,' embodying the results of investigations, during the first three years of his residence in London, on the Influence of Crystalline and Organic Structure upon Magnetism, and on the Polarity of the Diamagnetic Force. In 1856 Switzerland was visited in company with Professor Huxley, for the express purpose of scientific investigation, and joint papers were published by the two friends on the structure and motion of glaciers. It may be added that in 1852 Huxley and Tyndall applied for two vacant chairs in the University of Toronto, but they were not considered eligible. Other perilous journeys and investigations in company with Mr. Hirst were described in 1860 in Mr. Tyndall's work, 'On the Glaciers of the Alps.' In 1871 he published his 'Hours of Exercise in the Alps,' which is for the most part a record of bodily action.

It is difficult to write an impartial biographical notice of a man who, in the prime of life, is actively engaged in professional work before the public eye. Tyndall is a remarkable example of combined cerebral and muscular activity. To be the best physicist and the best climber might well satisfy the ambition of any man living in a highly intellectual age, when, at the same time, all classes admire, appreciate, and practise bodily exercise. Not only is Tyndall distinguished by the variety, extent, and originality of his researches, whether in heat, light, sound, electricity, and other branches of physical and physico-chemical science, but he is also a lecturer whose highest praise it is to be worthy to succeed Faraday at the Royal Institution. He has also produced two of the best popular books that have ever been written—the one on Heat, the other on Sound; and by popular we do not mean that the difficult and therefore most essential parts of the subject are omitted, but that they are fairly grappled with and made intelligible to the non-mathematical reader. He has published a small book entitled 'Faraday as a Discoverer;' a volume on 'Diamagnetism;' and in 1871 a collection of essays, entitled 'Fragments of Science.' His experimental researches on radiant heat in reference to the molecular constitution of bodies, which have occupied him during the last twelve years, are recorded in the Transactions of the Royal Society.

In all Tyndall's labours, whether as a writer or a lecturer, there is an unmistakable personality, so that you cannot forget the man in his work. This characteristic, which some might consider a defect, is really due to the thorough earnestness of his character. There is no play about his work. That which makes the subject easy to the reader or the listener is the result of very hard work on the part of the writer or lecturer, and this anxiety always to do his best has the effect of bringing the man himself prominently before us. A scientific paper or lecture by Tyndall implies an amount of previous careful elaboration that those only are aware of who have the privilege of going behind the scenes.

U

UDEN, LUCAS VAN [VANUDEN, LUCAS, E. C. vol. vi. col. 283].

UGOLINO DELLA GHERARDESCA, COUNT, famous especially for the cruel catastrophe of his death, was, for some time in the latter half of the thirteenth century, at the head of the faction of the Guelphs in Pisa, of which, by a series of traitorous practices, he made himself master. His deadly adversary was Ruggieri Ubaldini, Archbishop of Pisa, and one of the principal chiefs of the Ghibelines in that city; one of whose nephews Count Ugolino had slain. By various acts of unscrupulous finesse and policy, Ubaldini had in revenge brought about the ruin of Ugolino; whom, with the assistance and complicity of the people of Pisa, he imprisoned, March, 1288, in company with his two nephews and two sons in a tower of which the key, after their confinement on a scanty supply of provisions had lasted for some time, was thrown into the river Arno. The miserable inmates of the tower were left to perish of hunger; and Archbishop Ubaldini, and the people of Pisa, became, on account of their cruelty, obnoxious to universal odium and execration. The fate of Count Ugolino was not so much resented, for there was a conviction that by a series of treacheries he had deserved it; but for the more youthful and innocent members of his family, the pity was as profound as it was wide-spread. The catastrophe of the tower, involving the slowly fatal misery of Ugolino and his kinamen, has been frequently the subject of the sculptor and the painter; and Dante, in *Cantos xxxii. and xxxiii.* of his '*Inferno*,' has given a horrible vividness to this episode in the civil dissensions of Pisa. Count Ugolino, eternally tormented by hunger, eternally devours Ruggieri; and the loathsome picture which the poet calls up is that of "two spirits frozen in one hole, one of which gnaws the skull of the other."

UHLAND, LUDWIG [E. C. vol. vi. col. 225]. This popular German poet died on the 13th of November, 1862, aged 75. His songs have been often reprinted. His prose writings and posthumous remains appeared under the title of '*Schriften zur Geschichte der Dichtung und Sage*,' 3 vols. 8vo, Stuttgart, 1865, &c. Among the biographical and critical accounts of him may be mentioned—Pfeiffer's '*Ludwig Uhland*,' Vienna, 1862; Jahn's '*Ludwig Uhland*,' Bonn, 1863; and Mayer's '*Ludwig Uhland, seine Freunde und Zeitgenossen*,' 2 vols. Stuttgart, 1867.

UMBREIT, FRIEDRICH WILHELM KARL [E. C. vol. vi. col. 231], died at Heidelberg, on the 26th of April, 1860, a fortnight after the completion of his 65th year.

UNGER, FRANZ-JOSEPH ANDREAS NICHOLAUS, botanist, was born at Leitschach, in Styria, November 30, 1800. He was educated at Vienna and Prague. At first he studied for the law, but abandoning this, he devoted himself to medicine and natural history. In 1823 he incurred the suspicion of his government, and was imprisoned. During his confinement he was able to pursue his studies, amongst which botany seems to have attracted most of his attention, owing to his being permitted to make occasional visits to the Botanic Gardens of Vienna. In 1825 he was released; and, after graduating in medicine in 1827, he practised at Stockerau, near Vienna, and at Kitzbühel, in the Tyrol, until about 1833, when he succeeded Heyne as professor of botany at the Joanneum, at Gratz. In 1849 he went to Vienna as successor to Endlicher in the chair of botany in the University of that city. In 1866 he resigned that post, and retired to Gratz. He died at Gratz, February, 13, 1870. He wrote many

botanical works and papers, amongst which the most important are those relating to fossil plants, which were [his special study. He described a large number of species and genera, whose structure he ascertained by means of microscopical examination of their sections. He was eminently successful in bringing before the mind the general character of the floras of past periods, and in showing how the later growths seem to be an evolution of those which preceded them. His principal works are a paper on the zoospores of *Vaucheria*, published in 1827; '*Grundzüge der Anatomie und Physiologie der Pflanzen*,' 8vo, Vienna, 1846; '*Genera et species plantarum fossilium*,' 8vo, 1850; '*Die Urwelt in ihren verschiedenen Bildungs perioden*, 4to and folio, 1847, new edition, 1858; '*Anatomie und physiologie der Pflanzen*,' 8vo, Pest and Leipzig, 1855; '*Die versunkene Insel Atlantis*, 8vo,' Vienna, 1860; '*Wissenschaftliche Ergebnisse einer Reise in Griechenland und in den Ionischer Inseln*,' 8vo, Vienna, 1862; '*Die Insel Cypern*,' 8vo, Vienna, 1865, in conjunction with Kotschy; '*Die fossile Flora von Kumi in Euböa*,' Vienna, 1867, &c. He continued working to the time of his death, his last paper, published in 1871, being on the fragments of plants found in some of the very old Egyptian bricks.

UPCOTT, WILLIAM, antiquary and collector, born in London, June, 1779, was the illegitimate son of Ozias Humphrey, R.A. He was apprenticed to Wright, the bookseller, of Piccadilly, and was afterwards for six years assistant to Evans, of Pall Mall, where he attracted the notice and acquired the confidence of several well-known book collectors. On the foundation, in 1806, of the London Institution, in the Old Jewry, Porson was appointed chief, and Upcott sub-librarian. Here, while Porson directed his attention to the formation of a classical library, Upcott applied himself to the acquisition of a collection of works on British topography, in which he was eminently successful. Upcott's occupation at the London Institution left him little time for original research, but he published an exceedingly useful '*Bibliographical account of Works relating to English Topography*,' 3 vols. 8vo, 1818. He made extensive collections for a history of Oxfordshire, but as far as we know did nothing toward the writing such a work. Upcott was a great collector, especially of autographs, of which he eventually possessed an unrivalled store, and on all matters connected with which he came to be regarded as the leading authority of his time. Upcott was the discoverer of Evelyn's '*Memoirs, Diary, and Correspondence*,' the first edition of which he saw through the press, and he edited Evelyn's '*Miscellaneous Writings*.' The '*State Letters, &c.*, of Henry Hyde, second Earl of Clarendon,' &c., 1820, and the '*Diary and Correspondence of Ralph Thoresby*,' 4 vols. 8vo, 1830—32, were printed in a great measure from his collection. A '*Catalogue of Original Letters, Manuscripts, and State Papers, collected by William Upcott, of Islington*,' was "privately printed," 4to, London, 1836. The treasures described in this catalogue were dispersed after Upcott's death, but many were purchased for the British Museum. Upcott died at his residence, Autograph Cottage, Islington, in September, 1845.

UWINS, THOMAS, R.A. [E. C. vol. vi. col. 243]. This pleasing painter and estimable man died at his residence, Staines, on the 26th of August, 1857, aged 75. An ill-digested, tedious, and unsatisfactory '*Memoir of Thomas Uwins, R.A., late Keeper of the Royal Galleries, &c.*, by Mrs. Uwins,' in which all that is of value relating to the painter is thrown into the Appendix, appeared in 2 vols. 8vo in 1858.

V

* VACHEROT, ÉTIENNE, a French philosopher, was born at Langres, on the 29th of July, 1809, and in 1827 became a student at the École Normale; and after completing his course at this institution, devoted some years to the teaching of philo-

sophy in the provinces. He was admitted *agréé de philosophie* in 1833; and in 1836 took the degree of *docteur-es-lettres*, on which occasion his French and Latin theses—subsequently published—were entitled respectively, '*Théorie des premiers Prin-*

cipes suivant Aristote,' and 'De Rationis Auctoritate, tum in Re, tum secundum Anselmum, considerata,' 8vo, Paris, 1836. In the year following his admission to the doctorate he was selected by M. Cousin to fill the office of director of studies at the École Normale; and during the year 1839 supplied the place of M. Cousin in the philosophy chair of the Sorbonne. On the 28th of April, 1844, he received the decoration of the Legion of Honour. M. Vacherot carried off the prize of the French Institute for his 'Histoire critique de l'École d'Alexandrie,' &c., 3 vols. 8vo, Paris, 1846—51, the independence and freedom of which rendered it obnoxious to the clergy, and especially to the Abbé Gratry, at that time the chaplain of the École Normale, who died on the 5th of February, 1872, a few weeks after he had recanted the opposition which he had at first resolutely and eloquently shown to the doctrine of papal infallibility. The severance of M. Vacherot's connection with the École Normale put an end to the controversy, which had produced from the Abbé Gratry an 'Étude sur la sophistique contemporaine,' and a reply from M. Vacherot, entitled 'Lettre à M. Abbé Gratry,' &c., 1851. The 'Histoire de l'École d'Alexandrie' was also attacked in M. Veuillot's journal, 'L'Univers,' and the charges brought against it were answered by the author in a 'Réponse au Journal de l'Univers,' &c., 8vo, Paris, 1851. M. Vacherot became involved in a more serious quarrel of a political nature by the publication of his celebrated work, entitled 'La Démocratie,' 8vo, Paris, 1859, &c., "deuxième édition, suivie du Texte des Jugemens rendus en France contre l'Ouvrage," 8vo, Brussels, 1860, which entailed upon the author a legal prosecution, and a condemnation to a year's imprisonment. This sentence was reduced upon appeal to one of three months' imprisonment; but even this modified judgment carried with it the deprivation of political rights, to which M. Vacherot was not restored until March, 1870. His advocate, also, M. Emile Ollivier, was suspended for three months from his professional functions on account of the manner in which he had opened the defence of M. Vacherot. The latter became, in 1865, a candidate for the membership of the Académie des Sciences Morales et Politiques; but found his claim, otherwise a perfectly valid one, objected to by the authorities on account of his heretical doctrines. Three years afterwards, however, March 7th, 1868, he was elected to the Académie, in succession to M. Victor Cousin.

The principal works of M. Vacherot, besides those which have been already mentioned, are 'La Métaphysique et la Science: ou, Principes de Métaphysique positive,' 2 vols. 8vo, Paris, 1858, second edition, 3 vols. 18mo, 1863; 'Essais de Philosophie Critique,' 8vo, Paris, 1864; and 'La Religion,' 8vo, Paris, 1869, in which he endeavours, in accordance with psychological rules, to discover the origin of the religious sentiment. M. Vacherot has acted as the editor of some of Cousin's philosophical Lectures; and in addition to articles furnished to M. Franck's 'Dictionnaire des Sciences philosophiques,' and other publications, contributed, in 1855, to the journal, 'L'Avenir,' a remarkable series of essays on the Spirit of the Nineteenth Century. An article from his pen, which appeared in the 'Revue des Deux Mondes,' for July, 1868, with the title of 'La Théologie Catholique en France,' attracted considerable attention.

VALENCIENNES, ACHILLE, naturalist, was born at Paris, August 9, 1794. In 1830 he became professor of anatomy at the École Normale, and professor of zoology at the Museum of Natural History. He was the companion of Humboldt and Cuvier in some of their labours; but his reputation is chiefly based on his 'Histoire Naturelle des Poissons,' 11 vols. 8vo, 1829—1849. Cuvier helped him in the earlier volumes. Valenciennes furnished the volume on 'Ichthyologie' in Du Petit Thouar's account of his voyage round the world; and wrote numerous articles, most of which relate to marine zoology. He was a member of the Academy of Sciences and of many other scientific institutions. He died April 14, 1866.

VALLANCEY, GENERAL CHARLES, F.R.S., a once famous writer on the Irish language and antiquities, though English by birth was of French descent. Born in 1720 he entered the army young; attained a captaincy in the 12th regiment, and afterwards joined the royal corps of engineers, of which he obtained the colonelcy in 1782. About 1770 he was engaged on a military survey of Ireland, which occupied him for several years, and obtained the warm approbation of the government. It was in the course of this survey that his attention was strongly directed to Irish antiquities, the study of which became a more and more absorbing pursuit. He published 'A Grammar of the Ibero-Celtic or Irish Language; with an Essay on

the Celtic Language, showing the importance of the Ibero,' 4to, Dublin, 1773, new edition with additions, 8vo, 1782; and in 1774 commenced the issue of his 'Collectanea de Rebus Hibernicis, published from original MSS., and illustrated by Notes and Remarks.' The first number of this comprehensive work contained a description of the county of Westmeath, written by Sir Henry Piers in 1682, and was accompanied with a large map; the second number comprised a letter from Sir John Davis to the Earl of Salisbury; Archbishop Usher's 'Original and first institution of Corbes, Erenach and Termon Lands;' and an account of two ancient instruments lately discovered. Tanistry, the Brehon Laws, and other important subjects completed the first volume. There was then a delay of publication till 1781 when it was renewed, but the continuation consisted at first mainly, and soon exclusively, of original dissertations, in which the language and antiquities were treated with great research and fulness, but Vallancey's peculiar views and system of interpretation now formed an increasingly prominent feature. The publication of the Collectanea was continued till 1812, the last part issued being 'An Account of the Ancient Stone Amphitheatre lately discovered in the County of Kerry, with Fragments of Irish History relating thereto.' The Collectanea forms seven quarto volumes, but the seventh volume was to have contained further matter which was never printed; and the sixth volume is extremely scarce, the greater part of the impression having been accidentally destroyed. Vallancey was a man of great learning, research, and industry, and a most enthusiastic investigator and admirer of Irish antiquities; but he believed that the old inhabitants of Ireland were "descended from the Pheno-Scythians of the East," and he sought in the Sanskrit, Persian, Chaldee, Hebrew, and Arabic, to find corroboration of his notion. Yet though visionary in his theories he was patient in collecting, and his works are a quarry of valuable materials for the Irish antiquary; and he gave a great impulse to the study of the archæology and language of Ireland. Vallancey wrote 'The Ancient History of Ireland proved from the Sanscrit Books of the Bramins of India,' for private circulation; a 'Prospectus of a Dictionary of the Language of the Aire Coti, or Ancient Irish, compared with the language of the Cuti, or Ancient Persians,' &c., and various papers in the Transactions of the Irish Academy, but most of his dissertations were given in the Collectanea. Vallancey's labours were perhaps over-estimated in his own day, they are certainly underrated now. He was created LL.D.; elected fellow of the Royal Society in 1784; he was also a fellow of the Society of Antiquaries and other learned bodies. He was made a lieutenant-general in 1798 and a general in 1803. He died in Dublin on the 8th of August, 1812, aged 92.

* VAMBERY, ARMINIUS, traveller and philologist, was born at Duna Szerdahely, on the Danube, in 1832. He was educated at Pesth. In 1848 he took part in the revolution of the Hungarians against Austria, and when it was suppressed he went to Constantinople. Here he gave himself up to a study of the Oriental languages, which led to a strong desire to make personal researches in Central Asia, with a view to determining whence the Magyar stock originated. Knowing how difficult it would be for him to traverse the country of the Turkoman tribes as a European, he resolved to attempt to pass through it in the disguise of a mendicant dervish. In order to qualify himself to assume this character, he was obliged to study their ways, and undergo a long training. In 1863 he joined a party of dervishes or hadjis at Teheran, who were about to return to their homes in Turkistan. A general outline of his travels is given under ASIA, E. C. S. GEOG. DIV. col. 85. His position precluded him from making instrumental observations for geographical purposes, but it was highly favourable to his obtaining an insight into the inner life and languages of the peoples he visited; and much information will be found on these subjects in his book of 'Travels in Central Asia, being the Account of a Journey from Teheran across the Turkoman Desert on the Eastern shore of the Caspian to Khiva, Bokhara, and Samarcand . . . performed in 1863,' 8vo, London, 1864. Editions in Hungarian and German were published in the same year. He has written a few other works on Persia and Central Asia. Soon after his return from his travels he was appointed to the post he now holds, that of the professorship of oriental languages in the university of Pesth.

VANDER CAPPELLE, or CAPELLA, JAN, Dutch marine painter, was a native of Amsterdam, to the freedom of which city he was admitted on the occasion of his marriage in 1653. Nothing further is known of his life. He painted mostly calm

sea or river pieces in a clear, transparent, unaffected style, and in his way, is one of the best painters of his time and country. His works, however, seem to have been little appreciated, even in Amsterdam. The best of them are in English collections, such as those of the Duke of Bedford, Lord Overstone, Messrs. Ellis, Baring, Wright, &c. The National Gallery possesses a small but pleasing 'Coast Scene,' (No. 865) by him, which formed a part of the Peel collection. He etched a few plates.

VANDER GOES, HUGO [GOES, HUGO VANDER, E. C. vol. iii. col. 134].

VANDERGUCHT, MICHAEL, a celebrated engraver, was born in Antwerp about 1660. He learned engraving of one of the Boutats, and settled in London, where he met with much success. His best known plates are the portraits to Clarendon; several portraits after Kneller, including Atterbury, Congreve, and Addison; Sir Josiah Child, after Riley; and Savage, after Foster—this last being esteemed his best print. He also engraved many anatomical plates. He died in London, October the 16th, 1725.—His son and pupil,

GERARD VANDERGUCHT, born about 1695, was much employed by the booksellers in engraving portraits; and in his later years kept a print shop, and dealt in pictures. He died in 1776.—A second son, JOHN, also learned engraving of his father, and etched several plates, among others Thornhill's pictures in the dome of St. Paul's.

VANDER HOEVEN, JAN [HOEVEN, JAN VAN DER, E. C. S., col. 678].

VANDER MEIRE, GERARD, and known also as GEERAERT, or GERARD, VAN GHENT, an early Flemish painter was born at Ghent, probably about 1425. He belonged to a family of painters and is said to have been a pupil of Hubert Van Eyck, but this the ascertained dates of his life contradict. He painted, however, much in Hubert's manner, and may possibly have been a scholar of Jan Van Eyck, or worked in his school. He painted a portrait of a nun of St. Clara, Collette, as early as 1447; was received a master of the Guild of Painters of Ghent in 1452, and he was chosen one of the two jurats of that body in 1474. The time of his death is unknown. From the circumstance of many of his pictures having been destroyed in the religious troubles of the 16th century, his works, though much esteemed, are comparatively rare. His most famous work is the great altar piece, a triptych, representing in the centre Christ on the Cross, with the Brazen Serpent on one wing and Moses striking the Rock on the other, which he painted for the chapel of St. John at St. Bavon, where it still is. The Antwerp Museum contains seven paintings attributed to him (Nos. 23-29) of which six were brought from the church of St. Catherine at Hoogstraeten and are of doubtful authorship. Our National Gallery has a fine portrait by him, 'A Count of Henegau, with his patron Saint, Ambrose' (No. 264), and a small portrait (No. 696) of Marco Barbarigo, painted whilst Barbarigo held the post of Venetian consul in London, 1449.

VANDER NEER, AART, the most famous of the Dutch painters of moonlit landscapes, is noticed as ARNOLD VANDER NEER [E. C. vol. iv. col. 449]. The dates there given of his birth, 1619, and death, 1683, are those of the best authorities, but it has been lately stated that he was living in Rotterdam as late as 1691. The National Gallery has a fine landscape by him (No. 152), with figures and cattle painted by A. Cuypp.

VARNHAGEN VON ENSE, KARL AUGUST [E. C. vol. vi. col. 290]. This celebrated politician and writer died suddenly at Berlin, October 10th, 1858. Since his death many volumes of his letters, diaries, &c., have been published, and excited much discussion on account of the freedom with which many notable persons and institutions have been discussed in them. The chief of these works are two additional volumes of his memoirs, 'Denkwürdigkeiten,' vols. 8 and 9, Leipzig, 1859; 'Briefe von Alexander von Humboldt an Varnhagen aus den Jahre 1827—58,' which has passed through five or six editions in Germany and has been partially translated into English; 'Tagebücher von F. von Gentz,' Leipzig, 1861; 'Tagebücher,' vols. 1 to 6, Leipzig, 1861—62, vols. 7 and 8, Zürich, 1862—65; 'Blätter aus der preussische Geschichte,' 3 vols., Leipzig, 1868.

* VAUGHAN, THE WORSHIPFUL CHARLES JOHN, D.D., Master of the Temple, and a scholar and divine of considerable reputation, was born about the year 1817, and was educated successively at Rugby and at Trinity College, Cambridge. His university career was one of much distinction. He became Craven university scholar in 1836; and in the same year, and again in 1837, carried off the Porson Prize, offered to "such undergraduates as shall make the best translation of

a proposed passage in Shakspeare, Ben Jonson, Massinger, or Beaumont and Fletcher, into Greek verse." He was Sir William Browne's medallist for the Greek ode, and for epigrams, in 1837; in which year he took the Members' Prize for a Latin essay. In 1838, the year of his graduation as B.A., when he was senior classic, he was one of the chancellor's classical medallists, the other being Lord Lyttelton, who was also of Trinity, and with whom he was bracketed equal. He became a fellow of his college in 1839, and proceeded M.A. in 1841; in which year he was admitted to deacon's and to priest's orders. In October, 1841, he became vicar of St. Martin's, Leicester, a parish of which his father had formerly been the incumbent; and continued to discharge the duties of this office until his appointment, December, 1844, to the head mastership of Harrow School. He was created D.D. in 1845; and in February, 1851, was nominated a chaplain in ordinary to the Queen. He resigned the head mastership of Harrow about the close of the year 1859, having distinguished his occupancy of that office by the zeal and success of his academical activity, and the fervour and affection of his pulpit ministrations to his youthful charge. Many of his discourses of this period have been published in volumes entitled respectively, 'Sermons preached in the Chapel of Harrow School,' 8vo, London, 1847, second series, 8vo, London, 1853; 'Nine Sermons for Advent, Easter, &c., preached for the most part in the Chapel of Harrow School,' 8vo, London, 1849; and 'Memorials of Harrow Sundays: a Selection of Sermons preached in the Chapel of Harrow School,' 8vo, London, 1859. On the 4th of July, 1861, being speech-day at Harrow, Lord Palmerston laid the first stone of a new library intended to commemorate the head mastership of Dr. Vaughan, who, early in 1860, refused the bishopric of Rochester when it was offered for his acceptance, preferring to fulfil the humbler, but still important, office of vicar of Doncaster, upon which he entered almost immediately afterwards, assuming also the duties of rural dean and of chancellor of York Cathedral. He performed the functions of a parish clergyman in the most affectionate and exemplary manner, calling in to his aid a number of young men who helped to give efficiency to his labours at the same time that they acquired instruction and experience for their guidance in their own future pastoral avocations. His local discourses of this epoch may be represented by two volumes, entitled respectively, 'Lessons of Life and Godliness: a Selection of Sermons preached in the Parish Church of Doncaster,' 8vo, Cambridge, 1862, and 'Last Words in the Parish Church of Doncaster,' 8vo, London, 1869, second edition, 1870. After a residence of nearly ten years at Doncaster, Dr. Vaughan accepted the mastership of the Temple, in London, to which he was gazetted on the 16th of July, 1869, in succession to Dr. Robinson. In this new sphere he has carried out those plans of extraordinary activity which have elsewhere distinguished him, especially in the holding, during term, of early morning classes for the critical reading of the Greek Testament, and of special services in the Temple Church during Lent, the first of which for the present season he inaugurated with a sermon, on Ash-Wednesday, February the 14th, 1872.

Dr. Vaughan's literary activity has been almost exclusively of a professional kind. Besides various exegetical works on St. Paul's Epistles to the Romans, Philippians, &c., and on the Revelation of St. John, he has published a large number of occasional sermons, discourses, and addresses. They include 'The Personality of the Tempter, and other Sermons,' 8vo, London and Chiswick, 1851; 'Independence and Submission: the Use and Abuse of Each. Two Addresses,' &c., 8vo, 1851, &c.; 'Passages from the Life of Cicero,' 8vo, 1854, a lecture delivered in Exeter Hall before the Young Men's Christian Association; 'A Discourse on Church Discipline and the Burial Service,' 8vo, 1854; 'Epiphany, Lent, and Easter: a Selection of Sermons preached in St. Michael's Church, Chester-square,' 8vo, Cambridge and London, 1860, second edition, enlarged, 1861; 'Revision of the Liturgy: Five Sermons. (1) Absolution; (2) Regeneration; (3) Athanasian Creed; (4) Burial Service; (5) Holy Orders. With an Introduction,' 8vo, Cambridge, 1860; 'The Church of the First Days: Lectures on the Acts of the Apostles,' 12mo, Cambridge and London, 1864, &c.; 'Life's Work and God's Discipline: Three Sermons,' &c., 8vo, Cambridge and London, 1865; 'Characteristics of Christ's Teaching drawn from the Sermon on the Mount,' 8vo, London, 1866; 'Christ the Light of the World,' 8vo, London and New York, 1866; 'Twelve Discourses on Subjects connected with the Liturgy and Worship of the Church of England,' 8vo, London and Cambridge, 1867; 'Foes of Faith: Four Sermons

[(1) Unreality ; (2) Indolence ; (3) Irreverence ; (4) Inconsistency] preached before the University of Cambridge in November, 1868, 8vo, London and Cambridge, 1868 ; ' An Inaugural Sermon [2 Cor. xi. 16] preached in the Church of the Temple, November 7, 1869, 8vo, London, 1869 ; ' Lessons on the Cross and Passion : Six Lectures delivered in Hereford Cathedral, &c., 8vo, London and Cambridge, 1869 ; ' Earnest Words for Earnest Men ; or, the Gospel and the Pilgrimage, 8vo, London and Bungay, 1870 ; and ' Christ Satisfying the Instincts of Humanity : Eight Lectures delivered in the Temple Church, 8vo, London and Cambridge, 1870.

VAUGHAN, REV. ROBERT, D.D. [E. C. vol. vi. col. 301] died on the 14th of June, 1868, in his 73rd year.

VECHTE, ANTOINE, a distinguished French designer and sculptor in metal, was born at Vire-sous-Bil (Côte d'Or), about the beginning of the present century. M. Vechte's designs and works in the precious metals early attracted attention. In 1847 he was awarded a medal of the third class, sculpture, and in the following year one of the first class, he at the same time receiving the decoration of the Legion of Honour. To M. Vechte is due the credit, if not of having revived the almost forgotten art of repoussé in goldsmiths' work, at least of having first shown its great artistic capabilities. To the English public M. Vechte was first formally introduced at the Great Exhibition of 1851, where the Titan vase, and other things by him, attracted much attention. Since then his works have been in as great request here as in France. The International Exhibition of 1862 contained a magnificent collection of his recent productions. Among them were his Milton vase of silver repoussé, the property of the French government ; the great shield in silver and iron, damascened with gold, the subjects dedicated to Shakspeare, Milton, and Newton ; the Centaur and Lapithæ, and the Marine vases, the property of her Majesty ; the Titan vase ; the Ellesmere vase ; and the large and costly vase-candelabrum mounted with engraved gems, made for the Marquis of Breadalbane, and now at Longton. These and subsequent works were of oxidised silver repoussé, and their boldness of relief, accuracy of outline, modelling, surface, and finish, served no less to illustrate M. Vechte's ingenuity and dexterity in manipulation than his artistic power and feeling, the design being often of the most elaborate character, and seemingly made to court difficulties arising from the material. He died in October, 1868.

VENN, REV. HENRY, a zealous and earnest preacher of the Evangelical party in the Church of England, son of the Rev. Richard Venn, Rector of St. Antholin's, London, who represented a line of clerical ancestors from the time of the Reformation, was born at Barnes, in Surrey, in the year 1725. He received his preparatory education at two schools, the latter of which was at Bristol ; and in 1742 was admitted of Jesus College, Cambridge. He took his B.A. degree in 1745, and proceeded M.A. in 1749 ; and, as there was no vacancy in his own college, was unanimously elected by the fellows of Queen's to be one of their society. He vacated his fellowship on the occasion of his marriage in 1757, being at that time settled at Clapham, to the curacy of which he had been elected by the inhabitants. Here he contracted an intimate friendship with Mr. Thornton and Sir John Barnard ; memoirs of whom he afterwards published. In taking leave of his friends at Clapham, on his promotion to the large and valuable vicarage of Huddersfield, Yorkshire, he dedicated to them a volume of ' Sermons, 8vo, London, 1759, in token of the favour and affection with which he had been treated. He found the parish of Huddersfield in a state of " worse than Egyptian darkness ; " and his labours became so indefatigable and so successful that he " might be called the apostle of the district." He made frequent excursions for the purpose of preaching the Gospel in various parts of the kingdom, and was in active connection and co-operation with the Wesleys, Romaine, Madan, Fletcher of Madeley, and Whitefield, and especially with Lady Huntingdon, with whom he had become acquainted at the house of his friend Mr. Thornton. Speaking of his labours, in a letter which he addressed to Lady Huntingdon, December 10th, 1762, he said :—" My congregations are daily increasing. Besides my stated labours on the Lord's day, I generally preach eight or ten sermons in the week in the distant parts of the parish, where many come to hear who will not come to the church. I find my outdoor preaching much owned of the Lord." Mr. Venn's zeal, however, carried him beyond his strength. By his earnest and frequent preaching he had in ten years materially injured his constitution ; so that he was incapable of officiating longer in so exhausting a parish. He therefore accepted, in 1770, the rectory of Yelling, in Hunting-

donsire, a crown living which was offered to him by his friend the Lord Chief Baron Smythe, at that time one of the Commissioners of the Great Seal. Whilst at Yelling, as at Huddersfield, he continued his faithful administrations in the Countess of Huntingdon's chapels, in private houses, in barns, and occasionally in the open air, till some unpleasant litigations, about the year 1782, obliged him and other benefited clergymen to withdraw their services from the Countess. But he still continued the " irregular " practice of preaching in barns and other unconsecrated places in the vicinity of Yelling, and at Surrey and Orange Street Chapels, in London, up to the year 1790, and within a very short time of his death, when inability, and not disinclination, obliged him to cease from labour. He continued at Yelling until December, 1796, when his increasing infirmities compelled him to remove to Clapham, where he died on the 24th of June, 1797.

Mr. Venn was the author of several occasional ' Sermons, ' and of a volume entitled, ' Mistakes in Religion Exposed : in an Essay on the Prophecy of Zacharias, 8vo, London, 1774, 12mo, 1807, &c. But his principal work, and one which has been often reprinted in England, Ireland, and America, is his ' Complete Duty of Man : or, a System of doctrinal and practical Christianity. To which are added Forms of Prayer, ' &c., 8vo, London, 1763, eleventh edition, 12mo, London, 1820, &c., and other editions at Bath and Edinburgh.

VENTURA DI RALICIA, G. D. GIOACCHINO, an Italian orator and divine, and the member of a noble family, was born on the 8th of December, 1792, at Palermo ; where, at the age of fifteen, he entered the Society of Jesus, in whose House he subsequently became professor of rhetoric. Upon the suppression of the Houses of the Jesuits under King Murat of Naples, he joined the order of Preaching Friars, and presently became distinguished for his pulpit eloquence. He devoted himself with considerable ardour to the study of religion and philosophy ; and laid the foundation of his literary reputation by the production of an apology for the regular clergy, entitled ' La Causa dei Regolari al Tribunale del buon Senso, ' and more especially by the articles he contributed to the ' Enciclopedia Ecclesiastica. ' He was appointed censor of the press and member of the royal council of public instruction of Naples, the law barring the state employment of Sicilians out of Sicily notwithstanding ; and introduced and encouraged the popularisation of that new catholic philosophy which had arisen in France, where the Abbé Lamennais was its principal exponent. His funeral oration on the death of Pope Pius VII. (1823), which went through probably more than twenty editions, gained for him the sobriquet of " the Italian Bossuet. " In 1824, having been promoted in his order, he fixed his residence at Rome ; and in the same year, after having been made a member of the commission of censure, was further appointed successively to the chair of public ecclesiastical law, and to the chaplaincy of the University. Already in the possession of substantial favours, the future opened up to him a career of higher promotion, when for some reason not clearly ascertained, but probably based upon the envy of his adversaries, he resigned his professorship. His influence, however, with the Holy See did not diminish ; and Pope Leo XII. employed him in the conduct of various difficult negotiations of a political and ecclesiastical nature. His relations with the Abbé Lamennais gave rise to so much misrepresentation, that at length Ventura quitted the pontifical court, and devoted himself, for ten or eleven years, to preaching and to theological study, and literary production. During this period he was a frequent preacher at St. Peter's ; and delivered a series of Epiphany discourses for eleven consecutive seasons, in the church of St. Andrea della Valle. The accession of Pius IX. in 1846, opened up new prospects to the reforming aspirations of Ventura ; who, in the van of the moderate liberal party, and enjoying immense popularity and influence, for some time trusted to succeed in bringing about a permanent alliance between liberty and the Church. In 1848 he accepted, with the Pope's permission, the post of minister plenipotentiary and commissioner extraordinary of the insurrectionary Sicilian Government, at the Court of Rome ; and about the same time published various political pamphlets, two of which were entitled respectively, ' La Questione Sicula nel 1848 sciolta nel vero Interesse della Sicilia, Napoli, e dell' Italia, ' 8vo, Rome, 1848, 16mo, Palermo, 1848, &c. ; ' Sopra una Camera di Pari nello Stato Pontificio Opinione, ' 8vo, Rome, 1848, 18mo, Naples, 1848, &c. ; and a larger work on the falsehoods of diplomacy, ' Menzogne diplomatiche, ' &c., 8vo, Palermo, 1848, all of which produced a strong interest in the minds of the Italian people. In May, 1848,

Ventura, with other influential persons of his way of thinking, laboured to realise a project for the formation of an Italian Confederation, under the presidency of the Pope; but the scheme failed, as its promoters believed, through the opposition of the Abbé Gioberti and the King of Sardinia. After the flight of the Pope to Gaeta, November 24th, 1848, Ventura remained at Rome, always watching for the opportunity of patriotic action and advice, until the 4th of May, 1849, when he quitted it before the French occupation under General Oudinot; and despairing of being able to benefit his native country, repaired first to Montpellier, where he remained two years, and afterwards to Paris. Whilst at Montpellier he commenced authorship in French with the production of a polemical treatise entitled 'Lettres à un Ministre Protestant,' 12mo, 1849, the object of which was to prove the sojourn of St. Peter at Rome, in opposition to the denial of a minister of Geneva. He also commenced at Montpellier to deliver discourses in the French language; and in 1851 proceeded to Paris, where he presently added by his sermons and his books, to the reputation which had preceded him thither. For several years he attracted large congregations to the churches of the Madeleine and Saint Louis d'Antin; and in 1857 was chosen as Lent preacher at the Tuileries, when he delivered a series of discourses which were afterwards published in an annotated form, and with an introduction, by M. Veuillot, with the title of 'Le Pouvoir Chrétien,' &c., 8vo, Paris, 1858. Ventura died at Versailles on the 2nd of August, 1861; and his remains were conveyed to Rome, where they were buried in the church of his order, and under the pulpit which he had so often occupied.

The most considerable or the most famous of the works of Ventura, besides those already mentioned, are 'Le Bellezze della Fede: ovvero la Felicità di credere in Gesù Cristo e di appartenere alla vera Chiesa,' 3 vols., 8vo, Rome, 1839—42, &c., another edition, 2 vols., 8vo, Bellinzona, 1851, to which a sequel was produced with the title of 'La Madre di Dio Madre degli Uomini,' &c., 2 parts, 8vo, Rome, 1841; 'Discorso Funebre pei Morti di Vienna, recitato il Giorno 27 Novembre, 1848,' 12mo, Rome, 1848, 16mo, Italia, 1849; 'Elogio Funebre di D. O'Connell, recitato pei solenni Funerali celebratigli nei Giorni 28 e 30 Giugno,' &c., 4to, Dublin, 1847, 12mo, Naples, 1848, &c.; 'La Scuola de' Miracoli,' &c., 3 vols., 8vo, Rome, 1850, 2 vols., 8vo, Milan, 1851, &c.; 'Les Femmes de l'Evangile,' 12mo, Paris, 1853, and 'Nouvelles Homélies sur les Femmes de l'Evangile,' 8vo, Paris, 1857, to which was published as a sequel, 'La Femme Catholique,' &c., 2 vols., 8vo, Paris, 1859—60; 'La Tradition et les Semi-Pelagiens de la Philosophie,' &c., 8vo, Paris, 1856, with a sequel entitled 'La Philosophie Chrétienne,' &c., 3 vols., 8vo, Paris, 1861; 'Les Délices de la Piété: Traité sur la Culte de la très-sainte Vierge,' &c., 12mo, Paris, 1860; 'Œuvres Posthumes. Conférences, Sermons, et Homélies,' 8vo, Paris, 1862, otherwise entitled, 'Conférences, Sermons, et Homélies sur les principales Fêtes de l'Année,' 8vo, Paris, 1865.

* VERBOECKHOVEN, EUGÈNE JOSEPH, an eminent Belgian painter, was born at Warneton, West Flanders, June 9th, 1798. M. Verboeckhoven has painted a few portraits, including some of distinguished artists. He has also modelled some figures and reliefs; but those are mere by-play. His true avocation is that of an animal painter, his specialty cattle and sheep, and in this line he has long been regarded as the first in Europe. He has painted a great number of pictures, many of which are of large dimensions, and full of figures; in some instances the animals are the size of life. Cattle-markets and fairs, farm-yards, meadows with sheep and cattle, are frequent subjects of his pencil. After completing, a few years ago, one of the largest and most elaborate of his paintings, 'Cattle leaving a Farm-yard,' M. Verboeckhoven unhappily lost his sight, and he has since of course ceased to paint. He is a knight of the Order of Leopold and of the Legion of Honour, and was long president of the administration of the Museum.—His brother and pupil,

* CHARLES LOUIS VERBOECKHOVEN, born at Warneton, in 1802, also practised at first as an animal painter, but has obtained celebrity chiefly as a marine painter. Examples of his works are in the Antwerp Museum.

VERGNIAUD, PIERRE VICTURNIEN, a leader of the Girondist party in the great French Revolution, was born at Limoges, May 31st, 1753. Having received a good education under a Jesuit teacher, he obtained a scholarship at the Collège du Plessis, Paris. After a brief trial of theology at the Sorbonne, and a probation in a counting-house, both of which proved distasteful to him, he, in 1780, began to study for the bar, at Bor-

deaux; and, in the following year, became bachelor of law, and advocate of parliament. His success at the bar was considerable. He was nominated administrator of the department of Gironde in 1790, member of the Legislative Assembly for the same department in 1791, and at once took part in the stirring politics of the day. Like most of the Girondist deputies, he wavered between monarchism and republicanism. In 1792, when this party came into power, Vergniaud was elected successively vice-president and president of the Assembly. Vergniaud spoke violently against the king in the Assembly, but was one of those who secretly offered to aid him, on condition of the Girondists being allowed to retain office. The king's distrust, the determination of the Jacobins, and the absence of warlike successes, frustrated these schemes. Elected to the Convention, Vergniaud became more violent than before in his speeches; he voted for a republic, although it is known that he would have preferred a representative monarchy. He became secretary of the Convention towards the end of 1792, and was president for a few days in the early part of the following year. The anomalous position in which he had placed himself was shown in the fact that he had to pronounce the sentence of death on the king. He professed to share the opinions of the Convention, over which he presided; but this wavering did not restore him to favour with the excited people. Gasparin openly accused him and two other Girondists, of the secret application to the king in the preceding summer. Vergniaud could not deny it, and did not succeed in justifying himself in the eyes of the Convention. In April, Robespierre gave the signal for a fierce attack; twenty-two Girondists were expelled from the Convention; and being frustrated in a series of counter-manceuvres, Vergniaud and others were taken into custody in June. He was tried for treason on the 25th of October, 1793, before the Revolutionary Tribunal, sentenced to death on the 30th, and executed on the following day. Several years afterwards, by a decree of the Emperor Napoleon I., a statue of Vergniaud was placed on the grand staircase of the Palace of the Senate.

VERNET, ÉMILE JEAN HORACE, known as HORACE VERNET [E. C. vol. vi. col. 323]. This distinguished painter died on the 17th of January, 1863. A month before his death the Emperor, Napoleon III., had conferred upon him the grand cross of the Legion of Honour.

* VERNEUIL, PHILIPPE ÉDOUARD POULLETIER, COMTE DE, geologist and palæontologist, was born at Paris, February 13, 1805. After having served for a time in the office of the Minister of Justice he, in 1836, commenced a series of scientific explorations, in the course of which he visited and examined most parts of Spain, France, Norway, Sweden, and the European portions of the Russian and Turkish kingdoms. He co-operated with Sir R. I. Murchison and Count Keyserling, in the preparation of the well-known geological work, 'Russia in Europe and the Ural Mountains,' to which he contributed the second volume. In conjunction with M. Collomb, he has written several important memoirs on the geology of Spain, of which we may notice the 'Coup d'œil sur la constitution géologique de quelques provinces de l'Espagne,' 4to, Paris, 1853; and the map, the first which showed the geology of the whole peninsula, prepared by him in 1850, of which he and M. Collomb have since issued two or three editions. These maps and memoirs on Spain form the best sketch published of the geology of that country. Verneuil is also the author of the palæontological portion of Tschihatcheff's great work on Asia Minor, published in 1869. He has written numerous other geological papers, is a member of the Academy of Sciences, as well as several other societies, and was president of the Geological Society of France in 1852.

VERNIER, PIERRE, inventor of a mathematical instrument known by his name, was born at Ornans, Franche Comté, in or about the year 1580. From early years he evinced a liking for scientific instruments, which he studied in principle and in construction. He was employed by the Spanish government in various commissions, and on different occasions filled the offices of chatelain or commandant of the castle of Ornans, councillor of state, and director-general of the coinage in Burgundy. In 1631 he published at Brussels, 'La Construction, l'usage, et les propriétés du quadrant nouveau de Mathématiques,' containing among other things, a table of lines, and a method of finding the angles of a triangle when the lengths of the sides are known. But the chief value of the tract (now very scarce), is in the description of a new mode of measuring minute quantities, either linear or angular. This instrument (fully described in VERNIER, E. C., ARTS AND SC. DIV. vol. viii. col. 616), was at first called the *nonius*; but on the suggestion of Lalande towards the close

of the last century, it was named after its inventor, which name has been since retained in usage. Vernier died September 14th, 1637.

VERPLANCK, GULIAN CROMMELIN, an American writer, was born at New York in August, 1786. After graduating at Columbia College in 1801, he commenced the study of the law, was admitted to the bar, and gradually acquired an extensive practice: diversified by occasional visits to Europe. In 1814, he was a candidate for a seat in the New York State Assembly, as a member of the party at that time known as the Malcontents. Thenceforward, politics, law, and literature in turn engaged his attention. In 1820, he was chosen chairman of the Committee on Education in the New York legislature; soon afterward professor of the Evidences of Christianity, in the General Protestant Episcopal Seminary at New York; and from 1825 to 1833 represented New York city in Congress. He was several times member of the Senate in the State Legislature of New York; in 1846 he became president of the Board of Education for that State; and he temporarily or permanently filled various other offices in his native city. Among Mr. Verplanck's published works are the following:—'A Discourse on the Early Friends of America,' delivered before the New York Philosophical Society in 1818, and several times reprinted; 'The State Triumvirate,' with the 'Buckland Bards,' and 'The Epistles of Brevet-Major Pindar Puff,' political satires, 1819; 'Essays on the Nature and Uses of the Various Evidences of Revealed Religion,' 1824; 'Essay on the Doctrine of Contracts: being an Inquiry how Contracts are Affected in Law and Morals by Concealment, Error, or Inadequate Price,' 1825; 'Address on the Law of Literary Property,' delivered at a meeting convened to celebrate the extension of the Copyright Act from twenty-eight to forty-two years, a measure which he assisted in passing through the legislature in 1831; 'The Talisman,' 3 vols. of an Annual, written in conjunction with Messrs. Bryant and Sands, new edition in 1 vol. 1833; 'Discourses and Addresses on Subjects of American History, Art, and Literature,' 1833; Lectures on 'The Rights, Moral Influence, and Use of Liberal Studies,' 1833; oration on 'The Influence of Moral Causes on Opinion, Science, and Literature,' 1834; 'The American Scholar,' a discourse, 1836. He also edited an American edition of Shakspeare, 3 vols. large 8vo, 1844—1847. Nearly all the annual reports of the New York Education Board were drawn up by him, from 1846 onwards; and many of his opinions pronounced in the appeal cases before the Senate, have been published in the American law reports.

VETCH, CAPTAIN JAMES, R.E., was born at Haddington, in Scotland, May 13th, 1789. He entered the Cadet College at Great Marlow, Bucks, in 1804, and the Royal Military Academy at Woolwich, in the following year; assisted in the trigonometrical survey of Berkshire for a few months; received his commission as second lieutenant of Engineers in 1807, and first lieutenant in 1808. From 1810 to 1814 he served in Spain, taking part in the blockade of Cadiz, and in other operations of military engineering. After this, with the rank of captain, he commanded a company of sappers and miners for six years, first at Spike Island, near Cork, afterwards at Chatham. In 1821, on the recommendation of Colonel Colby, he was appointed to the Ordnance Survey, and conducted the operations in the Orkney, Shetland, and Hebrides Islands, with Lieutenants Drummond and Dawson as his assistants. In 1824 Captain Vetch quitted the Royal Engineers, and undertook the control of a group of silver mines in Mexico, comprising the Real del Monte, the Bolenos, and the United Mexican Mines. During eleven years' engagement in this office, his knowledge of engineering enabled him to construct good roads and other public works; while he collected many materials for a map of the country by astronomical, barometrical, and trigonometrical observations. Returning to England in 1835, he was for nearly thirty years engaged in active duties, mostly in the service of the government, undertaking in succession a remarkably diversified list of functions. He was one of the commissioners for settling Irish boundaries; undertook the reclamation of tide-lands and the forming of embankments in Ireland and Scotland; designed a plan of drainage for the city of Leeds, on the invitation of the corporation; aided Sir Henry de la Beche in forming plans for draining Windsor town, castle, park, and forest; prepared for the government a report on the plans submitted by several engineers for the formation of a harbour of refuge at Dover; became consulting engineer to the Admiralty, member of the Harbour Conservancy Board, and afterwards sole conservator of harbours; was

BIOG. DIV.—SUP.

one of the Metropolitan Commissioners of Sewers; proposed a scheme of drainage for Southwark (afterwards adopted with modifications); and, finally, in 1859, was appointed a member of the Royal Commission on Harbours of Refuge. He did not retire from active duties until the 74th year of his age. Among the professional pamphlets which he wrote was 'An Enquiry into the Means of Establishing a Ship Navigation between the Mediterranean and the Red Sea,' 1843; this furnished suggestions which were rendered available in subsequent years in the development of M. Lesseps' Suez Canal. Another related to a plan for an improved water-supply for the metropolis. Captain Vetch belonged to several scientific societies, including the Royal, the Geological, and the Geographical, and contributed papers to their transactions. He died December 7th, 1869.

* VEUILLOT, LOUIS, a French author and journalist, was born in 1813, at Boynes-en-Gatinais, in the department of Loiret; and, having accompanied his father, who was a working cooper, to Paris, in 1818, received or gained sufficient instruction to qualify him at thirteen years old for employment in an attorney's office. In spite of the slenderness of his education, he presently felt the impulse to a literary career; and at nineteen became a contributor to a ministerial journal. He connected himself successively with several provincial newspapers, and as an incidental part of his duties, involved himself in two or three duels, occasioned by the offensive vigour and personality of his style of writing. In 1837 he returned to Paris, and soon afterwards undertook the editorship of 'La Paix,' a doctrinaire journal, in the columns of which he exhibited his constitutional audacity. He was, at this time, an unbeliever and a scoffer at religion; but he returned from Rome, where he had arrived during Holy Week, 1838, and where he was presented to the Pope, the avowed champion of Ultramontane Catholicism. This conversion, which has proved as permanent as it was sudden, was presently signalised by the publication of various works of a devotional and apologetic character, including 'Les Pélerinages de Suisse,' Paris, 1838, eighth edition, 1856; 'Pierre Saintive,' Paris, 1840, a religious romance in the form of letters; 'Le Saint Rosaire médité,' Paris, 1840; 'Rome et Lorette,' Paris, 1841, sixth edition, 1855, being the record of the author's trip to Italy, with an autobiographic introduction; and 'Agnès de Lauvens: ou Mémoires de Sour de Saint-Louis,' Paris, 1842, fifth edition, 2 vols. 12mo, Tours, 1857. Having made the acquaintance of General Bugeaud, he accompanied the latter in the capacity of secretary, to Africa, and afterwards published a work entitled 'Les Français en Algérie. Souvenirs d'un Voyage fait en 1841,' 8vo, Tours, 1845; and upon his return to Paris was appointed to a chief clerkship in the Ministry of the Interior, an office which he vacated after a year and a half, in order to join the staff of 'L'Univers Religieux,' of which he became the principal editor in 1848. In the every-day columns of this paper, the favoured organ of Ultramontanism, M. Veuillot waged war against liberty, reason, science, and progress; and also published some polemical works directed against *universitaires*, philosophers, socialists, and revolutionists, and entitled respectively, 'Les Libres Penseurs,' 12mo, Paris, 1848, second edition, 1850, &c.; 'L'Esclave Vindex,' 12mo, Paris, 1849; 'Le Lendemain de la Victoire,' 12mo, Paris, 1849; 'Petite Philosophie,' comprehending five stories on Christian charity, 12mo, Paris, 1850; 'La Légèrité,' 12mo, Paris, 1852, &c. The bitterness of M. Veuillot's attack upon the bishops for their advocacy of classical learning, brought down upon him the censure of the Archbishop of Paris, against which M. Veuillot repaired to Rome in order to appeal in person. He was exonerated by the Pope; but on account of the whole spirit betrayed in 'L'Univers,' that journal was interdicted in several dioceses, and the reading of it by his clergy was expressly forbidden, in 1853, by M. Dupanloup, Bishop of Orleans. In January, 1860, the manner in which the temporal interests of the Pope were advocated in 'L'Univers,' was so obnoxious as to seem dangerous to the public peace, and directly menacing to the Imperial government, by which it was accordingly suppressed. The practical effect of this sentence was little more than the substitution of 'Le Monde' for 'L'Univers,' as the title of what was in fact the same journal; and the old title itself was restored in April, 1867, when 'L'Univers' resumed its strife with the lukewarm friends, no less than with the secret or open enemies of the Pope, with whose arms it was adorned. M. Veuillot was the special champion of the notorious *Syllabus*, and of the more recent Ecumenical Council, during whose session, December 8th, 1869—July 18th, 1870, he was present at Rome, exercising, so far as was possible to a layman, a vigilant surveillance over its discussions as well as its members.

4 F

The works of M. Veillot, besides those which have been already mentioned, comprise 'L'Honnête Femme,' 2 vols. 12mo, Paris, 1844, first published in 'Le Correspondant,' in 1843; 'Mélanges religieux, historiques, politiques, et littéraires,' 6 vols. 8vo, 1842—56, second series, 6 vols. 8vo, 1856—60; 'Le Droit du Seigneur au Moyen Age,' 8vo, 1854; 'De quelques Erreurs sur la Papauté,' 8vo, 1859; 'Ça et Là,' 2 vols. 16mo, 1860, &c.; 'Historiettes et Fantaisies,' 12mo, 1862; 'Satires,' 12mo, 1863; 'Le Parfum de Rome,' 2 parts, 12mo, 1862, fifth edition, 8vo, 1865; 'Les Odeurs de Paris,' 8vo, and 16mo, 1866, &c.; 'L'Illusion libérale,' second edition, 8vo, 1866; 'A propos de la Guerre,' 8vo, 1866; and 'Pensées de M. Louis Veillot: réunies de tous ses Ouvrages, par l'Abbé J. Charbonel,' 12mo, Paris and Tours, 1868. The pen of M. Veillot is said to have "been in the course of last year (1871) more formidable than ever;" and his recent work 'On the Two Sieges,' 8vo, Paris, 1871, is described by M. Philartès Chasles as "the book of a Catholic Juvenal, caustic, unsparing, admirably unjust, cruelly true, merciless, lawless, epigrammatic, hyperbolic; something between the Prophet Esdras and Martial, between Juvenal, Junius, Churchill and Rabelais."

* VICTOR EMMANUEL I., King of Italy, formerly Victor Emanuel II., of Sardinia. [E. C. vol. vi. col. 346]. During his visit to England in the latter end of 1855, Victor Emmanuel was admitted at Windsor, December 3rd, to the Order of the Garter; and on the 30th of January, 1859, gave his daughter the Princess Clotilde Maria Theresa, of Savoy, in marriage to Prince Napoleon, an alliance which was recognised as identifying the political interests of France more closely with those of Italy, and as being the prelude to the war of Italian independence. In April of the same year, the Emperor of Austria declared war against Sardinia, and Victor Emmanuel placed himself at the head of his troops to defend his invaded territories. The Emperor of the French, from whose co-operation Italy was taught to expect freedom "from the Alps to the Adriatic," followed his army, which had disembarked at Genoa on the 26th of April; and upon his landing at that port on the 12th of May, was received there by the King of Sardinia. A series of brilliant successes, including the victories of Montebello, Magenta, and Solferino, and the hard-won battle of San Martino—where Victor Emmanuel fought in the foremost ranks, and where one in every five of the Piedmontese soldiers was left dead on the field—raised high the hopes of Italian unification, only, however, to be destroyed by the abrupt proposition of an armistice, made by the Emperor of the French to the Emperor of Austria, on the 6th of July. Five days afterwards these two sovereigns met at Villafranca, and on the 12th of July agreed to a peace, the conditions of which were confirmed by the treaty of Zurich, the negotiation of which occupied the Austrian and French envoys from the 8th of August to the 10th of November, when it was signed and concluded. The principal gain resulting from this treaty to the cause of Italian unity and independence was the cession of Lombardy to Sardinia, whilst Venice was still left in the occupation of the Austrians; and for the French co-operation in securing this and other subsequent partial advantages, Victor Emmanuel was called upon to make over to the Emperor the territories of Nice and Savoy, the treaty which sanctioned their transfer being concluded on the 24th of March, 1860. But the national aspirations of the people of Italy outran the calculations of international diplomacy; and Tuscany, Parma, and Modena, impatient of the rule of their own sovereigns, whom they had expelled or deposed, successively declared, August, 1859, in favour of annexation to Sardinia, as representing the idea of a future united Italian kingdom under Victor Emmanuel. On the 3rd of September the Assembly of the Romagna followed the example of the Duchies by the adoption of a resolution expressive of their refusal to live any longer under the temporal dominion of the Pope. The states of Tuscany, Modena, and Parma, were provisionally incorporated; but their rights were reserved by one of the clauses of the treaty of Zurich, which was itself abrogated on the formation of the kingdom of Italy.

The great event of the year 1860 was the conquest of the kingdom of Naples by Garibaldi, who, fettered at nearly every step, especially the earlier ones, by royal proclamations and disavowals, made himself master of the two Sicilies, insular and continental, and condoned his patriotic offence by the splendid offer of his conquests to Victor Emmanuel, whom on his visit to his new dominions, in order to take possession, he saluted as "King of Italy," October 1st, 1860. On the 26th of December, the latter decreed the annexation of the Marches, Umbria, Naples, and Sicily to his dominions; and the title which Garibaldi

had conferred upon him was confirmed on the 17th of March 1861, by the unanimous vote of the Italian Parliament. The new kingdom was immediately recognised by the British Government, and by the Emperor Napoleon on the 23rd of June; and comprised the whole of Italy with the exception of Venice, and so much as was left of the territory of the Pope, who did not fail of energetic protests. "Opportunity," Baron Ricasoli had said, on the opening of the Parliament at Turin, February 18th, 1861, "will open up our way to Venice. In the meantime we think of Rome, which is for Italians not merely a right, but an inexorable necessity."

Interpreting the conduct of Victor Emmanuel with regard to Naples in 1860 as a precedent, Garibaldi believed the King of Italy to be fettered in the accomplishment of his desires after Rome by the French alliance, and did not doubt that the King would willingly accept a conquest which it was not expedient for him to attempt. Accordingly in July, 1862, he proceeded to Catania, in Sicily, for the purpose of raising an army to be directed against Rome; and in spite of a proclamation by King Victor Emmanuel forbidding the enterprise, landed in Calabria, and on the 29th of August was defeated and wounded at Aspromonte, by the royalist troops under Cialdini, who had received orders to "crush, destroy, and annihilate" him. A large number of deserters from the Piedmontese army, who were found in the ranks of General Garibaldi, were shot, whilst the remainder of the expeditionary force were finally admitted, after a substantial term of imprisonment, to the benefit of an amnesty.

Victor Emmanuel was one of the first to accept the suggestion for a Congress of the European Powers which was made, but without practical result, in November, 1863, by the Emperor of the French; with whom, in September, 1864, he concluded a convention which stipulated, on condition of the Papal Government being at that time in a position of self-defence, and of non-interference by the King of Italy, that the evacuation of Rome by the French troops should take place in two years after the settlement of the convention. It was also arranged that Florence should be adopted as the capital of the kingdom; a measure which, although it was the occasion of some discontent and disturbances at Turin, was affirmed by a law passed by the Italian Parliament on the 12th of December, 1864. The King made a formal entry into his new capital on the 1st of March, 1865; and on the 11th of May following, the court was transferred to Florence. On the 27th of March, 1866, the king of Italy concluded an alliance, offensive and defensive, with Prussia, in opposition to Austria, against which power he declared war on the 20th of June, two days after Prussia had taken the same step. The gain to Italy of the short, sharp, and decisive campaign which culminated on the 3rd of July in the Prussian victory of Sadowa, was the long-coveted Venetian territory, which Victor Emmanuel received, October 19th, from Austria at the hands of the Emperor of the French, to whom it had been transferred on the 4th of July, and who claimed to have saved Vienna from the most imminent hostile occupation. On the 7th of November, Victor Emmanuel made his triumphal entry into Venice, three days after the decree which declared its annexation to his dominions. Rome still remained isolated from the rest of Italy, and Garibaldi, whose patriotic impatience had led him to protest against the convention of September, 1864, in pursuance of the terms of which the French troops had evacuated the Eternal City in December, 1866, invaded the Papal territory, and thus brought about a renewal of the French occupation on the 30th of October, 1867, and his own complete defeat at Mentana on the 4th of November, after which, on the 25th of the same month, he was deported to his own island of Caprera, and placed under surveillance.

On the 8th of September, 1870, four days after the deposition of the Emperor of the French, Victor Emmanuel addressed a letter to the Pope, announcing that he was compelled to assume the responsibility of maintaining order in the Peninsula, and the security of the Holy See, and undertaking that his Government and his forces would restrict themselves absolutely to a conservative and tutelary action on behalf of the rights of the Roman people, which would be easily reconcilable with the inviolability of the Sovereign Pontiff and the spiritual authority of his chair. The Pope, who had previously refused to acknowledge the kingdom of Italy, protested against the meditated occupation; and having solicited the intervention of the King of Prussia to stay the execution of the project, received from that sovereign a refusal to disturb or endanger the friendly relations in which he stood to the King of Italy, on account of a question with which the interests of Prussia were not

concerned. The Italian troops accordingly entered Rome on the 20th of September, after a formal resistance from the Pope's soldiers, who had received orders to yield to violence when violence should be offered, and did not prolong the defence of the city after a slight breach had been made in the walls, through which General Cadorna proceeded to make an entrance. A plebiscite of the Papal dominions, taken early in October, resulted in an almost unanimous vote for the incorporation of Rome and its dependencies with the kingdom of Italy. Even the inhabitants of the Leonine city voted for the annexation, which was carried into effect by a royal decree on the 9th of October, and by the arrival, two days after, of General della Marmora as Lieutenant-Governor of the Roman provinces. [Pius IX., E. C. S. col. 997.] At the opening of the Italian Parliament at Florence on the 5th of December, Victor Emmanuel claimed to have "fulfilled his promises, and to have crowned the enterprise commenced twenty-three years before by his magnanimous father." "Italy," the king said, "is free and united henceforth, and depends upon herself for achieving greatness and happiness. We entered Rome by our national right, and shall remain there, keeping the promises solemnly made to ourselves of freedom to the Church and the independence of the Holy See in its spiritual ministry and its relations with Catholicity." The Government further undertook that, whether the Pope determined to continue his residence in the city, or not, his sovereignty should be guaranteed, as well as all the honours and privileges to which he was entitled. In the face of difficulties which opposed the immediate transfer of the capital to Rome, it was decided, at a meeting of the Italian Parliament at Florence on the 23rd of December, that the transfer should be postponed for six months, and should be carried into effect on the 1st day of July following.

On Christmas-Day, 1870, Prince Amadeus, Duke of Aosta, second son of Victor Emmanuel, left Florence for Spezzia and Madrid, in order to assume the crown of Spain; and on the same day the completion of the Mont Cenis tunnel was announced, the inauguration of which was celebrated with much ceremony and rejoicing in September, 1871—the crowning material glory of a reign which, in spite of chronic financial difficulties, has been mindful of industrial and commercial development, as it has of social, educational, ecclesiastical, legislative, and administrative reforms. On Sunday, the 2nd of July, 1871, the King of Italy paid a three days' visit to Rome, to which he had some months previously made a hurried and incidental one, for the purpose of taking formal possession, and of acknowledging it thenceforth as the head-quarters of the Government, from which the royal decrees would in future be issued, and where the ministers were left installed in their new offices. On the occasion of a longer visit to his new capital, where he arrived on the 21st of November, the King was received by Prince Humbert, the Ministers, the Members of the Municipality, and the National Guard, whilst the city was decorated with flags, and immense and enthusiastic crowds thronged the way to the Palace. On the 27th of November, the Italian Parliament was opened in Rome with a speech from the throne, in which, after expressions of pleasure and congratulation, the King renewed his obligations of faithfulness to those principles of liberty and order which had regenerated Italy, and to which he looked for the secret of strength and a reconciliation between the Church and the State. Having recognised the absolute independence of the spiritual authority, he was certain that Rome, as the capital of Italy, would continue to be the peaceful and respected seat of the Pontificate. The bills which would be laid before Parliament to settle the future position of the ecclesiastical corporations would be in harmony with Liberal principles: they would relate only to bodies and landed properties subject to the law, leaving untouched those religious institutions which have a share in the government of the Universal Church. Now that Italy was constituted, it was necessary to devote attention to rendering her prosperous by restoring her finances; and although the King's most ardent wishes were for the maintenance of peace, and nothing led him to fear that it would be disturbed, he claimed a long and searching study for the renewal of the national armaments, and the works for the defence of the national territory. The King proceeded to enumerate various bills concerning the internal administration, and to express a hope that the accomplishment of the national unity would, as one of its results, render party struggles less fierce. He rejoiced at seeing the population giving proofs of love of work; and said that the economical movement must be encouraged, scientific and technical education must be extended, and fresh means of communication and outlets for commerce must be pro-

vided. "The tunnelling of Mont Cenis," the speech went on to say, "is completed and that of St. Gothard is about to be undertaken. Those enterprises will facilitate and increase the friendly relations which already unite us with other countries, and will render more fruitful the legitimate emulation of work and civilisation." At the same time that the ceremony of opening the Italian Parliament was taking place with words of pacification at Monte Citorio, the Pope received three several deputations in his audience chamber at the Vatican, in answer to whose loyal addresses he scouted the idea of the conciliation of which the King was at that moment professing to cherish a hope, and protested that "none could be possible between Jesus and Belial, between light and darkness, between truth and falsehood." The Holy Father further expressed his unshaken faith in the destinies of a Church "accustomed to triumph on Golgotha," and his readiness to "give his life rather than yield to the devices of iniquity." The triumphant royal speech of November 27th, was followed on the 12th of December by a more cheerful financial statement from Signor Sella than had hitherto been submitted to the notice of an Italian Parliament; by whom it was received with strong marks of favour and approbation.

On the last day of the old year, the King of Italy received the members of the diplomatic body resident in Rome, when the United States' minister offered his Majesty the customary congratulations in the name of the other foreign ministers; and on New Year's Day, 1872, the king held a reception of the Ministers, Parliamentary deputations, the great officers of State, the military and municipal authorities, and other deputations. Returning thanks for the congratulations which were offered, he expressed a hope that the concord between the great representative bodies of the people and the state, which essentially contributed to the accomplishment of national unity, would be always maintained.

* VICTORIA ALEXANDRINA, QUEEN. We continue the chronological table, given in E. C. vol. vi. col. 348—57, to the present time.

1857. August 28th, Parliament was prorogued by commission, and the royal speech referred to the peaceful state of Europe then existing, the delay in fulfilling the stipulations of the Treaty of Paris, the barbarities inflicted on her Majesty's subjects in India, the redemption of the Sound dues, and other acts passed during the session. On the 24th of September, a royal proclamation was issued commanding a solemn fast on the 7th of October, in consideration of "the grievous mutiny and disturbances which have broken out in India." November 16th, the Siamese ambassadors were received at Windsor Castle by the Queen, when, in accordance with Siamese court etiquette they approached the royal throne in an attitude between crouching and crawling, and pushed their presents before them as they advanced. On the 3rd of December the Queen opened Parliament in person, the early date being rendered expedient by the failure of certain joint-stock banks and of some commercial firms, which had produced so much distrust as to lead to the authorisation by ministers of a temporary suspension of the Bank Charter Act.

1858. January 24th, took place the marriage of the Princess Royal and Prince Frederick William of Prussia, the ceremony being performed at the Chapel Royal, St. James's, by the Archbishop of Canterbury, in presence of the Queen, the princes and princesses of the two royal households, and a brilliant gathering of invited guests; and on the 10th of August her Majesty and the Prince Consort embarked at Gravesend on a visit to their daughter, the Princess Frederick William of Prussia. June 15th, the Queen assisted at the opening of Aston Park, near Birmingham, where she was received with immense enthusiasm. On her journey to Scotland, her Majesty halted at Leeds, September 6th, to open the new Town Hall. November 1st, the Governor-General of India issued a proclamation from Allahabad, announcing that henceforth all acts of the Government of India would be done in the name of the Queen alone; and on the 5th of November, the funeral car of the Emperor Napoleon I. was presented to France by her Majesty. On the 20th of December the final suppression of the Indian mutiny was announced, the campaign being at an end, so that there was no longer even the vestige of rebellion in the province of Oude; whilst the "last remnant of the mutineers and insurgents had been hopelessly driven across the mountains which form a barrier between the kingdom of Nepal and her Majesty's empire of Hindustan."

1859. January 18th, a warrant under the royal sign-manual was published in the 'London Gazette,' commanding the discontinuance of the special prayers offered up on January 30th,

May 29th, and November 5th. On the 29th of January her Majesty publicly inaugurated Wellington College, the result of a general subscription in commemoration of the "great Duke," after whom it was named; and on the 3rd of February the Queen opened Parliament in person. On the 18th of April the Queen in Council ordered the Archbishop of Canterbury to prepare a form of prayer and thanksgiving for the constant and signal success obtained by the troops in India. April 19th, Parliament was prorogued by commission, and on the 23rd the official notice of its dissolution, as well as writs for the new elections, appeared in the 'Gazette'; and on the 7th of June the new Parliament was opened by the Queen in person, who, in her speech from the throne, announced the policy of a strict neutrality in reference to the war in Italy, the renewal of diplomatic intercourse with Naples, animadverting also upon the increase of the navy, and parliamentary reform. June 17th, the Earl of Derby officially announced the resignation of his Ministry, which, on the 26th of February, 1858, had followed the administration of Lord Palmerston, by whom he was succeeded on the 18th of June, 1859, after the Queen had made an offer of the Premiership to Earl Granville, who became President of the Council in the Palmerston administration.

1860. January 24th, the Queen opened Parliament in person; and alluded particularly in her speech to the treaty of commerce between France and England which had been signed at Paris on the 23rd, and the ratifications of which were exchanged on the 4th of February. March 7th, her Majesty held a levée at St. James's Palace, for the purpose of receiving the officers of the newly-formed volunteer rifle corps, when about 2,500 attended, representing an effective force of 70,000 men. On the 4th of June the Queen wrote to her "good friend," President Buchanan, accepting on behalf of the Prince of Wales, the invitation sent by the President for the Prince to extend as far as Washington the visit he contemplated making to Canada. August 7th, the Queen reviewed her northern army of volunteers in the park adjoining Holyrood Palace, Edinburgh, when a total of 20,522 men of all arms, of whom about 18,000 belonged to Scottish corps, appeared on the ground. December 2nd, her Majesty paid the first visit, since her succession, to Oxford, on the occasion of the Prince of Wales quitting the university.

1861. February 5th, the third session of the sixth Parliament of Queen Victoria was opened by her Majesty in person; who, on the 16th of March, sustained a severe loss by the death of her mother, the Duchess of Kent, upon which addresses of condolence were presented by both Houses of Parliament, and various other corporate bodies throughout the kingdom. Parliament was prorogued by commission on the 6th of August, when the Queen's speech referred to the more important of the measures which had received the royal assent during the session. On the 14th of August was signed in London the treaty between her Majesty and the Grand Duke of Hesse, for the marriage of the Princess Alice Maud Mary with Prince Frederick William Louis of Hesse; and on the 21st of the same month, the Queen, accompanied by the Prince Consort, the Prince of Wales, and Prince Alfred, arrived at Kingston on the third royal visit to Ireland, which comprised a visit to the Curragh on the 24th and to Killybeg on the 26th and 27th. November 1st, her Majesty held, at Windsor Castle, the first investiture of the Most Exalted Order of the Star of India. December 14th, the Prince Consort died, to the great grief of the Queen, who from that time nearly to the present has led a life of comparatively unbroken seclusion, devolving court duties, to a great extent, on the Prince of Wales and other members of the Royal Family. The whole country broke forth into sorrow and expressions of condolence; and has rivalled the Queen herself in its desire to do honour, by monuments and memorials, to the departed Prince. The funeral of the Prince took place on the 23rd of December, in St. George's Chapel, Windsor, but his remains were subsequently removed to the costly mausoleum erected for their reception by her Majesty at Frogmore.

1862. January 23rd, the sympathy of the royal widow was powerfully elicited for the poor women who had been widowed by the great calamity at Hartley Colliery, near Newcastle-on-Tyne. "Her tenderest sympathy," Colonel Phipps wrote, by the Queen's command, "is with the poor widows and mothers, and her own misery only makes her feel the more for them. Her Majesty hopes that everything will be done as far as possible to alleviate their distress, and her Majesty will have a sad satisfaction in assisting in such a measure." July 1st, the Princess Alice was married to Prince Louis of Hesse-Darmstadt, who, by the Queen's writ, July 6th, was invested with the title of Royal

Highness. August 7th, Parliament was prorogued by commission; and on the 21st a memorial cairn was raised at Balmoral "to the beloved memory of Albert the Great and Good Prince Consort, erected by his broken-hearted widow, Victoria R."

1863. February 5th, Parliament was opened by commission, when the first paragraph of the royal speech referred to the treaty concluded with the King of Denmark for the marriage of the Prince of Wales and the Princess Alexandra; which was solemnised with great pomp in St. George's Chapel, Windsor, on the 10th of March. On the 8th of May the Queen visited the invalid soldiers in the Royal Military Hospital at Netley, the foundation-stone of which had been laid by the Prince Consort seven years before; and on the 20th of July caused a letter to be addressed to the Mayor of Birmingham, protesting—in consequence of a fatal accident to the "female Blondin"—against the use of Aston Park, which the Queen had opened, for the purpose of cruel, dangerous, and demoralising exhibitions. July 28th, Parliament was prorogued by commission; and a short time after the Queen made a tour in Germany, from which she returned on the 10th of September, when she disembarked at Woolwich. October 13th, the Queen, with several members of the royal family, was present at the inauguration of the Albert Memorial, at Aberdeen.

1864. February 4th, Parliament was opened by commission. On the 10th of March the Queen gave the names of Albert Victor Christian Edward to the infant son of the Prince of Wales, who was christened in the private chapel of Buckingham Palace; on the 30th her Majesty made her first appearance in public since her widowhood, on the occasion of a flower-show at the Horticultural Gardens, South Kensington; and on the 24th of May the rejoicings which had been customary on the anniversaries of the Queen's birthday, were resumed. July 7th, the Chapel Royal, Savoy, was destroyed by fire; and the Queen, who had greatly improved the building in 1843, undertook the cost of restoring it. July 29th, Parliament was prorogued by commission; and on the 30th of August the Perth Memorial to the Prince Consort was inaugurated in the presence of the Queen.

1865. February 7th, Parliament was opened by commission; and on the 14th of March the Queen visited the Hospital for Consumption at Brompton, where she made a minute inspection of the methods adopted for the relief of the patients. April 14th, President Lincoln was assassinated at Washington; and the Queen addressed an autograph letter of condolence—"from a widow to a widow," as her Majesty expressed it—to Mrs. Lincoln. July 6th, Parliament was prorogued by commission; and was afterwards dissolved by royal proclamation. August 26th, the Queen, being then on a visit to Germany, inaugurated a bronze statue of Prince Albert, at Rosenau, his birth-place. October 18th, Lord Palmerston, at that time Prime Minister, died at Brockett Hall, and was buried in Westminster Abbey at the desire of the Queen, who committed to Earl Russell the conduct of the Government, his accession to the Premiership being gazetted on the 6th of November.

1866. February 6th, the new Parliament was opened by the Queen in person. March 7th, the Queen's warrant was published instituting a new decoration, the "Albert Medal," to be awarded to such persons as should endanger their own lives in rescuing, or attempting to rescue, others from shipwreck or other perils of the sea. March 28th, the Queen addressed an autograph letter to Mr. Peabody, the eminent American philanthropist, offering him a portrait of herself—in default of his willingness to accept a baronetcy, or the Grand Cross of the Order of the Bath—in grateful acknowledgment of his munificent interest in the poor of London. July 5th, the marriage of Princess Helena Augusta Victoria with Prince Christian of Schleswig-Holstein-Sonderburg-Augustenburg, who received from the Queen the rank and title of Royal Highness, was solemnised at Windsor Castle. July 6th, the Russell administration was succeeded by that, being the third, of the Earl of Derby. On the 2nd of August, her Majesty subscribed £500 to the Bishop of London's Fund for the relief of sufferers from cholera in the east end of London; and on the 10th, Parliament was prorogued by commission. November 30th, the Queen visited Wolverhampton, in order to inaugurate the monument erected there to the Prince Consort.

1867. February 5th, the Queen opened Parliament in person, but the royal speech was read by the Lord Chancellor. May 20th, her Majesty attended at South Kensington in order to lay the first stone of the Albert Hall of Arts and Sciences, designed to perpetuate the memory of the late Prince Consort,

when an address to the Queen was read by the Prince of Wales, and a reply was made by her Majesty. June 26th, a royal warrant was signed granting an increase of pay to the army. July 13th, the Queen received, at Windsor, the Sultan of Turkey, who had arrived at Buckingham Palace the day before. July 17th, the fleet was reviewed at Spithead in the presence of the Queen, the Sultan, and the Viceroy of Egypt. On the 22nd of July the Queen received a visit from the Empress Eugénie, at Osborne; and on the 21st of August, Parliament was prorogued by commission, and the Queen visited the Duke of Roxburgh at Floors Castle, on her journey to Balmoral. October 16th, on the occasion of opening the Aberdeen Waterworks, the Queen personally addressed the assembly for the first time since the death of the Prince Consort. November 19th, Parliament was opened by commission, the unusually early date being determined mainly by the expediency of giving sanction to the Abyssinian Expedition.

1868. February 25th, took place the resignation of Lord Derby, who was succeeded as First Lord of the Treasury by Mr. Disraeli. March 12th, an attempt was made at Sydney, New South Wales, to assassinate the Duke of Edinburgh, who had visited the colony whilst cruising in his ship, the 'Galatea.' The Duke was wounded in the back by a bullet from a revolver; but his recovery was complete before his arrival in England, his return to which was judged expedient. On the 12th of May, her Majesty conveyed to the House of Commons, through Lord Royston, Comptroller of the Household, her answer to the address on the subject of the Irish Church. "Relying," she said, "on the wisdom of my Parliament, I desire that my interest in the temporalities of the United Church of England and Ireland in Ireland may not stand in the way of the consideration by Parliament of any measure relating thereto that may be entertained in the present Session." May 13th, the foundation stone of the new St. Thomas's Hospital was laid by the Queen. On the 14th of May an address on the subject of the Irish Church was presented by Irish prelates to the Queen at Windsor. June 19th, Prince Arthur was gazetted to a lieutenancy in the Royal Engineers; and on the 22nd, her Majesty held a "breakfast" in the gardens of Buckingham Palace. July 26th, on the occasion of the inauguration of the Luther monument at Worms, her Majesty forwarded a message to the King of Prussia:—"Pray express to the committee for the erection of the Luther memorial my most hearty congratulations upon the successful completion of this task. Protestant England cordially sympathises with an occasion which unites the Protestant princes and peoples of Germany." July 26th, the Queen had the satisfaction of welcoming the Duke of Edinburgh at Windsor. July 31st, the last Parliament elected under the Reform Act of 1832 was closed by commission, and its dissolution announced for the earliest possible day, in a speech read in the Queen's name by the Lord Chancellor. August 6th, her Majesty, whose health had recently caused much anxiety in the royal household, set out on a journey to Switzerland. She passed from Cherbourg to Paris on the 7th, and arrived on the 8th at Lucerne, which she left for Paris on the 9th of September on her return to England, where, at Windsor, she received Mr. Reverdy Johnson, the United States' minister, on the 14th. November 11th, a proclamation was issued for the dissolution of Parliament; and on the 20th, Mr. Burlingame, special ambassador of the Emperor of China, was presented to the Queen. December 5th, Mr. Gladstone succeeded Mr. Disraeli in the premiership; and on the 15th, the first Session of the eighth Parliament of Queen Victoria was opened by commission, the meeting for the despatch of business being postponed by two successive adjournments till February 16th, 1869.

1869. May 22nd, the 'Dublin Gazette' published the Queen's commands to the Lord Lieutenant, expressive of her gratification at the reception given to Prince Arthur in Ireland, where, however, his visit had been marred by a fatal riot, April 28th, at Londonderry. May 24th, the fiftieth birthday of her Majesty was celebrated in London and elsewhere with special rejoicings. June 28th, a breakfast was given by the Queen in the gardens of Buckingham Palace in honour of the Viceroy of Egypt, who had arrived in London on the 22nd, and who left for the continent on the 1st of July. July 26th, the royal assent was given to the Bill for the Disestablishment of the Church of Ireland. November 6th, the Queen opened the new bridge at Blackfriars, and the Holborn Viaduct.

1870. February 8th, Parliament was opened by commission, the projected Irish Land Bill being spoken of in the royal speech as a measure calculated "to bring about improved rela-

tions between the several classes concerned in Irish agriculture, which collectively constitute the great bulk of the Irish people." On the 11th of May, the Queen, accompanied by the Prince and Princess of Wales, formally opened the new buildings erected for the University of London in Burlington Gardens; and on the same day gave a state concert at Buckingham Palace. May 14th, the Princess Louise, as the representative of her Majesty, opened the new banqueting-hall of the Inner Temple. August 1st, the Irish Land Bill received the royal assent. October 24th, the Queen in council at Balmoral declared her consent to the marriage of the Princess Louise with the Marquis of Lorne, eldest son of the Duke of Argyll. December 5th, her Majesty received a visit from the Empress Eugénie at Windsor Castle.

1871. February 9th, the Parliament was opened by the Queen in person, and the royal speech was read by the Lord Chancellor. March 21st, the Princess Louise was married to the Marquis of Lorne in St. George's Chapel, Windsor; and on the 29th the Queen opened the "Royal Albert Hall of Arts and Sciences." April 3rd, her Majesty paid a visit to the ex-Emperor and Empress of the French, then, as now, March, 1872, resident at Camden House, Chiselmurst; and on the 5th, left Windsor Castle for Osborne, where, on the 15th of July, she received a visit which extended over some days, from her daughter and son-in-law, the Crown Prince and Princess of the German Empire, and their children, and a shorter visit on the 18th from the Emperor and Empress of Brazil. July 20th, a royal warrant was signed by her Majesty's command, to cancel and determine all regulations authorising the purchase, or sale, or exchange for money, of Commissions for the Army; a warrant which came into operation on the 1st of November. This method of abolishing purchase seemed to the ministers to be necessary in consequence of the numerical majority in the House of Lords against the Bill for the Re-organisation of the Army. August 21st, the Parliament was prorogued by commission, when the Lord Chancellor read the royal speech, which opened with an acknowledgment of the "loyal readiness with which you have made provision for my beloved children, Princess Louise and Prince Arthur." November 24th, the Queen left Balmoral for Windsor, where she arrived on the following morning, having been met at Carlisle by a messenger bearing a bulletin from Sandringham about the health of the Prince of Wales, who, a few days before, had sickened of typhoid fever. Her Majesty visited Sandringham on the 29th of November, and returned to Windsor on the 1st of December; renewing her visit to Sandringham on the 8th, when symptoms of gravity and alarm appeared, which culminated on the 13th, so that the death of the Prince for some time seemed imminent. Improvement commenced, however, on the 14th, and the Queen was able to return on the 19th to Windsor, where she spent Christmas for the first time for many years, her custom having been, since the death of the Prince Consort, to reside during that festive season at Osborne. On the 28th of December, her Majesty again repaired to Sandringham, having on the 26th addressed, through the Secretary of State for the Home department, a letter of thanks for the uncommon marks of sympathy and attachment which her people had manifested throughout the critical condition of the Prince of Wales.

1872. January 2nd, the Queen left Sandringham for Windsor, from which she repaired on the 19th to Osborne. The whole nation rejoiced, as it had before sorrowed, with the Queen and Princess of Wales; and on the 21st of January a special form of thanksgiving was used by authority in the Churches of England and Wales. On the 27th of February her Majesty, accompanied by the Prince and Princess of Wales, and other members of her family, attended St. Paul's in state to return thanks for the restoration of the Prince to health. The crowds that thronged every foot of the royal progress from Buckingham Palace to the Cathedral were as unbounded in their loyalty and enthusiasm as they were in their numbers; and their expressions of feeling met with a corresponding acknowledgment in a letter received from the Queen, on the 29th of February, by Mr. Gladstone. "The Queen," she wrote, "as well as her son and dear daughter-in-law, felt that the whole nation joined with them in thanking God for sparing the beloved Prince of Wales' life. The remembrance of this day, and of the remarkable order maintained throughout, will for ever be affectionately remembered by the Queen and her family." On the day last mentioned, February 29th, the Queen held a Court at Buckingham Palace, and afterwards took a drive; on her return from which she was grossly attacked by a lad who pre-

sented an old rusty and unloaded pistol within a foot of her head as she sat in her carriage, with the view, as he professed, of intimidating her into granting a pardon to the Fenian prisoners yet kept in confinement. On the 1st of March, the Queen left town for Windsor, and her departure from Buckingham Palace was signalled by immense and extemporised demonstrations of loyalty and attachment.

Two works, with the production of which the Queen has been intimately connected, may be mentioned at the conclusion of this chronicle. They are 'The Early Years of His Royal Highness the Prince Consort. Compiled under the direction of her Majesty the Queen, by Lieutenant-General the Hon. Charles Grey. [With Notes by the Queen, and two Portraits of the Prince Consort],' 8vo, London, 1867, French translation, 8vo, Paris, 1868, German translation, 8vo, Gotha, 1868, Italian translation, 4to, Venice, 1868, besides translations into other languages; and 'Leaves from the Journal of our Life in the Highlands, from 1848 to 1861. To which are prefixed and added, Extracts from the same Journal, giving an Account of earlier Visits to Scotland, and Towns in England and Ireland, and Yachting Excursions [by Queen Victoria, edited by Arthur Helps],' 8vo, London, 1868, illustrated edition, 4to, 1868, of which translations have appeared in German, Portuguese, Norwegian, Welsh, and other languages.

VIGNY, ALFRED VICTOR, COMTE [E. C. vol. vi. col. 383], died at Paris on the 17th of September, 1863. His latest literary work had been the careful and repeated revision of the poems which were published after his death with the title, 'Destinées. Poésies philosophiques,' 8vo, 1864, and were marked by the vague, morbid, and sceptical philosophy of his earlier poems.

VILLEMAIN, ABEL-FRANÇOIS. [E. C. vol. vi. col. 390.] The last years of this great writer were spent in retirement, but not in idleness. He published 'Essais sur la Génie de Pindare et sur la Poésie lyrique,' 8vo, Paris, 1859; and a pamphlet 'La France, l'Empire et la Papauté,' 1860, and he was engaged on an elaborate work on the history of Pope Gregory VII. almost to the time of his death, which occurred at Paris on the 10th of May, 1870, within a month of the completion of his 80th year.

* VIOLLET-LE-DUC, EUGÈNE EMMANUEL, an eminent French architect and writer on architecture, was born at Paris, January 27th, 1814. He was a pupil of M. A. Leclère. During 1836—37 he studied the ancient remains of Italy and Sicily; and afterwards those of the middle ages in central France. He has since devoted himself exclusively to mediæval architecture, and specifically to the French Gothic of the thirteenth century. For several years he has been the most distinguished champion and leading exponent of French Gothic; and he has exercised a much greater influence on English architects and archaeologists than any other contemporary foreign Gothic architect or writer. M. Viollet-le-Duc was in 1840 appointed inspector of works at the Sainte Chapelle, Paris, and he has since been charged officially with the erection and restoration of a great number of Gothic buildings—his labours being of course chiefly, but by no means exclusively, directed to ecclesiastical structures. Among the secular buildings erected by him are the Hôtels de Ville of Narbonne and St. Tréoutin. His principal restorations have been the costly works at Notre Dame de Paris; at first in conjunction with M. Lassus, but subsequently alone; the abbey church of Verzelay; Notre Dame de Châlons sur Marne; the churches of St. Père, Montréale (Yonne), Poissy, St. Nazarre de Carcassonne; the cathedrals of Sens, Amiens, Laon, &c. But M. Viollet-le-Duc is more widely known out of France by his writings than by his constructions. Of these the chief is his great 'Dictionnaire raisonné de l'Architecture Française du XI^e au XVI^e Siècle,' 10 vols. 8vo, with 4000 engravings, Paris, 1853—70; a work of the most painstaking research and clearness of statement, and of the utmost value to the student. Simultaneously with this appeared a companion dictionary, 'Du Mobilier Français de l'époque Carlovingienne à la Renaissance,' 4 vols. 8vo, 1855, &c., of less general interest, but also of great value. The 'Essay on the Military Architecture of the Middle Ages,' which originally appeared in the great dictionary, was afterwards published separately, and has since been translated into English by Mr. Macdermott, 1 vol. 8vo, 1860. Another important work of M. Viollet-le-Duc is his 'Entretiens sur l'Architecture,' 2 vols. 8vo, 1858, &c., with an atlas of plates in 4to; it forms the substance of an intended course of lectures on the theory and practice of architecture which his professional engagements prevented him from carrying out. Besides these he has published several monographs descriptive of Notre Dame de Paris, the

chateaux of Pierrefondes and De Coucy, and the city of Carcassonne; a series of 'Lettres sur la Sicile,' 8vo, 1860; and a great many papers in architectural and archaeological journals; and he has exhibited a large number of designs. M. Viollet-le-Duc has held the offices of inspector-general of places of worship in France, professor of the history of art and æsthetics in the École des Beaux-Arts, 1864, and architect to the government. He was made a knight of the Legion of Honour in 1849, and officer in 1858.

* VIRCHOW, RUDOLF, physiologist, was born at Schivelbein, in Pomerania, October 13, 1821. He was a pupil of Johannes Müller; took his degree of M.D. in 1843; subsequently became professor of pathological anatomy at Würzburg; and in 1856 removed to the same chair at Berlin, taking also the directorship of the pathological institute of that city. He has taken an active share in the removal of abuses or defects both in the political and medical world of Germany. He has effected a thorough change in the mode of studying pathology, partly by his lectures and partly by his books. In 1859 he was elected a member of the municipal council of Berlin, and he soon after led the opposition party in its attempt to reform the municipal police, the royal privileges, and other matters. He has been a vigorous opponent of Count Bismarck's schemes for developing the military and naval powers of Prussia, and has had more than one struggle with him. Since 1869 he has vainly sought to bring about the reduction of the armies of Europe. As a scientific man he has taken a very high rank. He is the editor of the 'Archiv für Pathologische Anatomie und Physiologie, etc.,' 8vo, which he founded in 1847 in conjunction with Reinhardt. He has written many works and papers. The most important are a work on cellular pathology, which was first published in 1858, and which has been translated both into English and French; 'Die Lehre von den Trichinen,' 8vo, Berlin, 1860, 3rd edition, 1866; 'Gesammelte Abhandlungen zur wissenschaftlichen Medicin,' 8vo, Frankfurt-am-Main, 1866; and 'Untersuchungen über die Entwicklung des Schädelsgrundes im gesunden und krankhaften Zustande,' 4to, Berlin, 1866.

* VITET, LOUIS, a French journalist, politician, and man of letters, was born at Paris on the 18th of October, 1802; and after having completed his studies at the École Normale, to which he was admitted in 1819, devoted himself for some time to the practice of education. His earliest important literary work was entitled 'Les Barricades. Scènes Historiques. Mai, 1858,' first two editions (anonymous), 8vo, Paris, 1826, fourth edition 1830, which attained considerable popularity, and was followed by 'Les États de Blois: ou, La Mort de M^m. de Guise. Scènes Historiques. Décembre, 1858,' 8vo, 1827, by 'La Mort de Henri III. Août, 1589. Scènes Historiques,' 8vo, first two editions, 1829, third edition, 1849, and by 'La Ligne. Scènes Historiques,' &c., 8vo, 1830, &c., new edition, 2 vols. 12mo, 1844. About the year 1824, and two years before the publication of 'Les Barricades,' M. Vitet became a contributor to the 'Globe;' and when the Revolution of July, 1830, opened the way for his friends to power, he obtained from M. Guizot, October 23rd, the office of Inspector-General of Historical Monuments, which had been created expressly for him. On the 10th of April, 1834, he was appointed secretary-general to the Ministry of Commerce, under M. Duchâtel; and in the same year became a member of the Chamber of Deputies, where he sat until 1848. In September, 1836, he was admitted to the Council of State, and during the years 1846—1848, acted as vice-president of one of its sections—that of Finance. Both as a deputy and as a member of the Council of State, M. Vitet was the adherent and upholder of Conservative measures; and as an opponent of the Revolution of 1848, he voted in the Legislative Assembly, to which he was returned, in 1849, by the Department of Seine-Inférieure, against all measures which were introduced in favour of Republican institutions. The coup-d'état of December 2nd, 1851, occasioned his retirement from public life; from which, however, he has lately made a remarkable emergence in accepting, under the Government of M. Thiers, the post of one of the Vice-Presidents of the National Assembly. M. Vitet, whose highest honours are literary rather than political, was elected, December 15th, 1839, an honorary member of the Académie des Inscriptions et Belles-Lettres; and on the 26th March, 1846, was admitted a member of the Académie Française, in succession to Alexandre Soumet, the poet, having, on the 30th of April, 1843, been made an officer of the Legion of Honour.

The principal works of M. Vitet, besides those already mentioned, are 'Monographie de l'Eglise Notre-Dame de Noyon,' 4to, Paris, 1845, Atlas, folio, 1845; 'Eustache Le Sueur, sa Vie

ses Œuvres,' 4to, 1843, 1849, &c., a remarkable estimate of the genius of Le Sueur, a celebrated painter of the 17th century, and one of the founders of the Académie de Peinture; 'Histoire des anciennes Villes de France. Recherches sur leurs Origines, sur leurs Monuments, sur le Rôle qu'elles ont joué dans les Annales de nos Provinces. Première Série. Haute Normandie. Dieppe,' 2 vols. 8vo, Paris, 1833, being, as its title indicates, the first instalment of a projected work of large proportions, of which no more volumes have been issued; 'L'Académie Royale de Peinture et de Sculpture. Étude Historique,' 8vo, 1861; 'Essais Historiques et Littéraires,' 12mo, 1862, and 'Études sur l'Histoire de l'Art,' 12mo, 1864, each of which forms part of the 'Bibliothèque Contemporaine,' 'De l'État actuel du Christianisme en France,' 12mo, Paris, 1867; and 'Le Christianisme et la Société.' (A propos du troisième Volume des Méditations religieuses de M. Guizot) 12mo, 1860.

VOLTAIRE, FRANÇOIS-MARIE AROUET DE. In the memoir of Voltaire in the E. C. vol. vi. col. 441, he is stated to have been born at Châtenay on the 20th of February, 1694, and this was the date given by Condorcet and the best authorities, and distinctly stated by Voltaire himself. Writing in 1765, he says, as quoted in the 'Nouv. Biog. Gen.' in support of this date, "I have entered on my 72nd year, in spite of my portraits (estampes), which, by a printed untruth, make me to have been born on the 20th of November, when I was born on the 20th of February." Yet it has been distinctly shown by M. Gustave Desnoiresterre 'Voltaire et la Société Française. La Jeunesse de Voltaire' (Paris, 1867), that he was born, not at Châtenay, but in the parish of Saint André-des-Arts, Paris, on the 21st of November, 1694. In the Acte de Baptême, November 22, 1694, it is expressly stated that he was born the previous day.

VORSTERMAN, LUCAS, an eminent Flemish engraver, was born at Antwerp, about 1580. He was a scholar of Rubens, by whose advice he gave up painting for engraving. In his own walk, Vorsterman resembled his master in preferring a bold, free, vigorous manner, to minuteness or elegance of finish. He engraved a great many plates from the principal works of Rubens, and under his superintendence; and the style of the great painter was never more characteristically rendered. The 'Descent from the Cross,' the 'Adoration of the Magi,' and the 'Battle of the Amazons'—a print of unusual size, being on six sheets—are among the most famous of his Rubens prints. Vorsterman also engraved the 'Entombment,' a 'Holy Family,' and two or three more after

Raffaëlle; and others after Correggio, Annibale Carracci, Gentileschi, and other Italian masters; also, a 'Bear Hunt,' by Snyders, and several more from the painters of the Netherlands. In 1623 he came to England, and remained here about eight years. He engraved one or two of the pictures in the king's gallery, but was chiefly occupied on the portraits of royal and noble personages by Vandyck, and a few by Holbein. In all, he engraved about one hundred and fifty plates. He died about the middle of the seventeenth century. His son and pupil **LUCAS VORSTERMAN**, the younger, born at Antwerp about 1605, engraved historical and subject pieces after Rubens, Teniers, and others, and many portraits, some of which were from his own designs. He engraved the plates to the Duke of Newcastle's curious work on horsemanship. His plates are far inferior to those of his father.

VROLIK, WILLEM, anatomist, was born at Amsterdam, April 29, 1801. His father, Gerard Vrolik, was well known as an anatomist and botanist, and formed an excellent museum, which he left to his son on his death in 1859. Willem studied at Utrecht, where he took his degree of M.D. in 1823; practised for a few years in Amsterdam; then took the chair of anatomy and physiology at Groningen; was engaged in the Belgian revolution of 1830–31; and afterwards took the professorship of anatomy and physiology at Amsterdam, which he retained till his death, December 22, 1863. He was a laborious student and writer. His attention was chiefly given to the comparative anatomy of the Vertebrata, more especially the Quadrumana, and to teratology. Some of his works on these branches of knowledge are of the highest value, as for instance his 'Tabulæ ad illustrandum Embryogenesein hominis et animalium tam naturalem quam abnormem,' 4to, with 100 plates engraved from his own drawings. 'Handboek der ziektekundige ontleedkunde. Aangeboren geberken,' 2 vols. 8vo, Amsterdam, 1840, 1842, which is essentially the text to the above-mentioned 'Tabulæ,' and monographs on the comparative anatomy of the chameleon, the chimpanzee, the babiroussa or wart-hog, the genus *Stenops* of Illiger, and *Hyperoodon*. Much of his time was, however, taken up in enlarging and classifying the museum which his father left him. The additions consisted partly of objects purchased, but largely of preparations which he made himself. At his death it was one of the finest museums of its kind in the world, more especially as regards the choiceness of the specimens.

W

WAAGEN, GUSTAV FRIEDRICH [E. C. vol. vi. col. 457].

Though well advanced in years Dr. Waagen still continued his journeys and his labours. As the result of a visit made to St. Petersburg, 1861–62, at the request of the Emperor of Russia, to examine and arrange the collection of pictures in the Palace of the Hermitage, he published 'Die Gemäldesammlung in der kaiserliche Eremitage in St. Petersburg,' 8vo, Munich, 1864; and later notes of his examinations of the art collections of Vienna, 'Die vornehmsten Kunstdenkmäler in Wien,' 2 vols. Vienna, 1866–67; and an account of his art studies in Spain in the 'Jahrbüchern für Kunstwissenschaft,' 1868. He died at Copenhagen, July 15th, 1868, aged 74.

* **WÄCHTER, KARL GEORG VON**, a celebrated German jurist, was born on the 24th of December, 1797, at Marbach-am-Neckar; and, after having received his preliminary education at Esslingen and Stuttgart, studied successively, between the years 1815 and 1818, at the Universities of Tübingen and Heidelberg. In 1819 he was appointed assessor to the Court of Appeal at Esslingen; but devoting himself to an academical career, became, in 1820 and 1822, respectively extraordinary and ordinary professor of law in the University of Tübingen, of which, in 1825, he was appointed rector. In combination with the rectorship he held, during the years 1829–30, the office of vice-chancellor; and, at Easter, 1833, migrated as professor of law to the University of Leipzig, from which he returned, in 1836, to

assume at Tübingen the functions of professor and chancellor. The last-named office involved a seat in the Würtemberg Chamber of Deputies, of which he was twice elected, in 1839 and 1845, and each time for a period of six years, to the Presidency. After fulfilling other offices, which varied, as political, academical, and judicial, he was appointed, in 1852, to the professorship of Roman Law in the University of Leipzig; and subsequently became a councillor of state and a privy councillor. In 1866 and 1867 he took part in the discussions which preceded the formation of the North German Confederation.

The works of Professor von Wächter are almost exclusively conversant about jurisprudence; and they include a Manual of the Romano-Germanic Penal Code, 'Lehrbuch des Römisch-deutschen Strafrechts,' 2 vols. 8vo, Stuttgart, 1825–26; Punishments and Prisons of Würtemberg, 'Die Strafen und Strafanstalten des Königreichs Würtemberg,' 8vo, Tübingen, 1832; Dissertations on Criminal Law, 'Abhandlungen aus dem Strafrechte,' 8vo, Leipzig, 1835; Common Law, especially Common Criminal Law, of Germany, 'Gemeines Recht Deutschlands, insbesondere gemeines deutsches Strafrecht,' &c., 8vo, Leipzig, 1844; Contributions to German History, especially with Reference to Criminal Law, 'Beiträge zur deutschen Geschichte, insbesondere zur Geschichte des deutschen Strafrechts,' 8vo, Tübingen, 1845; Discussions, &c., 'Erörterungen aus dem römischen, deutschen, und württembergischen Privatrechte,' 3

Parts, 8vo, Stuttgart, 1845—46; Project for a Civil Code for the Kingdom of Saxony, &c., 'Der Entwurf eines bürgerlichen Gesetzbuches für das Königreich Sachsen. Ein Beitrag zur Beurtheilung desselben,' 8vo, Leipzig, 1853; and Saxon and Thuringian Criminal Law, 'Das Königlich-Sächsische und das Thüringische Strafrecht. Ein Handbuch,' &c., 8vo, Stuttgart, 1857, &c. Professor Von Wächter has contributed articles to legal periodicals, especially to the 'Kritische Zeitschrift für Rechtswissenschaft,' Tübingen, 1826, &c.; and has edited 'Archiv für die Civilistische Praxis,' 8vo, 1818, &c.; and Baron L. T. von Spittler's 'Vorlesungen über Politik,' 8vo, 1828.

WADDINGTON, VERY REV. GEORGE, D.D., late Dean of Durham, a traveller and historian, eldest son of the Rev. George Waddington, vicar of Tuxford, Nottinghamshire, was born on the 7th of September, 1793, and was educated successively at the Charterhouse, London, and at Trinity College, Cambridge, where he took his B.A. degree in 1815, and proceeded M.A. in 1818. In 1811 he obtained Sir William Browne's medal for the Latin ode, 'Ode Latina [Prolium cum Gallis in Busaci Montibus commissum],' 8vo, Cambridge, 1811, and for Epigrams in 1814; won the Davies' University Scholarship in 1814, for the greatest proficiency in classical learning, and in the same year carried off the Chancellor's medal for English verse, of which the prescribed subject was 'Columbus,' 8vo, Cambridge, 1813, and afterwards published in various editions of the 'Cambridge Prize Poems,' of which a "complete collection, new and enlarged edition," was issued in 8vo, Cambridge, 1859. In 1815, the year of his graduation as eleventh senior optime, he was senior Chancellor's medalist; and his several distinctions were rewarded by his election in due course to a fellowship of Trinity. He devoted himself for a considerable period to oriental travel, the literary results of which will be seen in the titles of the works enumerated below; and he held for some years the vicarage of Masham, Yorkshire, a preferment in the gift of his college. On the 25th of September, 1840, he was installed Dean of Durham, in succession to Dr. Banks Jenkinson, promoted to the see of St. David's; and on the death of Archdeacon Thorp, the first Warden of the University of Durham, succeeded him in that office under an order in council of the 4th of June, 1841. Dr. Waddington was also, *ex officio* as dean, principal governor and member of the senate of the university; and, as he was never married, he was enabled to permit his charity to assume almost magnificent proportions. He presented two several sums of 2,000*l.* each to the Durham County Hospital, and a few months before his death filled with stained glass one of the windows of the cathedral, at a cost of about 1,400*l.* He was a large subscriber to London charities, and in the county of Durham was a supporter of nearly every benevolent institution. He was also a strong supporter of liberal opinions in the northern principality. He died at Durham on the 20th of July, 1869, and was interred in the cathedral burying-ground on the Saturday following his decease. The principal works of Dean Waddington are:—'Journal of a Visit to some Parts of Ethiopia,' 4to, London, 1822; 'A Visit to Greece in 1823 and 1824,' 8vo, London, 1825; 'The Present Condition and Prospects of the Greek or Oriental Church, with some Letters written from the Convent of the Strophades,' 8vo, London, 1829, new edition, revised, 1854; 'History of the Church from the Earliest Ages to the Reformation,' 3 vols. 8vo, London, two editions, 1835; 'History of the Reformation on the Continent,' 3 vols. 8vo, London, 1841; and 'Three Lectures on National Education,' 8vo, London, 1845.

WAGNER, RUDOLF, physiologist, was born at Baireuth, June 20, 1805. His education was pursued successively at Baireuth, Augsburg, Erlangen, Würzburg, and Paris. In the last-named city he came under the influence of Cuvier, by whom he was induced to give his close attention to comparative anatomy. In 1833 he was appointed professor of zoology at Erlangen, and in 1840 he succeeded Blumenbach as professor of comparative anatomy at Göttingen, which post he held till his death, October 12, 1864. His writings are very voluminous; but the subjects which he did most to advance were the structure and development of the egg, the structure of the brain of man and the higher mammals, the nervous system of the mammalia, and craniology. He was the editor of the 'Würzburger naturwissenschaftliche Zeitschrift,' 8vo, 1860, etc.; of the 'Handwörterbuch der Physiologie mit Rücksicht auf physiologische Pathologie,' 4 vols. Brunswick, 1842—43; and of the 'Bericht über die Zusammenkunft einiger Anthropologen in Sept. 1861 in Göttingen,' 4to, 1861, in which K. E. von Baer co-operated with him. He wrote, amongst other important text books,

'Lehrbuch der vergleichenden Anatomie,' 8vo, Leipzig, 1834—5; and 'Lehrbuch der speziellen Physiologie,' 8vo, Leipzig, 1839, both of which have passed through several editions. Of original works mention may be made of 'Neurologische Untersuchungen,' 8vo, Göttingen, 1854; 'Menschenschöpfung und Seelen Substanz,' 8vo, Göttingen, 1854; 'Vorstudien zu einer wissenschaftlichen Morphologie und Physiologie des menschlichen Gehirns als Seelenorgan,' 4to, Göttingen, 1860—62; and 'Zoologisch-Anthropologische Untersuchungen,' 4to, Göttingen, 1861.

WAKEFIELD, EDWARD GIBBON [E. C. vol. vi. col. 470], died on the 16th of May, 1862, aged 66.

WALCKENAER, CHARLES ATHANASE, BARON, a man of varied accomplishments, but chiefly known as a naturalist and geographer, was born at Paris, December 25, 1771. His parents died when he was young, and the care of him was undertaken by a rich maternal uncle. He was educated by the best masters in Paris, and went through a short course at Oxford, after which he studied at the École des Ponts et Chaussées and the École Polytechnique. In 1794 his uncle was executed, and he succeeded to his property, having narrowly escaped a similar fate. After the revolution he followed his own inclinations by occupying his time in cultivating general literature and the fine arts. He wrote novels, historical pieces, and compiled or translated accounts of voyages. When the Bourbons returned to power he took a share in the administration of affairs. Thus in 1816 he was mayor of one of the arrondissements of Paris, and from 1826 to 1830 he was a préfet first of the department of Nièvre, then of that of Aisne. In 1823 he was made a baron. In 1839 he undertook the care of the king's library and map collection. In 1840 he was elected the perpetual secretary of the Academy of Inscriptions. He died April 28, 1852. His writings are both numerous and of wide range, but a large proportion are translations or ordinary compilations. A few are of a more original character and of higher merit; such as the 'Histoire Naturelle des Aranéides,' oblong 12mo, Paris, 1806; 'Histoire Naturelle des Insectes, Aptères,' 4 tomes, 8vo, 1837—1847; 'Géographie ancienne historique et comparée des Gaules cisalpine et transalpine, suivie de l'analyse géographique des itinéraires anciens,' 3 vols. 8vo, and a quarto atlas, 1839, second edition 1862; 'Histoire de la Vie et des Ouvrages de J. de la Fontaine,' 8vo, 1820—1824; and 'Mémoires touchant la vie et les écrits de Mde. de Sévigné,' 5 vols. 12mo, 1842—1852, which was left unfinished. He also edited several editions of La Fontaine's works.

* WALCOTT, REV. MACKENZIE EDWARD CHARLES, a divine and ecclesiastical archaeologist, only son of the late Admiral Walcott, of Wintown, M.P. for Christchurch, Hants, and Charlotte, daughter of Colonel John Nelley, B.H.A., was born at Bath in the year 1822, and was educated as a commoner of Winchester College, and at Exeter College, Oxford, where he graduated in honours as B.A. on the 25th of May, 1844, and proceeded M.A. on the 14th of January, 1847. Subsequently he took the degree of B.D. After serving the curacies of St. Margaret's and St. James's, Westminster, and All Saints, Knightsbridge, respectively under the late Dean Milman, the Bishop of London, and the late Rev. W. Harness, he became and for some years continued minister of Berkeley Chapel, Mayfair; and in 1863 was collated precentor and prebendary of Chichester Cathedral.

Mr. Walcott, who is F.S.A., F.R.S.L., and an honorary member of many English and foreign archaeological societies, has been a diligent and successful student of ecclesiastical and general antiquities; and amongst the numerous works of which he is the author may be mentioned, 'The History of the Parish Church of St. Margaret, in Westminster, from its Foundation A.D. 1064,' &c., 8vo, Westminster, 1847; 'Westminster: Memorials of the City, St. Peter's College, the Parish Churches, Palaces, Streets, and Worthies,' 8vo, Westminster, 1849, new edition, 1851; 'The English Ordinal: its History, Validity, and Catholicity. With an Introduction on the three Holy Orders of Ministers in the Church,' 12mo, London, 1851; 'William of Wykeham and his Colleges,' 8vo, Winchester and London, 1852; 'The English Episcopate: Biographical Memoirs of the Bishops of England and her Colonies, from the Earliest Period to the Present Time,' 8vo, London, 1858, &c.; 'A Guide to the Cathedrals of England and Wales. With short Notes of the Chief Objects of Interest in every Cathedral City,' 8vo, London, 1858, second edition, with the modified title of 'The Cathedrals of the United Kingdom,' &c., 8vo, London, 1860; 'Church and Conventual Arrangement. With copious

References, a complete Glossary, and an Index,' &c., 8vo, London, 1861; 'The East Coast of England, from the Thames to the Tweed, descriptive of natural Scenery, historical, archaeological, and legendary,' 8vo, London, 1861; 'The Interior of a Gothic Minster. A Lecture delivered at the Architectural Museum, South Kensington, April 26th, 1864,' 8vo, London, 1864; 'Cathedrals: a Constitutional History of Cathedrals of the Western Church. Being an Account of the various Dignities, Offices, and Ministries of the several Members,' &c., 8vo, London, 1865; 'Memorials of the Cathedral Cities of England and Wales,' 8vo, Oxford, 1865; 'Sacred Archaeology: a Popular Dictionary of Ecclesiastical Art and Institutions, from Primitive to Modern Times: comprising Architecture, Music, Vestments, Furniture, Arrangement, Offices, Customs, Ritual, Symbolism, Ceremonial, Traditions, Religious Orders, &c., of the Church Catholic, in all Ages,' 8vo, London, 1866, a work in which the author brings to bear the entire learning of his life; and 'Traditions and Customs of Cathedrals,' 8vo, London, 1872. Mr. Walcott is the author of several "sacred poems," 'St. Paul at Athens,' 12mo, London, 1851, 'The Death of Jacob,' and 'The Dedication of the Temple,' 8vo, London, 1854, and of a small volume of miscellaneous verse entitled 'Leaflets,' 8vo, London, 1872; and he has also contributed largely to the general literature of the day in the pages of journals, reviews, and magazines, — the 'Ecclesiastic,' 'Ecclesiologist,' 'Sacristy,' 'Reliquary,' 'Musical Times,' 'Annotated Book of Common Prayer,' 'Dictionary of Doctrinal Theology,' 'Gentleman's Magazine,' 'Churchman's Family Magazine,' 'Archæologia Cantiana,' and to the 'Transactions of the Royal Society of Literature.' He also contributed to the 'Church and the World,' 8vo, London, 1866, edited by the Rev. Orby Shipley, an article on 'Cathedral Reform.'

WALDECK, PRINCES OF [E. C., vol. vi., col. 476]. After the war of 1866, the Prince of Waldeck made a proposition for the full amalgamation of Waldeck with Prussia, and after much negotiation a compact was concluded, June 10th, 1867, by which while the prince retained the nominal sovereignty, and obtained a sufficient revenue and important privileges, the government of the country passed wholly into the hands of the King of Prussia. Since the assumption of the title of German Emperor by the King of Prussia the sovereignty of the Prince of Waldeck has become the merest phantom.

* **WALES, ALBERT EDWARD, PRINCE OF**, eldest son of Queen Victoria and the late Prince Consort, heir-apparent to the British throne, was born at Buckingham Palace, on the 9th of November, 1841, and was christened at Windsor, by the Archbishop of Canterbury, on the 25th of January, 1842, with water brought from the river Jordan in 1825. On the 11th of September, 1849, he was gazetted as Earl of Dublin; and having received his early education from the Rev. H. M. Birch, Mr. Gibbs, the Rev. C. F. Tarver, and Mr. H. W. Fisher, was further trained academically at Edinburgh, Oxford, and Cambridge. On the 9th of July, 1860, he left England on a visit to Canada and the United States, accompanied by the Duke of Newcastle, and arrived at St. John's, Newfoundland, on the 24th of the same month. He visited Halifax, July 30th; Quebec, August 18th; Montreal, August, 25th; and Ottawa, September 1st: and, arriving at Detroit, in the United States, on the 20th September, visited Washington, where he was entertained by President Buchanan, on the 3rd of October; Philadelphia, October 9th; New York, October 11th; Boston, October 17th; and embarked at Portland, October 20th, on his return to England, which he reached, after an unusually tedious and disagreeable passage, landing at Plymouth on the 15th of November. In 1858 the Prince of Wales was gazetted a Colonel in the Army; and on the 12th of September, 1861, having been for some months stationed at the Curragh, discharged there his first public function, by presenting a new stand of colours to the 36th Regiment. He opened the Middle Temple Library on the 31st of October, 1861, and upon this occasion was admitted a Benchman of the Inn. On the 6th of February, 1862, the Prince, travelling as Baron Renfrew, as he had previously done in America, left England for a tour in the East, accompanied by General Bruce, Rev. Canon Stanley, at present Dean of Westminster, and others. The party landed at Alexandria on the 1st of March, and on the 5th of that month visited the Pyramids; Thebes on the 15th; Jaffa on the 28th; and Jerusalem on the 31st. On Monday, April 7th, the Prince and a small suite were permitted, as a mark of unprecedented favour, to enter the tombs of the patriarchs at Hebron; witnessed at Mount Gerizim the celebration of the Samaritan Passover; and on Easter-Day, on the shores of the

BIOG. DIV.—SUP.

Sea of Galilee, received the Holy Communion from Dr. Stanley. After spending several weeks in Syria, a homeward route was taken by way of Smyrna, Constantinople, Athens, Cephalonia, and Malta; and on the evening of the 4th of June, his Royal Highness reached Windsor Castle. On the 12th of June, he visited the Emperor Napoleon III. at Fontainebleau; and on the 4th of November, the 'Gazette' announced his intended marriage with the Princess Alexandra of Denmark, which was celebrated at St. George's Chapel, Windsor, on the 10th of March, 1863. At an afternoon sitting of the House of Lords, on the 5th of February preceding, the Prince of Wales took his seat for the first time, wearing a scarlet robe with ermine bars, proper to his rank as Duke of Cornwall, over the uniform of a General in the Army. On the 19th of February, in prospect of the marriage, Lord Palmerston brought forward a motion, which was unanimously adopted by the House of Commons, to settle 100,000*l.* per annum on His Royal Highness; and at the same time 10,000*l.* per annum was voted for the separate use of the Princess of Wales, and 30,000*l.* in the event of her surviving the Prince. Since their marriage the principal residences of the Prince and Princess of Wales have been Marlborough House, London, and Sandringham House, near King's Lynn, Norfolk; but they have constantly paid visits to various parts of the kingdom, and have on several occasions travelled beyond it. In September, 1864, they paid a visit to Denmark; in May, 1867, the Prince visited Paris, and Berlin in January, 1869, when, on the 20th, the King of Prussia invested him with the Order of the Black Eagle, the collar presented being the one previously worn by Prince Albert. In the spring of 1869, the Prince and Princess undertook a journey to the East, landing at Constantinople on the 1st of April, and proceeding to make an extended tour in Egypt, accompanied by scientific and literary men—including Professor Owen, Sir Samuel Baker, and Dr. W. H. Russell, the last of whom was the historiographer of the expedition—whose observations and researches were recognised as particularly valuable in archæology and ethnology. When the Khedive of Egypt visited this country, the pressure of English opinion against the slave-trade as practised in his dominions, was brought to bear upon him; and it was owing to the influence of the Prince of Wales with His Highness, that the expedition of Sir Samuel Baker, which has a distinct anti-slavery intention, and is even now (March, 1872) proceeding successfully, was equipped at the expense of the Khedive. Amongst the progresses, journeys, and public appearances of the Prince which have been limited to his mother's home dominions, may be mentioned the state visit which he paid with his bride to the City, on the 8th of June, 1863, when they were entertained, by the Corporation of London, at a banquet of uncommon splendour in the Guildhall; a like joint attendance at the Oxford Commemoration of June, 1863, when the degree of D.C.L. was conferred upon the Prince; the joint opening of the British Orphan Asylum at Slough, June 24th; the opening, by the Prince, of the new Town Hall at Halifax, on the 3rd of August; the visit, with the Princess, to the University of Cambridge, June 2nd, 1864; the opening of the Dublin International Exhibition, on the 9th of May, and of the Dramatic College at Woking, June 5th, 1865; the presence of the Prince at the annual banquet of the Royal Academy on the 5th of May, 1866, and on subsequent anniversaries; the visit of the Prince and Princess to York, August 9—12, 1866, when 25,000 Volunteers were reviewed in their presence by the Duke of Cambridge, and the Prince Consort memorial window in the Guildhall was formally unveiled; the presence of the Prince at the monster ball given on the 18th of July, 1867, to the Belgian Volunteers, at the Agricultural Hall, Islington; the joint visit of the Prince and Princess to Ireland, April 15—24, 1868, on which occasion, April 18th, the Prince was installed, in St. Patrick's Cathedral, as a Knight of St. Patrick; the joint visit to Glasgow, where, October 8th, 1868, the Prince laid the foundation-stone of the new University buildings; the presidency of the Prince at a meeting of the Royal Institution, June 21st, 1869, to promote the erection of a memorial in honour of Professor Faraday; the opening of the new Alexandra Dock, at Lynn, by the Prince, on the 7th, and the laying of the foundation-stone of the London Orphan Asylum, at Watford, on the 13th of July, 1869; the opening of the new Albert Docks, at Hull, and the unveiling of the statue of Mr. Peabody, the American philanthropist, at the Royal Exchange, respectively on the 22nd and 23rd of July, 1869; the laying of the foundation-stone of the new Grammar School, at Reading, July 1st, 1870; the formal opening, jointly with the Princess Louise, in the absence of Her Majesty, of the Thames Embankment, July 12th, 1870; and the laying of the

foundation-stone, with masonic honours, of the new Edinburgh Infirmary, on the 13th of October, 1870. On the 13th of November, 1871, the Prince of Wales, being then at Sandringham, began to suffer from feverish symptoms, which developed, on the 20th, into those of typhoid fever, and increased in intensity and peril until the 14th of December, on which day, as the tenth anniversary of his father's death from the same disease, there seemed to be a wide spread presentiment that the attack would terminate fatally. The day of his imminent death, was, however, the beginning of recovery : and on the 27th of February, 1872, he accompanied the Queen in her state visit to St. Paul's Cathedral to return thanks for his recovery to health. More than a nation seemed packed in the streets of the capital, and the spontaneous joy and loyalty of the people were unsurpassable. The principal thoroughfares and buildings were brilliantly illuminated for two successive nights ; and the provinces joined in the hilarity and gratitude of the metropolis.

On her first entry into London, March 7th, 1863, the Princess Alexandra met with an enthusiastic reception ; and as Princess of Wales every act and word has but helped to fix and augment the affection of the people. The Princess has borne six children to her husband, the youngest of whom, Prince Alexander John Charles Albert, was born on the 6th of April, 1871, died on the following day, and was buried at Sandringham. The other issue, two sons and three daughters, are named respectively, Albert Victor Christian Edward, born at Frogmore Lodge, Windsor, on the 8th of January, 1864 ; George Frederick Ernest Albert, born on the 3rd of June, 1865 ; Louise Victoria Alexandra Dagmar, born February 20th, 1867 ; Victoria Alexandra Olga Mary, born July 6th, 1868 ; and Maud Charlotte Mary Victoria, born on the 26th of November, 1869.

The Prince of Wales is Duke of Saxony, Prince of Saxe-Coburg and Gotha, Duke of Cornwall, Duke of Rothesay, Earl of Chester, Carrick, and Dublin, Baron Renfrew, Lord of the Isles, Great Steward of Scotland, K.G., K.T., K.P., G.C.S.I., K.T.S., G.C.B., P.C., a General in the Army, Colonel of the 10th Hussars, Colonel-in-Chief of the Rifle Brigade, Captain-General and Colonel of the Hon. Artillery Company, Honorary Colonel of several Volunteer Corps—the Oxford and the Cambridge University, Civil Service, Huntingdon Light Horse, Northern Brigade, Caithness, and the Sutherland Rifles. He was elected President of the Society of Arts, November, 22nd, 1863 ; a Past Grand Master of the Order of Freemasons, September 1st, 1869 ; a member of the United Grand Lodge of Freemasons in England, December 1st, 1869 ; and was installed Patron of the Freemasons of Scotland, at Edinburgh, October 12th, 1870. The Prince of Wales is also an Elder Brother of the Trinity House ; and in April, 1867, became President of St. Bartholomew's Hospital.

WALEWSKI, ALEXANDRE FLORIAN JOSEPH COLONNA, DUC, French diplomatist and senator, was born at the Castle of Walewice, Poland, May the 4th, 1810. After the death of his mother, a Polish countess, he went to pursue his studies at Geneva. In 1830, he joined the Polish patriots at Warsaw, fought at the battle of Grochow, and then accompanied Zamoycki and Wielopolski to London, where an attempt was made to induce the English Government to favour the Polish movement. Failing in this, Walewski went to France, became naturalised as a French citizen, entered the army in 1833, as captain in the Foreign Legion, became captain of the 2nd Chasseurs d'Afrique soon afterwards, and captain in the 4th Hussars in 1835. He went to Algeria, where he managed a confidential mission to Abd-el-Kadir, and was appointed director of the Arab bureau at Oran. In 1837 he published 'Un Mot sur la Question d'Afrique.' Returning to France in 1838, he resigned his commission in the army, entered the arena of political and 'salon' life, published a pamphlet, 'L'Alliance Anglaise,' and founded and edited the 'Messager,' which he afterwards sold to M. Thiers as a Government organ. In 1839 he was said to have been anonymously concerned in writing Alexandre Dumas's 'Madelmoiselle de Belle Isle,' though this was denied in other quarters ; but in 1840 he was the avowed author of 'L'Ecole du Monde, ou la Coquette sans le Savoir,' a comedy in five acts, produced at the Théâtre Français. In this same year he commenced his official career. M. Guizot sent him to Egypt, to negotiate with Mehemet Ali terms proposed by the European powers for the settlement of the Egyptian question. This was followed by missions to various governments, on some of the diplomatic controversies of the day ; among others, to Buenos Ayres, concerning which he published, 'Intervention Anglo-Française dans le Rio de la Plata,' 1848. When, after the French Revolution of 1848, Prince Louis Napoleon rose into power, Count Walewski joined

him, and was rewarded with diplomatic missions of various kinds, to Florence, Naples, and Madrid. In London, as French ambassador, he procured the recognition by England of the assumption of empire by Louis Napoleon, a recognition on which the Emperor placed great value. In 1855 the count succeeded M. Drouyn de Lhuys as Minister for Foreign Affairs ; he acted as plenipotentiary for France in discussing the treaty of peace with Russia on the conclusion of the Crimean war, and signed the treaty on the 30th of March, 1856. He was made senator and grand cross of the Legion of Honour. When the Emperor met the Czar at Stuttgart, Walewski accompanied him. In 1860 the portfolio of foreign affairs was transferred to M. Thouvenel, and Count Walewski became Minister of State. He presided in 1862 over the imperial commission for inquiring into literary and artistic property. Superseded in the premiership by M. Billault in 1863, he was soon afterwards elected to the Corps Législatif, by the department of Les Landes, of which department he had for some time been member of the Conseil Général for the canton of Saint Martin des Seigneaux. In 1865 he was chosen president of the Corps Législatif. He was created duc in 1866 ; resigned his seat in the Corps Législatif in 1867 ; returned to the Senate ; was elected member of the Académie des Beaux Arts in 1868 ; and died at Strasbourg on the 27th of September, 1868. The funeral procession in Paris, from the Madeleine to Père la Chaise, on the 3rd of October, was more than usually magnificent. At a time when the public men of France did not stand high in general estimation, the Duc Walewski bore the character of a man of probity, benevolence, and liberal views ; he never greatly enriched himself ; and a pension of 20,000 francs a year, granted to his widow by the Emperor in 1869, was a recognition of this fact.

* WALKER, ADMIRAL SIR BALDWIN WAKE, BART., K.C.B., sometime Surveyor-General of the Navy, was born in 1803. He entered the Royal Navy in 1812, while a mere boy, and worked up gradually through all the ranks in the service. He received his commission as second-lieutenant in 1820 ; served in the 'Nautilus' on the Jamaica station ; cruised on the African and South American coasts from 1823 to 1826 ; was then promoted to the rank of first-lieutenant, and served on the American station in the 'Rattlesnake' and the 'Ætna.' In 1828, while in the last-named ship, he aided in reducing the castle of the Morea, one of the last strongholds which the Turks possessed in the Peloponnesus, and the fall of which conducted to the final liberation of Greece. After further service in the 'Asia' the 'Britannia,' and the 'Barham,' he advanced to the rank of commander in 1834. In 1838, and many subsequent years, as captain, he commanded in succession the 'Vanguard,' the 'Queen,' and the 'Constance,' in the Mediterranean fleet. During part of this period, in 1841, he assisted Admirals Stopford and Napier in the operations on the coast of Syria. In 1847 he was appointed to the responsible office of Surveyor-General of the Navy. This post, which he filled during a period of thirteen years, was more than usually onerous, owing to the transition state of the ships belonging to the Royal Navy. The substitution of steam for sails had been almost completed, and the substitution of the screw for the paddle was rapidly advancing ; but the ships were still two and three deckers, mounting broadsides of comparatively small guns. The transformation of line-of-battle ships into frigates of great length and fleetness, armed with a few guns of enormous calibre, had not commenced ; still less the construction of ram-headed iron-clads, and the turret system of carrying the armament. Captain Walker, during the whole of his thirteen years at the Admiralty, was engaged in these transition labours. With him rested the main duty of altering the construction of ships already partially built ; cutting wooden sailing ships in two, lengthening them by the insertion of centre timbers, and putting in steam engines ; preparing the way, also, for that virtual reconstruction of the Navy, which commenced about the close of his duties at the Admiralty. Naval critics have disputed the excellence of this or that style of ship, but all admit that the Surveyor of the Navy displayed great judgment in his utilisation of old sailing ships by converting them into screw steamers. Captain Walker, by a baronetcy conferred in 1856, and a rise in naval rank in 1858, became rear-admiral Sir Baldwin Walker. On quitting the Admiralty in 1860, he took command of the fleet on the Cape of Good Hope station, and then of that on the East India station. He was promoted to the rank of vice-admiral in 1865, and admiral in 1870. During a portion of this period he commanded the Sheerness station. Amongst the honorary decorations conferred on him, are those of Knight Commander of the Bath, admiral in the Turkish ser-

vice, knight of the Russian Order of St. Anne, of the Greek Order of the Redeemer, of the Austrian Order of the Iron Cross, and of the Prussian Order of the Red Eagle.

WALKER, JAMES, an eminent civil engineer, was born at Falkirk, September 14th, 1781. He was educated partly at Falkirk School, partly at Glasgow University, and came, in 1800, to London, where he was articled to his uncle, Mr. Ralph Walker, a civil engineer in considerable practice. He derived his first knowledge of that branch of engineering in which he afterwards took the lead, maritime and hydraulic, by taking part in his uncle's operations at the East and West India Docks. In 1803 he formed the Commercial-road, as a new artery of communication from the city to the docks, and later, laid upon it a granite tramway, which has much facilitated the transmission of heavy traffic along that thoroughfare. In 1806, as engineer to the Commercial Docks Company, he planned the works which, with various extensions, have since from time to time been constructed. During a period of nearly sixty years, Mr. Walker was engaged on a large number of engineering works, some of magnitude and importance. He was not much concerned in railway engineering, having planned and executed only two lines, the Leeds and Selby, and the Hull and Selby. When the Liverpool and Manchester Railway was being constructed, and engineers were invited by the directors to suggest the best mode of traction for the trains, Mr. Walker was one of those who advocated the combination of locomotive and stationary power; the Stephensons preferred locomotive traction alone; they gained the day, and this decision may probably have had something to do with Mr. Walker's preference for other than railway engineering works. Among works which he executed in and near the metropolis were Vauxhall Bridge; frequent repairs and reconstructions of Blackfriars and Westminster Bridges, prior to their demolition and rebuilding by other engineers; the river wall of the new Houses of Parliament, with the coffer-dam to aid in its construction. His works in other quarters were, however, far more numerous and important; many of them, partly finished or not commenced, devolved upon him at the time and in consequence of the death of Mr. Telford. Among them may be mentioned the Clyde Victoria Bridge; improvements and river wall to the Clyde at and near Glasgow; repairs of the Caledonian and Crinan Canals; the Tame Valley Canal; the Netherton Tunnel of the Birmingham Canal; the extension of the Bute Docks at Cardiff; the pier and harbour at Granton, near Leith; improvements of Belfast Harbour; Harbours of refuge, or other Harbour works, at Dover, Harwich, Jersey, and Alderney; the Tyne Piers; the completion of Plymouth Breakwater; the foundations for a fort at one end of the Breakwater; the Bishop Rock Lighthouse off the Scilly Isles, a work little less difficult than the Eddystone, Bell Rock, and Skerryvore Lighthouses; numerous constructions and alterations of lighthouses for the Corporation of the Trinity House; and extensive drainage operations in the Middle Level Fen district, whereby 90,000 acres of rich arable land have been reclaimed. More, perhaps, than any other member of the profession, Mr. Walker was called upon by the Government, corporate bodies, and boards and companies of various kinds, for advice and plans on engineering subjects; and his reports on such matters were numerous. The City Sewers and the Thames Embankment were among the number. He was a fellow of the Royal Societies of London and Edinburgh, LL.D (University of Glasgow), Member of the Senate of the University of London, and for thirteen consecutive years president of the Institution of Civil Engineers. He died at his house in Great George Street, Westminster, October 8th, 1862.

WALKER, THOMAS, a magistrate and humorist, was born in the year 1784, at Manchester, where his father and uncle were extensive manufacturers, who, at the breaking out of the French revolution, were unfortunately mixed up with the political agitation of the day. The father was tried for high treason at Lancaster, where he was successfully defended by Erskine, who made one of his most brilliant speeches on the occasion; while the uncle, having left the country, settled at Naples, where he died many years after. Mr. Walker, whose delicate health had necessitated his private education, was entered of Trinity College, Cambridge, where he took his B.A. degree in 1808, and proceeded M.A. in 1811. He was called to the bar by the Society of the Inner Temple, on the 8th of May, 1812, and was appointed, in 1829, to be one of the magistrates of the Lambeth-street Police Court, London. In this position he won great approbation for the soundness and discretion of his practical views, and for the ardour with which he investigated the moral condition of

his district, and applied himself to its amelioration. He was particularly known, however, for the fulness and flavour of his gifts as a conversationalist, and for the humour with which he flooded the intercourse of social life. Towards the latter end of the year 1835, Mr. Walker's health suffered considerably; and, with a view to its re-establishment, he paid a visit to the Continent. He died of pulmonary apoplexy, on the 20th of January, 1836, at Brussels, in the cemetery of which city his remains were interred.

Mr. Walker was not a voluminous writer. He contributed to the literature of what would now be called social science a small work, 'On Pauperism and the Means of reducing it,' 8vo, London, 1826, also published in an abridged form, with the title of 'Observations on the Nature, Extent, and Offices of Pauperism, and on the Means of reducing it,' 8vo, London, 1831. But his chief performance was the production of a weekly periodical called 'The Original,' 8vo, London, 1835, which commenced its career in May, 1835, and, after an issue of twenty-six numbers, came to a close on the 11th of November following. The genial fun and humour of the author sufficed to give character and attractiveness to the most common-place topics, which, as discussed in the pages of 'The Original,' varied as follows:—'Acquaintance'; 'Agriculture'; 'Aristology, or the Art of Dining'; to which nine articles were devoted; 'Art of attaining High Health'; eleven articles; 'Art of Listening'; 'Art of Traveling'; 'Clubs'; 'Crossing the Alps Mathematically'; 'Education'; 'Execution'; 'Good Breeding'; 'Good Feeling'; 'Government'; 'Hot Water'; 'Isacriotism'; 'Mount Vesuvius'; 'My Mother'; 'Pauperism'; 'Poverty and Pauperism'; 'Praise of Wine'; 'Prison Discipline'; 'Prize-Fights'; 'Punctuality'; 'Roasted Apples'; 'Romeo and Juliet'; 'Savings Bank for Seamen'; 'Sick Wives'; 'Silver Threepences and Fourpences'; 'Suppers'; 'Temper'; 'Two-penny Post'; 'Youth and Age'; and various others.

* WALLACE, ALFRED RUSSEL, naturalist and traveller, was born at Usk in Monmouthshire, in 1823. After receiving his education in Christ's Hospital, at Hertford, and London, he assisted his elder brother in his profession as architect and surveyor, chiefly in making parish surveys. At twenty-one he became the teacher of English at a school in Leicester, but had not pursued this occupation long before his brother died. He thereupon resumed the business of surveyor and followed it for some years at Neath in Glamorganshire. While at Leicester he became acquainted with Mr. Bates, and in conjunction with him he formed a scheme for exploring the Amazon valley. The expenses of the journey, which lasted from 1848 to 1852, were defrayed by the sale of objects collected by them and sent over to England from time to time. In 1854 he went to the Malay Archipelago where he remained till 1862. These expeditions yielded many valuable results. They afforded much new information respecting the animals of regions, many of which had not been previously visited by a professed naturalist. A large number of new species and genera were found and have been described by himself, Bates, and others. But, perhaps the special feature in connection with his researches is the constant attention which he paid to the habits and geographical distribution of the animals he met with. He pointed out that the birds and mammals of the Malay Archipelago belong to two distinct faunas, the one inhabiting the northern portion, and the other the southern portion; and that the line of demarcation is naturally indicated by the deep water channel commencing with the narrow Straits of Macassar, which separates two comparatively shallow areas. He also conceived the theory of natural selection, which, however, had been previously and independently started by Mr. Darwin, although not published by him. Indeed, it was the essay 'On the tendency of varieties to depart indefinitely from the original type,' which Mr. Wallace sent to England that led to Mr. Darwin's public enunciation of his views. The two papers appeared together in the 'Proceedings of the Linnean Society' for 1858. He has since written many papers in which his opinions are more fully illustrated by the facts which he has personally observed. In the main his opinions agree with those of Mr. Darwin; but in some of the subsidiary points their views do not coincide. Nevertheless, he is one of the foremost advocates of Mr. Darwin's theory. He is a fellow of the Royal Geographical and other societies; and was president of the Entomological Society from 1870 to 1872. The Royal Society of London and the Geographical Society of France have awarded him gold medals for his researches on the physical geography and natural history of the Malay Archipelago. Amongst his independently published works the most noteworthy are 'A Narrative of Travels on the Amazon and Rio Negro, etc.,' 8vo,

London, 1853; 'The Malay Archipelago; the Land of the Orang-Utan and the Bird of Paradise,' 2 vols., 8vo, 1869; and 'Contributions to the theory of Natural Selection,' 8vo, 1870. Of his papers the most remarkable are those 'On the pigeons of the Malay Archipelago,' in 'Ibis,' vol. for 1865, pp. 365-400; and 'On the phenomena of variation and geographical distribution as illustrated by the Papilionidae of the Malayan region,' in 'Transactions of the Linnean Society,' vol. xxv., pp. 1-71, 1865.

WALLACE, WILLIAM VINCENT, musician and musical composer, was born at Waterford, June 1st, 1814. His father, bandmaster of the 29th Foot, taught him to play on most kinds of military musical instruments, and obtained for him instruction likewise on the pianoforte, violin, and guitar. The youth became so excellent a player that, before his eighteenth year, he had filled the diverse offices of organist of Thurles Cathedral, violinist at the Dublin Theatre Royal, and conductor of concerts in the same city. Being advised to take a long sea voyage as a cure for a malady in the eyes, he quitted Dublin about the year 1833, and for a lengthened period led a singularly adventurous and chequered life. He first went to Australia, where for a time he combined the functions of backwoodsman and herdsman, music being wholly laid aside. Accident placed him, however, on one occasion in circumstances to hear, at Sydney, some amateur playing of one of Haydn's string quartettes. It re-awakened early associations; and he resolved to employ his musical abilities as a means of livelihood. He gave concerts, himself playing the violin; and having won much distinction as a musician, proceeded to Tasmania and New Zealand, where success again awaited him. Then he went to India, where, amongst other events, he played before the Court of Oude. Crossing the Pacific, his next concerts were given at Valparaiso and Santiago in South America. Thence journeying over the Cordillera of the Andes, he reached Buenos Ayres and other towns, where his violin-playing was regarded as of a higher order than had ever before been heard in South America. His next principal places of performance were Havana, Vera Cruz, Tampico, Mexico, New Orleans, and New York. At the last-named city, about eleven years after quitting his native country, he married Miss Helen Stempel, a pianist. His own performance on the pianoforte was only a little less excellent than on the violin; and as a concert-giver and music director he was in much repute. In 1845 he came to London, but could not hold his ground against the great instrumentalists always to be heard here. Then it was that he turned his attention to composing, and speedily produced his 'Maritana,' in three acts, founded on the Spanish story of 'Don César de Bazan.' This met with great success, and has ever since been popular. It was followed in 1847, by 'Matilda of Hungary,' an opera which failed to hit the public taste. He made two visits to the continent, and superintended the bringing out of his operas at Vienna. He undertook to write an opera for the Grand Opera at Paris; but while preparing it, another attack of illness sent him on another sea voyage in search of health. He went to Rio de Janeiro in 1849, gave concerts there, then at New Orleans, then at New York. Having saved some money, he unfortunately invested it in a pianoforte manufactory at New York; lost it all in 1852; resumed his concerts; and returned in 1853 to England, where his chief employment for seven years was composing a large mass of vocal and instrumental music, chiefly for voice and pianoforte. In 1859 he produced 'Lurline,' an opera in three acts. This, and 'Maritana,' were the only two operas of his which had marked success; although he himself preferred the 'Amber Witch,' produced in 1861. Another opera was the 'Desert Flower,' produced in 1863. He contributed numerous pieces to 'Chappell's Musical Magazine,' and other publications. An incurable malady attacked him; he went to France in 1864, and died at the Château de Bagen, Haute Garonne, October 12th, 1865. His remains were brought to England, and buried on the 23rd at Kensal Green. The names of five operas are mentioned, which Mr. Wallace left in an unfinished state, viz., 'The King's Page,' 'Estrella,' 'The Maid of Zurich,' 'Gulnare,' and 'Olga.'

WALLICH, NATHANIEL, M.D., F.R.S. [E. C. vol. vi. col. 1029.]

WALTERS, EDWARD, architect, was born in London, December, 1808. His father, Mr. John Walters, was the architect of the Auction Mart, Bartholomew Lane, Shadwell Church, and other well-known buildings, but dying early, Edward was placed in the office of Mr. J. Clarke, and he was afterwards successively in the offices of Messrs. T. Cubitt, Lewis Vulliamy, and J. Walker. In 1832 he went to Constantinople to superintend

for Sir John Rennie the erection of various works for the Turkish Government. Leaving Constantinople in 1837, he returned home by way of Smyrna, Malta, Sicily, and Italy. After some hesitation, he decided to settle in Manchester, 1839, led thereto partly by a friendship he had formed at Constantinople with Richard Cobden; and one of his first works of any consequence in Manchester was a warehouse he erected for Mr. Cobden in Mosley Street. Mr. Walters made but slow progress for some years, but when his rare ability was recognised he rose rapidly, and for many years held the position of leading architect in the city. He erected some mansions of a superior character; several dissenting churches and chapels, and a few public buildings; but his speciality was in the large and stately warehouses which now form so striking a feature in the street architecture of Manchester. Before Mr. Walters's time the warehouses of Manchester were large, plain, common-place, brick buildings, for the most part mean and repulsive, rather than attractive. Mr. Walters saw that, from their size, the wealth of the firms to which they belonged, and the nature of the business transacted in them, they afforded ample opportunity for architectural character. He selected as his model the Italian Renaissance palaces which Barry had shown might be easily modified and adapted to English urban purposes, and he surprised the citizens by the stateliness, brightness, vigour, and solidity of aspect of his early buildings of this class; and notably those of Messrs. Schwabe & Cooke; James Brown, Portland Street, and Keershaw, Leese, and Co. The desire for such buildings spread fast and far, as it was seen that warehouses of this kind not only gave a certain stamp of solidity to a firm, but were admirably adapted for the display of goods and the transactions of business. Mr. Walters found himself with more commissions on his hands than he could well execute. All his many warehouses are Italian Renaissance in style, with great differences of elevation, outline, mouldings, and decoration, but all treated broadly, with special reference to the site, the business, and the cost; all unnecessary pretence being studiously avoided. His chief public building was the Free Trade Hall, completed in 1856, on the whole, one of the best buildings yet erected in this country for the holding of public meetings. Another good building of this class was the Warrington Public Hall, completed in 1861. The Manchester and Salford Bank, Mosley Street, a very elegant structure, the London, Liverpool, and Globe Insurance Office, and some of the Midland Railway stations were also successful modifications of his favourite Italian style. His chief ecclesiastical edifice was Cavendish Chapel, but Gothic was not his forte; and when, in the competition for the Manchester Assize Courts his carefully elaborated classic design was rejected for Mr. Waterhouse's brilliant Gothic one, and Gothic energy was successfully invading even the warehouse region in which he had long reigned unquestioned monarch, he felt it time to retire. In 1865 he transferred his business to his pupils, Messrs. Barker and Ellis, and by visits and travel, and spending his winters in Italy, he sought to recruit his health. He died at Brighton of pleurisy on the 22nd of January, 1872. (*Builder*, March 16th, 1872, where is a complete list of his buildings.)

WAN-WANG, the founder of the Chinese dynasty of Chow, was born, according to their chronology, about 1230, B.C. Like Confucius, he traced his pedigree back to the semi-fabulous Emperor Hoang-ty. He succeeded his father, Ki-ly, as governor of Chow, in 1185, B.C. By Ti-y, the last emperor but one of the Shang dynasty, he was made commander-in-chief of the Chinese army; but Chow-sin, son and successor of Shang, jealous of Wan-wang's power and popularity, threw him into prison, 1145, B.C., where he remained three years. Whilst in confinement he wrote a commentary, 'Keaou,' on the lines of Fou-hi, which still exists, and is esteemed by the Chinese one of their chief classics. When released and restored to his dignities, Wan-wang betook himself to his principality, reduced to obedience several subordinate chieftains, formed a powerful army, and became virtually independent, having obtained from the emperor the right to make war and peace. Chinese books dwell on his military qualities, the splendour of his court, his patronage of learning, his wisdom, clemency, and various virtues. He died about 1133, B.C., at the age of 97, having governed the Chow country for fifty years. His son, Woo-wang, permitted the tyrant Chow-sin to reign for a few years, when he deposed him and became the first Emperor of China and of the Chow dynasty; but Wan-wang is regarded by the Chinese as the actual founder of the dynasty. In course of time divine honours were decreed to Wan-wang, and temples erected to his honour throughout the empire.

* WAPPERS, BARON GUSTAF, an eminent Belgian painter, was born at Antwerp, August 23rd, 1803. He was a pupil of M. Van Brée, and a student in the Antwerp Academy, but completed his studies in Paris. His picture of 'The Devotion of the Burgomasters of Leyden,' exhibited in 1830, at once secured his position. He has since painted a large number of religious pictures, several of them for churches; historical, genre, and poetical subjects; and portraits of the King of the Belgians and other distinguished persons. His historical pictures refer chiefly to Belgian history, but he has painted two or three incidents in the life of Charles I., one of which is in the Musée Royal of Belgium, and some of other periods of English history. For the King of the French, Louis Philippe, he painted 'The Defence of the Island of Rhodes by the Knights of St. John of Jerusalem,' now at Versailles; and he has received commissions from Queen Victoria. In his own country Wappers has obtained abundant honour. He is member of the several academies; was first professor, and from 1846 to 1850, director of the Academy of Antwerp; was created Baron in 1847; is portrait painter to the King, and commander of the order of Leopold. He is also an officer of the Legion of Honour, France, knight of the Red Eagle of Prussia, the Royal Order of Bavaria, the Order of Christ of Portugal, &c.

WARD, SIR HENRY GEORGE, G.C.M.G. [E. C. vol. vi. col. 523], died at Madras, on the 2nd of August, 1860.

WARD, JAMES, R.A. [E. C. vol. vi. col. 521]. This remarkable painter died at his residence, Roundcroft Cottage, Cheshunt, on the 17th of November, 1859, having just completed his 90th year: he was born, October the 23rd, 1769, not 1770, as stated in the above memoir. His largest and best picture, 'Alderney Bull, Cow, and Calf,' noticed in the original memoir (col. 522), was purchased in 1862 for the National Gallery, where are also his 'Council of Horses,' painted in 1848, and 'Lake and Tower in De Tabley Park,' painted in 1814.

WARD, NATHANIEL BAGSHAW, botanist, son of Stephen Smith Ward, a medical practitioner in the East End of London, where the son was born August 13, 1791. At the age of thirteen his father sent him upon a voyage to Jamaica. An excursion into the interior introduced him to its palms and ferns, and thenceforward the study of botany became the chief occupation of his leisure hours. At an early date his house in Wellclose-square became known by the varied vegetation by which it was surrounded. The climate of Eastern London, however, and more particularly the impurity of the air, were sources of constant disappointment. In the summer of 1829 he happened to place the chrysalis of a moth in a glass bottle, covered by a lid, for the purpose of watching the development of the perfect insect. Upon the surface of the mould there appeared two specks of vegetation, which proved to be a fern and a grass. Their remarkably healthy appearance at once attracted his notice; but it required years of observation and experiment for him to determine what the physical conditions were that conducted to this healthiness. The result was the now well-known "closed or Wardian case," the principle of which mainly consists in affording the plants a proper supply of light and moisture, at the same time that they are protected from atmospheric impurities and sudden changes of temperature. Among the earliest applications of these cases to the transport of living plants between distant countries may be mentioned that of Captain Mallard, who, about forty years ago, brought from Sydney a collection of Australian plants for the Messrs. Loddiges; and that of John Williams, the Polynesian missionary, who took the Chinese banana from the Duke of Devonshire's seat at Chatsworth to the Samoan or Navigator's Islands, whence it was carried by the Rev. George Pritchard to the Friendly Islands and the Fiji, and has thus prevented the recurrence of those famines to which those islands had been previously subject. The chief use of these cases has, perhaps, been in the introduction of the tea and cinchona plants into India. The cinchona is now extensively cultivated on the Neilgherries. The cases have also been of signal service to horticulturists, to botanical gardens, and to the amateur gardeners of large towns. In a modified form they have lately been used for vivaria, and it is thought they may serve for the transport of insects and the smaller animals. Mr. Ward's first publication on the subject appears to have been in 1836, in a letter to the late Sir William Hooker, printed in the 'Companion to the Botanic Magazine' for May of that year. In 1838 Professor Faraday made it the subject of a lecture at the Royal Institution. In 1842 appeared the first edition of Mr. Ward's work, 'On the Growth of Plants in closely-glazed Cases.' He was elected fellow of the Linnean

Society in 1817, and of the Royal Society in 1852. He had a large medical practice, and for the greater part of his life was associated with the Apothecaries Society of London; first as superintendent of the gardens at Chelsea, most of the improvements in which were made at his suggestion; then as examiner in botany; then as master; and lastly, as treasurer. His hospitable home at Clapham Rise is described by Dr. Hooker as "the most frequented metropolitan resort of naturalists from all quarters of the globe since the time of Sir Joseph Banks." From the earlier gatherings in Wellclose-square originated in 1840 the Microscopical Society of London. His fine collection of dried plants, to which his friend the late Dr. W. H. Harvey had largely contributed, was in part purchased by the British Museum after his death. He died at St. Leonard's, June 4, 1868.

(Anniversary Address to the Linnean Society, 1869, by J. Bentham; *Gardener's Chronicle*; *Medical Gazette*, &c.)

WARINGTON, ROBERT, chemist, was born at Sheerness, September 7, 1807, and educated at Merchant Taylors' School, London. In 1822 he was apprenticed to Mr. Cooper, a manufacturing chemist. In 1828 he was appointed professor of chemistry in the London University. From 1831 to 1839 he was the chemist to Messrs. Truman, Hanbury, and Buxton, the brewers. In 1842 he took the position of chemical operator to the Society of Apothecaries, which he held till his death, which occurred at Budleigh Salterton, November 12, 1867. He was an active co-operator in the formation of the Chemical and Cavendish Societies, as also of the Royal College of Chemistry. He has assisted in the revision and drawing up of most of the English Pharmacopœias. The 'British Pharmacopœias' of 1864 and 1867 were, to a large extent, written by him. He wrote many chemical papers. One of the subjects which occupied his attention for several years was the mutually compensating operations which animals and plants exercise on the medium inhabited by them: for instance, animals which would die in a vessel of water when they alone tenant it, will thrive if plants grow in the same water. His observations, which appeared in the 'Annals and Magazine of Natural History,' had a marked influence in popularising the employment of aquaria. His latest paper was a valuable one on the same subject. It appeared in the 'Proceedings of the Royal Society' for 1867, under the title of 'On some alterations in the Composition of Carbonate of Lime Waters depending on the influence of vegetation, animal life, and seasons.' He was the inventor of the portable microscope known by his name.

WASHINGTON, JOHN [E. C. vol. vi. col. 549], was promoted to be rear-admiral in 1862. He died at Frascati, September 16, 1863.

WATERTON, CHARLES, naturalist, was born at Walton Hall, June 3, 1782, and educated first at a school at Tudhoe, near Durham, and then at the College belonging to the Jesuits at Stonyhurst, in Lancashire. In 1804 he went to Surinam, and from this year until 1824, with the exception of a few visits to his home, he rambled about South America. Although he did not attain to much distinction as a scientific man, he was well known as a good and enthusiastic field naturalist, and as he also had a spirited style of writing, his 'Account of Wanderings in South America, the North-west of the United States, and the Antilles, in 1812, 1816, 1820, and 1824, &c.,' 8vo, London, 1828, became popular. Being endowed with remarkable boldness, he frequently had personal contests with some of the larger animals. Thus, in his desire to procure an alligator's skin without any shot-holes in it, he captured one by bridling it, mounting on its back, and compelling it to go the way he wished. He also wrote 'Essays on Natural History' in three series, of which an edition appeared in 1871, with an account of his life by N. Moore, based largely upon autobiographical notes. He was very eccentric and abstemious in his habits. During the last years of his life he resided at Walton Hall, which stands on a small island. Here he had a large number of pets. Even the ordinary inhabitants of the island shared his attentions; for he gave strict orders that nothing should be killed or destroyed; so that the rabbits, sparrows, &c., roamed unmolested. He died May 27, 1865.

WATT, JAMES HENRY. [E. C. vol. vi. col. 569.] This distinguished line engraver died on the 18th of May, 1867, aged 68.

WATTS, ALARIC ALEXANDER [E. C. vol. vi. col. 570], died on the 6th of April, 1864, having just completed his 65th year.

* WATTS, GEORGE FREDERICK, R.A., an eminent historical and portrait painter, was born in London in 1818, and

studied at the Royal Academy. His name occurs in the exhibition catalogues as early as 1836; but he first obtained notice in 1843, when, at the Cartoon Competition, his 'Caractacus' secured a first-class prize of 300*l*. Mr. Watts then went to Italy, in order to study the great masters of religious and historical painting, and in so doing acquired a bias for the severe early Roman manner which has characterised his subsequent productions. On his return to England he engaged in the Fine Arts Competition of 1847, and was again successful, his oil painting of 'Alfred encouraging the Saxons to resist the Danish Invaders' having been awarded a first-class premium of 500*l*, and purchased by the commissioners. But though thus successful in the competitions, Mr. Watts was only employed to paint one of the actual decorations of the new Houses of Parliament—the fresco of St. George, in the Poets' Hall. Mr. Watts has, however, had other opportunities afforded him for displaying his power in mural painting. His most important work of the kind is 'The School of Legislation,' in the great hall of Lincoln's Inn, a picture in which are assembled the chief lawgivers of every age and country, somewhat in the manner in which Raffaele has assembled the great teachers of religion in his 'School of Theology.' The Lincoln's Inn fresco is the largest yet executed in this country, being 50 feet by 34 feet. Another fresco by Mr. Watts is the Majesty in the church of St. James the Less, Westminster. His easel pictures are mostly of classical and poetical subjects, and display subtlety as well as refinement of thought, and breadth of treatment: they include such subjects as—'Fata Morgana,' 'Life's Illusions,' 'Virginia,' 'Ariadne,' 'Thetis,' 'The Wife of Pygmalion,' 'Orpheus and Eurydice,' 'The Red Cross Knight and Una,' 'The Meeting of Jacob and Esau,' 'The Return of the Dove.' Mr. Watts has of late years painted several portraits, which differ much from the fashionable style of portraiture, aiming rather at severe truth than brilliancy. He is understood to be engaged on a series of heads of eminent contemporaries, of which those of Tennyson, Sir H. Lawrence, Millais, Leighton, &c., have been exhibited. He has also exhibited a marble bust of Clytie. Mr. Watts was elected A.R.A. in 1868 and R.A. in 1870.

WATTS, THOMAS, keeper of printed books in the British Museum, was born in London in 1811, and was educated at a school in Finsbury, kept by a Mr. Lymington. At an early age he showed a marked fondness for, and facility in acquiring languages, a passion for reading, and readiness in writing both prose and verse. On leaving school he continued the habit of diligent self-culture, and added to Latin, Greek and French, a mastery over Italian, Spanish, Portuguese, and German, and afterwards of Dutch, Danish, Swedish, Icelandic, Russian, Polish, and Hungarian. A constant and laborious student in the reading-room of the British Museum, when readers were comparatively few, he attracted the notice of the museum authorities and was invited by Mr. Baber, then keeper of the printed books, to examine and catalogue a collection of Russian books, which had been purchased on his recommendation, and the way in which he executed the commission led to his appointment, in January, 1838, as assistant in the library. Whilst conscientiously fulfilling the duties of this laborious and ill-remunerated post, he devoted all his spare hours to linguistic and literary studies, and added to his store on the one hand, Hebrew, Arabic, Persian, Turkish, Chinese, Sanskrit, and at least the principles of the oriental languages generally; and on the other, Welsh, Gaelic, Irish, and other Celtic tongues. Gradually rising in position in the library, Mr. Watts came to be regarded by Mr. Panizzi, who had succeeded to Mr. Baber's post, and who afterwards became principal librarian, as his most efficient auxiliary in re-arranging and improving the library. As a librarian, indeed, Mr. Watts was probably unrivalled. His rare knowledge of languages, of which he is said to have been familiar with nearly forty, and to have known the best books and the best editions of them in each, his prodigious memory and capacity for classification and organisation, enabled him to accomplish tasks which any other man would have shrunk from attempting, and failed in if he had tried. The special duty of arranging the library was devolved on him, and "for nearly twenty years every book that was acquired by the museum passed through his hands for the purpose of classification. It is believed that more than 400,000 volumes [this was stated by Mr. Watts himself, *Art. BRITISH MUSEUM, E. C. Arts and Sciences Div., vol. ii. col. 387*] were examined and classified by Mr. Watts during the period that he was so engaged." (Cowtan's 'Memories of the British Museum,' p. 287.) On the construction of the new reading-room, the arrangement of the large library of reference placed in it was made by him. The

selection of books for purchase was an important part of his official duty, on which he entered, and which he continued, with singular zeal. "The object," as he observed in an official letter addressed to Sir Antonio Panizzi, and printed by order of the House of Commons, "the object which has been kept in view during the last three and twenty years has been to bring together from all quarters the useful, the elegant, and the curious literature of every language; to unite with the best English library in England or the world, the best Russian library out of Russia, the best German out of Germany, the best Spanish out of Spain, and so for every language, from Italian to Icelandic, from Polish to Portuguese. In five of the languages in which it now claims this species of supremacy—in Russian, Polish, Hungarian, Danish, and Swedish—I believe I may say that, with the exception of perhaps fifty volumes, every book that has been purchased by the museum within the last three-and-twenty years, has been purchased at my suggestion. I have the pleasure of reflecting that every future student of the less-known literature of Europe will find riches where I found poverty; though, of course, the collection in all these languages together forms but a small proportion of the vast accumulations that have been added to the library during your administration and that of your successor." And this object, he was able to say, had been accomplished. "The museum is now supposed to possess . . . the best library in every European language out of the territory in which that language is vernacular." (*Art. BRITISH MUSEUM, E. C. Arts & Sciences Div. vol. ii. col. 385.*)

Mr. Watts was appointed the first superintendent of the new Reading Room, and his services were of especial value in facilitating the new arrangements; but he found the employment irksome and welcomed his transfer to the more congenial duty of the library proper. In 1866 he was promoted to be keeper of the printed books, and at once addressed himself with ardour to the task of bringing up the collections to his idea of a perfect library. His labours were incessant, and he regarded with a pardonable pride the results. "Wait another three years!" he said to the writer of this sketch, in the summer of 1869. A month or two later, he went for his annual holiday into South Wales. He was out of health, but he looked forward with confidence to the effect of change of air and scenery. A slip from a carriage as he was alighting at the Crown Hotel, Bridgenorth, caused what seemed but a slight injury to his right leg. Rest and local medical treatment failing to arrest the inflammation, he returned to London. He seemed to improve, but an attack of heart disease supervening, he expired almost suddenly on the 8th of September, 1869, at his residence in the British Museum, and was interred that day week in Highgate Cemetery.

As may be supposed, Mr. Watts's incessant official occupation, the many calls upon his attention when his official duties were nominally over, and the time required for the maintenance and extension of his prodigious range and variety of knowledge—and to the last he was acquiring with the zeal of the youngest student—left him little leisure for original composition. No independent work, indeed, bears his name. Yet he wrote much, and all that he wrote was valuable. At an early age he commenced to contribute to periodical literature, and if there were a complete list of his papers many of them would be found in unexpected quarters. Thus, in a series of papers on the British Museum, published anonymously in the 'Mechanics' Magazine' for 1836 and 1837, he pointed out the advantages offered by the vacant quadrangle of the building as the site of "a reading-room of ample dimensions, surrounded on all four sides by galleries for the books, communicating with each other and lighted from the top," an idea which afterwards suggested itself to Mr. Panizzi, and which in his hands resulted in the erection of the present magnificent Reading Room. In one of his early papers he showed that a newspaper in the museum, which was supposed to be the earliest published, 'The English Mercurie' of 1558, is an entire fabrication. He was a frequent contributor to the Transactions of the Philological Society, his papers on the English, on the Russian, and on the Hungarian languages being particularly valuable; the last, indeed, procured his immediate election into the Hungary Academy. To the unfinished 'Biographical Dictionary' of the Society for the Diffusion of Useful Knowledge, he contributed many memoirs. To the 'English Cyclopædia,' Mr. Watts was one of the most valued contributors. He furnished a very large number of lives of northern worthies to the Biographical Division, whilst for the Division of Arts and Sciences he wrote, among others, the almost exhaustive articles, British Museum; Libraries; and Welsh Language and Literature, the last of which was reprinted for private circulation. But the

articles he wrote, valuable as they are (and they are models of their kind), were far from being the only, or even the chief, assistance he rendered to a work in which from the first he took a singularly warm interest. Mr. Watts also wrote some valuable papers in the 'Athenæum' and other journals, and a few articles in reviews—one of the most noteworthy of which was that on Cyclopædias in the 'Quarterly Review' for April, 1863, probably the most learned and comprehensive essay on the subject ever published.

* WAUGH, SIR ANDREW SCOTT, geographical surveyor, was born in 1810. He entered the corps of Bengal Engineers in 1827, and joined the great trigonometrical survey of India in 1832. He conducted the Rangheer series of observations, which he began in 1834, and completed. He then continued the great arc series to the head of the Anna Series through the Terai country. In 1843 he succeeded Sir G. Everest as Surveyor-General of India and Superintendent of the Trigonometrical Survey; and his first undertaking was the completion of Sir G. Everest's project for the triangulation of the region between the great arc series and Calcutta. This was completed by his measurement of the Sona Khoda base. He then made a gridiron of triangulations west of the great arc series, which not only extended over a far larger area than the one devised by Sir George Everest, but comprised a country remarkably difficult for surveying on account of its mountainous character. It was commenced in 1847—48. In 1856 he instituted a series of levelling operations to determine the heights of the base lines of the interior. His writings are almost wholly connected with the survey, consisting of reports, and survey observations; a large proportion of the latter are unpublished, but form part of several of the MSS. volumes relating to the survey. In 1856 the Royal Geographical Society awarded him a gold medal for his services, and in 1861 he was knighted for the same reason; and, having been appointed major-general, retired from active service. He is a fellow of the Royal, Royal Geographical and other Societies.

* WAUTERS, CHARLES AUGUSTIN, a celebrated Belgian painter, was born at Boom, in 1811. He studied in the academies of Mechlin and Antwerp, and was a pupil of M. Van Brée. He obtained reputation by his 'Departure of Columbus for the New World,' exhibited at Antwerp in 1834, and has since painted a great many historical, religious, and poetical pictures, of which it will be enough to mention 'The Death of Mary of Brabant'; 'Peter the Hermit preaching the Crusade'; 'The Passage of the Red Sea'; 'Dante and Beatrice'; genre subjects, as 'The Day after the Ball,' and 'The Bathers'; and many portraits. M. Wauters was for some years director of the Mechlin Academy. He is a knight of the Order of Leopold.

WAYLAND, FRANCIS, D.D., LL.D., American professor and writer, was born at New York, March 10th, 1796. He graduated at Union College in 1813, studied medicine for three or four years, and became licentiate; but his taste leading him towards divinity, he entered Andover Theological College, obtained a tutorship in Union College, and in 1821 was appointed pastor in the Baptist Church. Without relinquishing his pulpit duties, he accepted in 1826 the professorship of mathematics and natural philosophy at Union College. In 1827 he was appointed president of Brown University, Providence, an office which he filled for twenty-eight years. His great desire was to render the university available for young men intended for commercial, manufacturing, and agricultural pursuits, and not to confine it, as it had until then been, to students in the learned professions. The difficulties in his way were considerable, but he succeeded in introducing marked improvements. He resigned his presidency in 1855; his Sunday preachings as a Baptist minister continued a few years later. Dr. Wayland (he received the degree of D.D. in 1827, and that of LL.D. in 1852) exhibited the same diversity of subjects in his published works as in his studies and professional avocations. The following writings were from his pen:—'Elements of Moral Science,' 1835, abridged for the use of schools in 1836; 'Elements of Political Economy,' 1837; 'University Sermons,' 1838, enlarged and republished under the title 'Salvation by Christ,' 1858; 'On the Limitation of Human Responsibility,' 1840; 'Thoughts on the Collegiate System of the United States,' 1842; 'Christianity and Slavery,' a controversy between Dr. Wayland and Dr. Fuller, in which the former strongly advocated the anti-slavery side, 1845; 'Life of the Rev. Adoniram Judson, D.D.,' 2 vols. 1853; 'Intellectual Philosophy,' 1854; 'Notes on the Principles and Practice of the Baptists,' 1856; 'Occasional Discourses,' 1858; 'Letters to the Churches on the Ministry of the Gospel,' 1863; 'Memoir of

Thomas Chalmers, D.D.,' 1864. Dr. Wayland died September 26th, 1865, while preparing a new edition of his 'Elements of Moral Science.'

(*Memoir of the Life and Labours of F. Wayland, D.D., including a Selection from his Personal Reminiscences and Correspondence*, by F. Wayland, jun. 2 vols. 8vo, New York, 1867.)

WAYNE, ANTHONY, a distinguished American general, was born at East Town, Pennsylvania, January 1st, 1745. A land surveyor by profession, he was, in 1773, elected a member of the Pennsylvania Assembly. In 1775 he joined the army, and received the rank of colonel. He accompanied General Thomas into Canada in the spring of 1776, and his conspicuous gallantry especially in the affair at Three Rivers, did much to lessen the discredit of that disastrous expedition. Wayne was created brigadier-general, and served with distinction at Brandywine, Monmouth, &c. For a daring night attack, July, 1779, on a fortress at Stony Point, on the Hudson, he received the thanks of Congress and a gold medal. His retreat from a superior British force at Jamestown, Virginia, was greatly commended by military critics. For his services in Georgia, the Legislature voted him a valuable farm. After the peace he was elected a member of the Pennsylvania Convention for considering the federal constitution. His last employment was the command of the war with the North-Western Indians in Ohio, 1792—95. A few months after its successful termination, he died at Presque Isle, now Erie, Pennsylvania, December, 1796.

WEBBER, JOHN, R.A., was born in London in 1752. His father, a Swiss, settled in London as a monumental sculptor, sent him to Paris to learn painting. He returned to London in 1775, entered as a student at the Royal Academy, and soon after practised as a landscape-painter. He received the appointment of draughtsman to the last expedition, commanded by Captain Cook, for the discovery of the North-West Passage, which sailed in 1776. Webber returned to England in 1780, and was employed by the Lords of the Admiralty to superintend the execution of the engravings made from his drawings. He afterwards pursued with success his calling as a landscape-painter, and engraved and published on his own account a series of views in aquatint of the principal places he had visited. His pictures are carefully drawn and finished, but exaggerated in colour. Webber was elected A.R.A. in 1785, and R.A. in 1790. He died May the 29th, 1793. Some of his water-colour drawings are in the South Kensington Museum.

* WEEKES, HENRY, R.A., was born at Canterbury, Kent, in 1807. He was a pupil of the sculptor Behnes, and in 1823 became a student in the Royal Academy. On leaving Mr. Behnes, he was engaged as assistant by Sir Francis Chantrey. On the death of Chantrey in 1841, Mr. Weekes, as his chief assistant, was entrusted with the completion of his principal unfinished works. From that time, working on his own account, he has steadily made his way to a foremost place among living English sculptors. Mr. Weekes has executed a few imaginative works, as the bas-relief of 'Jacob's Vision,' 1845; 'The Suppliant,' 1850; 'The Young Naturalist,' 1857; 'The Mother's Kiss,' 1858; 'Ariel,' 1863; 'Luna,' 1866; 'Cleopatra,' 1869; the colossal statue of 'Sardanapalus,' for the Egyptian Hall of the Mansion House, and one of the great groups for the Albert Memorial. But Mr. Weekes is better known by his memorial and monumental statues and busts. Of the former class are Provost Goodall, for Eton College; the Duke of Wellington; Sir Robert Peel; Sir T. F. Buxton; the monuments to the poet Shelley and his wife, Mary Wollstonecraft Shelley, executed in 1853 for the Priory Church, Christchurch, Hampshire; Lord Bacon, for Trinity College, Cambridge; John Hunter, for the Museum of the Royal College of Surgeons; William Harvey, for the Oxford Museum; Archbishop Sumner, for Canterbury Cathedral; Charles II., for the New Palace, Westminster; the Queen, for Calcutta. His busts include—the Queen; the Earl of Shaftesbury; Dr. Buckland; Professor Sedgwick; Sir G. C. Lewis, for Westminster Abbey; Sir Tatton Sykes; Mulready and Stothard, for the entrance-hall of the National Gallery; R. Jones, R.A., for the Royal Academy; and many other distinguished personages. Mr. Weekes was elected A.R.A. in 1851, R.A. in 1863. He is the author of a 'Treatise on the Fine Arts Section of the Great Exhibition of 1851.'

WEISHAUP, ADAM, a German jurist, and founder of the sect of the Illuminati, was born on the 6th of February, 1748, at Ingolstadt, in Bavaria, and was educated at the university of his native town, where he took his doctor's degree in the faculty of law in 1768. He became a teacher of law (repetent) in the university; and in 1772 and 1775 respectively was appointed

extraordinary and ordinary professor of natural law and of canon law. The chair of canon law had up to this time been regarded as a *peculium* of the regular clergy; and Weishaupt's appointment to this position excited considerable enmity, a feeling which he reciprocated, especially against the Jesuits, under whose influence and at whose hands he had received his earlier education. He associated himself, in 1776, with other persons of a kindred way of thinking, in an order of men called Illuminati, forming with them a powerful secret society in the interests of cosmopolitanism and universal human fraternity, and took advantage of the popularity which his lectures commanded amongst students of all the faculties to turn his chair into a propaganda. From his lecture-room, as from a centre, radiated the principles of cosmopolitanism until they had spread into the whole of Germany; and in 1782 he made a great but unsuccessful attempt to amalgamate his order with that of the Freemasons, for which purpose he attended a grand masonic congress which assembled in the last-named year at Wilhelmsbad. In 1784 the order of the Illuminati was suppressed, in common with other secret societies, by the Elector of Bavaria, and in the following year Weishaupt was deprived of his professorship. Hereupon he found a patron in Ernest, Duke of Saxe-Gotha, from whom he received the appointments successively of legationsrath, or embassy-counsellor, and of hofrath, or aulic counsellor. Professor Weishaupt died at Gotha on the 18th of November, 1830.

His principal works are 'Jus civile privatum ac Determinationes Juris Boici,' 2 vols. Ingolstadt, 1771—73; an Apology for the Illuminati, 'Apologie der Illuminaten,' 8vo, Frankfurt and Leipzig, 1786, a reply to a work produced by J. von Utzschneider; 'Apologie des Misvergnügens und Uebels,' &c., 3 parts, 8vo, Frankfurt and Leipzig, 1787, second edition, 2 vols. 8vo, 1790; On Materialism, &c., 'Ueber Materialismus und Idealismus,' 8vo, Nürnberg, 1787, second edition, 1788; Introduction, &c., 'Einleitung zu meiner Apologie,' 8vo, Frankfurt and Leipzig, 1787; the Amended System of the Illuminati, with all its Orders and Degrees, 'Das verbesserte System der Illuminaten, mit allen seinen Einrichtungen und Graden,' 8vo, Frankfurt and Leipzig, 1787, third edition, 1818; Supplementary Vindication of my Purposes, 'Nachtrag zur Rechtfertigung meiner Absichten,' 8vo, Frankfurt and Leipzig, 1787; Pythagoras: or, a Consideration of the secret Art of the World and of Politics, 'Pythagoras: oder, Betrachtung über die geheime Welt- und Regierungskunst,' 8vo, Frankfurt and Leipzig, 1790; On Truth and Moral Perfection, 'Ueber Wahrheit und sittliche Vollkommenheit,' 3 vols. 8vo, Ratisbon, 1793—97; the Lantern of Diogenes, &c., 'Die Leuchte des Diogenes: oder, Prüfung unserer heutigen Moralität und Aufklärung,' &c., 8vo, Ratisbon and Sulzbach, 1804; Materials towards a Knowledge of the World and of Men, 'Materialien zur Beförderung der Welt- und Menschenkunde,' 3 vols. 8vo, Gotha, 1810; and other works in politics, philosophy, and jurisprudence.

WEISSE, CHRISTIAN SAMUEL [E. C. vol. vi. col. 583], mineralogist, died on the 2nd of September, 1856, aged 76.

*WELLS, HENRY TANWORTH, R.A., portrait-painter, was born in London, in December, 1828. After practising some years as a miniature-painter, he, about 1860, abandoned that branch of art for full-sized portraiture in oil, and soon established his position among the leading portrait painters of the day. He has since exhibited an immense number of portraits, not always of persons of public interest, for the fidelity of his likenesses and the elegance of his manner have attracted a very wide range of sitters; but among his pictures have been some in which he has departed from the ordinary routine of portraiture, as in 'Preparing a Tableau-Vivant: Portraits of Florence, Mary, and Ada Bell,' 1865; 'Volunteers at a Firing-Point,' 1866; 'Earl and Countess of Spencer at a Firing-Point, Wimbledon,' which has been engraved; and 'Letters and News at the Loch-side,' 1868. One of the best of his recent portraits is that of Sir Charles Lyell, 1870. He has also exhibited a 'Roman Labourer,' 1864; a 'Reaper,' 1871; and 'The Outskirts of a Farmyard at Twilight,' 1865. Mr. Wells was elected A.R.A. in 1867, and R.A. in 1870.

WELSH, JOHN, was born at Boreland, in the stewardry of Kirkcudbright, on the 27th September, 1824. He was educated at Castle Douglas, and afterwards at the University of Edinburgh, with a view to the profession of an engineer; but in consequence of his success in the study of natural philosophy, he was engaged by Sir Thomas Brisbane, Bart., president of the Royal Society of Edinburgh, as an observer for his Magnetical and Meteorological Observatory at Makerstoun. When the period for the duration of this observatory was completed, Mr.

Welsh, in 1850, became assistant to Mr. Ronalds at the Kew Observatory, of which he was afterwards the superintendent. From this time until his death, in 1859, he rendered this physical observatory more and more efficient. In the 'Philosophical Transactions of the Royal Society for 1856' is a paper entitled, 'An Account of the Construction of a Standard Barometer, and Description of the Apparatus and Processes employed in the Verification of Barometers at the Kew Observatory;' and in the 'Proceedings,' vol. vi., a report of the general process adopted in graduating and comparing the standard meteorological instruments for the Kew Observatory; also a report on the graduation of thermometers, &c. The reports of the British Association likewise bear witness to the value of Mr. Welsh's services. In 1852 he made four balloon ascents for scientific objects. He contrived a sliding rule for hygrometrical calculations, and one for converting the observed readings of the horizontal and vertical force magnetometers into variations of magnetic dip and total force. As one of the members of the committee appointed by the British Association for the magnetic survey of the United Kingdom, Mr. Welsh undertook the North British division. The many useful labours in which he was engaged were cut short by an affection of the lungs, which terminated fatally on the 11th May, 1859, at Falmouth, to which he had retired for the benefit of a milder climate. He was elected a fellow of the Royal Society in 1857.

WERLHOF, PAUL GOTTLIEB, a distinguished German physician, was born March 24th, 1699, at Helmstädt; studied there, and settled at Hanover, where he became physician to George II. of England. He died July 26th, 1767. Werlhof was one of the ablest physicians of his time, and an excellent teacher. He wrote a valuable Latin treatise on fevers, in which, by his lucid classification, he considerably advanced the knowledge of the subject; also essays, some of them in German, on the small-pox, &c. His medical works were published in a collected form in 3 vols., 4to, in 1757. His letters were collected and published by Engel, 'Epistolæ Anecdote,' Berlin, 1784; his poems by Haller, in 1756.

WESTMORLAND, JOHN FANE, ELEVENTH EARL OF [E. C. vol. vi. col. 653], died on the 16th of October, 1859, and was succeeded in the title by his eldest surviving son, Francis William Henry Fane, twelfth Earl of Westmorland, born 1825.

*WESTWOOD, JOHN OBADIAH, entomologist, was born at Sheffield in 1805, and educated at Lichfield. In 1855 the Royal Society awarded him one of their royal medals for his long-continued researches in entomology, relating to all families of insects from every quarter of the world. He has done much good work in describing and systematising insects, as also in elucidating the true principles of classification. He has not, however, confined himself to these branches, but has given considerable attention to the structure, metamorphoses, and distribution of this group of creatures. He has written numerous excellent monographs, amongst which the most important are those on the *Cleridæ*, *Lucanidæ*, and *Pausidæ*. In 1861 he was appointed professor of zoology at Oxford; and is now president of the Entomological Society of London. Amongst his published works may be mentioned the 'Catalogue of Orthopterous Insects in the British Museum,' 4to, 1859, &c.; the second volume of Doubleday's 'Genera of Diurnal Lepidoptera;' 'A Catalogue of Hemiptera in the Collection of the Rev. F. W. Hope,' 8vo, London, 1842; 'The Butterflies of Great Britain, with their Transformations Delineated and Described,' 8vo, London, 1855, new edition, 1858; 'Facsimiles of the Miniatures and Ornaments of Anglo-Saxon and Irish MSS.,' folio, London, 1868; and, in co-operation with Mr. Spence Bate, a 'History of British Sessile-eyed Crustacea,' 8vo, 1861—69.

WHATELY, the MOST REV. and RIGHT HON. RICHARD, ARCHBISHOP OF DUBLIN [E. C. vol. vi. col. 660]. Though advanced in years, the archbishop continued his literary as well as his clerical activity, publishing, besides various Visitation Charges, 'Lectures on Some of the Parables,' 1859; a Lecture on Paley's Writings, 1859; and editions, with annotations, of Paley's 'Evidences of Christianity' and 'Moral Philosophy,' 1859; 'Introductory Lessons on the British Constitution,' 1859; 'The Parish Pastor,' 1860; 'Thoughts on the Proposed Revision of the Liturgy;' 'Miscellaneous Lectures and Reviews,' 1861; 'The Jews, a Lecture,' 1861; 'Election, an Essay,' 1862; and 'Habits, a Lecture,' 1862. He died on the 8th of October, 1863, at the age of 76. His 'Miscellaneous Remains,' edited by Miss E. J. Whately, appeared in 1864; a 'Memoir' of him by Mr. Fitzpatrick, 8vo, 1864; and a fuller 'Life,' by Miss Whately, in 1866.

WHEATSTONE, SIR CHARLES. [E. C. vol. vi. col. 1029.]

WHEWELL, REV. WILLIAM, D.D., F.R.S. [E. C. vol. vi. col. 1033], was born 24th May, 1794. The love of reading, and the promise of future ability displayed by him when a boy, induced his parents to remove him from the grammar-school in Lancaster, to that of Heversham, where he might have the chance of obtaining an exhibition for admission into Trinity College, Cambridge, the vicarage of Heversham being in the gift of that college. This he secured, and was admitted as sub-sizar in the October term of 1812, and he afterwards became full or foundation sizar, and obtained a scholarship. He graduated in 1816 as second wrangler and Smith's prizeman. In 1813 he obtained the Chancellor's prize for the best English poem on Boadicea. He became assistant tutor in mathematics, and in 1823 full tutor of one of the "sides," which he held during sixteen years. Soon after this appointment he took his Master's degree, entered into holy orders, and in due course graduated as D.D. He did not accept a college living, preferring to devote his powers to furthering the objects of the university as a place of education, and to the improvement of its system of instruction in those great branches of mental culture in which it was felt improvement was needed—namely, in the principles of the analytical methods as applied to physical subjects. He supplied the want of adequate elementary treatises, by publishing, in 1819, an 'Elementary Treatise on Mechanics,' a 'Treatise on Dynamics,' in 1823; an 'Introduction to Dynamics,' 'First Principles of Mechanics,' 'Treatise on the Free Motion of a Point, and on Universal Gravitation,' in 1832; 'Analytical Statistics,' 1833; and 'Mechanical Euclid,' 1837. This last work contained a section, 'On the Logic of Induction,' in which the leading idea which forms the basis of his 'Philosophy of the Inductive Sciences' is expressed, namely, "that induction consists in *superinducing* upon an assemblage of observed phenomena a conception, the creation of the mind, which is not in the phenomena, but which serves to bind them under a common aspect, and so give them an ideal unity."

By means of these works, and by his position as moderator in 1820, and in 1828 and 1829, he was enabled to influence the examinations for degrees, and thus bring about the desired improvement in the mathematics of the university.

Whewell was not only well versed in mathematical and physical science in all its forms, but his knowledge embraced classical and continental literature, metaphysics, and history, ethics, social and political economy, botany, architecture and engineering, and a large number of other subjects which served him in good stead in his 'History of the Inductive Sciences,' 1837. He also wrote the Bridgewater treatise on 'Astronomy and General Physics, considered in reference to Natural Theology.' In this work we have the idea which he afterwards elaborated, that the origin of even the axioms of mathematics is not due to any innate *a priori* intuition, but to experience, or a slow process of inductive observation.

Whewell was one of the founders of the Cambridge Philosophical Society in 1819, and contributed various papers to its Transactions. During the summers of 1826 and 1828, he joined Mr. Airy in a series of experiments for ascertaining the mean density of the earth, by comparing the rates of the same pendulum in deep mines and at the surface. These experiments were made in Dolcoath mine, in Cornwall. They failed in producing any result, from two singular accidents—one was the catching fire of the basket containing the apparatus while being drawn up; the other was the flooding of the mine.

In 1828 Whewell became professor of mineralogy, having studied that science in Germany under Professor Mohs. In 1824 he sent to the Royal Society (of which he had, in 1821, become fellow), an elaborate memoir 'On a General Method of calculating the Angles made by any Planes of Crystals.' Several papers by him, in the same department, were published by the Cambridge Society in 1822, 1827, and 1828. He resigned this appointment in 1832.

In 1827 Whewell became a fellow of the Geological Society, and next year its president. His paper on the Distribution of Scandinavian boulders was communicated to the society in 1847. He also took a lively interest in the meetings of the British Association, and was its president in 1841. He was one of the originators of the reports on the present state and progress of the several branches of science. He contributed reports on the tides, and on the mathematical theories of heat, magnetism, and electricity. His researches on the progress of the tide-wave in different regions of the ocean were published in the 'Philosophical Transactions' from 1833 to 1850, and were

BIOG. DIV.—SUP.

distinguished by the award of one of the royal medals. They led to a clear and satisfactory view of the Atlantic tides, one remarkable result being that there exist two points in the North Sea, one between Harwich and Amsterdam, the other near the entrance to the Baltic, in which there is no rise and fall of the tides.

In 1838 Whewell accepted the chair of Moral Theology and Casuistry. At that time Paley's work on moral philosophy was the text-book. In this, the basis of moral obligation is made to rest on expediency; but Whewell was strongly opposed to the utilitarian theory of morals, and endeavoured to substitute for it the Platonic or ideal system of philosophy, which refers all our knowledge, so far as it assumes a systematic form, to innate and primarily implanted conceptions, co-ordinated with facts by mental operations; that is, he insisted on the inward teaching of a divinely implanted conscience enlightened and guided by reason. His views were embodied in his sermons 'On the Foundation of Morals,' his 'Elements of Morality,' his 'Lectures on the History of Moral Philosophy in England,' and his 'Lectures on Systematic Morality,' 1846. These works, in conjunction with his other claims to scientific distinction, procured for him a place as corresponding member of the French Academy in the department of "Sciences Morales et Politiques—Section de Philosophie."

In 1839 Whewell retired from the tutorship of his college. Between 1835 and 1845 he published various essays on what he considered ought to be the special objects of a university education. His essay entitled 'Thoughts on the Study of Mathematics, as a part of a liberal Education,' led to a controversy with Sir Wm. Hamilton, who endeavoured to show that such studies, so far from being an essential means of cultivating the noblest faculties in the highest degree, effected their purpose, at best, in the most inadequate and precarious manner, and have less claim to encouragement than any other object of education.

In 1841 Whewell published his 'Mechanics of Engineering,' a work much wanted at the time. In this year he married Cordelia, the second daughter of John Marshall, Esq., M.P., of Hallsteads and Patterdale Hall, Cumberland. He also succeeded Dr. Wordsworth as Master of Trinity College, an office which he held during the remainder of his life. It was feared that the new master would be despotic, but his government proved to be that of a constitutional monarch. During many years "the Lodge" received a constant succession of distinguished guests. His wife, however, died in December, 1855, and Whewell, in order to obtain relief from the melancholy associations of his college residence, resigned his professorship of casuistry and visited Rome. In 1858 he married a second time, his partner being the widow of Sir Gilbert Affleck.

In 1849 Whewell sent to the Cambridge Philosophical Society a series of 'Remarks on Induction with reference to Mr. Mill's Logic.' His 'Novum Organum Renovatum' appeared in 1858, and in 1860 his 'Philosophy of Discovery,' being partly a reproduction of certain portions of the 'Philosophy of Inductive Science,' and several essays on Plato, Aristotle, &c., published by the Cambridge Society. His devotion to the Platonic view of the ideal world increased upon him, and in 1860 and the two following years his 'Platonic Dialogues' appeared, a work "not lightly executed," but the labour of many years. His work on Political Economy originated in a request in 1861 on the part of H.R.H. the Prince Consort that he would deliver a short course on that subject for the express instruction of the Prince of Wales (then a student of Cambridge).

In 1865 Whewell again became a widower. He was deeply touched by this event, for however hard and stern his character might appear, he is said to have been very susceptible to the gentle influences of female society. He was cheered by the society of an attached relative of his former wife, and gradually resumed his active literary life. He contributed to Macmillan's Magazine an article on 'Comte and Positivism,' his last production. On the 24th of February, 1866, while riding a horse which had already thrown him twice, he was thrown a third time, and was taken up senseless, from a concussion of the brain. He died on the 6th March, and was buried in his college chapel, at the feet of the statues of Newton and Bacon (the latter his own gift). He left no family, but provided by his will for the endowment of a professorship and studentships of international law. He also left to his college a large and valuable piece of adjacent ground together with funds for building on the site according to the wants of the college.

It is not necessary to point out the noble qualities of Whewell's character. They are impressed upon his works, and his roughnesses are forgotten in the long and permanent influence

for good that he exercised upon his college. The wide range of subjects which occupied his intellectual powers, great as they were, would probably have been fatal to anything like success, had it not been that his long training, first at a good grammar school under a master who understood method, and then at the University of Cambridge, where he was daily brought in contact with such men as Herschel, Airy, Babbage, &c., gave him such an amount of intellectual ballast as to insure proficiency in at least the pursuit of his choice—mathematical physics. The firm grasp he had on science is sufficiently proved by his 'History of the Inductive Sciences.' His grasp on some of the other subjects on which he published was necessarily in some respects faltering; so much so as to justify the well-known sarcasm of Sydney Smith.

Two excellent biographical sketches of Whewell have appeared,—one in 'Macmillan's Magazine,' No. 78, entitled 'William Whewell—In Memoriam,' by G. W. Clark, M.A., Public Orator in the University of Cambridge; the other in the 'Proceedings' of the Royal Society, vol. xvi. p. li., from the pen of his friend, Sir John Herschel, who has since found his rest in Westminster Abbey by the side of Newton, as Whewell reposes under the shadow of his statue.

* WHITTIER, JOHN GREENLEAF, American poet and miscellaneous writer, was born at Haverhill, Massachusetts, December, 1807. His parents, who were members of the Society of Friends, gave him a home education until his 18th year, when he went for two or three years to the Town Academy. In 1829 he commenced his literary career by editing the 'American Manufacturer,' a Boston paper which defended home industry against a proposed free-trade tariff. In the following year he took the editorship of the 'New England Weekly Review,' Hartford. He then returned for a time to his father's occupation of farming, diversified by two years' membership in the State Legislature of Massachusetts (1835—36). Identified warmly with the anti-slavery cause, he was chosen secretary of the American Anti-Slavery Society in 1836; and on removing to Philadelphia in the following year, he edited for two or three years the 'Pennsylvania Freeman,' in which his own writings contributed to the strengthening of the cause. In 1840 he removed to Amesbury, in Massachusetts, where he settled down to literary labour, which has since met with little interruption. He was for many years Massachusetts correspondent to the Washington 'National Era.'

Mr. Whittier's published works are numerous and varied, and more frequently in verse than in prose. Chief among them are the following:—Mémorial prefixed to a new edition of Brainerd's Poems, 1830; 'Legends of New England,' 1831, a work from which he afterwards drew materials for some of his poems on early colonial and Indian subjects, such as 'Mogg Megone,' 'The Bridal of Pennacook,' 'Cassandra Southwick,' and 'Mary Garvin'; 'Literary Remains of J. G. Brainerd,' 1832; 'An Essay on the Justice and Expediency of Slavery, considered with a view to its Abolition,' 1833; 'Leaves from Margaret Smith's Journal,' 1836; 'Collected Poems against Slavery, with letters from John Quincy Adams, 1837; 'Lays of my Home, and other Poems,' 1843; 'Ballads, and other Poems,' 1844; 'The Supernaturalism of New England' (contributed to Wiley and Putnam's 'Library of American Books'), 1845; 'Old Portraits and Modern Sketches,' a series of biographical essays, 1850; 'Collected Edition of his Poems published down to that date, 1850; 'Songs of Labour, and other Poems,' 1851; 'The Chapel of the Hermits, and other Poems,' 1853; 'Literary Recollections and Miscellanies,' 1854; 'The Panorama, and other Poems,' 1856; 'Complete Edition of his Poetical Works, 1857; 'Home Ballads and Poems,' 1859; 'In War-Time, and other Poems,' 1864; 'Snow Bound, a Winter Idyl,' 1866; 'Selections from his Prose Works, 1866; 'Later Complete Edition of his Poems, 1867; 'The Tent on the Beach, and other Poems,' 1867; 'Among the Hills, and other Poems,' 1869; 'Illustrated Edition of his Poetical Works, 1869.

* WHITWORTH, SIR JOSEPH, BART., F.R.S., LL.D., recognised as the leading mechanical engineer of the age, was born at Stockport, December 21st, 1803. He first attended a school kept by his father, then another school at Idle, near Leeds, and in 1817 went to live with his uncle, a cotton spinner in Derbyshire. Four years' daily familiarity with the machines in this factory was virtually his apprenticeship to the trade in which he has become so eminent. The knowledge hence acquired was strengthened by engagements at various cotton-machine factories in Manchester. Removing to London in 1826, he worked with Messrs. Maudslay, then with Messrs.

Holtzapffel, and then assisted Mr. Clements in making Mr. Babbage's celebrated calculating machine. Thus thoroughly grounded in the details of machine-making, he was joined by a partner, and in 1833 commenced the firm of Joseph Whitworth and Co. at Manchester. Not only has that establishment produced the most perfect mechanical workmanship in iron and steel, but Mr. Whitworth, by his published papers, has made known processes which enabled other machinists to improve the construction of machine-tools or engine-tools to a high pitch of excellence. In 1840 he read before the British Association at Glasgow a paper 'On the Preparation of Plane Metallic Surfaces,' describing a mode adopted by him of giving to plates of metal a truth of surface never before attained. His plan has since been generally adopted, and has contributed greatly to the perfection of machine-work, by lessening the friction of surfaces moving in contact, and increasing the accuracy of fittings. He next took up the subject of screw threads. Until then nuts and screws had been made at random, or at least without any definite system for regulating the number of threads in an inch. In a paper, 'On a Uniform System of Screw-Threads,' read before the Institution of Civil Engineers in 1841, he developed a plan which has since been generally employed by machine-makers for establishing a clearly defined relation between the finenesses or measurements of all kinds of screw-threads. In the same year he invented and introduced a new street-sweeping machine, which is much employed in the great towns of the north. Among his other inventions are the duplex lathe, a reversing tool to use with the planing machine, and standard gauges for metal plates, sheets, and wire. At the Great Exhibition in 1851 he showed his measuring machine, a small and exquisite piece of apparatus by which one-millionth part of an inch can be measured; the commissioners' council medal was awarded to him for this invention. (The apparatus was again shown at the London International Exhibition in 1871.) In 1853 he visited America, at the request of the Committee of Council, to examine and report upon the machinery at the New York Exhibition. In 1855 he turned his attention to arms of precision, and began a series of experiments for the War-Office on the best mode of rifling muskets. In 1857 his first rifle, with a hexagonal rifled bore, was tried at Hythe, and achieved more accurate shooting than had ever before been known; and then, applying the same principle to large ordnance, he rifled a 68-pounder, which sent a shot completely through a 4-inch armour-plate—a degree of penetrating power which had not until then been attained. On a particular trial for great range in 1862, he attained, with a 9-inch 310-pounder, the unprecedented distance of 11,343 yards. He has also experimented on the advantages of flat-headed projectiles, and on the kind of metal best fitted for making large guns. In perfection of mechanism, the Whitworth guns have never been excelled, though circumstances have led to the choice of Fraser guns and Snider rifles in the English service. In 1867 he was awarded one of the few grand prizes at the Paris Exhibition. In the following year he published, 'Miscellaneous Papers on Mechanical Subjects.' In 1869 he was created baronet; and has had conferred on him the degrees of LL.D. (Dublin) and D.C.L. (Oxford), the decoration of the Legion of Honour, and the Albert gold medal of the Society of Arts. Sir Joseph is honourably distinguished by the founding of the "Whitworth scholarships" for students in the mechanical arts. He invested 100,000*l.*, the interest of which is to be appropriated for thirty scholarships of 100*l.* each, to be held either two or three years. The scholars must be under twenty-six years of age, and must pass a test examination in mechanical arts and the sciences on which they depend; beyond this test, competition is to determine the selection. The Committee of Council are to be the trustees, while the Science and Art Department is to conduct the examination and competition, with the personal aid of Sir Joseph Whitworth as long as he lives. The plan came into operation in 1869.

WIERTZ, ANTOINE-JOSEPH, Belgian historical painter, was born at Dinant, February 22nd, 1806. He studied under M. Van Brée in the Antwerp Academy, where in 1832 he won the grand prize of Rome by his painting of 'Scipio.' At Rome he painted a 'Patroclus,' and one or two other pictures on a large scale, and was, in 1837, elected a member of the Academy of St. Luke. Returning to Brussels, he set to work upon several historical and religious compositions of colossal proportions, maintaining himself during their progress by painting smaller genre pictures and portraits. M. Wiertz, like our Haydon, was an enthusiast for "high art" and grandeur of scale, and employed his pen as well as pencil in supporting his own opinions and demolishing those of his opponents. Further to propagate his

views, he opened a large atelier for the free instruction of young painters. He was, however, more fortunate than Haydon, inasmuch as he secured the sympathy of the government, who, in 1851, built him a public atelier at a cost of 64,000 francs, to which, in 1861, a further sum of 23,000 francs was added for its enlargement. In 1840 he received the cross of the order of Leopold. M. Wiertz painted many immense pictures, and many of more moderate dimensions. Among them are—in the church of the Augustines, one fifty feet high, representing the Struggle between the Principles of Good and Evil; a huge allegory on the exterior of his atelier; 'A Martyr under Diocletian,' and many more. His later works were painted according to a method invented by him, and which, in a pamphlet on the subject, 'Peinture Morte: Procédé nouveau,' Brussels, 1859, he asserts to be easier of execution, superior in effect, and more permanent than any hitherto employed. M. Wiertz also wrote 'Étude sur Mathieu van Brée'; and an 'Éloge de Rubens,' which was crowned by the Academy of Antwerp in 1840. He died, June 18th, 1865. His atelier is now the property of the nation, a sum of 85,000 francs having been voted in 1866 by the Belgian House of Representatives in order to complete the purchase. On the walls are seven large paintings, 'Eve,' 'Christ in the Sepulchre,' 'The Triumph of Christ,' 'The Revolt of the Angels,' 'Satan,' 'Ambition,' 'The Homeric Contest'; and fifty or sixty of his easel pictures, and some pieces of sculpture fill the rooms. The 'Wiertz Museum' is open to the public. The street in which it stands is named after the painter.

WILLEHAD, an Anglo-Saxon bishop and missionary, was born in Northumberland in the first quarter of the eighth century and was educated at York. He was not ordained priest till turned of thirty, when he obtained permission to go as a missionary to the pagans of Friesland and the adjacent parts, where St. Boniface had been recently martyred. He met there with much opposition and much success; was more than once driven from the country, on one occasion his companions and disciples being nearly all massacred; was encouraged to persevere by Charlemagne and by Pope Adrian I.; and, finally, was rewarded by the general conversion of both Frieslanders and Saxons, and the quiet foundation of the diocese of Wigmodia, afterwards Bremen. Willehad was consecrated bishop, July 13, 787; and he immediately set about building a noble cathedral at what is now Bremen, ordaining priests, &c. He died during a visitation of his diocese, November 8, 789. Bishop Willehad wrote a commentary on the epistles of St. Paul and other works, MSS. of some of which are extant. Willehad ranks as a saint in the Romish calendar, the 8th of November being set apart as his festival. His Life, written by Ansharius (about 850) is printed by Mabillon, 'Acta Sanct.' iv., 364; Langebek, 'Script. Rerum Danicarum,' vol. i., and Pertz, 'Mon. German. Hist.' ii., 378, &c.

* WILLEMS, FLORENT, Belgian painter, was born at Liège about 1812, and studied at Mechlin Academy. He formed his style on the Dutch masters, and especially Terburg, whom he follows closely, alike in choice of subjects and manner of treatment, with the necessary qualification for differences arising from the fact that each deals with the familiar habits of the higher classes of his own time. But if Terburg's chef d'œuvre was the famous Satin Gown (as the picture entitled 'Paternal Instruction,' is almost invariably called), so a white satin gown is the chief feature of several of Willems' most admired pictures, and it is painted with scarce inferior dexterity or finish to the original. Silk and velvet dresses, and almost all kinds of costume are, however, painted by him with equal skill, appreciation of texture, and taste. Willems is essentially a costume painter, his figures serving rather to set off his mechanical art than any higher purpose. The subjects are such as 'The Coquette at her Glass,' 'A Conversation,' 'A Musical Party,' 'The Toilette of the Bride,' 'The Message,' 'The Presentation,' &c. Occasionally, as in his 'Interior of a Silk-mercer's Shop in 1661,' he has adopted the period as well as the manner of Terburg. In treatment Willems' pictures are always refined; the persons have an air of birth and style, and the technical qualities are of a very high order. M. Willems settled in Paris in 1839, and has since held his place as one of the most fashionable painters of the day. He received the cross of the Legion of Honour in 1853, and was promoted to be officer in 1864.

* WILLIAM I., FREDERICK WILLIAM LOUIS, EMPEROR OF GERMANY, AND KING OF PRUSSIA, second son of Frederick William III., and brother of Frederick William IV., King of Prussia [E. C. vol. ii. col. 1031, and E. C. S. col. 551], was born on the 22nd of March, 1797, and was early

destined for a military career. He took part in the campaigns of the period 1813–15 in the war against France; and on the accession of his brother, in June, 1840, was made lieutenant or viceroy of the province of Pomerania. On the 6th of March, 1848, he was appointed governor-general of the Rhine Provinces; but he continued at Berlin until the 20th of that month, when, considerable odium having been excited against him on account of his supposed share in causing the fusillade of the troops upon the people, which afterwards led to a sanguinary encounter, he left Berlin in disguise, and repaired to this country, ostensibly on a special mission from the King of Prussia to Queen Victoria. Considerable difference of opinion was expressed with regard to the expediency of his recall, which by some persons was judged to be necessary; but having been elected a member of the Assembly appointed to discuss the Prussian constitution, he left England for Berlin on the 28th of May, although he took no part in the deliberations. In June, 1849, he took the field as commander of the Prussian army of intervention against the insurgents of Baden and Bavaria, whose last stronghold of Rastadt he entered in triumph on the 23rd of July; and in October following, he established himself at Coblenz in the capacity of military governor of the Rhine Provinces. In 1854, at which time he was either the proprietor or commander of several regiments in the Prussian, Russian, and Austrian services, he was made colonel-general of the infantry, and governor of the federal fortress of Mayence; and, as a variety from his military associations, became president of the aggregate lodges of the Prussian Freemasons. He protested with considerable energy against the attitude of neutrality assumed by Prussia during the Crimean war, an attitude which, being practically disastrous to the allies, occasioned such a loss of prestige in Europe that when Prussia at the last moment was invited to send representatives to the Peace Congress, which sat in Paris, March, 1856, it was, in the words of Lord Palmerston, "not to negotiate the treaty of peace, but to accede to the result of the negotiations of those who were more directly interested in the matter." On the 10th of July, 1856, the Prince and Princess of Prussia arrived in England on a visit to her Majesty, which continued until the 29th, when they left Osborne on their return to the Continent. On the 24th of October, 1857, the mental and bodily health of the King of Prussia being in an unsatisfactory condition, the Prince, in virtue of a mandate signed on the previous day by the King at Potsdam, assumed the Regency for three months, and expressed his firm desire to conform faithfully to the Constitution and the laws of the country, and to direct the affairs of the Government according to the intentions of the King, which were known to him. He paid a short visit to England on the occasion of the marriage of his eldest son to the Princess Royal, on the 25th of January, 1858. His term of office as Regent was from time to time periodically prolonged; until, in pursuance of a royal mandate, dated October 7th, 1858, he two days afterwards assumed the Regency "until the day when his Majesty should be again in a state to exercise the royal power himself." On the 26th of October, the day of the closing of the session of the Legislative Bodies, he took the prescribed oath to maintain the Constitution; and on the 5th of November dismissed the Manteuffel administration, for which he substituted that of the Prince of Hohenzollern-Sigmaringen, which early manifested a desire to augment the naval force of the country, and a tendency also to increase the war-budget. He succeeded to the throne on the death of his brother, King Frederick William IV., on the 2nd of January, 1861; and on the occasion of his coronation, which took place at Königsberg on the 18th of October following, he placed the crown on his own head, declaring that he held it from God alone. On the 1st of January, 1862, he decreed the substitution of the German language instead of French, in Prussian diplomatic despatches; and on the 11th of March dissolved the Prussian Chambers on account of their resistance to the military expenditure of the Government. The difficulties in which he found himself involved with the Chambers on the same subject in September following, obliged him to summon Herr von Bismarck from France, to which he had been accredited as ambassador scarcely four months previously, in order to undertake the Premiership and the Ministry of Foreign Affairs. From this time the public career of the King, as well as the interests of Prussia and of Germany, become all but personal to the career of the powerful minister who became successively Count and Prince Bismarck [E. C. S. col. 245]. Extricated by the quarrel with Denmark, which ended victoriously for Prussia in April, 1864, from the critical and threatening position in which a series of disputes with the Chambers on the question of the reconstruction

tion of the army, of military finance, and of the royal prerogative, had involved the King and his ministers, the latter were again brought face to face with a kindred difficulty by the refusal of the Chambers, July 1865, to vote supplies for the development of the navy. Hereupon the King issued a decree, countersigned by all the ministers, placing at the disposal of the Minister of Marine a sum not exceeding 500,000 thalers for the construction of heavy cast steel guns for the fleet, for the expenditure of which grant the Ministers of Marine and Finance were to be held jointly responsible to the King. The combined operations of Prussia and Austria against Denmark, and even the conclusion of the treaty of Gastein, August 14th, 1866, which defined the co-domination of Prussia and Austria in Schleswig and Holstein, were but episodes of superficial concord between powers who were really at deadly feud for the leadership of Germany. When, therefore, on the 16th of June, 1866, Austria announced her intention to afford Saxony military aid against Prussia, the latter power was prompt to consider this as a *casus belli*, and on the 18th, formally declared war against Austria. On the 29th of June, the first tidings of victory arrived at Berlin; next day, the King, with Count Bismarck in attendance, left the capital for the seat of war; and on the 3rd of July, the Austrians sustained the disastrous and decisive defeat of Sadowa. In the final days of the same month the preliminaries were settled in Count Mensdorff's Castle of Nicolsburg, resulting in the peace of Prague; and on the 4th of August the King returned to Berlin, where he was enthusiastically received, and where, on the next day, at the solemn opening of the Diet, he returned thanks "for God's gracious goodness" as manifested in the success of the Prussian arms. On the 20th of September, the triumphal entry of the troops into Berlin was made in grand pageant, in which the King and Queen, the Princes and the Generals, took a prominent part. Peace treaties with individual states—as Bavaria, Württemberg, and Baden—now occupied the King's ministers, together with the consolidation of the conquered provinces, and the formation of the North German Confederation, the constitution of which was finally framed and ratified on the 16th of April, 1867. The chief extraneous event of the year was the settlement of the pressing difficulty with France, relative to the fortress of Luxemburg, the neutralisation of which was, with mutual satisfaction, achieved by a Conference of European Powers—England, France, Austria, Prussia, Russia, and Holland—which sat in London from the 7th to the 11th of May. In June, 1867, the King visited the great Exhibition of Art and Industry at Paris, where he stayed from the 5th to the 14th; and on the 10th of September of the same year, the North German Confederation met for the first time under the new constitution. On the 1st of January, 1870, the Prussian diplomatic agents abroad were accredited as representing the North German Confederation alone; and at the opening of the North German Parliament on the 4th of February, the King of Prussia announced that union with South Germany on national grounds was the object of his incessant attention, and expressed his confidence in the continuance of peace. Peace, however, was not to continue; and the approximate unification of Germany was to be precipitated by hostile pressure from without.

On the 15th of July, 1870, the Emperor of the French declared war against Prussia, ostensibly because the King would not undertake that the candidature of Prince Leopold of Hohenzollern-Sigmaringen for the crown of Spain, which he had already declined, should never be renewed; and because of an alleged insult to France in the person of her ambassador, Count Benedetti, who intrusively preferred his demands upon the King whilst the latter was walking with Count Lehndorff, his adjutant, in the Kurgarten at Ems, on the 13th of July. On the day after this occurrence the King returned to Berlin; and on the 19th of July, in his address to the North German Parliament, claimed to have done all that his honour and dignity permitted to preserve peace to Europe, and expressed his confident reliance on the united will of the German governments, whether of the North or South. The co-operation of Bavaria had been already notified on the 16th; and at the close of the King's speech, the Saxon minister, Baron von Friessen, called for cheers for the head of the North German Confederation, which were heartily given again and again by the whole Assembly. This enthusiasm was the falsification of the dream of the Emperor Napoleon, who had fancied that Bavaria, Württemberg, and Baden, would abandon their engagements with the North German Confederation so soon as war should be declared. On the 31st of July the King of Prussia set out for the seat of war; and, notwithstanding his

advanced age, distinguished himself by his cheerful endurance of the privations and dangers of the campaign, and for the pious gratitude which characterised the bulletins which he transmitted to Queen Augusta after the several successes of the arms of the German hosts. On the 2nd of September, he received the personal surrender of the Emperor, to whom he allotted Wilhelmshöhe, near Cassel, for his residence; and on the same day ninety thousand French troops laid down their arms as prisoners of war, and were sent to join the immense number of their comrades who had preceded them into captivity in Germany. On the 10th of December the North German Parliament, by a large majority, passed a bill authorising the insertion of the words "empire" and "emperor" in the Constitution; and on the 18th of the same month a deputation from that body waited on the King, whose head-quarters were at that time at Versailles, with authority to offer him the imperial crown of Germany, a dignity which had for sixty years been in abeyance. On the 1st of January, 1871, the King held a New Year's reception in the palace of Versailles; where, on the 18th, in the Hall of Mirrors, in the presence of all the German princes, under the standards of the army before Paris, and surrounded by the representatives of the different regiments, he was proclaimed Emperor. On the 28th of January, after a siege of 131 days, Paris surrendered; and on the 1st of March, the Germans made their triumphal entry into the city, previous to which, February 26th, a treaty of peace had been concluded at Versailles, the conditions of which were reluctantly adopted by the National Assembly on the 28th, and the ratifications of which were exchanged at Frankfurt in May following. This treaty imposed upon France the loss of a fifth part of Lorraine, including Metz and Thionville, and Alsace, less Belfort, as well as the payment of a war indemnity of five milliards of francs, or 200,000,000*l.*, which enormous sum was to be paid by successive instalments, extending over a period of three years, or up to the month of May, 1874. Meanwhile various cities and departments of France were to be held as guarantees by a German army of occupation, whose numbers, and the area which they occupied, were to be diminished proportionately with the decrease of the balance of the war indemnity. The Emperor returned to Berlin on the 17th of March, and was received with a brilliant enthusiasm; and on the 16th of June took part in the triumphal entry of the German troops into Berlin, and assisted at the inauguration of the statue of Frederick William III. On the 21st of March he presided at the opening of the Reichstag, and concluded his speech with the expression of a prayer that "the re-establishment of the German Empire might be a promise of future greatness; that the German Imperial war, fought so gloriously by us, might be followed by an equally glorious peace of the Empire; and that the task of the German people henceforth might be to prove victorious in the universal struggle for the products of peace. God grant it!" The expression of a similar wish characterised the speech with which the Emperor closed the session of the Reichstag on the 15th of June. On the 8th of June he received the Emperor of Russia, as the latter passed through Berlin on his way to Ems; and early in September, interchanged visits with the Emperor of Austria at Gastein and Salzburg. He opened the Reichstag on the 16th of October, with a speech longer and more various in its topics than is generally heard from a throne. On the 27th of November, the Prussian Diet was opened by the Emperor in person, who promised some administrative reforms, and directed attention to finance and the furtherance of education, and mingled with the congratulations which he addressed to the representatives of his ancestral kingdom, an argument upon the necessity of being forearmed against future dangers.

A grand banquet was given at Berlin on the 18th of January, 1872, in connection with the meeting of the Chapter of the Order of the Black Eagle, when the Emperor-King spoke of the occasion as the celebration of a double anniversary of the most important events of Prussian history. "On this day 171 years ago," said his Majesty, "the first King of Prussia was crowned; this day last year my acceptance of the Imperial German crown, unanimously offered me by all the Princes and free towns of Germany, was proclaimed. Conscious of the obligations I have assumed, I, on the first anniversary of this great event, again express to the illustrious persons who offered to me my new position, in presence of their representatives, my deeply felt thanks, hoping that by our united efforts we shall succeed in fulfilling the just hopes of Germany." The Bavarian minister then, in the name of the King of Bavaria and the illustrious Federate Allies in the Empire proposed "The health of the German Emperor, William the Victorious."

The Emperor of Germany, at that time Prince Frederick William Louis of Prussia, married, on the 11th of June, 1829, Marie Louise Augusta Catherine, now the Empress Augusta, daughter of the late Charles Frederick, Grand Duke of Saxe Weimar, by whom he has two children, a son and a daughter, the former of whom, FREDERICK WILLIAM NICOLAS CHARLES, Crown Prince of Prussia and of the German Empire, was born on the 18th of October, 1831, and was married at the Chapel Royal, St. James's, on the 25th of January, 1858, to Victoria Adelaide Mary Louisa, Princess Royal of England, by whom he has several children. The Prince is favourably known for the liberalism of his political opinions, which formerly placed him in something like antagonism to the extra-constitutional proceedings of his father; whilst as a soldier he highly distinguished himself in the campaign against Austria in 1866, and in the more protracted war against France in 1870—71. He took advantage of the leisure of peace to visit this country, with the Princess and their family, in July, 1871. He is a general in the Prussian service, and a field-marshal of Prussia, October 28th, and of Russia, November 8th, 1870; and inspector-general of the fourth inspection of the army of the German Empire. He is also a commander or proprietor of regiments in the Austrian and Russian services.

WILLIAM III. (ALEXANDER PAUL FREDERICK LOUIS), KING OF THE NETHERLANDS, Prince of Orange-Nassau, Grand Duke of Luxemburg [E. C. vol. vi. col. 726.] The personal sympathy of the King of the Netherlands for his subjects was elicited by the disastrous inundations which in January and February 1861, submerged about 40,000 acres of land, and reduced nearly 30,000 of the Dutch peasantry to destitution. On the 2nd of August following, the government of the Netherlands recognised Victor Emmanuel as the King of Italy; and in 1861, and again in 1862, the King paid a visit to the Emperor Napoleon III., whose invitation for a proposed European Congress, issued in November, 1863, he promptly accepted. In August, 1862, the government of King William remonstrated against the severities of Russian administration in Poland; and on the 1st of July 1863, in accordance with a law which had been passed in the preceding August, slavery was abolished in the Dutch West Indian colonies, where, at the period of emancipation, there were 44,645 slaves, for all of whom the owners received compensation. On the 17th of November, 1863, a jubilee commemoration of the deliverance of the Netherlands from the usurpation of France, was celebrated with general enthusiasm. In 1866, the Grand-Duchy of Luxemburg, which had formed a part of the Germanic Confederation from its institution in 1815, became more closely connected with the Netherlands, the King of which, as Grand-Duke, administers its government, separately from that of his kingdom, by a lieutenant, who, at present, is his brother, Prince Henry. The rumoured negotiations for the cession of Luxemburg to France in March, 1867, gave rise to an amount of jealousy which threatened a quarrel between France and Prussia, which was averted by the conclusion of the treaty of London, May 11th, in accordance with which the city of Luxemburg, up to that time a fortress of immense strength, was disarmed and neutralised. The reign of King William has been distinguished by the advances which have been made in the social life of Holland and its dependencies, by the conclusion of various commercial treaties, by the increased facilities which have been accorded to the internal communications of the country, and by the encouragement which has been given to the investigation and the historical exposition of the rise and progress of Dutch nationality. The King of the Netherlands is proprietary colonel of the 63rd Regiment of Austrian Infantry, and commander of the Russian regiment of Ukraine Dragoons, and of the 11th Regiment of Prussian Hussars. The elder of his two sons, WILLIAM NICOLAS ALEXANDER FREDERICK CHARLES HENRY, Prince of Orange, who was born at the Hague on the 4th of September, 1840, is a lieutenant-admiral, a general of infantry, inspector of cavalry, and proprietor of the Russian Ufa Regiment of Infantry; whilst the younger son, Prince WILLIAM ALEXANDER CHARLES HENRY FREDERICK, who was born at the Hague on the 25th of August, 1851, is a naval lieutenant of the first class, a captain in the regiment of grenadiers and chasseurs, as well as in the 4th regiment of hussars, and in the horse artillery.

* WILLIAMS, MONIER, an Oriental philologist, was born in 1819, at Bombay, of the presidency of which his father, the late Lieutenant-Colonel Monier Williams, was surveyor-general. He was educated successively at King's College, London, and at Balliol College, Oxford, where he was entered in 1838. He left

the university, however, shortly after, upon his nomination to an Indian writership, and spent some time as a student at the East India College, Haileybury, where he distinguished himself by his singular proficiency in Oriental learning. Relinquishing the idea of an Indian career, he repaired a second time to Oxford, where he became a member of University College, and took his B.A. degree on the 15th of May, 1844, proceeding M.A. on the 30th of April, 1846. In 1843 he was elected to the Boden scholarship, "for proficiency in the Sanskrit language and literature;" and in 1844 was appointed Sanskrit professor at Haileybury, where he remained until the suppression of that institution in 1858. For two years he acted as teacher of the Oriental languages at Cheltenham College; and in December, 1860, was elected by Convocation, after a hard contest with Professor Max Müller, to the Sanskrit professorship at Oxford, which, like the scholarship he had previously gained at the university, had been founded in accordance with the will of the late Colonel Boden, who was of "opinion that a more general and critical knowledge of the Sanskrit language would be a means of enabling his countrymen to proceed in the conversion of the natives of India to the Christian religion, by disseminating a knowledge of the sacred scriptures amongst them, more effectually than all other means whatsoever."

The works of Professor Monier Williams are almost entirely philological, and include 'An Elementary Grammar of the Sanskrit Language, partly in the Roman Character, arranged according to a new Theory, in Reference especially to the Classical Languages. With short Extracts in easy Prose. To which is added, a Selection from the Institutes of Manu, with References to the Grammar, and an English Translation,' 8vo, London, 1846, &c.; 'A Dictionary, English and Sanskrit,' 4to, London, 1851, published under the patronage of the Honourable East India Company; 'An Easy Introduction to the Study of Hindustani, in which the English Alphabet is adapted to the Expression of Hindustani Words,' &c., 12mo, London, 1858; 'Original Papers illustrating the History of the Application of the Roman Alphabet to the Languages of India. Edited,' &c., 8vo, London, 1859; 'Hindustani Primer: containing a first Grammar suited to Beginners, and a Vocabulary,' &c., 12mo, London, 1860; 'The Study of Sanskrit in Relation to Missionary Work in India: an Inaugural Lecture. With Notes and Additions,' 8vo, London and Oxford, 1861; 'Sanskrit Manual. Containing, Part I. The Accidence of Grammar. Part II. Progressive Exercises,' 12mo, London and Oxford, 1862, second edition, enlarged, 8vo, London, 1868; 'A Practical Hindustani Grammar: containing the Accidence in Roman Type, a Chapter on the Use of Arabic Words and a full Syntax, &c. Also Hindustani Selections, &c. With a Vocabulary by C. Mather,' &c., 8vo, London and Hertford, 1862; 'Indian Epic Poetry: being the Substance of Lectures recently given at Oxford. With a full Analysis of the Rāmāyana and of the Maha-Bhārata,' 8vo, London and Oxford, 1863. Professor Williams has likewise produced editions of the Sanskrit drama, 'Vikramorvasi,' 1849; of the Sanskrit drama, 'Śakuntalā,' with notes and literal translations, 1853, of which he further published a free translation, entitled 'Śakuntalā: or, the Lost Ring. An Indian Drama. Translated into English Prose and Verse, from the Sanskrit of Kalidasa,' 4to, Hertford, 1855, third edition, 8vo, 1856.

WILLIAMS, REV. ROWLAND, D.D., a divine and biblical critic, son of the Rev. Rowland Williams, M.A., rector of Ysceiog, and prebendary of St. Asaph, was born in Flintshire, in 1817, and at ten years of age was sent to Eton, where he became Newcastle medallist in 1835, and whence he proceeded, with a scholarship, to King's College, Cambridge. His university career was one of considerable distinction; and in his first year of residence, 1838, he obtained Battie's University Scholarship for the greatest proficiency in classical learning. He graduated as B.A. in 1841, and was elected to a fellowship of his college; proceeded M.A. in 1844; took his B.D. degree in 1851, and that of D.D. in 1857. He received deacon's orders in 1842, and priest's orders in 1843, both from the Bishop of Lincoln. For a short time he was assistant-master at Eton, which post he was compelled to relinquish through illness. In 1842 he became classical tutor of his college, where he remained eight years, until January, 1850, when he became vice-principal and senior tutor of St. David's College, Lampeter, and chaplain to the Bishop of Llandaff. In 1849, he gained the prize of 500*l.*, offered by Dr. Muir, for an essay on the comparative merits of Hinduism and Christianity—a like premium having been offered on the same terms, but not awarded, in the University of Oxford—which, in an expanded and modified form, was afterwards

published under the title of 'Hinduism and Christianity compared,' 8vo, 1856, which has been regarded as his greatest literary production, and as a valuable contribution to modern English theology. The earliest published work of Dr. Williams appears to have been a volume of poems called 'Lays from the Cimbric Lyre,' a work redolent of piety, patriotism, and tolerance, but exhibiting few traces of that mental movement under which he was even then suffering. He was appointed select preacher at Cambridge in 1854, and the sermons which he preached in that capacity awakened thought, enquiry, and some little alarm. These sermons, together with others preached at Lampeter, were published with the title of 'Rational Godliness after the Mind of Christ and the written Voices of His Church,' 8vo, Cambridge and London, 1855, a volume which contains the first published enunciation of those views which were afterwards identified with his name. The views referred to may be summarised as follows:—The Bible is the written voice of the congregation, the record of the spiritual exercises of past time; and by Inspiration is to be understood not the infallibility of such record, but the fact that its authors were moved by that Divine Spirit, who is everywhere and at all times the source of all holy desires, all good counsels, and all just works. In this sense Inspiration is the Divine source and law of *all* truth and excellence; and, therefore, is not to be limited to any given time or to any particular church or nation. The controversies in which the publication of 'Rational Godliness' involved the author, determined him to sever his connection with Lampeter, and in 1859, he resigned his fellowship at Cambridge, and was presented to the living of Broadchalke, Wilts, which was in the gift of King's College. About the same time, he married, remaining, however, at work at Lampeter, whilst his vicarage-house was building, under a licence of non-residence from the Bishop of Salisbury. He finally left Lampeter, where he had spent twelve years in elevating the tone and position, and promoting the efficiency of that institution, in 1862, from which date he devoted himself personally to the care of his parish. A volume entitled 'Essays and Reviews,' which has been productive of an almost immense amount of controversy, was published in February, 1860; and to this volume—which in June, 1864, was condemned by both Houses of Convocation—Dr. Williams contributed an article on 'Bunsen's Biblical Researches,' for which he was prosecuted by his diocesan, Dr. Hamilton, in the Court of Arches. The judgment of the Court was adverse to Dr. Williams; and he, together with his fellow-essayist, Mr. Wilson, was sentenced, December 15th, 1862, to a year's suspension. However, on appeal to the Judicial Committee of the Privy Council, the judgment was reversed, February 8th, 1864, when Lord Chancellor Westbury, who allowed the costs of the appeal, determined that the opinions expressed by Dr. Williams were not inconsistent with his position as a clergyman of the Church of England. The Archbishops of Canterbury and York did not entirely concur in the judgment, and pastoral letters on the subject were afterwards issued by both these prelates. Dr. Williams continued his pastoral and literary activity, especially devoting himself to his favourite field of Hebrew literature and biblical criticism, until his death, which occurred after a few days' illness, on the 18th of January, 1870, at his vicarage of Broadchalke.

The works of Dr. Williams, besides those which have been already mentioned, include 'Orestes, and the Avengers,' 8vo, London, 1857, an adaptation to English readers, of the 'Eumenides' of Æschylus, in which some of the main features of the author's classical prototype are accurately preserved and presented; a volume of sermons entitled 'Broadchalke Sermon-Essays on Nature, Mediation, Atonement, Absolution,' &c., 8vo, London, 1867; 'Owen Glendower: a Dramatic Biography. Being a Contribution to the Genuine History of Wales. And other Poems. By Goronva Camlan [i.e., R. W.],' 8vo, London and Hertford, 1870, a work of posthumous publication, of considerable interest as embodying the author's well-known opinions on several subjects, religious and otherwise. The *magnum opus* of Dr. Williams, left unfinished at the time of his death, has received a partial publication, the first volume by himself, and the second, embracing all he had completely prepared, introduced by a touching preface from the pen of his widow, informing the reader that the Rev. W. W. Harvey conducted it through the press. The first volume, entitled 'The Prophets of Israel and Judah during the Assyrian Empire,' 8vo, London, 1866, contains in chronological order, Joel, Amos, Obadiah, Hosea, Micah, Isaiah (first part), and Nahum, to each of which is prefixed an introduction, whilst a new version from the Hebrew is given,

with critical notes and a commentary. The second volume, presenting generally the same characteristics as the first, bears the title of 'The Hebrew Prophets, translated afresh from the Original, with regard to the Anglican Version, and with Illustrations for English Readers,' 8vo, London, 1872. Dr. Williams contributed largely to the periodical literature of his time, and especially furnished articles to the 'Archæologia Cambrensis,' and on Welsh subjects to the 'Quarterly Review,' in which he treated, 'Welsh Methodism,' the 'Welsh Church,' and 'Welsh Barda.'

WILLIS, NATHANIEL PARKER [E. C. vol. vi. col. 737]. This popular writer died at New York, February, 1867.

WILLMORE, JAMES TIBBITS, Associate Engraver in the Royal Academy [E. C. vol. vi., col. 741], died on the 12th of March, 1863, in the 63rd year of his age.

WILSON, RIGHT REVEREND DANIEL, D.D., Lord Bishop of Calcutta and Metropolitan in India and Ceylon, son of a substantial silk-manufacturer in London, was born in Church Street, Spitalfields, in the year 1778, and in November, 1798, entered into residence at St. Edmund's Hall, Oxford, where he took his B.A. degree on the 2nd of March, 1802, and proceeded M.A. on the 10th of October, 1804. He was created D.D. by diploma, April 12th, 1832. In 1803 he carried off the Chancellor's prize for an English essay, of which the prescribed subject was 'Common Sense,' and which afterwards found a place in the second volume of 'Oxford English Prize Essays,' 12mo, Oxford, 1836. He was ordained deacon on the 20th of September, 1801, by Dr. Brownlow North, Bishop of Winchester, and became curate of Chobham and Bisley, Surrey, where under the guidance of the incumbent, the Rev. Richard Cecil, he began to distinguish himself as an earnest and powerful preacher. He vacated his curacy in November, 1803, and returned to Oxford, where from January, 1804, to January, 1807, he was assistant-tutor at St. Edmund's Hall; and from January, 1807, to June, 1812, was sole tutor and vice-principal. During half of this period of between eight and nine years, he combined with his academical duties the charge of the small parish of Worton, a few miles distant from Oxford. In 1809 he resigned the curacy of Worton, and entered upon a wider sphere of clerical duty by becoming assistant-curate of St. John's Chapel, Bedford Row, Bloomsbury; of which he became sole minister in 1812, when he resigned his collegiate offices in order to devote himself the more exclusively to his pastoral duties. During his twelve years' incumbency of St. John's Chapel, he was known as one of the foremost champions of the Evangelical party in the metropolis; and the constant crowds of intelligent auditors attested the power of his preaching and the influence of his doctrine. On the 4th of June, 1824, he was instituted to the vicarage of St. Mary's, Islington, of which the patronage was vested in his family, and in which he exercised a kind of episcopal oversight throughout a parish nearly as populous as a diocese. Immediately after his induction, which took place on the 2nd of July, he set himself to develop its resources. Under his hand new churches sprang up in a district till then remarkable chiefly for its decorous quietude; and the spiritual campaign became a complete victory. After eight years of conscientious and efficient parochial work, he was nominated, through the influence of Lord Glenelg and his brother, Sir Robert Grant, to the bishopric of Calcutta, with episcopal jurisdiction over the entire peninsula of Hindustan and the island of Ceylon, as well as over Australia, New Zealand, and Tasmania, which are now divided into twelve separate dioceses. The letters patent appointing him to this perilous dignity were dated April 16th, 1832, and he was consecrated on the 29th of the same month. The acceptance of such an office, in which three of his immediate predecessors had died within nine years, was a matter of much seriousness and solemnity; and he regarded his entry upon its duties, to use his own expression, as a "baptism for the dead." The overwhelming cares of his immense diocese were somewhat lightened by the foundation successively of the new see of Madras, in 1835; of Bombay, in 1837; and of Colombo, in 1845; over which the Bishop of Calcutta now substituted a quasi-metropolitan jurisdiction for his former episcopal superintendence. For a quarter of a century Bishop Wilson administered, with his accustomed zeal, courage, and power, the affairs of his diocese; and a cathedral at Calcutta arose under his care as naturally as district churches had formerly arisen in his London parish. He died at the Bishop's Palace, Calcutta, on the 2nd of January, 1858.

Bishop Wilson was the author of various 'Tracts,' 'Expository Lectures,' 'Letters,' 'Sermons,' 'Pleas for Missions and Episcopal

Charges; but their sometime interest and value can hardly be said to be preserved in their integrity. The following works may be specially mentioned:—*'The Divine Authority and Perpetual Obligation of the Lord's Day asserted in Seven Sermons delivered in 1830,'* 12mo, London, 1831; *'Travels on the Continent of Europe, in the Summer of 1823,'* which, having gone through several editions, was reproduced in the 5th volume of the *'Christian Library,'* 8vo, London, 1836; *'The Bishop of Calcutta's Farewell to England. Five Sermons delivered on Public Occasions during a temporary Visit to England, together with the Addresses to the Propagation Society,'* 12mo, Oxford, 1846; and a volume of posthumous publication, entitled *'Bishop Wilson's Journal Letters: addressed to his Family during the first nine Years of his Indian Episcopate,'* 8vo, London, 1863. The last volume was produced under the editorial care of the Rev. Daniel Wilson, M.A., Wadham College, Oxford, who, upon his father's elevation to the episcopate, succeeded him in the vicarage of St. Mary's, Islington, where he still continues filially to follow out the principles by which his predecessor was actuated.

* WILSON, DANIEL, LL.D., was born in Edinburgh, January 3rd, 1816. He was educated in his native town, and displayed a taste for archaeological pursuits, preferring to explore the works of man in the Old Town, the result of which appeared in the year 1848, in his *'Memorials of Edinburgh in the Olden Time,'* 2 vols. 8vo. In 1851, he published *'Pre-historic Annals of Scotland,'* 2 vols.; while his great work entitled *'Pre-historic Man'* appeared in 1862. Numerous papers on archaeological subjects have also issued from his pen. He is also the author of a *Life of Chatterton* and one of *Oliver Cromwell*. In 1853 he was appointed professor of History and of English Literature in the University of Toronto, in which he still continues.

* WILSON, ERASMUS, F.R.S., surgeon and dermatologist, was born in 1809. In 1831 he was elected a member of the Royal College of Surgeons. He has written several anatomical and medical works, but his most important writings are those which relate to cutaneous diseases. He has been for many years the consulting surgeon to St. John's Hospital for Diseases of the Skin, and is the editor of the *'Quarterly Journal of Cutaneous Medicine and Diseases of the Skin.'* In 1869 he presented his fine collection of specimens illustrative of the normal and abnormal structure of the human skin to the Royal College of Surgeons, as also the sum of 5000*l.* for the endowment of a professorship of dermatology. He has accepted the offer made to him to be the first occupier of the chair, and in February, 1870, he commenced his first series of dermatological lectures.

WILSON, GEORGE, M.D., F.R.S.E., younger brother of Daniel Wilson, LL.D., was born at Edinburgh, February 21, 1818. He was one of a numerous family, many of whom were carried off early, his twin brother John surviving until the age of eighteen. He was educated at a private school, on leaving which he entered the laboratory of the Royal Infirmary of Edinburgh as an apprentice, and afterwards the University as a medical student; he also worked in Professor Christison's laboratory. In 1838—9 he visited London, and passed some time as a student in Professor Graham's laboratory at University College. Returning to Edinburgh, he graduated in medicine, and in 1840, received a licence from the Royal College of Surgeons as a lecturer on chemistry, his certificates qualifying the students for the diplomas of that body. He opened a laboratory in Brown Square, near the University, lecturing every day besides teaching a practical class and instructing private pupils. He was very successful as a lecturer on account of his lively wit, cheerful manner, benevolent nature, enthusiasm for his subject, and sweet clear voice. His health, however, suffered from these exertions, and he soon became a permanent invalid. A disease in the foot had troubled him for some years, and in January, 1843, it was amputated. He also suffered from a disease of the lungs and other maladies, in spite of which he displayed a wonderful amount of intellectual activity not only in science, but in literature, including poetry, of which he was very fond. In 1843, he became lecturer on chemistry to the Edinburgh Veterinary College, and held a similar appointment in the School of Arts, where his lectures were very popular. During an illness which confined him to his room, he dictated his *'Text Book of Chemistry,'* published in Chambers' Educational Course. He also wrote for the Cavendish Society, the *'Life of the Hon. Henry Cavendish,'* in which the claims of that distinguished man to the great discovery of the composition of water are minutely discussed and compared with the rival claims of Priestley, Watt and Lavoisier. In the same year, 1851,

he published the *'Life of Dr. John Reid,'* the physiologist. In 1855, he was appointed to the chair of Technology and keeper of the Industrial Museum established in connection with the University. Here he continued to work with great effect during a few years, when in November, 1859, having to pay a professional visit to Glasgow, he caught cold, which brought on inflammation of the lungs and pleurisy. He died on November 22nd of that year, at the early age of 41. A memoir by his sister Jessie (now Mrs. Sime) was published in 1860, appended to which is a list of his works and papers, which includes six volumes, thirty-five papers on scientific subjects, seventeen published lectures and addresses, five biographical sketches, viz., Dalton, Wollaston, Boyle, Black, and James Wilson, two pamphlets and several poems published in Blackwood and Macmillan. His friend, Dr. J. H. Gladstone, has contributed to the memoir an estimate of Dr. Wilson's scientific work, in which he says: "He added to our store of knowledge in chemistry, in physiology, and in natural philosophy; but not so much by actual discoveries as by elucidating points that were previously involved in obscurity. . . . As he published much, with little leisure for quiet research, he also frequently suggested thoughts and processes which others have pursued to a successful issue." His papers on the presence of fluorine in recent fossil plants and animals, in blood, and milk, &c., and in ocean waters, first showed how widely diffused is that remarkable element. But perhaps the most complete of his investigations are his researches on colour-blindness, which are collected in a remarkable volume. He tested the vision as to colour of his brother professors, of his pupils, of the police, of the attendants of a lunatic asylum, and of whole companies of soldiers, infantry, artillery, and hussars, and was thus able to determine with some accuracy, the proportion of the colour-blind, about two per cent. being found defective, in mistaking greens, reds, and browns, and sometimes calling red black; while about five per cent. were found subject to this peculiarity in a minor degree. He showed the danger attending the use of red and green signals on railways, and of the red and green lamps on the port and star-board sides of steam-vessels and of the use of the same colours in light-houses, and he directed the attention of railway companies to the necessity of examining their engine-drivers as to their ability to distinguish coloured signals. All Dr. Wilson's miscellaneous writings are marked by his own fervent piety, but it may be added that none of his writings convey an adequate idea of the inexpressible charm of manner that distinguished the man.

WILSON, HORACE HAYMAN [E. C. vol. vi, col. 748]. This eminent Oriental scholar died on the 8th of May, 1860, aged 64. A complete list of his writings, drawn up by himself a fortnight before his death, is printed at the end of the memoir of him in the *'Annual Report of the Royal Asiatic Society,'* 1860.

WILSON, RIGHT HON. JAMES [E. C. vol. vi, col. 749], political economist, died on the 11th of August, 1860. He had resigned his post as financial secretary, on account of failing health, some months before his death.

WINDHAM, LIEUTENANT-GENERAL SIR CHARLES ASHE [E. C. vol. vi col. 756]. Shortly after his return to England from the East, General Windham was elected member for East Norfolk, April, 1857, but in the following August he went to India on account of the Sepoy mutiny, to take command of a column under Lord Clyde. He was unsuccessful at Cawnpore, but rendered good service at Lahore and elsewhere. In 1861 he received the colonelcy of the 46th regiment; in 1863 was promoted to the rank of lieutenant-general; was nominated K.C.B. in 1865, and in 1867 was appointed commander of the British forces in North America. He was holding this command when the circumstance occurred which led to his death. Whilst in Kansas whither he had gone to inspect some land he had purchased, he was attacked with heart disease and advised to remove to a milder locality. He removed to Jacksonville on the St. John River, and whilst still suffering from illness, the house in which he was residing was destroyed by fire, January 27th, 1870. Exposure and excitement increased the malady and he died on the 3rd of February following, in his 60th year.

WINER, GEORGE BENEDICT. [E. C. vol. vi col. 759.] This distinguished theologian died at Leipzig on the 12th of May, 1858, aged 69.

* WINSLOW, FORBES, M.D. [E. C. vol. vi col. 1034.]

WINSTON, CHARLES, archaeologist, was born in 1814. He was called to the bar in 1845, and practised with success; but his inclination was for the study of antiquities, and espe-

cially those of the art of painting on glass, on which subject he came to be regarded as the leading authority. Mr. Winston examined most of the known examples of ancient glass in this country, made many hundreds of sketches of the more remarkable specimens, and much of that on the Continent, and with the help of Messrs. Powell made numerous experiments with a view to a closer approximation to the pigments and material of the old glass-painters. The results of his earlier investigations are given in his 'Inquiry into the Difference of Style observable in Ancient Glass-Paintings. With Hints on Glass-Painting,' 8vo, London and Oxford, 1847, second edition, 1868. His later inquiries were mostly embodied in memoirs read before the Archaeological Institute, and the Institute of British Architects, and, having appeared in the journals of those societies, were posthumously collected and published as 'Memoirs Illustrative of the Art of Glass-Painting,' with a biographical memoir, 8vo, 1866. These works were of great service in elucidating the history and early practice of the art. But Mr. Winston wrote and thought as an amateur rather than as an artist, and whilst his research was of the highest value, his æsthetic opinions were often misleading. The introduction of the feeble Munich transparencies into Glasgow Cathedral was in a great measure owing to Mr. Winston's advice and influence; and his opinion, there can be little doubt, had much weight in determining to a like unhappy choice the authorities of St. Paul's Cathedral, London. Mr. Winston died suddenly of heart-disease at his chambers in the Temple, on the 3rd of October, 1864. His drawings from ancient stained glass, nearly 800 in number, were exhibited in the rooms of the Archaeological Institute and the Arundel Society in April, 1865, prior to their removal to the British Museum, to which institution he had bequeathed them.

* WINTHROP, ROBERT CHARLES, American politician, orator, and writer, was born at Boston, May 12th, 1809. In 1828 he graduated at Harvard University, then studied law under Daniel Webster, and was admitted to the bar in 1831. Soon abandoning the legal profession, however, he gave his attention to politics; entered the State Legislature of Massachusetts in 1834; filled the office of Speaker of the House of Representatives in 1837 and two following years; and was elected member of Congress in 1840. After a European tour, he became Speaker of the House of Representatives in Congress in 1847. In the contests of that period between Democrats, Whigs, and Free-soilers, Mr. Winthrop shared the alternations of success and defeat—failing to get re-elected to Congress in 1849; obtaining a seat in the Senate in 1850; losing it again in the following year, being defeated in a contest with Mr. Sumner; and experiencing another failure (also in 1851) in a struggle for the governorship of the State of Massachusetts. Since that time Mr. Winthrop has devoted the chief part of his attention to literature. During his parliamentary career he had delivered many speeches and addresses which attracted notice by their logical clearness and scholarly finish. These, or some of them, were afterwards collected, and republished under the title, 'Addresses and Speeches on various Occasions,' 8vo, Boston, 1852. Later publications by him have been 'Lectures on Algernon Sidney,' Boston, 1853; 'Second Series of Addresses and Speeches on various Occasions, delivered in 1852—57,' Boston, 1857; 'George Washington, an Address on laying the Corner-Stone of the Boston Public Library,' Boston, 1855; 'On Christianity, as a Remedy for Social and Political Evils,' Boston, 1857; 'An Address on Learning and the Fine Arts,' delivered on the occasion of unveiling a statue of Washington, Boston, 1859; 'Memoir of the Honorable R. Appleton,' Boston, 1861; 'Life and Letters of J. Winthrop,' 2 vols. Boston, 1864—67; 'Massachusetts and its Early History,' lectures delivered before the Massachusetts Historical Society, Boston, 1869; 'Eulogy pronounced at the Funeral of George Peabody, on the 8th of February, 1870' (twenty-four privately printed copies), 4to, Boston, 1870.

WISEMAN, CARDINAL NICHOLAS. [E. C. vol. vi. col. 766.] Notwithstanding the demands on his time and attention arising from his high position and episcopal duties, Cardinal Wiseman continued to cultivate his literary tastes, and even to appear in the walks of original authorship. In 1858 he published 'Sermons, Lectures, and Speeches, delivered during a Tour in Ireland;' and a little later, a more original and entertaining work, 'Recollections of the Four Last Popes,' 8vo, 1858. He also brought out a new edition of his romance 'Fabriola.' He died on the 15th of February, 1865, and was interred in the Roman Catholic Cemetery, Kensal Green. He was succeeded as Archbishop of Westminster by the Rev. Edward Manning.

Large subscriptions have been raised for the erection of a cathedral at Westminster, as the most fitting memorial of Cardinal Wiseman, the first Roman Catholic archbishop of Westminster. Cardinal Wiseman was the author of the article 'Catholic Church,' in E. C. Arts and Sci. Div. vol. ii. col. 673.

WITHERINGTON, WILLIAM FREDERICK, R.A. [E. C. vol. vi. col. 771.] The veteran landscape-painter continued, despite his advancing years, and, it must be admitted, failing powers, to practise the art in which he had so long delighted. To every exhibition of the Royal Academy he continued to contribute till 1863, in which year he sent no fewer than four pictures. But he sent no more; and, after months of illness, he died, April 10, 1865, aged very nearly 80: he was born on the 26th of May, 1785.

* WÖHLER, FRIEDRICH, a distinguished German chemist, was born at Eschersheim, near Frankfurt-am-Main, July 31st, 1800. In 1812 he entered the Gymnasium at Frankfurt, and in 1819 the University of Marburg, where he made considerable advance in medical studies, which he further pursued at Heidelberg University in 1820—22. Under the tuition of Gmelin, he paid great attention to chemistry and mineralogy. In 1823, after receiving the degree of doctor of medicine, he removed to Stockholm, and placed himself under Berzelius, whom he accompanied on a geological and mineralogical tour. Removing to Prussia in 1825, he was appointed teacher in the newly established Technical School at Berlin, and a year or two afterwards professor in the same establishment. In 1827 he was the first to isolate the metal aluminium, although it was not obtained in masses large enough for manufacturing purposes till many years afterwards by St. Claire Deville. In 1831 he settled at Cassel, where he became professor of chemistry in the Technical School. His first scientific publication of importance, after some papers in the journals, was a German edition of Berzelius's 'Lehrbuch der Chemie,' 1833, fifth edition, 1843. A portion of Wöhler's own work on the principles of chemistry was, indeed, published before this, viz., 'Grundriss der Chemie,' Berlin, 1831, fourteenth edition, Leipzig, 1868. This relates to Inorganic Chemistry; the second part, Organic Chemistry, appeared in 1840, seventh edition, 1868. A French translation of this valuable work, by Grandeau, was published in 1858. During part of his residence at Cassel he carried on, with two partners, a nickel manufactory, having discovered a new method of obtaining that metal in a state of great purity; and published a paper on sulphur mineral-water springs, 'Die Schwefelwasserquellen zu Nenndorf.' Removing to Göttingen in 1836, he was appointed professor of medicine, director of the Chemical Institution, and inspector-general of pharmacy for the kingdom of Hanover. In 1847 he published a forensic-chemical essay on poisoning by arsenic. In 1853 appeared his 'Practische Uebungen in der chemischen Analyse,' Göttingen; of which an English translation by Lieber was published in the same year, and another by Hofmann in 1854. In 1861 he published 'Die Mineralanalyse in Beispielen,' Göttingen. Amongst his other labours has been the translation of eighteen volumes of Berzelius's 'Jahresbericht über die Fortschritte der physischen Wissenschaften.' He has written numerous papers in Liebig's 'Annalen der Chemie und Pharmacie,' Poggendorff's 'Annalen der Physik und Chemie,' and other journals, as well as in the Transactions of the Philosophical Society of Göttingen. In 1864 he was elected foreign member of the Institute of France, as successor to Mitscherlich. He is also a member of the Academy of Sciences of Göttingen, of Vienna, and elsewhere.

WOOD, NICHOLAS, mining and colliery engineer, was born at Sourmires, near Newcastle-on-Tyne, April 24th, 1795. He was educated at the village school of Crawcrook; after which he was sent, in 1811, by Lord Ravensworth, to the Killingworth Collieries, there to learn the occupation of coal-viewer. George Stephenson was there at the time, and the two youths formed an intimacy which lasted till death parted them. Nicholas was consulted by George in reference to the invention of a safety-lamp for the use of pitmen, prepared the first drawing of it, shared the danger of a first experimental trial in a very foul mine, and ever afterwards defended the 'Geordie' against the 'Davy'—asserting the priority of Stephenson over Sir Humphry Davy. Later in life, George Stephenson placed his son Robert under Wood, to learn practical details concerning mineral surveying and engineering. In 1815 Wood published communications to a local journal on this subject, and thus made himself favourably known. Studying the action of the crude locomotives known up to that time on colliery tramways, he, in 1822, boldly advocated the use of such means of traction on tramways

and railways generally, in preference to ropes and stationary engines. In 1825, when the Stockton and Darlington Railway had proved successful, he published his 'Treatise on Railroads,' the first work on the subject, of which several editions have since appeared. He rejected the idea that locomotives could be made to run twenty miles an hour, but nevertheless had great confidence in them; and the sagacious suggestions contained in his 'Treatise' contributed largely to the fostering of railway enterprise. In 1827 he gave evidence before the Parliamentary Committee on the Liverpool and Manchester Railway; and in 1829 acted as one of the judges to award the premium offered by the directors for the best plan of a locomotive. In 1830—31 he communicated two papers to the Natural History Society of Northumberland and Durham, on the geology and palæontology of the district. In later years he pursued the inquiry in papers read before the British Association for the Advancement of Science, on the formations, strata, dykes, and denudation of the coal-fields. In 1844 he removed from Killingworth to Hetton, and was engaged in extensive operations as manager and part proprietor of the Hetton and other collieries, mineral adviser to the Durham Bishopric estates and to Lord Ravensworth, and as a kind of consulting engineer in relation to numerous railway schemes. In 1845 he joined in the "Battle of the Gauges," taking sides with the Stephenson and the narrow gauge. He proposed an official registration of mining industry, as a measure likely to be equally useful to economic geology and to commercial statistics—a suggestion that bore good fruit some years afterwards. He was a member of the local Committee on Colliery Accidents, which procured the passing of the Mines' Inspection Act in 1851. In 1852 he founded the North of England Institute of Mining Engineers, of which he remained president until his death: his annual addresses, and fourteen papers on mining subjects, possessed great practical value. A paper, 'On Improvements in the Working of Coal Mines,' was published in the 'Proceedings of the Institution of Mechanical Engineers.' At Hetton, in 1855, he endeavoured to establish a school or college "for the cultivation, improvement, and teaching of mining science, especially as applicable to coal mines;" it failed at the time, but led to the founding of the Government School of Mines. Mr. Wood, who was a fellow of the Royal and Geological Societies, and a member of the Institutions of Civil Engineers and Mechanical Engineers, died on the 19th of December, 1865.

WOODWARD, BERNARD BOLINGBROKE, F.S.A., was born at Norwich, in 1816, and was the eldest son of Samuel Woodward, author of the 'Geology of Norfolk.' On leaving school he was placed in Messrs. Gurney's bank; but his thoughts turned towards the ministry, and he entered Highbury Theological College; at the end of his term there he graduated B.A. at the London University, and accepted a call to the pastorate of the Independent Church at Harleston, near Bungay. Whilst here he edited 'Barclay's English Dictionary,' and otherwise assisted Messrs. Child in carrying various works through the press. Removing to London, in 1850, he devoted himself mainly to literary work, wrote a 'History of Wales from the Earliest Times,' 1851, a 'History of America to the End of the Administration of President Polk,' and contributed to various journals. He found, at length, his right place on receiving from Prince Albert the appointment of Royal Librarian. The books in the royal library required rearranging, and the collection of drawings by the old masters was in a state of utter confusion. Encouraged by the Prince, who watched his labours with great interest, Mr. Woodward thoroughly examined the long-hidden treasures, and rearranged, remounted, and classified the drawings and prints, photographed the choicer specimens, and placed the whole in excellent order for exhibition and reference. On the death of the Prince Consort Mr. Woodward's labours were more arduous and responsible, and he received the title of Librarian in Ordinary to the Queen, and Keeper of Prints and Drawings at Windsor Castle. The examination of the Windsor drawings led him to devote more attention to art, with which he eventually acquired a considerable acquaintance. In May, 1863, he published the first number of the 'Fine Arts Quarterly Review,' and he continued to edit it as long as it appeared; but it was a post for which he had no special qualifications, and to that, no doubt, the non-success of the work is to be partly attributed. Mr. Woodward continued diligently occupied on his various labours till his death, which occurred somewhat suddenly, from heart disease, at his residence, Royal Mews, Piccadilly, October 12th, 1860. He had just completed the descriptive text of a richly illustrated monograph of Windsor Castle; also that of a series of photographic reproductions entitled 'Specimens of the Drawings of Ten Masters from the Royal Collection at Windsor

BIOG. DIV.—SUP.

Castle,' folio, 1870; and he commenced a chronological dictionary which has been completed by Mr. W. L. R. Cates, under the title of an 'Historical and Chronological Encyclopædia.' A revised edition of his 'Natural History of the Year,' was published in 1872.

WOODWARD, SAMUEL PEARCE, naturalist, brother of the preceding, was born September 17th, 1821. In 1838 he entered the London University (now University College), and obtained temporary employment in the British Museum library. From 1839 to 1845 he was subcurator of the museum belonging to the Geological Society of London. In 1845 he became professor of botany and natural history at the Royal Agricultural Society, Cirencester. In 1848 he was appointed an assistant in the department of geology and mineralogy in the British Museum. Shortly before his death he was appointed one of the examiners in geology and palæontology to the University of London. He died at Herne Bay, July 11th, 1865. From his earliest youth he had delicate health, and for the last twenty years of his life suffered from chronic asthma. He, nevertheless, worked hard, and contributed numerous articles to the scientific literature of the day. Amongst these may be mentioned his paper on the family *Rudistes*, in the 'Quarterly Journal of the Geological Society,' vol. xi., for which the Wollaston donation fund of 1854 and 1857 was awarded him. He prepared the geological map of England and Wales published by the Society for the Diffusion of Useful Knowledge, under the superintendence of Sir R. I. Murchison; and he assisted Professor Owen in the portion of his 'Palæontology' which relates to the invertebrates. His principal work was a 'Manual of Recent and Fossil Shells,' 8vo, London, 1851—56, second edition, 1866. He was one of the founders of the Cotteswold Naturalists' Field Club, and a fellow of the Geological and of the Linnean Society.—A younger brother,

* HENRY WOODWARD, F.G.S., F.Z.S., has also attained distinction as a geologist and writer on palæontology. He has given special attention to the structure and classification of the fossil Crustacea, on which subject he has written several reports for the British Association; as also several papers which are contained in the 'Geological Magazine,' the 'Quarterly Journal of the Geological Society,' &c. He also contributed the first portion of a monograph on the *Merostomata*, to the volumes of the Palæontological Society. Mr. Woodward is assistant keeper of the geological department of the British Museum, and editor of the 'Geological Magazine.'

* WOOLNER THOMAS, A.R.A., sculptor, was born about 1822. His earliest appearance as an exhibitor at the Royal Academy, was in 1843, with a model of 'Eleanora.' A model of 'Alastor,' in 1846, and various other works of a like ambitious order, followed; but, before settling down in London, Mr. Woolner paid a visit to Australia, and secured friends and friendly commissions there. His earliest decided success was obtained by the medallions in high relief of eminent contemporaries, including Wordsworth, Carlyle, Tennyson, Browning, Millais, &c., and which procured him commissions for numerous similar portrait-medallions. Later he executed a like series of marble busts, among them being vigorous and characteristic portraits of Rajah Brooke; Sir William Hooker; Sir Francis Palgrave; the Rev. J. H. Newman; Archdeacon Hare; Professor Sedgwick, and Alfred Tennyson, for Trinity College, Cambridge; Gladstone, for the Bodleian Gallery, Oxford (the pedestal having reliefs from Homer); Darwin, Carlyle, Sir Hope Grant, Sir Bartle Frere, Bishop Temple, &c. Mr. Woolner has executed several admirable statues, of which that of Lord Bacon, in the Oxford Museum, may be cited as an example for purity of line and form, largeness of style, characteristic expression, variety and truth of surface. His poetic statues and groups and reliefs take a wide range, including, among others, such subjects as 'Puck,' 'Ophelia,' 'Love,' 'Elaine with the shield of Sir Lancelot,' and 'Virgilia bewailing the Banishment of Coriolanus,' 1871. Mr. Woolner has also designed several monumental works and some of an ornamental character. He was elected A.R.A. in 1870.

WROTTESELEY, JOHN, F.R.S., SECOND BARON, a distinguished astronomer, was born at Wrottesley Hall, near Wolverhampton, August 5th, 1798. In 1817 he graduated first class in mathematics at Oxford University. He then studied law, and for a while practised at the equity bar; but, directing his attention to astronomy, he became more and more absorbed in the pursuit, and in 1829—31 built and fitted up an observatory at Blackheath. Amongst other apparatus, he furnished it with a fine transit-instrument of sixty-two inches focal length, and three and three-quarter inches clear aperture; and set himself a definite work to do, of lasting usefulness to practical astro-

nomers, though not likely to lead to brilliant discoveries on his own part. Taking the Astronomical Society's Catalogue of 2881 stars, he selected 1318 of the sixth and seventh magnitudes, of which he proposed to determine the right ascension with great accuracy, by means of eight or ten observations on each star. This work occupied him and his assistant, Mr. Hartnup, for four years, during which time they made 12,007 observations and measurements. The memoir and tables recording these labours were printed in the tenth volume of the Royal Astronomical Society's 'Memoirs,' and were rewarded with the gold medal of the Society in 1839. Mr. Baily, the president, on presenting the medal, drew attention to the lasting importance of the observations. In 1835 Mr. Wrottesley (he did not succeed his father in the peerage till 1851) furnished a Supplementary Catalogue of Fifty-five Stars to vol. xii. of the Society's 'Memoirs.' In 1842 he commenced the erection of an observatory at Wrottesley Hall, and provided it with a fine equatorial, ten and three-quarter feet focal length, by seven and three-quarter inches aperture; the object-glass having a flint-glass lens by Guinaud, and a lens of crown glass by Dollond. He devoted several years to a patient examination of such stars as seemed most likely to exhibit sufficient parallax to determine their distance; and the result of these observations was printed in the 'Philosophical Transactions' of the Royal Society in 1851. He next devoted three years to an examination of 1009 stars in the British Association Catalogue, made five observations on each, and determined their right ascensions with great accuracy; the results were published in vol. xxiii. of the Royal Astronomical Society's 'Memoirs.' From 1841 to 1843, he was president of the Royal Astronomical Society, and delivered many addresses on the presentations of medals, &c. From 1854 to 1858 Lord Wrottesley was president of the Royal Society. In 1859 he communicated to the Royal Society a memoir 'On the Application of the Calculus of Probabilities to the Results of Measurements of the Positions and Distances of Double Stars.' It relates to small but singular discrepancies in the measurements made by different observers on the same night, and by the same observers on different nights. This was one of the instances in which he devoted a large amount of

patient research to a subject intended to facilitate the computations of other astronomers, rather than to add to his own fame. In 1860 he completed a 'Catalogue of the Positions and Distances of 398 Double Stars,' which was printed in vol. xxix. of the Astronomical Society's 'Memoirs.' Lord Wrottesley died on the 27th of October, 1867. He was an active member of the Council of the Society for the Diffusion of Useful Knowledge during the whole term of its existence, and wrote the 'Treatise on Navigation,' published in the Society's 'Library of Useful Knowledge.'

* WURTZ, CHARLES ADOLPHE, a French chemist of eminence, was born at Strasburg, November 26th, 1817. He studied at the Protestant Gymnasium in his native city, went through a course of medical tuition, and received the degree of doctor in 1843. He then removed to Paris, where, in 1845, he prepared a course of studies on organic chemistry. In 1846 he was appointed chemical director of the School of Art and Manufactures; in 1851, professor in the Agronomic Institution of Versailles; and in 1854, professor of medical chemistry and pharmacy, performing the duties which had previously devolved upon Dumas and Orfila. In 1856 he was chosen member of the Academy of Medicine, after this a member of the Committee on Hygiene, and then a member of the Philomathique Society and of the Chemical Society. In 1865 he obtained the Imperial biennial prize of 20,000 francs on the recommendation or nomination of the Academy of Sciences. In 1867 he succeeded Pérouze in the chemical section of the Academy; and in 1869 was made commander of the Legion of Honour. Besides papers in the 'Annales de Chimie et de Physique,' the 'Répertoire de Chimie Pure,' and other scientific journals, M. Wurtz has published, 'Sur l'Insalubrité des Résidues provenant des Distilleries,' 1859; 'Leçons de Philosophie Chimique,' 1864; 'Traité Élémentaire de Chimie Médicale,' 1864—65; 'Leçons Élémentaires de Chimie Moderne,' 1866—68; and his principal work, 'Dictionnaire de Chimie Pure et Appliquée,' large 8vo, 1868 and subsequent years. The valuable introduction to this work has been published in English as 'A History of Chemical Theory from the Age of Lavoisier to the Present Time,' translated by H. Watts, 8vo, London, 1869.

X

XIMENES DONOSO, DON JOSEF, a celebrated Spanish painter, was born at Consuegra in 1628. He learned the rudiments of painting of his father, Antonio Ximenes; then studied in the school of Francisco Fernandez; and afterwards went to Rome, where he stayed seven years, devoting much of his time to architecture. As a painter, he imitated the Italian manner, which he is said to have introduced into Madrid. His chief works are the frescoes in the convent of S. Francisco at

Madrid; the chapel of S. Juan de Letran, Valencia; the chapel of Val de Christo, Segorbia; and in the cathedral of Toledo. He also painted many pictures for private patrons. By Spanish writers he is praised for his correct academic style; but he was deficient in original power. Ximenes Donoso practised also as an architect. Several buildings are attributed to him, but none of any consequence, and his taste in architecture was corrupt. He died September 14th, 1690.

Y

YARRANTON, ANDREW, a promoter of many ingenious schemes for the advancement of industry and commerce, was born at Larford, Worcestershire, in 1616. In early life he was engaged in a linendraper's shop at Worcester, but soon quitted it; and on the breaking out of the civil war joined the Parliamentarians, and rose to the rank of captain. Little is known of his military career, except that he discovered and frustrated one of the plots of the Royalists, for which he was thanked and rewarded by Parliament in 1648. When Oliver Cromwell rose to power, Yarranton, like many of the Presbyterians, quitted the army. In 1652 he commenced ironworks near Bewdley, and, aided by his wife, established a small linen factory for the employment of the villagers around. He made, at his own cost, improvements in the navigation of the Severn, near Bewdley. After two years' imprisonment (1660—62) for supposed plotting against the Royalists, he published a vindication, 'A Full Discovery of the Presbyterian Sham Plot.' He

engaged in works of river engineering—deepening the Salwarp between Droitwich and the Severn, improving the Stour between Stourport and Kidderminster, planning a canal from the Severn to the Thames (almost exactly in the line of route practically adopted a century later), and improving the Avon from Tewkesbury to Stratford. His active and inventive mind was always at work on new plans. He urged the Worcestershire farmers to adopt rotation of crops, and published a treatise, of which the second edition bore the title, 'The Improvement Improved by a Second Edition of the Great Improvement of Lands by Clover,' 12mo, London, 1663. He surveyed and planned docks for London; he went to Saxony in 1665, learned how tin plates were made, and afterwards established a manufactory of them in his native county; he went to Holland to inquire into the causes of the prosperity of that country, and returned home full of projects for the encouragement of trade and industry—fisheries, river improvements, linen manufac-

tures, new developments of the iron and woollen manufactures, the establishment of land registry, and of loan banks on the security of land, the formation of new harbours, improvements in the navy, &c. These projects supplied the subjects of 'England's Improvement by Sea and Land. In two parts,' 8vo, with folding plates and maps, 1677, which was published about 1680; both attacked in a pamphlet, 'Coffee-House Dialogues between Captain Y. and a Baronet of the Middle Temple,' and defended in 'England's Improvements Justified, and the Author thereof, Captain Y., Vindicated,' &c. Dunkirk was at that time held by the English; and one of his pamphlets, or rather broadsheets, was, 'A New Map of the Town of Dunkirk, Harbour, and Castle on the Sea, with Reasons for their Demolition,' folio, 1681—to prevent them from falling into the hands of the French. Nothing beyond this date (1681) seems to be known of this remarkable man.

* YOLLAND, COLONEL WILLIAM, R.E., was born in 1810. After studying at the Royal Military Academy, Woolwich, he received his commission as second lieutenant of Royal Engineers in 1828. From 1830 to 1835 he served in Canada. On his return he joined Colonel Colby in the operations connected with the Ordnance Survey, in which duties he was engaged from 1838 to 1854. He was stationed successively at the Survey offices at the Tower, Southampton, Dublin, and Enniskillen. The results of these labours, and of some which were completed before he joined the Survey, were recorded in 'An Account of the Measurement of the Lough Foyle Base in the North of Ireland during the Years 1827—8—9,' 'Astronomical Observations made with Ramsden's Zenith Sector,' and especially 'Astronomical Observations made with Airy's Zenith Sector between the Years 1842 and 1850, for the Determination of the Latitudes of various Trigonometrical Stations in Great Britain and Ireland,' 4to, 1852. He wrote the article 'Geodesy' in the 'Mathematical Course' prepared and published for the Royal Military Academy. In 1854 he was appointed one of the inspectors of railways under the Board of Trade—an office which he has filled to the present time (1872). In 1856 he was nominated a member of a military commission appointed to inquire into the best mode of training officers for the scientific corps of the army, i.e., the Artillery and the Royal Engineers; and in pursuance of this inquiry, he visited the military establishments of France, Prussia, Austria, and Sardinia. Colonel Yolland has passed through all the grades of promotion from second lieutenant to colonel of Royal Engineers; but his duties are now chiefly concerned with civil-engineering and surveying, in connection with the Board of Trade.

YOUNG, JOHN, a mezzotinto engraver of some ability, who flourished at the end of the last and early part of the present century. His most noted print is from Mortimer's picture of the 'Great Fight between Broughton and Stevenson.' In 1815 he engraved for the Sultan Selim III. 'A Series of Portraits of the Emperors of Turkey, from the Foundation of the Monarchy to the Year 1815,' atlas folio, of which nearly the whole edition was sent to the Ottoman court. Young is now chiefly remembered by his etchings and catalogues of the Stafford, Grosvenor, Angerstein, Miles, and Leicester galleries (4to, 1820, &c.), which, though the etchings are often incorrect in drawing, and the descriptions superficial, are handy and useful works of reference. Young was engraver in mezzotinto to the king, and for several years keeper of the British Institution. He died March 7th, 1825.

* YVON, ADOLPHE, a distinguished French painter, was born at Eschwiller (Moselle), in 1817, and was a pupil of Paul Delaroche. His first exhibited picture was a portrait at the Salon, 1842. In 1843 he went to Russia, and from the studies which he made there he painted several pictures, exhibited at the Salon in 1847 and following years. In 1846 he exhibited the 'Remorse of Judas,' and he painted 'The Seven Capital Sins' and other theological and allegorical subjects. But he discovered the path in which he was to achieve success when he painted his Russian battle-pieces (1850, &c.), especially 'Ney leading the Rear-Guard in Russia' (1855). These pictures procured him the honour of being sent to the Crimea to represent the achievements of the French arms. His first great picture of the series, 'The Capture of the Malakoff,' was assigned the post of honour at the Salon of 1857, and, with the rest of the series, was placed at Versailles. The success of these led to his receiving a command to accompany the staff of Napoleon III. in the Italian campaign. Of his pictures of leading events in these campaigns, painted for Versailles, four reductions made by him for the Emperor—three of scenes at the Malakoff, and the fourth, 'The Battle of Solferino'—were exhibited in the International Exhibition of 1862. At the International Exhibition of 1871 appeared only 'Russian Peasants.' M. Yvon's battle-pieces are regarded as the perfection of art by his countrymen. They are usually of episodes in a battle; extremely clever in treatment; full of life, vigour, and movement; well drawn, bright in colour, and perspicuous in arrangement. But they are theatrical in effect, and deliberately inexact, everything being rendered subservient to the glory of France and the Emperor. M. Yvon received the cross of the Legion of Honour in 1855, and the great medal in 1857.

Z

* ZAHN, JOHANN KARL WILHELM, a celebrated German archaeologist, was born at Rodenberg, in Schaumburg, August 21st, 1800, and studied architectural design in the Cassell Art Academy. During 1822—24 he studied at Paris, and then proceeded to Italy, where he devoted himself particularly to the remains of Pompeii. On his return to Germany he published the result of his examination of the wall-paintings of that city, 'Neuentdeckten Wandgemälde in Pompeji,' Stuttgart, 1828. This work attracting much notice, he was nominated professor in the Berlin Art Academy, and in 1830 directed to return to Italy to complete his inquiries. He accordingly spent that and the three following years in studying, drawing, and modelling the antiquities in the cities and galleries of Naples, Pompeii, Calabria, and Sicily. During those years appeared his great work on the pictures and ornamental art of Pompeii, &c., 'Die schönsten Ornamente und merkwürdigsten Gemälde aus Pompeji, Herculanium, und Stabia,' folio, Berlin, 1828—30. He was also, through the interest of Prince Metternich, employed in making casts, models, and reproductions of the principal bronzes, vases, &c., in the Museo Borbonico. After his return to Berlin he published, 'Auserlesene Verzierungen,' Berlin, 1840—44; 'Ornamenten aller klassischen Kunstepochen,' folio, third edition, 1861, &c.; and various essays and designs of much value.

* ZIEBLAND, GEORG FRIEDRICH, a distinguished German architect, was born at Regensburg, on the 7th of February, 1800, and studied in the Munich Academy under J. M. Quaglio and

Fischer. Some designs made by him having attracted the notice of Ludwig I. of Bavaria, he was sent by the King in 1827 to study the early ecclesiastical architecture of Italy. While at Rome he decorated the walls of Ludwig's residence, the Villa Malta, with paintings copied from those of Pompeii. On his return to Munich in 1829 he was appointed a member of the Council of Architecture, and erected the land-tax commission's house, and some other official buildings; completed the Maria-Hilf Church in the suburb of Au, commenced by Ohlmüller; and erected royal and other monuments in the church of St. Cajetan, at Aibling, &c. But the work which has made Ziebland's great reputation is the Basilica of St. Bonifacius, commenced in 1835, and completed in 1850, at the cost of King Ludwig, the most perfect reproduction hitherto made of a Roman basilica. It is 283 feet long, and 113 feet wide; and is of red brick, the interior being supported by sixty-four monolithic columns of grey Tyrolean marble, with white marble capitals. The pavement is of marble; the roof, open timber-work, elaborately painted; on the walls are Hess's most celebrated series of frescoes. St. Bonifacius is the largest and most splendid of the modern churches of Munich, and of its class the finest in Germany.

ZIEGLER, CLAUDE LOUIS, French painter and designer in ornamental art, was born at Langres in 1804, and studied under M. Ingres. His early works—'Giotto and Cimabue,' the 'Death of the Foscari' (1830), and the portrait of Marshal de
